Nome Community Center Inc	Improving Health Through Food Access in Nome	AK	Residents of Nome and surrounding villages face significant barriers to accessing affordable, nutritious food, which directly impacts health outcomes. The cost of groceries in rural Alaska is among the highest in the nation due to transportation challenges, limited supply chains, and geographic isolation. Many households must rely on infrequent shipments and small local stores where healthy foods are often expensive or unavailable. Food insecurity is a growing concern in the region and contributes to higher rates of chronic health conditions such as diabetes, cardiovascular disease, and obesity. When individuals and families cannot consistently access nutritious foods, it becomes more difficult to manage healthy lifestyles, maintain reliable attendance at school or work, and sustain mental and physical wellness. For many residents, the local Food Bank, Community Garden, Nome Emergency Shelter (NEST), and XYZ Senior Center serves as critical safety nets for people during times of financial hardship and need for support. With the increase in expenses and unreliable SNAP and Medicaid benefits, the demand for services and support has increased significantly.	Initial phase of the project will entail increased food distribution through the Nome Food Bank, Nome Emergency Shelter (NEST), XYZ Senior Center, and the Community Garden. During this phase, education will demonstrate the importance of nutrition and healthy lifestyle choices. Partnerships with local entities will ensure wholistic support and services. The second phase of the project will focus on long-term solutions and sustainability. Education on gardening, subsistence, and financial management will be offered during this phase. Supplies will be distributed to support local subsistence, such as fishing poles and preservation supplies.	\$50,000-\$250,000	Single Community	Nome Census Area	Deferred or Not Advanced

North Slope Borough	North Slope Rural Clinic Upgrades	AK	Health clinics across the North Slope Borough serve as the primary access point for medical, behavioral health, emergency stabilization, prevention, and chronic disease management services in some of the most remote communities in the United States. Clinics in: • Atqasuk • Anaktuvuk Pass • Kaktovik • Nuiqsut • Point Hope • Point Lay • Wainwright • Utqiagvik operate in extreme Arctic conditions where power disruptions, aging infrastructure, and equipment limitations pose risks to patient safety and continuity of care. Many existing clinic facilities require infrastructure upgrades, and several rely on aging generators that have exceeded their operational lifespan. Power interruptions in these environments can: • Disrupt emergency stabilization and trauma response • Interrupt vaccine refrigeration and medication storage • Disable electronic health systems and telehealth services • Compromise behavioral health service continuity • Increase risk to patients and staff This project addresses a critical rural health transformation need: strengthening capital infrastructure and resiliency to ensure uninterrupted access to care in remote communities.	The North Slope Borough Health Department proposes to support clinic facility upgrades and generator replacement across all North Slope communities. 1. Generator Replacement • Purchase and installation of new, appropriately sized backup generators for each village clinic. • Integration with existing electrical systems. • Weather-resistant housing and Arctic-rated equipment. • Compliance with safety and regulatory standards. 2. Targeted Facility Infrastructure Upgrades • Electrical system improvements to support modern medical equipment. • Structural or interior repairs necessary to maintain safe operations. • Energy efficiency enhancements where feasible. • Protection of IT and telecommunications infrastructure. • Improvements that ensure compliance with health and safety standards.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Implementation Application

North Slope Borough	Health Impact Assessment & Cultural Practice Healing Model Research	AK	Rural communities in the North Slope Borough experience disproportionate rates of chronic disease, behavioral health challenges, and limited access to culturally aligned services. Health planning and infrastructure investments often occur without a formal Health Impact Assessment (HIA) process grounded in both epidemiological data and Indigenous knowledge systems. This project addresses a critical rural health transformation opportunity: establishing a data-driven and culturally informed foundation for improving access, quality, coordination, and long-term fiscal sustainability of health care in rural Alaska. Specifically, this initiative will: • Strengthen appropriate care availability by identifying service gaps and barriers. • Advance prevention and chronic disease strategies through upstream health impact analysis. • Integrate behavioral health considerations into community planning. • Foster collaboration across Tribal, local government, and health system partners. • Develop an innovative care framework rooted in cultural healing practices to improve trust and engagement in care delivery.	The North Slope Borough Health Department proposes to request \$450,000 to procure qualified contractors to implement two coordinated and transformative efforts for health care in Alaska. 1.) Rural Health Impact Assessment (HIA) A contracted public health and evaluation team will: • Conduct cross-sector stakeholder engagement across rural communities. • Analyze epidemiological, behavioral health, environmental, and social determinant data. • Assess projected health impacts of economy, policy, infrastructure, and system-level decisions. • Identify gaps in appropriate care availability and service coordination. • Develop actionable, evidence-based recommendations to improve quality, access, and cost-efficiency. The HIA will inform rural health transformation planning and strengthen long-term fiscal sustainability by guiding strategic investments toward high-impact prevention and care coordination strategies. 2.) Cultural Practice Healing Model Development A culturally competent facilitation and planning team will: • Conduct structured engagement with Elders, cultural knowledge bearers, and community stakeholders. • Identify protective cultural practices that support prevention, resilience, and behavioral health. • Develop a formal Cultural Practice Healing Model framework. • Provide implementation guidance and workforce training recommendations. • Produce a scalable framework adaptable across rural communities. This initiative will strengthen workforce capacity by equipping providers with culturally responsive tools and supporting trauma-informed approaches. It advances innovative care delivery models that integrate traditional healing and public health systems.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

North Slope Borough	North Slope Borough Medical Billing Implementation	AK	The North Slope Borough Health Department delivers prevention, behavioral health, clinic-based, and community health services across some of the most remote communities in Alaska. While services are expanding to meet community need, revenue cycle infrastructure has not been fully developed to maximize third-party reimbursement opportunities. Limited internal billing capacity and the absence of a dedicated medical billing structure restrict the Department’s ability to: • Capture eligible Medicaid and insurance reimbursements • Sustain workforce and service expansion • Support prevention and behavioral health program growth • Improve fiscal forecasting and financial transparency To advance rural health transformation, strengthening revenue cycle management is essential to improving fiscal sustainability and reducing reliance on short-term or uncertain funding streams. This project addresses a critical system-level transformation opportunity: building durable medical billing infrastructure to align financial operations with service delivery and ensure long-term sustainability.	The North Slope Borough Health Department proposes to request RHTP funding to either: 1. Hire a full-time Medical Billing Agent (including wages and benefits), or 2. Procure a qualified contractor to provide comprehensive medical billing and revenue cycle management services. Key Project Components: 1. Revenue Cycle Development • Establish billing workflows for eligible services. • Ensure compliance with Medicaid, Medicare (where applicable), and third-party payer requirements. • Develop documentation and coding standards aligned with reimbursable services. • Improve claims submission, tracking, and denial management processes. 2. Workforce & Administrative Capacity Building • Train clinical and prevention staff on documentation requirements. • Strengthen internal processes to support accurate coding. • Establish financial monitoring and reporting dashboards. 3. Contractor Option (if selected) • Solicit and contract with an experienced rural medical billing vendor. • Integrate billing services with electronic health record systems. • Provide ongoing revenue cycle oversight and optimization.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

North Slope Borough	North Slope Land Based Youth Adventure & Prevention Program	AK	Youth across the North Slope Borough face increasing risks related to behavioral health challenges, substance misuse, social isolation, and limited access to structured extracurricular opportunities. Rural isolation and harsh environmental conditions can limit opportunities for positive youth engagement, physical activity, and leadership development outside of school settings. At the same time, the Arctic environment provides unique opportunities for culturally relevant, land-based learning experiences that strengthen resilience, connection to place, and protective social supports. This project addresses a critical prevention opportunity: expanding land-based wellness and leadership programming that promotes physical health, behavioral health resilience, and youth engagement through structured outdoor adventure experiences. By combining expedition-style outdoor learning with ongoing after-school programming, the initiative strengthens prevention infrastructure and builds long-term protective factors among youth across the North Slope.	The North Slope Borough Health Department proposes to implement a land-based youth adventure and prevention program consisting of two complementary components: • multi-day outdoor expeditions led by professional instructors from the National Outdoor Leadership School (NOLS), and • weekly after-school adventure programming in North Slope communities. This initiative aligns directly with RHTP allowable uses including: • Prevention and chronic disease • Behavioral health • Healthy Communities • Workforce and leadership development • Training and technical assistance • Fostering collaboration 1. Land-Based Youth Expedition Program Partnering with NOLS instructors, youth participants will engage in structured outdoor expeditions focused on: • leadership development • teamwork and communication skills • resilience and stress management • environmental awareness and land stewardship • physical activity and healthy lifestyle development • confidence building and goal setting Expeditions will incorporate culturally respectful land-based experiences that encourage youth to build meaningful connections with the Arctic environment while developing leadership and life skills. 2. Weekly After-School Adventure Programming In addition to expedition programming, the project will establish recurring after-school adventure activities designed to maintain engagement throughout the year. Activities may include: • hiking and outdoor exploration • winter survival and safety skills • team-based adventure challenges • outdoor physical fitness activities • leadership and confidence-building exercises • culturally informed land-based learning opportunities These activities will provide safe, structured alternatives to risk-taking behaviors and create consistent engagement opportunities for youth across communities.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

North Slope Borough	North Slope Prevention & Community Wellness Outreach Initiative	AK	Communities across the North Slope Borough experience elevated rates of chronic disease, substance misuse, suicide risk, trauma exposure, and preventable health conditions. Geographic isolation, limited behavioral health access, and high travel costs create barriers to consistent prevention engagement. There is a critical opportunity to expand community-driven, culturally responsive prevention initiatives that engage both youth and adults, strengthen protective factors, and integrate behavioral and physical health education into accessible community-based programming. This project advances rural health transformation by strengthening prevention infrastructure, expanding behavioral health engagement, and improving access to high-quality, community-centered wellness initiatives across all North Slope communities.	The North Slope Borough Health Department proposes to implement a coordinated suite of prevention-focused outreach initiatives designed to increase access, engagement, and sustainability of prevention services across the region. Core Project Components: 1. Youth Wellness Camp Initiative - A structured, culturally grounded wellness camp for youth focused on: • Behavioral health awareness and resilience building • Substance misuse prevention • Physical activity and nutrition education • Cultural identity strengthening and protective factors • Leadership development and peer mentorship The camp will incorporate trauma-informed approaches, evidence-informed prevention curricula, and engagement from community role models and Elders. 2. Men’s Health Prevention Outreach (Travel to All North Slope Communities) Prevention staff will travel to: • Atqasuk • Anaktuvuk Pass • Kaktovik • Nuiqsut • Point Hope • Point Lay • Wainwright • Utqiagvik to conduct targeted men’s health engagement sessions focused on: • Chronic disease prevention (heart disease, diabetes, hypertension) • Cancer screening awareness • Behavioral health and suicide prevention • Substance misuse prevention • Healthy coping strategies and stress management • Increasing engagement in primary care and preventative screenings This outreach reduces barriers to access by bringing prevention services directly into communities. 3. North Slope Behavioral & Physical Health Conference A regional conference designed to: • Integrate behavioral health and physical health education. • Provide prevention training and continuing education. • Foster cross-sector collaboration between providers, Tribal partners, schools, and community leaders. • Strengthen community knowledge of available services. • Promote culturally responsive and trauma-informed prevention practices. The conference will enhance local workforce capacity and strengthen coordination across systems of care.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

North Slope Borough	North Slope Rural Health Technology Modernization	AK	Health facilities and clinics across the North Slope Borough operate in an environment where aging technology infrastructure, limited broadband stability, and outdated hardware reduce efficiency, compromise data security, and limit coordination of care. Many rural clinics rely on aging computers, unsupported software systems, limited network redundancy, and insufficient data storage capacity. These limitations directly affect: • Timely documentation and reporting • Secure transmission of patient information • Telehealth capabilities • Care coordination across providers • Workforce productivity • Regulatory compliance and cybersecurity readiness To advance rural health transformation, technology infrastructure must support secure, reliable, and scalable service delivery. Modernized IT systems are foundational to improving appropriate care availability, strengthening behavioral health integration, enhancing prevention services, and ensuring fiscal sustainability.	The North Slope Borough Health Department proposes to secure RHTP funding to modernize and standardize technology infrastructure across health facilities and clinics in all North Slope communities. Technology Upgrades Will Include: Hardware Modernization • New desktop and laptop PCs • Monitors and dual-screen workstations • Printers and multifunction copy machines • Handheld radios • Secure servers and backup systems • Network switches and structured cabling • Data storage systems Network Infrastructure • Upgraded network connections • Enterprise-grade Wi-Fi routers • Wi-Fi extenders for clinic coverage • Network redundancy and failover equipment • Secure VPN access capability Cybersecurity & Software • Updated operating systems and licensed software • Virus protection and endpoint security • Firewall upgrades • Encrypted storage solutions • Multi-factor authentication systems • Data backup and disaster recovery systems These upgrades will create standardized, secure, and resilient infrastructure across rural clinic sites.	\$1M-\$5M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

North Slope Borough	North Slope Rural Workforce Training	AK	Rural communities in the North Slope Borough face significant workforce shortages across prevention services, behavioral health, and the Community Health Aide Program (CHAP). Geographic isolation, high travel costs, limited local training availability, and credentialing requirements create barriers to maintaining a qualified and sustainable workforce. Retention and advancement of local providers is essential to improving appropriate care availability, strengthening behavioral health systems, advancing prevention strategies, and ensuring long-term fiscal sustainability of rural health services. This project addresses a critical transformation need: investing in workforce certification, advancement, and retention to strengthen rural health system capacity and improve access, quality, and continuity of care.	The North Slope Borough Health Department proposes to secure RHTP funding to support airfare, training registration, certification, and credentialing costs for frontline health personnel in prevention, behavioral health, and CHAP programs. This initiative aligns directly with RHTP allowable uses including: • Workforce • Behavioral health • Training and technical assistance • Appropriate care availability • Prevention and chronic disease • Fostering collaboration Funding will support participation in the following training and certification activities: Community Health Aide Program (CHAP) • CHAP Session Training • CHAP State Board Certification • Emergency Trauma Technician (ETT) Training • Advanced CHAP certifications • Appropriate care availability across seven rural communities Behavioral Health Workforce • Behavioral Health Aide Certification • Counselor and Clinician License Renewals • Advanced Clinical Certifications • Continuing Education Units (CEUs) required for licensure Prevention & Community Health • Prevention Specialist Certification • Mental Health First Aid (MHFA) • CPR / Basic Life Support • Supervisory or Leadership Certifications • Advanced Trainer Credential • Continuing Education Units (CEUs) required for licensure • Advanced public health or prevention credentials Due to the remote location of the North Slope Borough, airfare and technology limitations represent substantial barriers to workforce development. RHTP investment will directly remove barriers to access training infrastructure not locally available.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

North Slope Borough Fire Department	Foundations for Regional EMS Training	AK	All communities in the North Slope Borough are geographically isolated, requiring expensive air travel to provide training opportunities for certification, skills and continuing medical education. Improvements to video conferencing and internet connectivity have begun to create additional training opportunities, but the cost of training equipment, particularly that geared toward at risk populations in the states RHTP proposal, is cost prohibitive to full realization of this opportunity. Medical care in village clinics is limited to first responder service and village Community Health Aide/Practitioners. Access to higher levels of medical care, such as that in Barrow or Anchorage, requires medevac assets that may have limited availability or difficulties of access created by geography and/or weather. This project seeks to improve the quality of local BLS and potential limited ALS care, supporting the ability for local first responder services to seek licensure as full-fledged ambulance services, and enhancing the local knowledge and skills of local EMS and health providers, to support them in patient care when delays to patient access to higher levels of care exist. Other EMS regions have a similar problem, and there is early discussion of collaboration on similar and compatible projects among the EMS regions state wide.	This project seeks to take a hub and spoke approach to regional EMS training, purchasing identical training equipment for a regional center in Barrow, and satellite sites in each village. This will allow for decentralization of training, while allowing remote students to follow along with with skills and training with identical equipment in their home communities. For more specialized equipment, such as OB trainers and ALS equipment, the intent is to create a central cache in Barrow that can be sent as needed to specific communities. A preliminary equipment list to support this approach included adult and pediatric airway mannikin for each village, baby CPR mannikins, trauma training equipment, iSimulates to allow for remote scenarios for each village and a central set in Barrow to support teaching. Additional equipment for a regional basis includes birthing simulators that can simulate common delivery problems, a low-medium fidelity trauma mannikin to support ALS skills and Barrow and the training needs of the fire department medevac service, and additional ALS training equipment to eventually support the local delivery of ALS certification classes in Barrow like EMT-II, EMT-III and AEMT. This would also allow the long term opportunity to collaborate with the Arctic Slope Native Association in simulation and scenarios. The hospital, in partnership with a local university, supports a nursing school program in Barrow. This equipment would allow for collaboration that could include simulation of full continuity of care between initial assessment, stabilization and transport in the field, to village clinic and/or medevac and/or ambulance to the Samuel Simmonds Memorial Hospital. As SSMH seeks to expand their capabilities to include an operating room and seeking certification as a level III trauma center, this will allow the fire department and health department to both take enhance and take advantage of these capabilities for area residents and better support the capabilities in the transfer of patients from SSMH to other specialty centers in Anchorage by the fire department aeromedical division.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Implementation Application

North Slope Borough Fire Department	Regional EMS training for vulnerable populations and long-term sustainment	AK	Access to quality training is impacted by remoteness in NSB villages due to remote geography and the costs associated with airfare. Weather or limited resources can also mean that sick patients requiring medevac may wait hours or days for transfer to an appropriate facility. In small villages, one incident might significantly strain the resources or morale of local responders, especially in the case of fatalities that might have close community connections to responders within the community. This project is the first step in a multi-year plan to improve the training of villages, Barrow and the NSBFD medevac division to incrementally increase the level of care provided to RHTP target populations relative to the existing capabilities of each entity. This project also seeks funds to create additional instructors to improve long term training sustainability, supporting a separate RHTP proposal for purchasing equipment for a regional hub and spoke EMS training center approach. Last, this proposal seeks to improve responder resilience by ensuring each community has access to at least one person trained in psychological first aid and critical incident stress debriefings.	This project takes consists of three separate tracks to improve training. The first divides the fire department into loose functional areas with similar capabilities: village fire departments, Barrow Fire Department, and the Aeromedical Division. This track seeks to incrementally improve the capabilities of each functional area relative to their existing capability in support of RHTP target populations through funds allocated to specific classes, with a first year focus on pediatrics. The second track is to improve long term sustainability of the training program by seeking funds for instructor training to support the separate RHTP proposal seeking equipment to create a regional EMS training center on a hub and spoke model. Last, the third track seeks to funds to send personnel from each community to training in psychological first aid and critical incident stress debriefing.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Implementation Application
North Slope Borough Fire Department	EMS equipment for vulnerable populations	AK	Currently, the village ambulances do not have a method of properly securing infants and small children to a stretcher and limited pediatric trauma equipment, like size appropriate backboard or vacuum mattresses. Additionally, NSB villages do not have the appropriate equipment or training to care for patients requiring manual or mechanical ventilation for sustained periods of time. This proposal addresses both of these problems by purchasing ETT/EMT level appropriate equipment to fill this void.	Pediatric transport needs will be met by using RHTP funds to purchase a pediatric vacuum mattress and commercially available pediatric securing device, like a pedimate, for each NSB community ambulance. For manual ventilation support, the proposal seeks funds to purchase an Archeon EoLife for each ambulance. This device provides feedback on the rate and volume of manual ventilations administered using a bag, valve mask device, providing feedback on the quality of breaths as well as proper mask seal. This device directly supports American Heart Association resuscitation guidelines which emphasize the importance of delivery of proper volume breaths during resuscitative efforts.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

North Star Behavioral Health	North Star Cerner EHR Implementation Project	AK	Behavioral health hospitals, particularly Institutions for Mental Diseases (IMDs), were excluded from federal Meaningful Use incentives, resulting in dated systems that lack interoperability with rural and Tribal providers. Rural Alaskans face long travel times, limited local services, and fragmented transitions of care, which can cause delays, safety risks, and readmissions. North Star’s statewide role, including the only acute inpatient program for children under 12 and specialized services for veterans and first responders, makes it a critical hub for rural patients. However, current technology limits real-time coordination with referring and returning providers, schools, and community behavioral health organizations. The proposed modernization of the Cerner EHR aims to create a secure, interoperable infrastructure that supports seamless data exchange, expanded telehealth (including rural IOP with Starlink), earlier intervention through school and community partnerships, and improved workforce satisfaction and retention. These enhancements will improve access, quality, and sustainability of rural behavioral health care in line with RHTP priorities.	Behavioral health hospitals, particularly (IMDs), were excluded from federal Meaningful Use incentives, leaving many facilities with outdated systems that cannot reliably share information with rural and Tribal providers. For rural Alaskans—who often face long travel distances, limited local treatment options, and fragmented care transitions—these gaps create delays, safety risks, and avoidable readmissions. North Star serves as a statewide behavioral health hub, including Alaska’s only acute inpatient program for children under 12 and specialized services for veterans and first responders, yet current technology limits real-time coordination with rural clinics, schools, Tribal health organizations, and community behavioral health agencies. Implementing the Cerner EHR will create a secure, interoperable infrastructure that supports timely data exchange and expands telehealth options. These changes directly advance RHTP’s goals around access, care coordination, and system sustainability. North Star will implement the Cerner Electronic Health Record as the core infrastructure for modernizing behavioral health care delivery across Alaska. This includes full system build, interface development, data migration, workflow redesign, staff training, and cybersecurity enhancements. Once live, Cerner will support real-time exchange of clinical information—admissions, discharges, medications, safety plans—with Tribal partners, rural hospitals and clinics, and statewide data networks. The platform will integrate with North Star’s Quality Assurance and Performance Improvement (QAPI) processes, enabling stronger outcome monitoring, safer medication practices, equity tracking, and enhanced reporting for value-based care. Beyond inpatient modernization, Cerner will serve as the technological backbone for expanding future telehealth-based Intensive Outpatient Program (IOP) services. North Star aims to broaden partnerships with schools, community agencies, and Tribal organizations to create virtual step-down pathways for youth and adults returning home.	\$1M-\$5M	Behavioral health/su bstance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

North Star Volunteer Fire Department	Frontier EMS Rapid Access and Patient Extrication Program	AK	The North Star Volunteer Fire Department serves a rural and frontier area where many residents build homes off established road systems, down long driveways, on seasonal trails, or in areas with limited infrastructure. As a result, emergency vehicles cannot always directly access patients. During winter months, the problem intensifies due to heavy snow loads, narrowed roadways, drifting, and reduced street widths. Standard ambulances and fire apparatus often cannot safely navigate these conditions, delaying emergency medical response. In addition, our service area hosts numerous outdoor activities and events such as dog sledding and snowmachining across trail systems and remote terrain. When injuries occur during these events, responders face significant challenges reaching patients quickly and safely. Without specialized off-road equipment, accessing and transporting injured individuals from these locations is time-consuming and resource intensive. This lack of reliable off-road access directly impacts response times and patient outcomes. Addressing this gap is critical to ensuring timely, equitable emergency medical care for residents and visitors in our rural community.	Our proposed approach is to modernize and expand our off-road emergency response capabilities by replacing outdated equipment and acquiring purpose-built all-terrain and winter response assets. Through this grant, we will purchase Side-by-Side vehicles, snowmachines, trailers, updated rescue equipment, cold weather PPE, and patient transport systems specifically designed for rugged terrain and extreme winter conditions. This investment will allow us to remove aging, unreliable equipment currently used in limited off-road responses and replace it with safer, more dependable, and medically appropriate transport platforms. The new equipment will be configured to support patient packaging, stabilization, and secure transport from remote locations to the established road system where ambulances can assume care. By improving the transfer point between off-road response and traditional EMS transport, we will reduce delays in definitive care and improve patient outcomes. The equipment will be integrated into our existing response plans, training programs, and maintenance systems to ensure long-term sustainability. Personnel are already trained in wilderness EMS, cold weather operations, and technical rescue, allowing immediate operational deployment upon acquisition. Standard operating guidelines will be updated to formalize activation criteria, response protocols, and safety procedures. In addition to improving service within our own jurisdiction, this project strengthens regional response capacity. The upgraded equipment will be available for mutual aid when requested, allowing us to assist surrounding departments that lack specialized off-road or winter rescue capabilities. This collaborative approach enhances overall emergency preparedness across our region and ensures consistent access to emergency medical care for rural residents and visitors. By upgrading equipment, improving reliability, and enhancing patient transport capability from remote areas to the road system, this project directly addresses current response gaps and creates a sustainable, modern solution for rural emergency access challenges.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Deferred or Not Advanced

North Star Volunteer Fire Department	Rural EMS Workforce Development and Simulation Training Initiative	AK	Advancements in medical simulation technology have significantly improved the way EMS personnel are trained to respond to real-world emergencies. However, many rural departments, including ours, lack access to modern training equipment due to limited funding. Without advanced training aids, responders must rely on basic or outdated training tools that cannot fully replicate the complexity and stress of real patient care situations. This project addresses the need for more realistic, hands-on training opportunities for our EMS providers. By acquiring a modern EMS training manikin, our department will be able to conduct high-quality scenario-based training that closely mirrors real medical emergencies. This type of training allows responders to practice patient assessment, airway management, cardiac care, trauma treatment, and other critical interventions in a controlled environment before encountering these situations in the field. Improving the realism and quality of training directly strengthens the skills, confidence, and decision-making ability of our EMS personnel. In rural communities where emergency responders may be the first and only medical providers for extended periods of time, strong training is essential. By investing in better training tools, we can ensure our providers are better prepared to deliver effective care, ultimately leading to improved patient outcomes in the communities we serve.	Our approach is to enhance the quality and realism of EMS training by acquiring an advanced medical simulation manikin capable of replicating a wide range of emergency medical conditions. This training device will allow our department to conduct scenario-based simulations that mirror real-world incidents commonly encountered by rural EMS providers. The advanced manikin will enable training in critical areas such as cardiac arrest management, airway interventions, respiratory emergencies, trauma care, patient assessment, and other life-threatening medical conditions. Unlike traditional training tools, modern simulation manikins provide real-time feedback on key interventions such as chest compressions, ventilation quality, airway placement, and other lifesaving skills. This feedback allows students and instructors to evaluate performance, identify areas for improvement, and reinforce correct techniques during training exercises. By incorporating this technology into our training program, we will be able to create more realistic and challenging scenarios that strengthen both individual clinical skills and team-based response coordination. Personnel will have the opportunity to repeatedly practice complex medical scenarios in a controlled environment, improving confidence, decision-making, and patient care skills before responding to actual emergencies. This equipment will support training for paid staff, scholarship firefighters, and volunteer members within our department. Additionally, the manikin will allow us to expand training opportunities by conducting regular skills sessions, continuing education programs, and scenario-based drills designed to maintain clinical competency. Ultimately, this approach strengthens our EMS training infrastructure and ensures responders are better prepared to deliver high-quality patient care in the field. By improving training realism and providing measurable performance feedback, the project directly supports improved emergency medical response and better patient outcomes for the rural communities we serve.	Under \$50,000	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced

Northern Hope Center	Northern Hope Center Integrated Drop-In and Peer Crisis Pathway	AK	Northern Hope Center operates a drop-in center in Fairbanks that provides low-barrier support to individuals experiencing behavioral health challenges throughout Interior Alaska. While the drop-in model has proven effective, our current capacity is limited, and we lack the peer crisis infrastructure needed to serve individuals in acute crisis, divert them from emergency departments and contact with law enforcement, and connect them to sustained clinical care. There is a critical and unmet need for peer-delivered crisis support in Interior Alaska, a region where behavioral health provider shortages are severe, emergency departments are overburdened, and community-based crisis alternatives are virtually nonexistent. RHTP funding represents an opportunity to build on a working foundation and close this gap.	Northern Hope Center will expand its existing drop-in center and launch a new peer crisis component, creating a five-part Integrated Drop-In and Peer Crisis Pathway. First, we will expand drop-in hours, staffing, and on-site supports to serve more individuals and increase the depth of care available at walk-in. Second, we will hire and train Peer Support Specialists with lived experience of recovery to provide direct support, crisis accompaniment, and system navigation. Third, we will launch crisis stabilization services as a community-based alternative to emergency department visits, allowing individuals to de-escalate safely and connect to follow-up care. Fourth, we will establish warm handoff protocols with clinical partners to ensure continuity of care beyond the initial crisis contact. Fifth, we will deploy a mobile outreach team to extend services beyond our Fairbanks site to encampments, shelters, and rural communities throughout the region. This integrated model addresses the full continuum from outreach to stabilization to clinical connection, built on an operational foundation that is ready to scale.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Deferred or Not Advanced
Northern Hope Center	Northern Hope Center Reentry Peer Support and Community Integration Initiative	AK	There is no health-centered group home in Fairbanks designed to support adults navigating reentry, recovery, and health stabilization. Individuals reentering the community face compounding barriers, such as mental health disorders, substance use histories, trauma, and profound disconnection from health care, with almost no specialized support available. Without stable housing and consistent peer support during the critical reentry period, individuals cycle through emergency departments, crisis services, and incarceration at enormous cost. Northern Hope Center has the organizational foundation, community relationships, and behavioral health expertise to establish this resource. RHTP Readiness Grant funding will support the planning and design work needed to ensure it is done right.	Northern Hope Center will use Readiness Grant funding to plan a new health-centered group home across four workstreams: (1) feasibility and licensing assessment covering regulatory requirements, site options, and operational cost modeling; (2) peer support program design, including recruitment strategy, certification pathways, supervision frameworks, and peer-delivered service protocols co-designed with individuals with lived reentry experience; (3) health care integration planning, including provider mapping, warm handoff protocols, and telehealth options; and (4) community engagement and partner development with reentry-experienced community members, Tribal partners, law enforcement, and service providers. The Readiness phase will culminate in a detailed implementation plan and budget for a future RHTP Implementation Grant application.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Deferred or Not Advanced

Northern Hope Center	Northern Hope Center Telehealth and Digital Access Initiative	AK	Northern Hope Center currently has no telehealth capability. While our in-person drop-in and behavioral health services are effective for individuals who can reach our Fairbanks site, we are unable to serve the many rural and remote Interior Alaskans who need behavioral health support but cannot travel to access it. Telehealth represents the single greatest opportunity to extend our reach across this region, but building it responsibly requires planning. Without proper feasibility assessment, community engagement, and technology design work, telehealth investments risk producing platforms that don't work in low-bandwidth environments, don't meet client needs, or don't integrate with clinical workflows. This Readiness Grant will fund foundational planning to design a telehealth and digital access program purpose-built for Northern Hope Center's population and the realities of Interior Alaska.	Northern Hope Center will use Readiness Grant funding to conduct three parallel planning workstreams. First, we will assess the feasibility of a telehealth video counseling platform by reviewing HIPAA-compliant vendor options, evaluating bandwidth and device requirements in target rural communities, and consulting with clinical staff on workflow integration. Second, we will engage current and prospective Peer Support Specialists and community members to design a virtual peer support model that extends peer services remotely and to identify training needs and technology requirements specific to virtual peer work. Third, we will research consumer-facing digital tools appropriate for our client population, assess digital literacy and device access, and conduct community engagement to understand client needs and preferences. Across all three workstreams, we will partner with Tribal organizations and rural community members to ensure the design is culturally grounded and technically appropriate for Interior Alaska. The planning process will culminate in a detailed, fully costed implementation plan, ready for submission in a future RHTP funding cycle.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Deferred or Not Advanced

Northgate Alaska	Mat-Su Young Adult Catalyst: Strengthening the Transition to Healthy Adulthood	AK	Northgate Alaska through the iAMSOMEBODY program has partnered closely with the Thrive Coalition to strengthen youth engagement across the Mat-Su Valley. Together with schools, prevention organizations, and community partners, these efforts create events and programs that connect youth with positive organizations and mentorship. Through this collaboration, partners identified a significant gap. Once students graduate from high school, few coordinated opportunities support their transition into adulthood. While education and some work opportunities exist, social spaces for young adults are limited and often center around substance-use environments. The Mat-Su Valley has strong community networks, including a large faith community and civic organizations committed to supporting young people. However, there is no coordinating role focused on connecting these resources and creating consistent opportunities for young adults. This gap increases the risk of isolation, substance misuse, and behavioral health challenges during a critical stage of life. The opportunity is to extend the youth ecosystem already present in the Mat-Su Valley into young adulthood by creating clean, dry, and sober opportunities for connection, mentorship, leadership development, and community engagement. Early conversations have explored the potential for a gap-year style leadership experience that could provide a meaningful pathway for growth and service as young adults launch into adulthood.	This project will establish a dedicated Young Adult Catalyst role to strengthen the transition from youth engagement into healthy young adulthood across the Mat-Su Valley. The Catalyst will collaborate closely with partners in Thrive Coalition, including schools, prevention organizations, faith-based youth networks, and community groups. The role is not to duplicate existing programs but to connect partners, identify opportunities, and coordinate consistent activities that support young adults after high school. The initiative will begin by convening partners and mapping existing opportunities serving young adults. This process will identify gaps, align resources, and build shared ownership across organizations already invested in youth and community development. Through this collaboration, partners will explore solutions that leverage each organization’s strengths. This includes using the population-to-relationship funnel model already used in Thrive and iAMSOMEBODY initiatives— from large clean, dry, and sober community gatherings to mentorship, leadership development, and personal growth. The Catalyst will also pilot clean, dry, and sober gatherings that provide welcoming social environments where young adults can build relationships, develop leadership skills, and connect with mentorship and service opportunities. These gatherings will emphasize belonging, personal development, and civic engagement while strengthening partnerships among organizations serving youth in the region. The Catalyst will also participate in existing Thrive opportunities and leadership development activities to ensure this work dovetails with the regional youth ecosystem and creates a clear runway into young adulthood. As the effort develops, the initiative will explore whether a central hub could support young adults through a gap-year style leadership experience. Drawing from international models familiar within the faith community, this concept could provide a structured year focused on leadership development, community engagement, and service. Within this hub, sub-communities could form around interests such as faith, creative arts, nature and adventure, or vocational exploration, allowing multiple organizations to contribute expertise while maintaining a unified ecosystem of support. The first year will focus on convening partners, piloting gatherings, and learning from participants to refine a sustainable model that strengthens the transition into adulthood.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

NorthStar Gaming	Guiding youth when they feel lost	AK	Youth living in rural and remote communities across Alaska often face significant barriers to accessing mental health support. Geographic isolation, limited availability of behavioral health providers, stigma surrounding mental health, and lack of transportation can prevent young people from receiving help when they are struggling. Many rural youth experience feelings of loneliness and disconnection, which can increase the risk of depression, substance misuse, and suicide. At the same time, many youth regularly connect through online gaming and digital platforms. This presents an opportunity to meet youth in a space where they already feel comfortable and engaged. By creating a supportive online community where someone is always available to listen, encourage positive interaction, and promote kindness, this project aims to reduce isolation, increase access to support, and create a safe environment where youth feel seen, heard, and valued.	Our proposed approach is to create a safe, supportive online community designed specifically for youth in rural and remote communities across Alaska. The program will utilize an online gaming and communication platform where youth can connect with peers, participate in positive activities, and engage with trained mentors who are available to provide encouragement and support. By meeting youth in a familiar and comfortable digital environment, the program removes many of the barriers associated with accessing traditional mental health services. A key component of the program is ensuring that someone is always available online to interact with youth, whether they want to play games, participate in activities, or simply talk. This consistent presence helps create a reliable support system and ensures youth never feel alone when they are struggling. Mentors will help guide conversations, promote healthy coping strategies, and encourage positive peer-to-peer interactions. The program will also incorporate structured activities such as online games, challenges, and community events that promote teamwork, communication, and relationship-building. Youth will be encouraged to participate in tracking and sharing random acts of kindness, which will be recognized through fun incentives and prizes. This approach helps build a culture of empathy, positivity, and mutual support. To ensure equitable participation, the program will work to make sure youth have access to reliable internet so they can fully engage in the program regardless of their geographic location. By combining technology, positive engagement, and consistent mentorship, the project aims to reduce isolation, strengthen connections, and provide an accessible support network for youth who may otherwise have limited resources available to them.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Northway Village	Northway Community Wellness and Cultural Learning Center	AK	Northway is a remote Upper Tanana community where long winters, extreme temperatures, and limited indoor facilities make it difficult for residents to stay physically active and socially connected for much of the year. Currently, there are very few dedicated spaces where youth, families, and Elders can gather for wellness activities, cultural learning, and community connection. This lack of indoor wellness infrastructure creates challenges for supporting prevention-focused health activities, youth engagement, and opportunities for Elders to stay active during the winter months. Social isolation and limited recreational opportunities can contribute to behavioral health challenges and reduced opportunities for healthy lifestyle activities. This project would explore the renovation of an existing building to create a community wellness and cultural learning center in Northway. The space would provide a safe and consistent location for physical activity, youth mentorship, cultural teaching, and wellness programming coordinated with local partners. By creating a place for year-round health, cultural, and community activities, the project would strengthen prevention efforts and improve overall wellness in the community.	Northway Village Council proposes to explore the renovation of an existing community building to create a community wellness and cultural learning center that can support year-round health, prevention, and cultural activities in the community. The project would focus on developing a safe and welcoming indoor space where residents can participate in physical activity, youth mentorship, cultural learning, and community wellness programming. The space could include areas for movement and exercise, gathering space for cultural teaching and workshops, and room for community wellness events and prevention activities. Programming would be coordinated in partnership with existing community programs. The Northway Clinic Community Health Representative could help host wellness activities such as walking programs, group exercise for Elders, and community health education events. The tribe’s Social Services Director could coordinate youth mentorship, family activities, and prevention programming supported through existing grants and services. The center would also create opportunities for Elders to share traditional knowledge and skills with younger generations through workshops, cultural gatherings, and intergenerational activities. By bringing together physical wellness, cultural learning, and community support in one location, the project would strengthen prevention efforts and create a consistent place for positive activities throughout the year. Northway Village Council would also work with regional partners such as Tanana Chiefs Conference and local organizations to support programming and ensure the center can contribute to long-term health and wellness in the community.	\$50,000-\$250,000	Single Community	Southeast Fairbanks Census Area	Advance to Implementation Application

Northwest Nurses & Allied Health LLC	Bringing Nurses and Allied Health Professionals to Rural Alaskan Communities.	AK	Alaska suffers from a drought of healthcare providers. This issue is exaggerated in rural and frontier communities. Northwest Nurses intends to be a conduit to incentivize and bring healthcare providers to rural Alaskan markets. We are a company founded by healthcare professionals who know the challenges of operating in Alaska.	The first step in our approach is to build the bench. Currently, we have over 30 nurses and allied health professionals ready to step into their first contract. If awarded funding our approach would be to incentivize greater recruitment through not only competitive pay and benefits packages, but a commitment to truly showcase the career opportunity that experience in rural Alaska has to offer. Second, we apply a two tier approach to serving Alaskan communities. 1) A direct to facility approach for hospitals and clinics in rural Alaska. They need help staffing their outfit, we bring it to them. 2) For remote and frontier communities we would identify the need for mobile clinics on a case by case basis. One identified, we would arrange for the necessary equipment and personel to be transported to location for a set time period. This could be days to weeks dependant upon need and may include mobile housing units.	\$1M-\$5M	Other	Statewide	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Yakutat (City and Borough)	Deferred or Not Advanced

Norton Sound Health Corporation	1G Maternal and Neonatal Equipment Upgrades	AK	NSRH delivers between 60 and 110 babies each year with a consistent record of high-quality care. The maternal and neonatal equipment at Norton Sound Regional Hospital is nearing the end of its functional life cycle, putting that quality at risk. The current system also lacks modern telemedicine interfaces to tertiary obstetric and neonatal facilities. This technological gap creates a "referral burden" where patients are sent to Anchorage simply because the local facility lacks the specific stabilization hardware required for high-risk deliveries. Current data indicate that 50% of infant deaths in Alaska occur in the neonatal period (0–27 days), with over half of those being very or extremely preterm infants who require immediate, high-fidelity stabilization. Without updated equipment, NSHC remains vulnerable to equipment downtime and cannot use modern telehealth links that could enable local clinicians to consult with NICU specialists in real time. This project presents an opportunity to design a State-of-the-Art Perinatal Suite. By planning a comprehensive upgrade, NSHC can transition to a model that integrates wireless, remote fetal monitoring—which has been shown to shorten labor duration and improve patient outcomes—with advanced neonatal stabilization. This allows us to standardize care to AAP and ACOG national standards, ensuring that every child born in the region has access to lifesaving technology that matches the level of care found in urban tertiary centers.	NSHC will employ a multidisciplinary planning approach to ensure that new maternal and neonatal technologies are not only procured but fully integrated into the clinical workflow and physical infrastructure of the Norton Sound Regional Hospital. 1. Clinical Gap Analysis & Standardization The project will begin with a rigorous audit of existing Labor and Delivery (L&D) assets against the latest American Academy of Pediatrics (AAP) and ACOG national standards. We will identify specific equipment—such as T-piece resuscitators, high-fidelity fetal monitors, and advanced neonatal warmers—required to manage infants born at 32 weeks or later locally. This phase ensures that the new fleet of equipment standardizes care across all shifts and providers. 2. Technical Integration & Telehealth Mapping A key component of the approach is the selection of "smart" platforms that support real-time data sharing. We will design a Tele-NICU link that allows for synchronous consultation between NSHC clinicians in Nome and neonatologists at tertiary centers in Anchorage. This involves mapping the IT infrastructure and cybersecurity protocols necessary to transmit high-resolution fetal heart strips and neonatal vitals during critical stabilization events. 3. Infrastructure & Utility Validation Our facilities and biomedical engineering teams will evaluate the L&D unit’s current medical gas and electrical capacity. Modern neonatal ventilators and stabilization units often have higher oxygen and power demands than legacy equipment. The planning process will include any necessary "behind-the-wall" utility upgrades to ensure the facility can support a 100% duty cycle for life-sustaining equipment. 4. Implementation & Simulation Training Roadmap To ensure the transition does not disrupt active patient care, NSHC will develop a phased Go-Live schedule. This includes a comprehensive competency-based training program utilizing high-fidelity simulation. By practicing stabilization protocols with the new equipment before deployment, we ensure nursing and medical staff can respond with precision during high-stress obstetric emergencies. 5. Procurement & Sustainability Strategy The final stage of the approach involves developing a long-term procurement and maintenance contract. This ensures that the selected equipment is durable enough for Arctic transit and that a local stockpile of specialized consumables (e.g., neonatal sensors, circuits) is maintained to avoid supply chain disruptions.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	1L Tribal Healer Workforce Development	AK	The Problem We are facing a "knowledge gap" crisis. Traditional healing is a resource-intensive practice that requires years of one-on-one mentorship, yet NSHC currently lacks the dedicated funding to support apprentices during this long learning curve. With waitlists exceeding half a year, patients in crisis—especially those struggling with behavioral health issues or addiction—are being denied access to the very traditional practices that offer the most profound healing. Without a structured apprenticeship program, we risk losing the specialized knowledge of our Elders and failing to meet the clear community demand expressed in our 2025 patient data. The Opportunity This project presents an opportunity to formalize the Tribal Healer Apprenticeship Pipeline. By funding new apprentices, NSHC will: Reduce Waitlists: Increasing the number of providers to meet the 1,100+ visit demand. Integrate Care: Positioning Tribal Healers alongside Primary Care and Behavioral Health teams for a truly holistic "Whole Person" approach. Ensure Cultural Continuity: Protecting and passing on Alaska Native traditional medicine to the next generation of healers.	NSHC will implement a structured, mentorship-based apprenticeship program overseen by a Program Coordinator to ensure both clinical accountability and cultural integrity: Apprentice Recruitment & Mentor Matching: We will identify candidates from the region who show a calling for traditional medicine and pair them with experienced healers for intensive, hands-on mentorship. Key Training Milestones: The curriculum will include traditional plant medicine, bodywork, and spiritual counseling, balanced with documentation training. This documentation is vital for clinical safety and preparing for future Medicaid reimbursement pathways. Collaborative Reviews: Periodic progress reviews will be held with traditional healers and NSHC leadership. These reviews ensure that the "quality of care" meets both the high standards of traditional practice and the safety requirements of the modern clinical environment. Integrated Primary Care: Apprentices will participate in "Integrated Care Team" meetings, learning how to coordinate with doctors and therapists to support patients through recovery and chronic disease management.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	10 New Computers/Servers for NSHC	AK	The Problem Our current technology infrastructure has reached its "end of life." Servers are at capacity, and workstations are unable to run the latest medical software updates efficiently. This creates a high risk for system outages, which in a remote healthcare setting can be catastrophic. Furthermore, as NSHC expands its Telemedicine and data-driven wellness programs, our existing storage and switching capacity cannot handle the increased data load, leading to "digital congestion" that threatens the security and speed of patient data management. The Opportunity This project presents an opportunity for a Regional IT Modernization. By deploying medical-grade computers, printers, and high-capacity servers, NSHC will: Strengthen Cybersecurity: Implementing hardware that supports modern encryption and security protocols to protect patient privacy. Enable Clinical Growth: Providing the "headroom" needed for advanced imaging, high-definition video consults, and expanded data analytics. Standardize the Fleet: Creating a uniform equipment environment that simplifies maintenance and troubleshooting for our IT specialists.	NSHC will follow a structured, IT-specialist-led deployment strategy to ensure zero disruption to clinical services: Procurement & Compatibility Audit: Following a deep-dive consultation with IT specialists, we will select servers, switches, and workstations that are fully compatible with our current EHR and imaging software while offering a 5-to-7-year growth horizon. Tiered Deployment: We will roll out the new hardware in phases, starting with high-impact clinical areas and the "Core Server Room," followed by a village-by-village workstation refresh. Storage & Redundancy Upgrade: We will implement high-capacity storage devices and modern network switches to ensure data redundancy, protecting against data loss during power fluctuations common in rural Alaska. Post-Deployment Review: After each phase, we will gather staff feedback on system speed and reliability, adjusting our installation protocols to maximize efficiency for the next phase.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	2A Behavioral Health Integration and Care	AK	The Problem The region faces a lethal combination of high trauma, high SUD rates, and a fragmented delivery system. A four-week wait time for behavioral health is not just a delay—it is a critical safety risk in a region with suicide rates nearly seven times the national average. When mental health services are physically or procedurally separated from primary care, patients often drop out of the referral loop, leading to increased emergency room utilization and worsening chronic conditions. The Opportunity This project allows NSHC to design a "Total Health Integration" strategy. We have the opportunity to: Eliminate the "Referral Gap": Moving from a "referral-out" model to an "on-site" model where behavioral health is a standard part of every primary care visit. Specialized Staffing: Hiring a dedicated APP and Clinician to focus exclusively on bridging the gap between psychiatry and family medicine. Holistic Interventions: Creating evidence-based protocols that treat the "whole person," addressing the intersection of SMI (Serious Mental Illness), SUD, and physical comorbidities. Reduce Stigma: By normalizing mental health as a standard component of a clinic visit, we lower the cultural barriers that prevent residents from seeking care.	NSHC will utilize a Collaborative Care Model (CoCM) approach to design the integration: Embedded Staffing: The new Advanced Practice Provider (with psychiatric focus) and Licensed Clinician will be stationed within the primary care wing, attending daily huddles with medical staff. Universal Screening: The team will design a system-wide protocol for universal behavioral health screenings during all intake exams, using the PRAPARE and PHQ-9/GAD-7 tools. Warm Hand-Off Workflows: We will develop "immediate consultation" protocols, allowing a medical provider to bring a clinician into the exam room the moment a mental health need is identified. Psychiatric Consultation Bridge: The APP will serve as the bridge to specialized psychiatry, managing medications and complex cases that typically contribute to the four-week waitlist. Tele-Health Synergy: For our 15 village clinics, the team will design "Virtual Integration" pathways, ensuring remote residents have the same immediate access to the integrated team via high-definition video.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	2B Population Health Based Care Model	AK	The Problem Our region faces staggering rates of chronic disease, yet our current care delivery remains largely "facility-based." Patients in remote villages often wait until symptoms are severe before seeking care, leading to poor outcomes and high costs. Currently, there is a lack of structured, regional follow-up; patients are often discharged from the hospital back to their villages without the local support needed to manage their recovery or medications, resulting in a high rate of avoidable readmissions. The Opportunity This project allows NSHC to design a "Clinic Without Walls." We have the opportunity to: Proactive Outreach: Moving from "waiting for patients" to reaching out via text and phone to manage hypertension, diabetes, and prenatal care before crises occur. Addressing SDOH: Utilizing CHRs as the frontline "navigators" who connect patients with food security, housing, and heating assistance—factors that drive 80% of health outcomes. Modern Communication: Implementing a HIPAA-secure text and digital outreach platform that mirrors how our younger and working-age populations actually communicate. Workforce Empowerment: Creating five new community-based roles (CHRs) that provide local career paths for residents within their own villages.	NSHC will utilize a multidisciplinary "Squad-Based" approach to bridge the geographic and clinical gaps between our 15 remote villages and the regional hub. The core of this approach is the hiring of one Advanced Practice Provider (APP) and five Community Health Representatives (CHRs). Proactive Outreach & Data Stratification: The APP will act as the clinical lead, utilizing our Electronic Health Record (EHR) to risk-stratify the population. Instead of waiting for patients to present with symptoms, the team will proactively identify residents with high-risk chronic conditions—such as uncontrolled hypertension or complex diabetes—who have not had a clinical touchpoint in the last 90 days. Omni-Channel Communication: Recognizing the digital divide and cultural preferences, the team will implement a tiered communication strategy. This includes HIPAA-secure text messaging for younger/working-age populations, structured phone follow-ups for medication management, and traditional written communication for our Elder population. Embedded CHR Navigators: The five CHRs will serve as the "boots on the ground," conducting home visits and facilitating care coordination. They will focus on addressing the Social Determinants of Health (SDOH) by connecting patients with essential local resources like food security programs, heating assistance, and transportation for clinical appointments. Holistic Coordination: The team will facilitate a "warm hand-off" between patients and primary care providers, ensuring that every outreach effort is documented and actionable. This approach transforms care from a series of isolated clinical visits into a continuous, holistic wellness journey.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	2C Central Scheduling Model	AK	The Problem Currently, scheduling at NSHC is decentralized, meaning a patient might have to call three different departments to coordinate a primary care visit, a dental exam, and a behavioral health consultation. This fragmentation leads to high "no-show" rates, as patients struggle to track multiple uncoordinated appointments. Manually managed schedules often result in "dead zones" where providers are idle while patients are on a weeks-long waitlist. Furthermore, the lack of real-time analytics makes it impossible to deploy staff flexibly across the region based on shifting community needs. The Opportunity This project allows NSHC to design a "Unified Access Portal." We have the opportunity to: Automate the Administrative Load: Using AI to optimize calendar density and reduce human error in booking. Reduce Patient Wait Times: Identifying and filling cancellations in real-time to move waitlisted patients into slots faster. Enhance the Patient Experience: Providing automated, multi-channel reminders (text, phone, email) to reduce no-shows and improve adherence to care plans. Data-Driven Workforce Management: Using real-time analytics to identify where provider demand is highest and adjusting schedules to meet that need.	NSHC will lead a design and implementation process that merges advanced technology with a specialized centralized team: AI-Integrated Platform Design: We will select and configure an AI-powered scheduling engine that integrates directly with our existing Electronic Health Records (EHR). This system will use predictive algorithms to identify patterns in no-shows and suggest optimal booking intervals for different types of visits (e.g., complex chronic care vs. quick screenings). Centralized Scheduling Hub: We will design the operational structure for a dedicated Central Scheduling Team. This team will serve as the "Air Traffic Control" for the regional health system, handling all intake, specialty referrals, and village-to-Nome transport coordination. Real-Time Resource Analytics: The approach includes the development of a dashboard that provides administrators with a "heat map" of facility utilization. This allows us to maximize the use of expensive clinical space and ensures that high-demand specialists are fully booked during their limited rotations to remote villages. Multi-Channel Automated Reminders: To accommodate regional connectivity challenges, the system will be configured to send automated reminders via text, automated voice calls, and email, ensuring that patients in even the most remote locations stay connected to their care plan. Flexible Workforce Deployment: The system will feature "Float Pool" scheduling capabilities, allowing NSHC to rapidly deploy per-diem or traveling staff to specific villages during health outbreaks or staffing shortages.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	2D Development of a Regional Behavioral Urgent Response Team	AK	The Problem The Norton Sound region is currently facing a dual crisis of rising mental health emergencies and substance abuse outbreaks. Current response models are fragmented; local village responders often lack the specialized behavioral health training needed for acute stabilization, and regional clinicians in Nome are frequently too far away to provide immediate on-site support. This leads to a reliance on law enforcement and emergency medevacs, which are high-cost, high-trauma, and often escalate the patient’s distress. The lack of a rapid-response clinical team creates a "referral gap" where patients in crisis wait too long for intervention, leading to worse outcomes and increased strain on the regional healthcare workforce. The Opportunity This planning project allows NSHC to design a "Mobile Crisis Anchor." We have the opportunity to: De-escalate in Place: Providing the tools and staff to stabilize patients in their own villages, reducing the need for out-of-region transfers. Clinical-First Response: Moving away from law-enforcement-led interventions to a trauma-informed, clinical-led model. Telehealth Integration: Utilizing high-definition digital tools to "virtually deploy" specialists into a village the moment a crisis occurs. Workforce Protection: Offloading the burden of crisis management from local Health Aides to a dedicated regional team.	NSHC will lead a multidisciplinary design process to establish the BURT framework: Cross-Disciplinary Team Composition: The design will specify a team consisting of a Psychiatric Advanced Practice Provider (APP), a Licensed Clinician, and Peer Support Specialists with "lived experience." This ensures the response is clinically rigorous yet culturally grounded. Rapid Deployment Workflows: We will develop "Activation Protocols" for both virtual and physical deployment. This includes a 24/7 Crisis Dispatch model that integrates with current village emergency lines to ensure the BURT team is notified immediately. Tele-Crisis Technology Suite: The team will be equipped with ruggedized, high-definition telehealth kits (connected via Starlink) to provide "eyes-on" clinical assessment within minutes of an alert, even if weather prevents immediate travel to the village. Culturally Competent Crisis Training: We will develop a specialized curriculum for the BURT team focused on Arctic-specific trauma-informed care, incorporating Indigenous values of community healing and de-escalation. Digital Case Management & Follow-Up: The approach includes the design of a "Post-Crisis Bridge" in our EHR. This ensures that every BURT intervention triggers an automatic 24-hour, 72-hour, and 7-day follow-up with the patient’s primary care team and local CHRs.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	3J Implementation of Developed Project: Heart Disease Screening Technology	AK	The Problem The Norton Sound region experiences high rates of cardiovascular disease, yet our current diagnostic infrastructure is stretched beyond its limit. Prolonged waitlists for echocardiography and cardiac rhythm monitoring mean that patients with symptoms such as palpitations, chest pain, or shortness of breath are often left in a "holding pattern" for weeks. During this time, underlying conditions like atrial fibrillation or structural heart disease can worsen, leading to preventable hospitalizations or sudden cardiac events. The lack of available monitors and a single, over-utilized echo machine creates a critical bottleneck that hinders timely intervention and strains our clinical staff. The Opportunity This project presents an opportunity to build a "Rapid Cardiac Diagnostic Center." We have the opportunity to: Eliminate the Echo Backlog: Adding a second, modern unit to double our daily imaging throughput. Decentralized Monitoring: Using iRhythm Zio monitors—wearable, water-resistant patches—that allow patients to go home to their villages while their heart data is continuously recorded and analyzed. Specialist Integration: Leveraging the Alaska Heart Institute to provide faster expert interpretation and more frequent on-site clinics. Preventive Screening: Shifting from "crisis management" to early detection for high-risk diabetic and hypertensive patients.	NSHC will implement a high-tech, collaborative approach to cardiac care: Advanced Equipment Procurement: We will purchase a state-of-the-art Echocardiography unit with high-definition cardiac imaging capabilities and a large pool of iRhythm Zio ECG Monitors. These wearable monitors are specifically chosen for their high patient compliance and their ability to capture up to 14 days of continuous data. Expanded Partnership with Alaska Heart Institute (AHI): We will formalize an expanded service agreement with AHI to increase the frequency of cardiology "Field Visits" to Nome. This partnership will also include a "Tele-Cardiology" component where NSHC technicians can upload echo images for real-time specialist review. Streamlined Diagnostic Workflow: We will design an "Express Cardiac Path" where patients identified as high-risk in primary care can be immediately fitted with a Zio monitor and scheduled for an echocardiogram within 7 days, rather than the current month-long wait. Technical Training & Certification: NSHC ultrasound technicians and nursing staff will receive advanced training on the new echocardiography software and the iRhythm data management platform to ensure clinical results are high-quality and timely. Wearable Distribution Logistics: We will establish a village-based distribution model for Zio monitors. A patient in a remote village can have the monitor applied at their local clinic, wear it for the prescribed period, and then mail it directly to the processing center or return it to the clinic, ensuring data is captured without the patient ever leaving their community.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	3P Doppler Ultrasound Upgrade	AK	The Problem Our existing Doppler units are nearing the end of their service life and lack the sensitivity required for modern clinical best practices. Outdated scanners provide lower-quality audio and visual data, which can lead to "diagnostic uncertainty"—especially in high-stakes obstetric cases or when screening for vascular blockages. In the Arctic, where a medevac can cost upwards of \$20,000, we cannot afford to have ambiguous diagnostic tools. Currently, the lack of standardized, high-fidelity units across all campuses creates a "technology gap" between the regional hospital and the village clinics. The Opportunity This project presents an opportunity for Diagnostic Equity and Precision. We have the opportunity to: 1. Standardize the Region: Ensuring a pregnant mother in a remote village receives the same diagnostic accuracy as one in Nome. 2. Accelerate Medevac Decisions: Providing clinicians with crystal-clear Doppler data to confidently decide when a patient needs emergency transport. 3. Enhance Obstetric Safety: Using high-sensitivity fetal Dopplers to monitor heart rates with greater precision during prenatal visits and labor. 4. Improve Vascular Outcomes: Enabling bedside screening for DVTs and peripheral artery issues, preventing strokes and pulmonary embolisms.	NSHC will execute a comprehensive region-wide rollout of modernized Doppler technology: *Procurement of High-Fidelity Doppler Units: We will acquire a fleet of state-of-the-art handheld and bedside Doppler scanners. These units will feature advanced digital noise suppression and high-sensitivity probes capable of detecting even faint fetal heart tones or low-velocity vascular flow. *Region-Wide Deployment Schedule: We will replace legacy units across the Norton Sound Regional Hospital, the Quyaana Care Center, and all 15 village clinics. This ensures 100% "Diagnostic Parity" across the NSHC footprint. *Comprehensive Staff Training: We will implement a specialized training program for all providers and Community Health Aides (CHAs). This includes hands-on workshops in "Bedside Doppler Excellence," focusing on correct probe placement and sound interpretation for both obstetric and vascular applications. *Integration with Tele-Health: The new units will be compatible with our existing Tele-Health infrastructure, allowing village-based providers to share high-quality Doppler audio or visual data with specialists in Nome or Anchorage in real-time for second opinions. *Standardized Maintenance Protocol: We will establish a regional maintenance cycle, where NSHC’s Biomedical Engineering team performs regular calibrations and software updates on the standardized fleet, ensuring the devices remain in peak condition regardless of location. *Digital Data Logging: Where applicable, the units will integrate with our Electronic Health Record (EHR), allowing Doppler findings to be directly uploaded to a patient’s chart for long-term clinical tracking.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	3R Colonoscopy provider training program	AK	The Problem Alaska Native people suffer from colorectal cancer incidence rates of 80.9 per 100,000—the highest globally. While NSHC’s intensive efforts pushed our screening rate to 77% in 2025, many other rural Alaska regions still struggle with lower screening uptake and a lack of local procedural expertise. Colonoscopy is technically demanding; the "provider gap" in the bush is a major barrier to reducing cancer mortality. Currently, there is no centralized, high-fidelity simulation hub in the Bering Strait to facilitate the rapid training of new providers or to support peer-training for neighboring tribal health regions. The Opportunity This project presents an opportunity for Statewide Clinical Mentorship. We have the opportunity to: 1. Export NSHC’s "Success Blueprint": Sharing the methods and materials that achieved 77% screening with other bush communities. 2. Establish a Rural Training Center: Creating a destination in Nome where other rural providers can train on high-fidelity haptic simulators without traveling to the Lower 48. 3. Bridge Global Health Disparities: Leading the effort to lower colorectal mortality across all of rural Alaska through standardized, simulated mastery. 4. Sustain Local Access: Ensuring the seamless replacement of retiring providers while simultaneously elevating the skills of the regional workforce.	NSHC will implement a "Center of Excellence" model that serves our region and the broader rural Alaska network: *Procurement of Advanced Haptic Simulation Hub: We will acquire a state-of-the-art colonoscopy simulator capable of replicating the unique anatomical challenges often seen in our patient population. This hub will be the centerpiece of our regional training program. *Development of a "Rural Outreach" Curriculum: We will document the clinical and administrative workflows that led to our 77% screening success. This material will be packaged into a "Training Toolkit" available to other bush community providers. *Intra-Region Provider Rotations: We will establish a rotation program where providers from other rural Alaska health corporations can come to Nome for intensive "Sim-Lab" sessions, refining their haptic skills and biopsy techniques alongside NSHC experts. *Pathology Library Sharing: Our simulation software will include a digital library of aggressive lesions common in the Alaska Native population, which we will use to train all visiting rural providers in early-stage recognition. *Virtual Mentorship & Debriefing: Using the simulator’s cloud-based recording features, we will provide remote "proctoring" for other bush providers, allowing our experts to review their simulated cases and provide feedback from Nome. *Annual "Rural Alaska Endoscopy Summit": NSHC will host a training event in Nome, utilizing the simulation lab to synchronize best practices and safety protocols for endoscopy teams across the state’s most remote regions.	\$50,000-\$250,000	Hospital	Statewide	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	4B Direct Patient Monitoring for High-Risk Patients	AK	The Problem Traditional care models in the Norton Sound region are reactive, and the barriers to proactive care are both technical and emotional. High-risk patients often fall into a "communication black hole" if they lack a phone. However, technology alone is not the answer; if remote monitoring feels like "surveillance," it can trigger historical trauma and lead to low engagement. Geographic isolation already creates a sense of abandonment; without a culturally sensitive way to monitor health, patients remain at high risk for unmanaged complications and expensive, stressful emergency medevacs. The Opportunity This project presents an opportunity to build a "Culturally Anchored Safety Net." We have the opportunity to: *Trauma-Informed Connection: Using the bi-directional feature for supportive "Wellness Checks" rather than just data collection, reducing the anxiety associated with chronic disease management. *Cultural Literacy: Providing training and device interfaces that utilize local terminology and visual cues, ensuring the technology feels like a community tool rather than an outside imposition. *Independent Connectivity: Bypassing local infrastructure gaps with cellular-enabled "Smart Hubs" that ensure the most vulnerable have the most reliable connection. *Equity in Healing: Ensuring that the patients with the fewest resources receive the most consistent, respectful, and culturally aligned clinical support.	NSHC will implement a technology-enabled monitoring system rooted in cultural safety and trauma-informed care: *Procurement of Culturally Accessible "Smart-Hubs": We will deploy RPM devices that sync to a central, cellular-enabled base station. These hubs will be selected for their simplicity (one-touch use) and large-font, high-contrast displays to accommodate elders and those with sensory sensitivities. *Trauma-Informed Bi-Directional Messaging: The communication feature will be used for more than clinical alerts. The Program Coordinator will use it for supportive outreach, such as "Good morning" check-ins or encouragement of medication adherence, framed in a way that builds trust and reduces the "clinical" feel of the intervention. *CHA-Led Regional Training: We will travel to all 16 villages to conduct training in partnership with Community Health Aides (CHAs). By having local, trusted providers introduce the technology, we ensure the rollout is culturally oriented and addresses any community concerns regarding privacy or data use. *Integrated Data & AI Triage: Biometric data flows into a secure, HIPAA-compliant hub. AI triage identifies anomalies, allowing the clinical team to intervene early. These interventions will follow a Trauma-Informed Protocol, in which providers lead with empathy and active listening during the resulting telemedicine consult. *Behavioral Health "Safety-Netting": For high-risk behavioral health patients, the bi-directional messaging serves as a "virtual home visit." This consistent contact reduces the trauma of isolation and provides a secure, private channel for patients to express needs before they reach a crisis point. *Language & Visual Customization: Where possible, device prompts and training materials will be translated into regional dialects (Inupiaq, Central Yup'ik, or St. Lawrence Island Yupik) and other community languages, ensuring the technology speaks the language of the community.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Norton Sound Health Corporation	1A Emergency Medical Transport Modernization	AK	The primary opportunity for this project lies in modernizing infrastructure to keep pace with historic growth in patient care volumes and clinical demand. As detailed in the January 2026 CEO Report, NSHC is currently experiencing "record-high volumes" at the Nome Primary Care Clinic and across its preventive service lines. However, the emergency transport fleet—the literal backbone of this system—is aging out. The current fleet includes hub ambulances in Nome and Unalakleet that are over 10 years old, creating a precarious vulnerability in a region where mechanical failure in sub-zero temperatures can be fatal. Furthermore, the existing ambulance garage in Nome is insufficient for the current scale of operations. With over 1,280 total ambulance and medevac runs conducted in FY2025, the facility lacks the climate-controlled capacity and maintenance space required to protect these high-value assets from Arctic degradation. This project presents a critical opportunity to replace the aging fleet and expand facility capacity, ensuring that NSHC's physical infrastructure is as resilient and high-performing as the clinical teams it supports.	NSHC's approach is a dual-track modernization of both mobile assets and fixed infrastructure to support the region's intense clinical demand. First, we will replace aging ambulances in Nome and Unalakleet with new, Arctic-grade vehicles. This is a critical necessity given that in FY2025, the Norton Sound Emergency Department managed 5,462 encounters, and the Unalakleet Clinic managed 3,541 encounters. These vehicles are the primary link for the thousands of patients seen at these hubs, ensuring that emergency ground transport is available and reliable regardless of extreme weather. Second, we will expand and modernize the ambulance garage and facility building in Nome. The current facility is at capacity and cannot efficiently house the fleet or provide the controlled environment needed for rapid response and preventative maintenance. By increasing the square footage and improving climate control, we protect these high-value assets and ensure that the paramedics and EMTs serving over 9,000 annual encounters across the ER and Unalakleet clinic have a staging area that matches the record-high patient volumes NSHC is currently seeing. This integrated approach ensures that our transport capabilities can scale alongside our growing clinical services.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1B Long-Term Care Facility Expansion	AK	As we expand our long-term care (LTC) facility, renovations are needed within the existing building where it will connect to the new addition. Improving this transition area is essential to ensure the two structures function as one cohesive, integrated care environment. Aligning hallways, resident rooms, and shared spaces will support smooth movement for residents and staff, reduce bottlenecks, and enhance overall safety. Upgrading the connection point also allows us to modernize older systems—such as ventilation, lighting, and accessibility features—so they match the standards of the new construction. This consistency supports better infection control, improved workflow efficiency, and a unified resident experience. These renovations ensure the expanded campus operates as a seamless nursing home rather than two separate facilities. By creating a smooth, well-designed transition between buildings, we strengthen care coordination, enhance daily living for residents, and support staff in delivering high-quality, person-centered long-term care.	The project will complete the Quyanna Care Center expansion and renovation by adding two additional resident rooms, new staff office space, and a modernized nursing station designed to support higher-acuity care. These upgrades will increase capacity, improve staff workflow, and enhance the quality of services provided to Elders who wish to remain close to family and community. The improved nursing station will support more complex clinical needs, strengthen monitoring capabilities, and ensure rapid response to changes in resident condition. To ensure orderly progress, the project will follow a phased construction timeline that maintains resident safety and minimizes disruption to daily operations. Work will be sequenced to protect occupied areas, preserve access to essential services, and prevent interruptions in long-term care routines. Each phase will include clear milestones, contingency planning for weather or supply delays, and coordination with departments responsible for infection control, maintenance, and life-safety compliance. A dedicated project manager will be assigned to lead the expansion, overseeing planning, scheduling, permitting, and on-site construction activities. This role includes maintaining communication with contractors, ensuring alignment with regulatory requirements, managing timelines and budgets, and monitoring the quality of all completed work. The project manager will also coordinate internal logistics to help staff prepare for temporary adjustments in traffic flow, noise, or space limitations during construction. Regular check-ins with key stakeholders—including organizational leadership, clinical staff, facilities teams, resident advocates, and Tribal or community representatives—will ensure the project remains aligned with operational needs and community expectations. These meetings will allow for early identification of potential issues, strengthen transparency, and ensure the renovation meets current healthcare facility and life-safety standards. Once complete, the expanded and renovated facility will offer a more functional, culturally supportive, and clinically capable long-term care environment. The project will enhance resident comfort, support staff effectiveness, and strengthen the long-term sustainability of Elder care services for the region.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1C Design/Plan for Conversion of duplex in Nome to a 4-bed assisted living facility	AK	The Bering Strait region faces a critical gap in its healthcare continuum: the absence of a dedicated Assisted Living Facility (ALF). Currently, 10 community members are forced to leave the region annually for assisted living placement because no middle-tier care option exists locally. This creates a heartbreaking dilemma where elders who do not require the high-acuity medical care of a skilled nursing facility are still "medically exiled" to Anchorage or beyond, leading to a profound disruption of family connections and cultural ties. Furthermore, this gap creates a "bed-blocking" inefficiency within NSHC’s existing infrastructure. As NSHC experiences record-high patient care volumes and historic growth in clinical demand (as noted in the Jan 2026 CEO Report), the lack of an ALF forces elders to remain in high-cost Long-Term Care (LTC) or acute care beds simply because there is no appropriate "step-down" housing available. This project addresses the urgent opportunity to convert existing underutilized space into a licensed ALF, resolving this physical bottleneck and ensuring that NSHC’s resources are utilized at the most appropriate and sustainable level of care.	NSHC’s approach focuses on the rapid, high-impact conversion of existing underutilized medical space into a licensed 4-bed Assisted Living Facility. This project is specifically right-sized to pilot a sustainable, local alternative for the 10 community members forced to leave the region annually due to the lack of middle-tier care. Key elements include: Structural Conversion: Modification of existing clinical rooms into 4 private, ADA-compliant residential suites. The design prioritizes a "small-house" model, which is proven to provide better health outcomes and higher quality of life for elders than large, institutional settings. Technological Integration: Utilizing our 2025 Advancing Health IT Award status, we will outfit these 4 suites with non-intrusive remote monitoring and emergency call systems, ensuring 24/7 safety without compromising resident autonomy. Workforce Utilization: The facility will be staffed by local caregivers from our robust pipeline—supported by 400+ scholarships awarded—ensuring that residents receive care in a culturally and linguistically familiar environment.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1D Design/Plan for NSRH expansion with Behavioral Health Focus	AK	The opportunity lies in moving away from a "medical-only" model for behavioral health crises. Currently, NSHC’s infrastructure lacks a dedicated BH wing, forcing high-acuity patients into the ED—which saw 5,462 encounters in FY2025—or into Acute Care beds that are designed for medical, not psychiatric, needs. This creates a high-risk environment for both patients and staff. The Data Gap: Beyond suicide rates, the prevalence of Serious Mental Illness (SMI) among AI/AN adults is 11% higher than the U.S. general population, yet these individuals are 17% less likely to receive treatment due to geographic barriers (SAMHSA, 2025). The Bottleneck: This expansion addresses the physical bottleneck by creating seven 24/7 local stabilization beds. This allows NSHC to "right-size" its facilities to accommodate the growing demand for mental health services without disrupting the record-high patient volumes currently managed across our primary and acute care lines.	Allocate planning and design funds to assess the feasibility of expanding the current 18-bed hospital to a 25-bed facility, including dedicated space for behavioral health patients. This effort will evaluate clinical needs, workflow requirements, safety standards, and infrastructure considerations to ensure the expanded unit meets growing demand for acute and behavioral health services. A detailed project timeline will be developed outlining key milestones for architectural planning, engineering assessments, regulatory review, and cost estimation. NSHC will assign a dedicated project manager to oversee all phases of the planning and design process, coordinate internal and external stakeholders, and ensure timely progress. Regular stakeholder meetings—including hospital leadership, clinical teams, facility staff, and community partners—will be scheduled to maintain transparency, support informed decision-making, and address challenges proactively throughout the project. NSHC will construct a specialized hospital wing designed for integrated BH stabilization. The approach centers on "Trauma-Informed Design," creating a secure yet healing environment that includes private stabilization rooms and a secure outdoor courtyard. Leveraging our 2025 Advancing Health IT Award, we will install high-definition tele-behavioral health links, allowing for 24/7 consultation with remote specialists. This approach ensures that we aren't just adding beds, but are creating a technology-forward hub that keeps patients in a local, culturally familiar setting while they receive world-class psychiatric stabilization.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1E Design for Patient Lodging and Assisted Living Options to NSRH	AK	The opportunity lies in filling a profound void in the regional continuum of care. Currently, the 16 remote communities of the Bering Strait face significant barriers to accessing care in Nome. With only 36 lodging rooms for a population where 6,500+ residents must travel by air for services, many patients stay in overcrowded or unsuitable conditions, increasing stress and complicating recovery. This planning project addresses the urgent need for dedicated patient lodging that provides a safe, reliable environment for the 100,000+ annual NSHC encounters, supporting better treatment adherence and allowing families to remain involved in the healing process. Simultaneously, the region currently has zero assisted living facilities, resulting in at least 10 residents each year being institutionalized or relocated outside the community. These forced relocations weaken cultural ties and disrupt the family connections essential to elder wellness. By developing the feasibility and design for a 12-bed ALF and 24-bed (or larger) Patient Hostel, NSHC will seize the opportunity to "right-size" its residential infrastructure. This project moves NSHC from a reactive model to a person-centered, culturally appropriate system that ensures more residents receive the right level of support within their own community, surrounded by their language and traditions.	**Project Overview** Norton Sound Health Corporation (NSHC) will use planning funds to design a new patient lodging facility that will be physically connected to the main hospital. This facility will include a dedicated assisted living section to address critical regional needs, creating a seamless continuum of care for Norton Sound residents. The project aims to bridge the gap between acute clinical care and long-term residential support through a technically sound and culturally sensitive design. **Phased Design Framework** NSHC will adopt a structured, four-phase approach to transition from concept to a "shovel-ready" final design: **Discovery & Technical Assessment:** A multidisciplinary team of architects and engineers will conduct structural, environmental, and regulatory assessments. This will ensure that the design meets stringent healthcare standards, residential safety requirements, and ADA accessibility guidelines while optimizing the physical connection to the hospital. **Schematic Design & Operational Flow:** We will hold design sessions with clinical providers and facility staff to map patient flow. This will ensure that the transition between the hospital and lodging is safe, private, and operationally efficient for both staff and residents. **Community-Integrated Design:** To ensure cultural appropriateness, NSHC will engage Elders, caregivers, and residents from remote villages. These sessions will help ensure that the facility reflects regional preferences, incorporating communal spaces and aesthetics that honor the heritage of the people we serve. **Final Blueprint & Regulatory Review:** The final phase will produce detailed architectural drawings, a comprehensive cost estimation, and a regulatory roadmap for assisted living licensure and healthcare compliance. **Project Governance and Accountability** NSHC will appoint a dedicated Project Lead to oversee all planning activities. This lead will be responsible for: - Coordinating architecture and engineering consultants and ensuring that milestones are met on schedule. - Managing communication between internal clinical, facilities, and executive departments. - Aligning the final design with NSHC's long-term organizational goals and capital budget. **Conclusion** This approach creates a practical blueprint for a facility that expands lodging capacity, introduces essential assisted living services, and strengthens the region's healthcare infrastructure.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1F Design/Plan for NSRH Ambulance Garage, Facilities, and Nutrition Storage Hub	AK	The Problem NSHC’s emergency vehicles and critical mechanical systems currently face significant operational risks. With a consistent volume of roughly 110 ambulance runs monthly, our fleet is heavily utilized but remains exposed to harsh Arctic elements. Aging utility systems are also housed within the main hospital footprint, complicating maintenance and limiting future expansion. Additionally, current food storage is over capacity and aging, resulting in occasional failures and food losses in a region where supply chains are already fragile. The Opportunity This project presents an opportunity to design a centralized Utility and Logistics Hub. By planning a dedicated, heated ambulance garage alongside a consolidated power plant and expanded nutrition storage, NSHC can solve three critical vulnerabilities. This approach frees up valuable space within the main hospital for clinical expansion while creating a weather-protected environment for emergency response and food security infrastructure that matches our current and projected service volumes.	NSHC will utilize RHTP planning funds to engage a multidisciplinary team of engineering, architectural, and construction experts to develop a comprehensive facility plan for a new outbuilding located behind the main hospital. The approach focuses on three integrated functional areas: emergency response readiness, infrastructure resilience, and nutritional logistics. 1. Technical & Engineering Assessment The planning effort will begin with a rigorous evaluation of the site layout and utility connection requirements. A primary focus will be the design of a centralized utilities hub to house the hospital’s main boilers, electrical systems, and critical mechanical infrastructure. Engineers will develop a transition plan to relocate these systems from the current hospital footprint into the new "power plant" without disrupting active patient care. This phase will also assess the high-load electrical and HVAC requirements for industrial-scale refrigeration. 2. Operational Readiness Design Architects will collaborate with EMS and Plant Operations teams to design a purpose-built, heated, and weather-protected garage. This facility will be engineered to securely house two ground ambulances and air ambulance vehicles. The design will prioritize "hot-start" capabilities to eliminate delays caused by frozen equipment or vehicle warm-up times in Nome’s extreme winter conditions, directly improving response readiness for the approximately 110 ambulance runs managed monthly. 3. Nutritional Logistics & Storage Mapping The planning team will design expanded walk-in refrigerator and freezer units specifically to address current space shortages and aging infrastructure. The approach involves mapping a storage workflow that accommodates the region’s unique shipping constraints, allowing for bulk procurement and the stable storage of traditional subsistence foods. 4. Regulatory & Safety Compliance NSHC will ensure the comprehensive facility plan meets all operational, safety, and emergency-response standards. This includes a thorough review of State of Alaska Fire Marshal codes for utility plants and EMS facility requirements. 5. Final Project Roadmap The final stage of this approach will produce a shovel-ready package including detailed architectural drawings, equipment requirements, and a Class C cost estimate. This will provide a clear path for subsequent construction phases while identifying how the new outbuilding creates space for future hospital expansion.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1H Patient Transport Access/Expansion	AK	The Problem The current lack of accessible transport options creates an "equity gap" in our healthcare delivery. While 15% of our general population reports transportation barriers, the impact is felt most acutely by those with mobility impairments. In our 15 remote villages, the absence of handicapped-accessible vehicles means that Elders often have to be transported in the back of trucks or on snowmachines, which is unsafe and undignified. This lack of appropriate infrastructure often forces patients with disabilities to relocate out of the region to access more "accessible" urban environments, leading to cultural isolation and diminished health outcomes. The Opportunity This project presents an opportunity to design a Region-Wide Accessible Transit Network. By planning for the procurement of handicapped-accessible, high-clearance vehicles for both the Nome hub and the village clinics, NSHC can ensure that "care at home" is a reality for everyone, regardless of physical mobility. This planning effort will focus on a fleet that meets ADA (Americans with Disabilities Act) standards while remaining rugged enough for Arctic terrain, ensuring that our Elders can age in place with dignity and reliable access to their medical providers.	NSHC will utilize a data-driven logistics approach to ensure these new assets are deployed where the 2025 PRAPARE data shows the most significant "transportation-to-care" gaps. The project will focus on the planning and procurement of a specialized eight-vehicle fleet: Fleet Specification (6 ADA-Compliant Vans): We will develop technical requirements for six high-clearance, 4x4 transit vans. These will be equipped with heavy-duty Arctic insulation, "hot-start" engine heaters, and hydraulic wheelchair lifts. These vans will serve as the primary transport link between the Nome airport, hospital campus, and regional housing, ensuring the 15% of patients reporting barriers can transition safely between travel hubs. Specialized Village Access (2 Side-by-Sides): For village clinics with more restrictive terrain or narrow boardwalk systems, we will specify two enclosed, heated side-by-side utility vehicles (UTVs). These will be outfitted with specialized patient-loading systems to allow for the dignified and safe transport of Elders and mobility-impaired patients from their homes directly to the clinic door. Geospatial Need Mapping: We will map the specific locations of patients who identified transportation barriers to determine the most impactful placement for each vehicle type across the 15-village network. Technical Training & Safety: A core component of the approach is the creation of a "Regional Driver Safety Manual." This will include training on the operation of ADA lifts in sub-zero temperatures and specialized patient-handling protocols for those with disabilities or complex medical needs.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	11 Increased Patient Transport Frequency for Little Diomedes Island	AK	The Problem Little Diomedes’s transport crisis is a "perfect storm" of limited capacity and zero redundancy. Since the sea ice can no longer reliably support a seasonal fixed-wing runway, the community is tethered to a single rotary-wing link. Our data from 2024–2025 proves that the existing schedule is insufficient; with healthcare staff taking up 25% of available seating on many flights, patients are frequently left behind. When combined with the high rate of weather and mechanical cancellations, residents can be stranded for weeks. This lack of predictable transit is a primary driver of the health inequities identified in our 2025 PRAPARE screenings. The Opportunity This project presents an opportunity to design a Dedicated Diomedes Medical Bridge. The planning effort will focus on: Contracted Surge Capacity: Formalizing a plan for NSHC-priority helicopter charters that bypass the "full capacity" limitations of the Essential Air Service flights. Provider/Patient Separation: Ensuring that traveling healthcare personnel have dedicated transport that does not displace patients. Mechanical/Weather Redundancy: Exploring multi-modal backups, including specialized vessel transport during the open-water season to provide a fail-safe when aircraft are grounded.	NSHC will implement a structured, three-phased coordination plan to eliminate the transport bottleneck between Nome and Little Diomedes. This approach moves away from the current ad-hoc system toward a reliable "Medical Bridge" specifically designed to bypass the 100% capacity issues identified in our 2024–2025 flight reviews. Phase 1: Demand & Capacity Assessment (Months 1–3) The initial phase will involve a rigorous audit of current travel patterns, patient demand, and helicopter seat availability. We will map the 15% transportation barrier identified in our 2025 PRAPARE data specifically to Diomedes residents to identify those with the highest clinical risk due to delayed care. Phase 2: Roster Optimization & Scheduling (Months 4–8) NSHC will organize patient rosters based on medical priorities, appointment availability, and weather windows. By grouping multiple appointments into each supplementary charter, we maximize efficiency and ensure that no flight departs with empty seats while patients are stranded. This phase creates a predictable, well-coordinated transport schedule that aligns patient travel with Nome-based clinic visits. Phase 3: Refinement & Continuous Improvement (Months 9–12) The final phase focuses on scaling the process based on utilization trends, patient feedback, and provider input. We will implement Quarterly Reviews to evaluate key indicators, including the number of patients transported, reductions in rescheduled visits, and the cost-effectiveness of each charter. Dedicated Oversight: The Transportation Coordinator A core component of this approach is the creation of a Dedicated Transportation Coordinator role. This individual will oversee all logistics, including: Real-time communication with the helicopter operator and Nome healthcare providers. Managing patient scheduling to ensure each supplementary flight is used to its full potential. Mitigating the impact of mechanical or weather-related cancellations by maintaining a "ready-to-travel" standby list. This role is essential for maintaining consistent access, reducing the "seat competition" between staff and patients, and ensuring the most remote community in the United States receives timely, reliable medical transport.	\$50,000-\$250,000	Hospital	Single Community	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1J Surgical Recovery Equipment	AK	The Problem The SRU is currently operating with non-functional hydration equipment. This creates a gap in the "Gold Standard" of post-surgical care. After procedures like colonoscopies, patients require immediate access to water and ice for hydration and to soothe throat irritation from sedation/intubation. When this equipment is broken, it negatively affects the patient’s recovery experience and comfort. Our 2025 PRAPARE data showed that 28% of our patients already face stressors related to their care journey; adding the discomfort of an inadequately equipped recovery room further complicates their path to wellness. The Opportunity This project presents an opportunity to modernize the Surgical Recovery Hydration Station. By replacing the obsolete unit with a medical-grade, high-efficiency ice and water dispenser, NSHC can: Improve Patient Satisfaction: Directly addressing a common pain point for the 200+ annual endoscopy patients. Ensure Clinical Compliance: Meeting the hydration requirements set by post-operative care protocols. Optimize Staff Time: Keeping nurses at the bedside by providing necessary recovery supplies within the unit itself.	NSHC will follow a structured procurement and installation plan to ensure the new unit is integrated seamlessly into the SRU: Technical Specification & Procurement: We will select a modern, antimicrobial ice/water unit designed for clinical environments. This unit must meet high-volume demands while adhering to strict hospital sanitation standards. Accountability & Installation: A Facilities Coordinator will be assigned to oversee the project, managing the removal of the non-functional unit and the plumbing/electrical installation of the new model. Timeline Development: We will establish a clear 6-month roadmap from bid to "first use" to minimize disruption in the surgical suite. Post-Installation Review: Following the first 100 procedures post-installation, we will conduct a review gathering staff and patient feedback to ensure the unit is meeting the expected performance and comfort benchmarks.	Under \$50,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1K Dental Infrastructure Modernization	AK	The Problem The existing dental compressor is aged and prone to mechanical failure. Because this single unit serves all 10 dental bays, a breakdown results in a total cessation of services, including emergency extractions and preventative cleanings. For the nearly 4,000 patients served annually, these interruptions are more than an inconvenience; they are a safety and compliance risk. Outdated air-delivery systems can struggle to maintain the moisture-free, medical-grade air quality required for modern dental procedures, potentially compromising the integrity of clinical work and equipment longevity. The Opportunity This project presents an opportunity to modernize the "engine room" of the Nome Dental Clinic. By replacing the outdated compressor with a high-capacity, oil-free, and energy-efficient unit, NSHC can: Eliminate Service Interruptions: Guarantee that all 10 bays remain operational. Ensure Clinical Safety: Meeting the highest standards for medical-grade compressed air. Optimize Facility Efficiency: Reducing noise pollution and energy consumption within the dental wing.	NSHC will execute a focused replacement plan centered on clinical continuity: Procurement & Specification: We will procure a medical-grade, multi-motor compressor system designed for a 10-bay high-volume clinic. This "redundant" design ensures that even if one motor requires service, the other can maintain enough pressure to keep the clinic running. Accountability: A dedicated Facilities Project Lead will be assigned to manage the vendor and coordinate with the Dental Department Lead. Coordinated Installation: To minimize disruption for the 3,785 annual patients, the installation will be scheduled during off-hours or a pre-planned administrative block. Post-Installation Review: We will conduct a performance review 30 days post-install to gather staff feedback on air pressure consistency and noise reduction, ensuring the unit meets all clinical needs.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1M Design/Plan Village Community Wellness Centers	AK	The Problem Health equity is impossible when a patient lacks a private, dignified space to meet with a provider. In homes without running water or privacy, a Telemedicine appointment can feel invasive or logistically impossible. Currently, the lack of a "third space"—a place that is neither the clinical exam room nor the overburdened home—means residents often skip preventive care and mental health resources. There is a desperate need for a reliable hub that offers both the "soft" resources of wellness (fitness, nutrition, self-help) and the "hard" resources of sanitation. The Opportunity This planning project allows us to design the "Village Sanctuary Model." We have the opportunity to: Dignify the Care Experience: Providing a safe, warm space where a person can shower and do laundry before or after a private video consult with a specialist. Modernize Telemedicine Access: Moving beyond the "clinic-only" model to a community-based Tele-Suite that feels less like a medical exam and more like a supportive self-care environment. Holistic Resource Centralization: Creating a one-stop shop for fitness equipment, nutrition resources, and self-help materials, making health a proactive, daily pursuit.	NSHC will lead a design process that prioritizes the "Human Experience" alongside technical clinical requirements: Design for Warmth and Safety: The Project Lead will work with architects to ensure the hub is not just functional, but inviting. This includes comfortable seating, natural lighting where possible, and a layout that ensures privacy for Telemedicine and showers while maintaining a communal "wellness" feel. The Wellness Hub Service Menu: We will map out how to integrate fitness equipment and nutrition education into spaces that also house laundry and sanitation facilities. Tele-Suite Technical Standards: Designing soundproof, high-speed Telemedicine kiosks that are easy to use for Elders and offer a private link to Nome-based specialists. Stakeholder Partnership: Coordinating with local entities to ensure the hub is a "safe space" for all community members, including those in recovery or seeking behavioral health support.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1P Renovation and Handicapped Access Improvements to the Main Entrance of NSHC Facilities	AK	The Problem The main entrance of the Norton Sound Regional Hospital faces unique Arctic challenges. Manual or aging automated doors can fail during high-wind events, and standard ramps often become dangerously slick despite constant maintenance. For patients with mobility aids, the physical effort required to enter the building during a storm can be significant. Additionally, a lack of consistent tactile wayfinding makes navigation difficult for patients with visual or cognitive impairments, creating an "accessibility gap" at the region's most critical health hub. The Opportunity This project presents an opportunity to design a State-of-the-Art Accessible Main Entrance for the Nome hospital. We will: Guarantee Reliability: Designing heavy-duty, "Arctic-rated" automated entry systems that function flawlessly in extreme weather. Ensure Slip/Fall Resistance: Engineering heated thresholds and specifying advanced, high-traction materials to eliminate ice buildup at the entry point. Prioritize Universal Design: Integrating intuitive wayfinding and "wave-to-open" sensors to support independent access for all 10,000 regional residents.	NSHC will lead a design process that marries ADA compliance with Arctic engineering: Specialized Accessibility Audit: We will evaluate the current hospital entrance using the ADA Standards for Accessible Design, specifically looking for "friction points" in the path of travel from the parking lot to the lobby. Engineering for Durability: The Project Lead will work with architects to specify corrosion-resistant aluminum and stainless-steel hardware and industrial-grade motors capable of handling high-traffic and wind-load requirements. Safety-First Surfaces: We will design an entryway that includes heated ramp systems and "Grip-Grate" or knurled aluminum surfaces to provide maximum slip resistance for wheeled devices and pedestrians. Intuitive Wayfinding: The design will incorporate high-contrast signage and tactile floor markers to guide patients with visual or cognitive impairments safely into the clinical wings.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1Q Renovation of the NSHC Day Shelter Facilities	AK	The Population in Crisis The need for this renovation is evidenced by the specific scale of housing instability in our region: 364 Unhoused Individuals: Our 2025 data identifies 364 residents currently experiencing homelessness, all of whom face extreme risks of frostbite, SMI, and SUD. Critical Mortality Rates: The suicide rate in the Nome Census Area (\$93.9\$ per \$100,000\$) underscores the lethal intersection of homelessness and untreated trauma. Barriers to Reintegration: Without a physical "bridge" to resources, these 364 individuals remain trapped in a cycle of instability due to a lack of private space for case management and digital access for housing applications. The Opportunity: The Supportive Bridge Model This planning project allows NSHC to design a "Bridge to Stability" that specifically moves these 364 residents toward health and housing. We will design: Direct Resource Links: Digital kiosks where guests can independently manage housing and benefit applications. Continuity of Care: Dedicated private suites for Peer Support Specialists and Case Managers to facilitate the "hand-off" to long-term social supports. Trauma-Informed Safety: A layout featuring "Quiet Wellness Zones" to support guests experiencing SMI or acute distress, ensuring the shelter is a place of healing rather than a source of further trauma.	For Question 3: Project Concept Approach, we focus on how the renovation will functionally operate as that "Supportive Bridge" for the 364 individuals experiencing homelessness. The design moves away from a traditional "open hall" shelter toward a zoned, clinical, and resource-rich environment. Project Concept Approach (Question 3) NSHC will employ a multidisciplinary planning approach that integrates Trauma-Informed Care (TIC), Behavioral Health Clinical Standards, and Social Determinant of Health (SDOH) Navigation: Zoned Trauma-Informed Layout: The design will move away from high-stress, open-plan spaces. Architects will create a "Zoned Environment" including: Active Zones: High-traffic areas for meals and social connection. Quiet Wellness Zones: Low-sensory areas with acoustic dampening for individuals experiencing SMI symptoms or acute psychological distress. De-escalation Nooks: Strategically placed "safe alcoves" that allow guests to self-regulate without leaving the safety of the facility. Integrated "Supportive Bridge" Suites: We will design private, soundproof consultation rooms equipped with high-fidelity Telemedicine hardware. These rooms are dual-purpose: Clinical: Allowing guests to meet privately with SUD counselors or Psychiatrists. Resource Navigation: Providing a dignified space for guests to meet with Case Managers to work through the 2025-identified barriers to housing and employment. Digital Resource Hubs: We will plan for the installation of ruggedized, user-friendly digital kiosks. These kiosks will serve as the primary interface for the "bridge" out of homelessness, offering a one-stop-shop for housing applications, PFD/Social Security management, and resume building, supported by on-site Peer Mentors. Culturally Responsive Healing Architecture: Following consultation with NSHC Tribal Healers, the design will incorporate "Healing through Heritage" elements—using natural materials, Indigenous artwork, and communal "Talking Circle" configurations—to foster a sense of belonging and reduce the "institutional trauma" often associated with clinical facilities. Safety & Passive Observation: To ensure the safety of both guests and staff, the design will prioritize passive security. This involves wide sightlines and shatter-resistant materials that allow for unobtrusive	Under \$50,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

supervision, reducing the need for a carceral security presence which can be a trigger for those with high rates of PTSD.

Norton Sound Health Corporation	1R Wales System Upgrades - Water Storage Tank Replacement	AK	The Problem The existing water storage tanks in Wales are functionally failing. Decades of salt-air exposure and extreme freeze-thaw cycles have caused significant structural corrosion and leaks. These vulnerabilities allow pathogens to enter the water supply, posing a severe public health risk. Furthermore, the lack of real-time data means that leaks or temperature drops are often only discovered after a system failure, leading to costly emergency responses and periods where the community is without safe water. The Opportunity This planning project allows NSHC to design a Modernized Arctic Water Storage System. We have the opportunity to: Eliminate Health Risks: Utilizing antimicrobial materials to prevent biofilm and bacterial growth. Implement Remote Oversight: Installing IoT sensors that allow NSHC facilities and local operators to monitor system health 24/7. Modernize the Workforce: Training local Wales residents on the maintenance of high-tech water systems, creating skilled local roles.	NSHC will lead a design process centered on technical reliability and local empowerment: Engineering & Environmental Audit: We will assess the current site to ensure the new tank foundations can withstand shifting permafrost and coastal erosion. Smart-System Specification: The design will include antimicrobial tank linings and an IoT sensor suite (connected via Starlink/Satellite) to provide real-time alerts on water quality and tank levels. Local Operator Curriculum: We will develop a training manual specifically for Wales operators, focusing on the maintenance of IoT hardware and emergency troubleshooting. Strategic Procurement: Given the logistical challenges of Wales, the planning phase will include a Barge Logistics Plan to ensure materials are delivered during the narrow summer shipping window.	\$50,000-\$250,000	Hospital	Single Community	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1S Outdoor Exercise Equipment and Walking Paths	AK	The Problem In our 15 villages, the environment is often a barrier rather than an asset for health. Residents face uneven, unlit terrain that poses a high risk of falls, especially for Elders. The total absence of public exercise equipment means that physical activity is often limited to high-intensity subsistence tasks, leaving a gap for those who need low-impact or rehabilitative movement. This lack of infrastructure contributes to a "seasonal sedentary cycle," where activity levels drop dangerously during the winter months, exacerbating chronic physical conditions and impacting mental well-being across the lifespan. The Opportunity This planning project allows NSHC to design a "Village Wellness Circuit" tailored for the Arctic. We have the opportunity to: Democratize Fitness: Providing free, 24/7 access to high-quality exercise equipment that is ADA-compliant and age-inclusive. Safety Through Design: Implementing solar-powered LED path lighting to ensure walking trails are safe and inviting during the long months of Arctic darkness. Digital Health Integration: Installing weather-resilient kiosks that provide health education and biometric tracking, turning a simple walk into a proactive medical check-in that empowers residents to manage their own wellness. Community Connectivity: Designing paths that link essential village hubs—such as the clinic, school, and post office—encouraging "active transport" as part of daily life.	NSHC will lead a multidisciplinary design process focused on Arctic resilience, inclusivity, and clinical integration: Community-Specific Site Mapping: We will work with local leadership in each of the 15 villages to identify optimal routes that maximize use and connectivity. This includes geotechnical assessments to ensure paths are built on stable ground, avoiding areas prone to permafrost degradation or coastal erosion. Universal and Adaptive Design: Equipment selection will prioritize "Universal Design" principles. We will specify adaptive resistance machines and cardiovascular stations that are accessible to both able-bodied individuals and those using mobility aids, ensuring the equipment remains functional in temperatures as low as -40°F. Smart Infrastructure & Lighting: The design includes high-intensity solar-powered LED lighting with motion sensors. This maximizes safety during the dark winter months while minimizing energy consumption. Integrated Wellness Kiosks: We will design digital hubs that offer biometric monitoring (blood pressure, heart rate, O2) and sync with NSHC wellness initiatives. These kiosks will be ruggedized to withstand extreme wind, snow, and salt-air exposure. Culturally Responsive Aesthetics: The design will incorporate local art and signage in Indigenous languages, fostering a sense of community ownership and pride.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	1U Collaboration with NPS and BSSD on upgrades to playground equipment for school and community use	AK	The Problem Regional playgrounds are currently "play deserts" for children with sensory processing disorders or physical disabilities. Many existing structures are over 20 years old, featuring high-impact surfaces that are dangerous in icy conditions and layouts that do not support modern STEM-based or imaginative play. This lack of inclusive infrastructure leads to social exclusion for children with special needs and misses a critical window for fostering early-childhood physical and cognitive health among our massive youth patient population. The Opportunity This project presents an opportunity to design "Next-Generation Developmental Play-Hubs." We have the opportunity to: 1. Guarantee Inclusion: Designing sensory-rich zones and ADA-accessible equipment that allows children of all abilities to play together. 2. Integrate STEM Learning: Creating interactive "outdoor classrooms" where play-stations teach physics, biology, and math. 3. Enhance Safety: Implementing real-time safety monitoring technology and non-slip, impact-absorbing Arctic surfaces. 4. Community Socialization: Creating hubs where caregivers can gather, promoting social connectedness—a key factor in reducing regional family stress and improving mental health.	NSHC will lead a collaborative design process focused on "The Whole Child": • District-Wide Partnership: We will form a design committee with the Nome Public Schools and Bering Strait School Districts to ensure play zones align with educational and developmental goals. • Inclusive & Sensory Mapping: The design will include "Quiet Zones" for children with autism and "Active Zones" with adaptive swings and carousels for children with mobility devices. • STEM Integration: We will design stations that incorporate traditional Indigenous knowledge—such as celestial navigation or local biology—into STEM play structures. • Arctic-Resilient Engineering: The Project Lead will specify materials like high-density polyethylene (HDPE) and powder-coated steel that resist cracking in -40°F temperatures. • Smart-Safety Monitoring: The design will include integrated sensor technology to monitor equipment integrity and high-definition, solar-powered lighting for safety during the long winter.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced
Norton Sound Health Corporation	2E Remote Clinic Morgue Electrical Backup	AK	Frequent power outages disrupt mortuary care in NSHC's village clinics, creating distress for families and staff and risking loss of dignity for decedents. In the past year, eight electrical outages directly affected morgue operations, leading to service delays, temperature instability, and increased emotional strain on families awaiting arrangements. Ensuring reliable backup power is essential to maintain safe storage conditions, protect the integrity of remains, and support consistent, respectful mortuary care under all circumstances.	Procure and install automatic-activation generators or transfer switches for all village morgue facilities to ensure uninterrupted operation during power outages. Establish a phased installation schedule that prioritizes communities with the highest outage frequency. Assign a facilities coordinator to oversee procurement, contractor scheduling, installation, and quality assurance. Following installation, conduct staff orientation and perform post-installation reviews to gather feedback, verify system performance, and address any operational challenges.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	2F Morgue Equipment Upgrades	AK	The Problem The current cadaver lift at the NSHC morgue is outdated, prone to mechanical failure, and poses a direct hazard to staff and the dignity of the deceased. In the past year alone, two workplace injuries occurred as a result of equipment malfunctions. These incidents not only endanger our employees but also threaten to disrupt funeral preparations for families who may have traveled long distances from remote villages. A failure during a funeral process is a profound violation of the standard of care and respect NSHC promises to its residents. The Opportunity This project presents an opportunity to modernize our mortuary infrastructure to meet current safety and ergonomics standards. We have the opportunity to: Eliminate Workplace Injuries: Replacing a manual/failing lift with a modern, powered unit that adheres to OSHA safety guidelines. Uphold Cultural Dignity: Ensuring the seamless and respectful handling of bodies during the critical window of funeral preparations. Modernize Facilities: Integrating high-capacity, reliable equipment that can accommodate the physical requirements of a diverse patient population. Enhance Operational Efficiency: Reducing the time and staff required for mortuary handling, allowing facilities teams to focus on broader campus maintenance.	NSHC will follow a rigorous facilities management approach to the selection and implementation of this equipment: Specifications & Selection: A facilities project lead will be assigned to identify a high-capacity, modern cadaver lift that features intuitive controls, safety locks, and smooth hydraulic or electric movement. The unit must be compatible with existing mortuary storage and Arctic environment climate controls. Installation Planning: We will develop a detailed installation timeline that coordinates with the clinical and mortuary schedules to minimize downtime. This includes the removal of the outdated unit and the structural reinforcement (if necessary) of the installation site to support the modern lift’s weight and power requirements. Workforce Safety Training: Once installed, we will launch a mandatory training program for all facilities and clinical staff involved in mortuary services. This training will focus on ergonomic operation, emergency shut-off protocols, and regular safety checks. Digital Integration: The equipment’s maintenance schedule will be integrated into NSHC’s centralized facility management software to ensure automated reminders for inspections and lubrication. Post-Installation Review: Within 60 days of installation, we will conduct a review gathering staff feedback to address any operational challenges and ensure the new equipment has successfully mitigated the safety risks associated with the previous unit.	Under \$50,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	2G Portable Back-Up generator for village clinics	AK	The Problem Frequent and unpredictable power outages in our remote villages create a dangerous instability in healthcare delivery. In the past year alone, nine significant outages across three clinics directly impacted the care of over 200 patients. When a clinic loses power, electronic health records (EHR) become inaccessible, lighting for emergency procedures fails, and temperature-sensitive medications are put at risk of spoilage. Currently, without standardized backup power, our Village Health Aides must operate in high-stress, low-visibility environments, often during the long months of Arctic darkness, which significantly compromises patient safety and provider well-being. The Opportunity This project presents an opportunity to "Harden" our regional health infrastructure. We have the opportunity to: Ensure Clinical Continuity: Maintaining 100% uptime for all medical and communication systems regardless of the local grid status. Protect Cold-Chain Integrity: Safeguarding thousands of dollars in vaccines and medications from temperature excursions. Enhance Disaster Resilience: Transforming village clinics into reliable "Emergency Shelters" for the community during prolonged regional power failures. Reduce Equipment Damage: Preventing the costly electrical surges and "brown-out" damage that occur when power is inconsistently restored to sensitive medical devices.	NSHC will implement a comprehensive engineering and facilities approach to ensure clinical power resilience: Site-Specific Engineering Audits: A facilities coordinator will lead a technical assessment of each clinic to determine precise load requirements. This ensures that generators are sized to support not just lighting, but high-draw medical equipment, HVAC systems, and IT infrastructure. Procurement of Arctic-Grade Units: We will specify industrial-strength, diesel-powered generators equipped with "Cold-Weather Packages" (including block heaters and insulated enclosures) designed to start reliably in temperatures as low as -50°F. Phased Installation & Logistics: Given the reliance on the seasonal barge system, we will develop a tiered installation timeline. Units will be staged in Nome and deployed to villages during the summer shipping window, with NSHC facilities teams coordinating the electrical integration at each site. Automatic Transfer Switch (ATS) Integration: Each system will include an ATS to ensure a seamless, sub-second transition to backup power the moment a grid failure is detected, protecting sensitive digital systems from crashing. Remote Monitoring Technology: We will install IoT-based monitoring systems that allow the Nome-based facilities team to track fuel levels, battery health, and engine status in real-time for every village generator. Local Maintenance Training: We will provide village-based staff with "First-Responder" maintenance training, ensuring they can perform basic checks and manual starts if necessary, supported by annual professional servicing.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	2H Improve snow removal for Norton Sound Health Corporation facilities, improve emergency operation	AK	The Problem Current reliance on third-party contractors for snow removal has proven insufficient for the scale and urgency of NSHC’s operations. Last winter, the region experienced 18 reported incidents of delayed snow removal at NSHC facilities, leading to six major access disruptions and two staff injuries related to slips and falls on uncleared paths. Contractors often prioritize municipal or residential contracts, leaving clinical emergency bays blocked during critical windows. The rising costs and inconsistent service levels of external vendors create an unpredictable operational environment that endangers patient safety and strains the facility's budget. The Opportunity This project presents an opportunity to build Internal Emergency Capacity. We have the opportunity to: Guarantee 24/7 Access: Establishing a dedicated team that initiates clearance the moment snow begins to fall, ensuring ambulance bays and ER entrances are never compromised. Enhance Workforce Safety: Reducing the risk of staff and patient injuries by maintaining a higher standard of "Black-Top" clearance and sanding. Cost Stabilization: Transitioning from high-cost, variable contractor fees to a stable, predictable in-house operational budget. Specialized Equipment: Procuring heavy-duty, Arctic-spec loaders and blowers specifically suited for the unique drifting patterns of coastal Nome and the surrounding villages.	NSHC will execute a phased transition to a fully self-reliant snow management model: Equipment Procurement: We will purchase a fleet of modern, high-capacity snow removal units, including a heavy-duty front-end loader with specialized snow-pusher attachments, a high-velocity blower for clearing large drifts, and a dedicated sanding/salting truck. Equipment will be specified with "Extreme Cold" packages to ensure hydraulic and engine reliability in sub-zero temperatures. Specialized Staffing: We will hire three full-time employees dedicated to the Snow Removal and Facilities Grounds team. These roles will be trained in Arctic-specific clearing techniques that prevent "snow-packing" and optimize drainage during the spring thaw. Operational Command & Oversight: An Operations Manager will be assigned to lead the team, implementing a "Weather-Watch" protocol. This ensures that the team is deployed proactively based on meteorological alerts, rather than reacting after snow has already accumulated. Phased Onboarding & Training: The project includes a structured onboarding timeline where new staff are trained on the specific site plans of each NSHC facility, identifying "Priority 1" areas such as ambulance egress, oxygen tank access, and emergency exits. Strategy Adjustment & Feedback: We will schedule quarterly reviews to gather feedback from clinical staff and emergency responders. This data will be used to adjust clearing routes and schedules, ensuring that the highest-utilization areas receive the most frequent attention.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	2i NSRH Kitchen Upgrades	AK	The Problem The current Norton Sound Regional Hospital kitchen facilities have reached the end of their functional lifespan. Outdated layouts and aging equipment hinder the preparation of safe, nutritious meals, leading to longer service times and a limited menu variety that can impact patient satisfaction and recovery. More critically, the frequent failure of refrigeration and freezer units has resulted in the significant wastage of food resources, which is particularly costly in Nome due to high freight expenses. Additionally, the inefficient kitchen layout contributes to staff fatigue and increases the risk of cross-contamination, posing a safety risk to both patients and the workforce. The Opportunity This planning project allows NSHC to design a "Modern Nutritional Hub." We have the opportunity to: Guarantee Food Security: Installing reliable, monitored refrigeration to prevent resource loss. Enhance Patient Recovery: Redesigning workflows to support a wider variety of fresh, nutritious, and culturally appropriate meals. Improve Infection Control: Implementing a layout that physically separates prep, cooking, and sanitation zones to eliminate cross-contamination risks. Boost Staff Well-being: Creating an ergonomic workspace that reduces the physical toll on our essential foodservice workforce.	NSHC will utilize a professional design and engineering approach to modernize the kitchen infrastructure: Ergonomic & Workflow Redesign: We will work with specialized kitchen consultants to create an "Efficient Flow" layout. This redesign will minimize unnecessary staff movement, optimize the "prep-to-plate" timeline, and ensure a logical flow that prevents the intersection of raw ingredients and finished meals. Energy-Efficient Appliance Specification: We will select industrial, energy-efficient appliances designed for high-volume hospital use. This includes high-recovery ovens, induction cooktops, and smart refrigeration systems that reduce the facility's carbon footprint and operational costs. Digital Inventory & Temperature Management: The approach includes the implementation of an automated, 24/7 digital monitoring system for all cold storage. This system will alert facilities staff to temperature fluctuations before food spoilage occurs, safeguarding our regional food investment. Innovative Waste Reduction: We will design a kitchen management system that utilizes digital inventory tracking to reduce over-purchasing and food waste, aligning with NSHC's goals for environmental sustainability. Safety-First Surface Upgrades: The design will specify non-porous, easy-to-clean surfaces and anti-microbial flooring to maintain the highest standards of sanitation and infection control. Stakeholder Engagement: We will conduct workshops with current kitchen staff and clinical dietitians to ensure the new design meets the specific nutritional needs of our patient population, including the ability to process and serve traditional local foods.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3A After-School Youth health/wellness program	AK	The Problem The Bering Strait region faces a significant "wellness gap" during the school year. While "Summer-cise" successfully engages youth in the warmer months, the transition to the long Arctic winter brings a lack of structured after-school activities. This void contributes to higher rates of youth inactivity and mental health challenges. Simultaneously, NSHC faces a persistent workforce challenge: the lack of reliable after-school care options in Nome and the surrounding villages. This deficiency results in frequent staff absenteeism, reduced clinical hours, and increased turnover as parents struggle to balance professional duties with family well-being. Without a dedicated youth wellness program, the region misses a critical opportunity to foster early healthy habits while supporting the healthcare workers who keep the community safe. The Opportunity This project presents an opportunity to create a "Year-Round Wellness Continuum." We have the opportunity to: Extend a Proven Success: Scaling the "Summer-cise" curriculum into a four-season model. Bolster Workforce Retention: Providing NSHC staff with a reliable, health-focused after-school solution. Holistic Youth Development: Combining physical literacy with academic support and nutritional education. Strengthen Community Partnerships: Utilizing existing infrastructure like the Nome Recreation Center and Bering Strait School District gyms to maximize impact.	NSHC will implement a collaborative, multi-site wellness model designed to meet the unique needs of Arctic youth: Collaborative Framework: We will partner with the City of Nome (Recreation Center) and the Bering Strait Regional School District to utilize existing gymnasiums and classrooms. This maximizes current infrastructure while ensuring programs are located in familiar, accessible community hubs. Curriculum Design: Building on "Summer-cise" principles, the program will offer a daily schedule that includes: Structured Physical Activity: High-energy indoor sports, traditional Native games, and fitness challenges to combat winter inactivity. Academic & Wellness Support: Dedicated time for homework assistance, combined with age-appropriate wellness workshops on nutrition, dental hygiene, and mental health resilience. Nutritional Support: Providing healthy snacks that meet federal nutritional standards, addressing food insecurity for participants. Staffing & Mentorship: We will hire a Program Coordinator and a team of Wellness Mentors. We will also create "Junior Counselor" roles for high school students, fostering leadership skills and creating a pipeline for future healthcare and wellness professionals. Digital Integration & Data Tracking: We will implement a digital check-in and health-tracking system to monitor participation rates and physical activity milestones. This data will be used to refine the curriculum and demonstrate the program's impact on youth wellness. Workforce Priority Access: While open to the community, NSHC will establish a "Priority Enrollment" tier for healthcare employees to directly address the workforce retention crisis. Safety & Cultural Competence: All staff will undergo intensive training in trauma-informed care and cultural safety, ensuring the program is a welcoming environment for all Indigenous youth in the region.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3B Recruitment and Retention Incentives	AK	The Problem NSHC faces a workforce crisis characterized by high vacancy rates and an over-reliance on expensive temporary "locum tenens" staff. The cost of living in Nome and the surrounding villages—especially housing and food—is significantly higher than the national average, making traditional salary structures uncompetitive. High turnover rates lead to "institutional memory loss," where new staff must constantly be retrained on regional protocols and cultural nuances. This instability leads to provider burnout, reduced patient satisfaction, and a fragmented care delivery model that struggles to meet the needs of a high-risk population. The Opportunity This planning project allows NSHC to design a "Total Rewards" Framework. We have the opportunity to: Level the Playing Field: Offsetting the high cost of Arctic living through strategic stipends and bonuses. Invest in "Grown-Our-Own": Including professional development incentives that encourage local residents to advance into higher-level clinical roles. Prioritize Well-being: Implementing wellness benefits that address the unique mental health challenges of working in isolated, high-latitude environments. Enhance Quality of Care: Building a permanent team that understands the specific medical and cultural history of our regional families.	NSHC will utilize a data-driven HR strategy to design a competitive and sustainable incentive model: Market & Cost-of-Living Analysis: We will conduct a comprehensive study comparing NSHC’s total compensation against other Tribal health organizations and urban Alaska centers. This includes a "Cost-of-Arctic-Living" index to ensure housing and utility stipends are accurately scaled. Tiered Incentive Structuring: We will design a multi-tiered package that addresses specific "High-Need" roles (e.g., Nursing, Mid-level providers, and Behavioral Health) while ensuring non-clinical support staff—who are the backbone of our operations—are also incentivized. Housing & Relocation Innovation: The approach includes designing a "Soft Landing" program, featuring housing stipends and assistance in navigating the limited local housing market, which is often the primary barrier to successful recruitment. Professional Development Pathways: We will build "Career Ladder" incentives, providing tuition reimbursement and paid "study time" for staff seeking advanced certifications. This specifically targets regional residents to move from entry-level to professional roles. Resiliency & Wellness Benefits: Recognizing the intensity of rural medicine, the package will include "Arctic Resiliency" benefits, such as enhanced mental health support, fitness memberships, and "Travel Stipends" to help staff maintain connections with family outside the region. Retention Milestones: Instead of just sign-on bonuses, we will implement "Loyalty Bonuses" at the 5, and 10-year marks, rewarding those who provide the long-term continuity our patients need.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3C HR File Upgrades/Modernization	AK	The Problem NSHC’s current HR infrastructure is heavily dependent on legacy paper records and manual data entry, which are susceptible to error and security vulnerabilities. As we expand to manage 58+ RHTP initiatives, we lack a standardized, digital framework to support high-volume recruitment and compliance tracking. However, rushing into a software purchase without a dedicated planning phase poses a significant risk of "system mismatch"—where a chosen platform may not integrate with our existing clinical systems or survive the bandwidth constraints of our remote village clinics. The Opportunity This project presents an opportunity to conduct a Comprehensive HR Technology Audit and Design. We have the opportunity to: Market Analysis: Review and demo modern HRIS/Document Management platforms (e.g., Workday, UKG, or specialized medical HR software) to find the best fit for a Tribal organization. Gap Analysis: Identify exactly where our current manual workflows fail and design digital "replacements" that automate compliance. Security Architecture: Design a cloud-based structure that meets stringent HIPAA and SOC2 requirements for sensitive workforce data. Implementation Readiness: Ensure NSHC is "shovel-ready" for a digital migration with a fully costed implementation plan.	NSHC will execute a multi-phased design process to move from a paper-heavy legacy to a digital-ready future. This extended timeline allows for Rigorous Vendor Validation and Infrastructure Alignment: Stakeholder Requirements Gathering: We will document the specific administrative hurdles faced by HR, department heads, and village clinic managers, ensuring the design solves the "Time-to-Hire" bottleneck. Cloud-Platform Comparative Analysis: We will evaluate 3–5 specialized healthcare HR platforms (e.g., UKG, Workday, or specialized Tribal health modules) to find a solution that balances high-security AI document processing with an intuitive user interface. Arctic Connectivity Proof-of-Concept: We will perform "Latency Drills" to see how cloud-based AI tools perform under real-world Bering Strait internet conditions. This ensures that a village clinic manager can upload a credentialing document as easily as someone in the Nome hub. AI & Automated Workflow Design: We will design the "Logic Gates" for automated compliance. This includes mapping how the AI will "read" a medical license, verify it against state databases, and trigger an automated alert to the provider 90 days before expiration. Archive Digitization Blueprint: We will design the protocol for the mass-scanning of our physical files. This includes determining the "Metadata" required so that all legacy records become instantly searchable and audit-ready. Compliance & Security Architecture: The design will prioritize a "Zero-Trust" security model, ensuring that sensitive workforce data is encrypted at rest and in transit, meeting all HIPAA, SOC2, and federal audit standards.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3D Ski Path grooming equipment to make a seasonal ski path on the NSHC Housing campus	AK	The Problem As the new NSHC housing complex opens in stages between 2026 and 2028, hundreds of staff will be moving into a centralized area that lacks immediate, safe, and reliably maintained outdoor exercise space. Without a technical study of the new building orientations, the newly created wind-tunnel effects could make grooming impossible if the trail is not strategically placed. Furthermore, purchasing heavy grooming equipment without a site-specific plan risks "equipment-mismatch" for the unique terrain of the new campus. The Opportunity This project presents an opportunity for a Dynamic Wellness Design Study. We have the opportunity to: Live Site Observation: Use the 2026 winter season to monitor actual snow accumulation and wind patterns around the first completed buildings to optimize the final trail map. Strategic Procurement Planning: Identify the specific "prime mover" and grooming attachments needed for a 2027/2028 implementation. Governance & Safety Design: Develop formal maintenance SOPs and MOUs with local partners (e.g., Nome Winter Sports Association) before full occupancy. Recruitment Advantage: Finalize a "Ski-In/Ski-Out" amenity plan to boost the recruitment of medical professionals for the 2027/2028 hiring cycles.	NSHC will utilize an 18-month planning window to ensure the trail system is technically sound and ready for implementation by the 2027/2028 season: Staged Site Analysis (2026 Winter): We will conduct on-site "Snow Mapping" during the initial 2026 opening phase. By observing how snow drifts against the new building footprints, we can identify the most stable corridors for a groomed track that requires minimal fuel and effort to maintain. Grooming Fleet Vetting: We will research and demo Arctic-grade grooming technology, specifically looking for high-torque, tracked UTVs or snowmobiles and "Renovator" drags capable of breaking wind-packed Arctic crust. Collaboration & Partnership Design: We will draft formal Memorandums of Understanding (MOUs) with the City of Nome and the Nome Winter Sports Association to coordinate equipment sharing, volunteer grooming, and regional trail connectivity. Operational SOP Development: We will create a comprehensive manual for trail maintenance, including "Trigger Points" (grooming schedules based on snowfall), safety protocols for dark-month operations, and equipment storage requirements. Resident Interest & Safety Planning: We will survey the initial 2026 residents to refine trail loops (beginner vs. intermediate) and design a solar-powered LED lighting plan to ensure the track is navigable during the 20+ hours of daily winter darkness. Implementation Roadmap: The planning phase will culminate in a finalized procurement list and budget for the 2027/2028 Implementation project, ensuring NSHC is "ready to buy" the moment the housing complex reaches full occupancy.	\$50,000-\$250,000	Hospital	Single Community	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3E Playground equipment for NSHC campus	AK	The Problem With the new housing complex reaching final occupancy in 2027/2028, a high density of children from both staff and patient families will reside on campus. Currently, there is no dedicated, safe outdoor play infrastructure designed for this diverse population. Patient families, often far from their home villages, face "confinement stress" without outdoor outlets. Furthermore, standard playground equipment often fails in the Arctic due to permafrost heaving and extreme cold, creating safety hazards rather than wellness opportunities. The Opportunity This project presents an opportunity for Integrated Arctic Family Wellness Design. We have the opportunity to: Shared-Use Synergy: Design a space that fosters connection between resident staff families and visiting patient families, building a stronger regional community. Therapeutic Play: Incorporate sensory and inclusive play features that support children who may be on campus for medical reasons. Technical Specification: Select "Cold-Weather Rated" materials that remain safe and durable at -40°F. Strategic Placement: Use the 2026 construction footprints to place the playground in a wind-sheltered "micro-climate" easily accessible from both the staff and patient housing wings.	NSHC will utilize an 18-month planning window to design a playground that is safe, inclusive, and ready for a 2027/2028 implementation: Dual-Access Site Analysis: We will utilize the 2026 "Staged Opening" phase to identify a central, wind-sheltered location that is equally accessible to both the employee and patient housing buildings. This ensures that families in medical transit have the same "doorstep" access to wellness as permanent residents. Inclusive & Therapeutic Design Research: We will work with specialized manufacturers to identify "All-Abilities" equipment. The design will focus on inclusive features that accommodate children with different mobility or sensory needs, recognizing that a portion of the users will be children of patients or pediatric patients themselves. Arctic Engineering & Foundations: We will research permafrost-stable foundation designs (e.g., helical piers) to prevent equipment from shifting during seasonal freeze-thaw cycles, ensuring the playground remains level and safe year-round. Safety & Visibility Blueprint: We will design a comprehensive safety plan, including cold-weather resilient, fall-attenuating surfacing and solar-powered LED lighting. This ensures the playground is a safe "Safe Zone" during the long periods of winter darkness. Governance & Maintenance Framework: We will develop a collaborative oversight model involving NSHC Facilities and a resident/patient-advocacy committee to ensure the equipment is maintained to the highest clinical safety standards. Phased Implementation Roadmap: The project will culminate in a finalized procurement list and installation budget, synchronized with the final 2027/2028 housing completion.	\$50,000-\$250,000	Hospital	Single Community	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3F Upgrades to the City of Nome pool and collaboration as a wellness and health care space	AK	The Problem The Nome pool relies on aging mechanical systems that are prone to failure. These outages disproportionately impact young children who travel across 23,000 square miles for short-term, intensive swim-safety programs. If the pool is down during their stay, a critical window for life-saving instruction is lost. Furthermore, our Elders face a "mobility gap"; when the pool is closed, they lose their primary tool for managing arthritis and cardiovascular health without the risk of falls on icy terrain. Currently, there is no formal agreement that synchronizes these specialized needs. The Opportunity This project presents an opportunity for Cross-Generational Life-Safety Integration. We have the opportunity to: *Drowning Prevention for Children: Secure the "Survival Pipeline" for village youth, ensuring the facility is operational for essential swim-safety instruction. *Elder Mobility and Healing: Design a clinical schedule that provides dedicated "Quiet Hours" and warm-water therapy for seniors and PT/OT patients. *Infrastructure Resilience: Replace failing equipment to ensure 99% uptime, protecting the community's most vulnerable users. *Clinical Synergy: Create a space where NSHC therapists can provide water-based rehabilitation without displacing school-based lessons.	NSHC will utilize a 12-month planning window to establish a sustainable operational and technical framework for this multi-agency facility: *Regional Partnership Coalition: We will convene a planning committee including NSHC, the City of Nome, NPS, BSSD, and NACTEC. This group will develop a Multi-Agency Joint-Use Agreement (JUA) that prioritizes both school-based swim safety, NSHC Medical and Elder-focused therapies, and open times for exercise and fun. *Technical Engineering Audit: We will partner with the City to conduct a mechanical audit. The resulting procurement plan will prioritize high-durability filtration and high-efficiency heating systems to maintain the consistent, warmer water temperatures required for Elder therapy and infant swim classes. *Coordinated Scheduling Model: We will design a "Regional Master Schedule" that accounts for intensive "Swim Weeks" for village youth while reserving dedicated blocks for Elder Wellness and NSHC clinical referrals. *Vulnerable Population Safety Protocols: The planning phase will include the design of specialized safety protocols, such as enhanced lifeguard training for pediatric and geriatric emergencies, and the selection of modern hydraulic lift systems for patients with limited mobility. *Shared Maintenance & Funding Strategy: We will establish a collaborative maintenance fund, exploring how NSHC medical billing, school district contributions, and municipal funds can be "braided" to ensure the pool's long-term financial health. *Accessibility Audit: We will perform a comprehensive review of ADA compliance, focusing on ensuring that the locker rooms and pool entry points are fully accessible to Elders and children with physical or sensory disabilities.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3g: Planning and Project Design: Critical Upgrades to Nome Recreation and Wellness facility.	AK	Problem The NRC is facing a systemic failure of its core utilities. The boilers are approaching obsolescence, creating a risk of a total facility freeze-up during peak event season. Currently, the locker rooms, kitchen, and lavatory areas are out of operation, reducing the facility's utility for the Nome Health and Career Fair and for the hundreds of athletes who travel to Nome for the Lonnie O'Connor Basketball Tournament. Because the NRC is the only local venue capable of hosting the Iditarod and Iron Dog banquets, these failures threaten the region's economic stability and cultural identity. Without an engineered plan, we risk a catastrophic closure during a major regional gathering. Opportunity This project presents an opportunity for Infrastructure Sovereignty and Event Resilience. We have the opportunity to: 1. Secure the "Big Event" Pipeline: Designing a fail-safe heating system that ensures the facility can host 1,000+ people during the Iditarod or Midnight Sun Music Festival. 2. Restore High-Capacity Hygiene: Planning the rehabilitation of locker rooms to support the influx of village youth and athletes during regional tournaments. 3. Optimize Clinical Spaces: Designing modern spaces and meeting rooms to support the Nome Health and Career Fair, health coaching, and NSHC-led screenings. 4. Engineer Shelter Readiness: Ensuring the facility is fully prepared to serve as a regional "Mass Care" shelter during disasters. 5. Preserve community exercise and wellness spaces.	NSHC will utilize a 12-month planning window to develop an actionable blueprint for the NRC’s modernization: *High-Capacity Mechanical & Structural Audit: We will hire Arctic engineers to assess the boiler plant and HVAC. The audit will focus on "Peak Load" capacity—ensuring the systems can handle the extreme demands of heating the building at maximum capacity during events like the Elders and Youth Conference. *Multi-Use Space Optimization: We will create architectural plans that allow for rapid transitions between uses—from a basketball court to a banquet hall for the Iron Dog or a concert venue for the Midnight Sun Music Festival. *Design of Health Spaces: We will develop A&E plans to modernize the facility's lab and meeting rooms, specifically designed to host the Nome Health and Career Fair, wellness classes, and year-round clinical events and screenings. *Emergency & Festival Infrastructure: We will design integrated power and data protocols to support the high-tech needs of modern festivals and the backup power required for an Emergency Evacuation Shelter. *Joint-Use & Maintenance Agreement (JUA): NSHC and the City will draft a formal agreement defining shared costs and the prioritization of the space for both daily Kindergym/Elder activities and the major regional tournaments. *Phased Construction Sequencing: We will develop a construction schedule that works around the "Big Three" (Iditarod, Iron Dog, and Basketball Tournament), ensuring the facility remains open during the region's most critical economic windows.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3H Purchase of laser surgical ophthalmology equipment and quarterly ophthalmology visits	AK	The Problem Access to surgical eye care currently relies on a "displacement model" that causes social and economic instability. Patients must leave the region for Anchorage, which disrupts childcare, subsistence, and cultural support. Furthermore, without a YAG laser in Nome, patients who develop common post-surgical clouding are forced to fly back to Anchorage for a two-minute procedure. This unnecessary travel increases exposure to urban stressors and substance use triggers. Currently, NSHC lacks the formal facility design and specialist partnership framework to host these surgical services locally. The Opportunity This project presents a Planning Opportunity for Comprehensive Vision Care. We have the opportunity to: 1. Design an End-to-End Cataract Care Model: Planning for both initial surgery and subsequent YAG laser capsulotomies in Nome. 2. Engineer Specialized Facilities: Designing a surgical bay that meets the strict environmental standards for sensitive laser equipment. 3. Establish Sustainable Partnerships: Formalizing quarterly specialist rotations with Anchorage-based ophthalmology groups. 4. Protect Patient Livelihoods: Designing a "Surgical Intensive" schedule that minimizes time away from work and family.	NSHC will utilize this planning phase to create a "shovel-ready" surgical ophthalmology program: *Technical Feasibility & Equipment Spec: We will identify the specific technical requirements for a comprehensive ophthalmology package, including an excimer laser (LASIK), a high-precision YAG laser, and phacoemulsification systems. *Facility Engineering and Design: We will engage with architects and medical engineers to design a dedicated "Eye Surgical Bay" within the hospital, focusing on redundant climate control and power stability required for lasers. *Specialist Partnership Development: We will draft and negotiate formal Memorandums of Agreement (MOAs) with specialized ophthalmologists to ensure reliable, quarterly surgical rotations. *Care Pathway Mapping: We will design the integrated pre- and post-op protocols that allow our local optometry team to manage patients before and after the specialist arrives, reducing the need for any out-of-region travel. *Tele-Ophthalmology Integration Planning: We will design the digital imaging infrastructure needed for visiting specialists to perform "virtual screenings" from Anchorage to prioritize the quarterly surgical queue. *Economic Impact Analysis: We will develop a scheduling model that aligns surgical "blocks" with seasonal subsistence cycles to minimize the economic impact on patients.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3I Implementation of Developed Project: Home Sleep Testing Expansion	AK	The Problem Sleep apnea is highly prevalent in our region, yet it remains critically underdiagnosed due to a lack of local testing infrastructure. Currently, NSHC has a limited number of HST units, leading to long waitlists and a "diagnostic bottleneck." Many patients, faced with the prospect of traveling to Nome for an in-lab study or waiting months for a home unit, simply opt out of testing. This result is a high volume of untreated cases that eventually manifest as costly emergency interventions for heart failure, stroke, or severe fatigue-related accidents. The Opportunity This project presents an opportunity to implement a "Community-Based Diagnostic Grid." We have the opportunity to: Eliminate the Backlog: Doubling our testing capacity to ensure that every referred patient can begin their study within 14 days. Reduce Patient Travel: Shifting the diagnostic model so that the equipment travels to the village, rather than the patient traveling to the hub. Preventive Intervention: Identifying sleep-disordered breathing early to mitigate the risk of high-cost cardiovascular comorbidities. Maximize Clinical Resources: Utilizing established neurology partnerships to provide remote interpretation of the increased data volume.	NSHC will utilize a coordinated regional logistics and clinical workflow to expand sleep diagnostics: Equipment Procurement & Specification: We will purchase six Type III Home Sleep Testing devices. These units are specifically chosen for their durability, ease of use for patients, and seamless integration with our digital neurology platforms. Regional Distribution Network: We will establish a "Rotation Schedule" where units are strategically deployed to village clinics based on referral volume. This ensures that equipment is never sitting idle and that high-demand communities have immediate access. Standardized Patient Education: We will develop culturally appropriate, simplified instruction kits (including visual guides and video tutorials) to ensure patients can successfully self-administer the test, reducing the rate of "invalid" studies that require a re-test. Staff Training & Competency: Village-based Health Aides and Nome-based respiratory staff will be trained in device sanitization, data uploading, and patient troubleshooting. Integrated Data Management: The project will leverage our existing Electronic Health Record (EHR) and neurology partnerships. Once a test is completed in a village, the data is uploaded to a secure cloud where board-certified neurologists can interpret the results remotely, facilitating a rapid turnaround from "test" to "treatment plan." Logistics Oversight: A dedicated coordinator will track the "Chain of Custody" for each machine as it moves between Nome and the villages via local air carriers, ensuring units are tracked and maintained according to manufacturer standards.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3K Implementation of Developed Project: MRI Modernization and Improvement	AK	The Problem Our current MRI scanner is a legacy system that lacks the gradient strength and software packages required for complex specialty imaging. Consequently, patients requiring advanced neurological, cardiac, or fine-tissue musculoskeletal scans must be medevaced or flown commercially to Anchorage. This creates a dangerous "diagnostic delay" and forces patients into the high-volume waitlists at ANMC. Additionally, the aging hardware faces increasing downtime, further extending regional wait times and compromising the reliability of our emergency diagnostic services. The Opportunity This project presents an opportunity for Regional Diagnostic Independence. We have the opportunity to: *Expand Clinical Scope: Enabling complex sequences (e.g., MRCP, Diffusion-Weighted Imaging, and advanced Angiography) to be performed locally. *Reduce ANMC Dependency: Bypassing the 4–6 week wait times often found at urban referral centers by providing immediate local access. *Eliminate Travel Barriers: Saving patients and the healthcare system the massive costs associated with air travel, lodging, and patient escorts for out-of-region imaging. *Accelerate Emergency Care: Providing high-definition imaging for stroke and trauma patients in-house, allowing for life-saving interventions to begin hours earlier.	NSHC will execute a phased modernization of the MRI suite to ensure minimal disruption to patient care: *Advanced System Selection: We will procure a state-of-the-art MRI unit equipped with advanced software packages specifically designed for high-complexity clinical needs, such as neuro-functional imaging and detailed cardiac mapping. *Infrastructure Retrofitting: Our facilities team will coordinate the necessary shielding and power upgrades. We will prioritize "Low-Helium" magnet technology to reduce our reliance on difficult-to-ship cryogen refills in our remote Arctic location. *Specialized Staff Training: NSHC radiologic technologists will undergo advanced certification training on the new complex protocols. We will also establish "Tele-Radiology" links with specialists to allow for real-time oversight of complex scans. *Logistical Synchronization: We will coordinate the magnet delivery—using specialized air-freight or barge logistics—to align with a "Quick-Turn" installation window to minimize service interruptions. *Service Continuity Plan: During the transition, NSHC will utilize a temporary mobile MRI solution or prioritize emergency air-transfers to ensure critical diagnostic needs are met without delay. *Digital Integration: The system will be fully integrated into our PACS, allowing for seamless image sharing with ANMC and other specialists for collaborative care, ensuring that while the scan is done in Nome, it can be read by the world's best specialists instantly.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3L Implementation of Developed Project: CT Scanner Cardiac Screening Upgrade	AK	The Problem Heart disease is often a "silent killer" in the Arctic. Many residents are unaware of their cardiovascular risk until they experience a myocardial infarction (heart attack), necessitating an emergency medevac that can cost upwards of \$25,000. Our current CT scanner lacks the specialized EKG-gating hardware and "Calcium Scoring" software required to visualize the coronary arteries without motion blur. This diagnostic gap means we miss opportunities for early prevention, forcing our healthcare system to remain reactive rather than proactive. The Opportunity This project presents an opportunity for Advanced Preventive Cardiology. We have the opportunity to: *Early Detection: Identifying "silent" coronary artery disease in asymptomatic patients during routine wellness exams. *Risk Stratification: Providing clinicians with a definitive "Calcium Score" to guide the aggressive management of cholesterol and blood pressure. *Cost Avoidance: Preventing expensive emergency medevacs and long-term disability through early, low-cost pharmaceutical and lifestyle interventions. *Local Access: Removing the travel barrier to cardiac screening, ensuring that high-risk residents can be screened and managed within their home region.	NSHC will execute a comprehensive technical and clinical upgrade to our existing CT suite: *Hardware Integration: We will procure and install an EKG-Gating System for the CT scanner. This hardware synchronizes the CT X-ray pulses with the patient's heartbeat, allowing the scanner to take "still" images of the coronary arteries between heartbeats. *Software Implementation: We will install specialized CAC Scoring Software that automatically identifies and quantifies the volume and density of calcium in the coronary arteries, generating a standardized "Agatston Score" for the radiologist. *Clinical Protocol Development: Our cardiology and radiology teams will collaborate to develop a "Cardiac Screening Pathway." This includes clear criteria for which patients should receive a CAC scan (e.g., those with a family history or borderline risk factors) and standardized follow-up care based on the results. *Specialized Staff Training: NSHC CT technologists will receive intensive training on EKG lead placement and cardiac-specific scanning techniques to ensure high-quality, motion-free images. *Diagnostic Integration: CAC scores will be integrated into our EHR and shared with the patient's Primary Care Provider (PCP) and Community Health Aides (CHAs) to ensure a "whole-team" approach to the patient's heart health. *Community Awareness Campaign: NSHC will launch a regional education initiative to explain the importance of "Heart Scoring" to village residents, encouraging high-risk individuals to seek screening during their next trip to Nome.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3M Rural Xray Training and Utilization	AK	The Problem NSHC has deployed X-ray hardware across the region, but under-utilization remains a challenge. Currently, some patients are still sent to Nome because village staff may lack the "hands-on" confidence to perform complex views. Furthermore, practicing X-ray techniques on live patients is ethically and legally restricted due to radiation exposure. Without a high-fidelity training mannequin that features human-like skeletal structures and tissue density, providers cannot "practice to perfection" in their home clinics, leading to avoidable travel costs and diagnostic delays. The Opportunity This project presents an opportunity for Regional Diagnostic Self-Sufficiency. We have the opportunity to: 1. Maximize Capital Investment: Ensuring the X-ray units in all 15 villages are utilized for 100% of appropriate clinical cases. 2. Practice Without Exposure: Using "X-ray Phantoms" to allow CHAs to practice difficult positioning (like lateral views or pediatric angles) without radiation risk to humans. 3. Standardize Imaging Quality: Developing a regional "Best Practices" curriculum that ensures images taken in a village clinic meet the same standards as the regional hospital. 4. Model Regional Success: Using our training framework to help other tribal health organizations across Alaska optimize their own remote imaging programs.	NSHC will implement a multi-modal training strategy to transform our village providers into expert "Limited-Scope" X-ray operators: *Procurement of X-Ray Training Phantoms: We will acquire high-fidelity training mannequins designed specifically for radiologic training. These phantoms contain human-like bones and soft-tissue equivalents, allowing staff to take actual X-rays of the mannequin to verify their positioning and exposure techniques. *Hands-On "Skills Blitz" Sessions: We will provide travel resources to bring village staff to the Norton Sound Regional Hospital for intensive rotations with certified Radiologic Technologists. *Remote "Over-the-Shoulder" Mentorship: We will leverage our telemedicine infrastructure to provide real-time, remote coaching. While a CHA is positioning the training mannequin in a village, a Technologist in Nome can provide live feedback via video. *Mastery-Based Positioning Lab: The training phantoms will be rotated through the 15 village clinics, allowing staff to complete a "Positioning Checklist" (Chest, Hand, Foot, Ankle) to maintain their proficiency and certification. *Quality Assurance (QA) Feedback Loop: Every image taken in a village will be reviewed by our Radiology team, with structured feedback provided back to the village provider. *Standardized Utilization Protocols: We will develop clear clinical guidelines that empower APPs to order and utilize local X-rays immediately, reducing "consultation lag."	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3N Pharmacist-Directed IV Pump Implementation	AK	The Problem Many of the most effective modern medications for chronic autoimmune and inflammatory conditions are available only via infusion. Because our 15 village clinics lack the high-precision IV pumps required to administer these "biologics," patients are forced into a disruptive "travel for treatment" model. This leads to poor medication adherence and worsened health outcomes. Furthermore, the lack of equipment standardization between the villages and the regional hospital creates a "technology hurdle" that increases the risk of medical errors during patient transfers. The Opportunity This project presents an opportunity for Chronic Disease Equity. We have the opportunity to: 1. Deliver Biologic Therapies Locally: Providing life-improving infusions for RA, Crohn’s, and MS directly in the village. 2. Standardize Regional Safety: Matching the village pump systems to the Hospital and Medevac fleets to eliminate transition-of-care risks. 3. Empower Remote Pharmacists: Utilizing the BD Alaris "Guardrails" software to allow Nome pharmacists to safely direct complex chronic infusions from a distance. 4. Improve Quality of Life: Eliminating thousands of hours of unnecessary patient travel, allowing residents to stay with their families while managing their chronic conditions.	NSHC will implement a unified regional infusion network focused on chronic disease management: *Procurement of Standardized BD Alaris Fleet: We will purchase units that are identical to the hospital’s upgraded pumps, ensuring a single, region-wide training and safety standard. *Chronic Infusion Formulary Expansion: The NSHC Pharmacy will develop specific protocols for common chronic biologics (e.g., Infliximab for RA/Crohn's, Ocrelizumab for MS) to be administered safely in a village setting using the pump's "Smart" drug library. *Unified "Guardrails" Sync: We will ensure every pump in the region—whether in a village clinic, on a medevac flight, or in the hospital—runs the exact same safety software, preventing dosing errors as patients move between levels of care. *Specialized Clinical Training: Village staff will be trained not just on pump mechanics, but on the specific monitoring requirements for chronic biologic infusions, including managing potential infusion-related reactions. *Tele-Pharmacy "Direct-Link": We will utilize the digital interface of the Alaris pumps to allow Nome pharmacists to perform a "Second Sign-Off" on complex chronic medications before the infusion begins in the village. *Long-Term Patient Tracking: Infusion data will be integrated into the regional EHR, allowing specialists to track the effectiveness of these life-altering medications over months and years without the patient needing to leave their community for every check-up.	Under \$50,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3O Bladder Scanner Expansion	AK	The Problem NSRH currently relies on a single bladder scanner shared across several geographically separated hospital units. This "single-point-of-failure" creates significant clinical risks: 1. Diagnostic Delays: During peak hours, clinicians in the ER may have to wait for the scanner to be released from the Acute Care wing, delaying the diagnosis of acute urinary retention. 2. Infection Risk: Delays in scanning often lead to "precautionary" catheterizations, which increases the risk of CAUTIs and patient discomfort. 3. Staff Inefficiency: Nursing staff spend valuable time tracking down equipment rather than focusing on direct patient monitoring. The Opportunity This project presents an opportunity for Point-of-Care Diagnostic Efficiency. We have the opportunity to: 1. Eliminate Equipment Bottlenecks: Providing immediate access to bladder scanning in both the Emergency and Acute Care units. 2. Enhance Obstetric Safety: Improving the monitoring of bladder volume in post-partum patients to prevent complications. 3. Reduce Clinical Risk: Minimizing invasive procedures through the use of reliable, non-invasive ultrasound technology. 4. Standardize Technology: Adding a second unit that matches the current fleet to ensure staff familiarity and ease of maintenance.	NSHC will implement a strategic expansion of its diagnostic imaging fleet: *Procurement of Advanced Bladder Scanner: We will acquire a high-fidelity, portable bladder scanner that utilizes automated 3D ultrasound technology to provide fast, accurate volume measurements. *Strategic Deployment: The new unit will be permanently stationed in a high-traffic clinical area (such as the Emergency Department or Labor & Delivery), while the existing unit remains in Acute Care. This ensures that a scanner is always within "seconds" of a patient in need. *Staff Competency Training: We will conduct hands-on training for all nursing and provider staff. This training focuses on correct probe orientation and interpreting results for diverse patient populations, including pediatric, obstetric, and geriatric patients. *Infection Control Protocol: We will implement standardized cleaning and maintenance protocols for the new device, ensuring it remains a sterile and reliable tool for point-of-care use. *EHR Integration: The new scanner will be configured to upload results directly to the patient’s Electronic Health Record (EHR). This allows the care team to track bladder volume trends over time without manual data entry, reducing the risk of transcription errors. *Biomedical Calibration: The unit will be added to the hospital’s Preventative Maintenance (PM) schedule, ensuring that NSHC Biomedical Engineering performs regular accuracy checks and software updates.	Under \$50,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3Q Emergency Workforce Training Technology	AK	The Problem Current emergency training is fragmented. Hospital Providers often travel to maintain ACLS/PALS certifications, leading to staffing gaps in Nome. Meanwhile, Community Health Aides (CHAs) and village responders struggle to maintain ETT/EMT skills because "low-fidelity" plastic manikins do not simulate the complex physical responses of a real patient. This "skill decay" is a major risk in remote villages where emergencies are high-stakes but low-frequency. Without a unified, high-fidelity simulation platform, we cannot guarantee a standardized response across our 15-village network. The Opportunity This project presents an opportunity for Total Regional Readiness. We have the opportunity to: 1. Standardize Advanced Care: Using simulation to provide ACLS and PALS training in-region, keeping doctors and nurses at the bedside. 2. Empower CHAs and Volunteers: Providing Health Aides and community responders with high-fidelity manikins that "respond" to their treatments during ETT/EMT drills. 3. Youth Workforce Pipeline: Engaging high school students in dual-credit emergency medicine courses using the latest simulation technology. 4. Integrated Drills: Running "Simulated Transfers" where a village EMT and a hospital Provider use identical technology to practice the hand-off of a critical patient.	NSHC will implement a "Full-Spectrum" simulation program across the region: *Procurement of High-Fidelity Simulator Fleet: We will purchase a range of advanced manikins: "Sim-Man" for ACLS and adult EMT training, "Sim-Junior" for PALS, and specialized trauma models for ETT certification. *CHA and Village Integration: We will deploy mobile "Sim-Kits" to village clinics. These allow Community Health Aides (CHAs) to practice high-acuity scenarios locally, with manikins that provide digital feedback on compression depth, airway management, and drug administration. *Provider Certification Hub: We will establish a permanent simulation lab in Nome for hospital staff to complete their ACLS/PALS renewals, utilizing software that records and debriefs their performance against international gold standards. *Community and Youth Outreach: We will partner with regional schools to offer ETT and EMT courses for high school students, using "gamified" computer simulations to teach anatomy and emergency protocols before moving to hands-on manikin practice. *Synchronized Regional Drills: Every quarter, NSHC will host a "Regional Code Day" where providers in Nome and responders in the villages participate in a synchronized simulation, practicing the entire arc of care from the initial EMT response to the hospital ACLS intervention. *Digital Performance Analytics: The system will track "skill trends" across the region, identifying if specific villages or departments need more focus on pediatric care or cardiac response, allowing for data-driven clinical education.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3S Safety and Communication Systems Modernization	AK	The Problem Our existing life-safety systems—including fire alarms, nurse call, and code alerts—are non-integrated and building-specific. Currently, an emergency in one facility may not be visible to responders in another because these systems do not "talk" to each other across the campus network. This fragmentation is exacerbated by our rapid growth; new construction often requires standalone fire panels and alert units, adding complexity rather than cohesion. Without a unified plan, we face a "response lag" during fire or medical crises, jeopardizing staff and patient safety, particularly for those with limited mobility. The Opportunity This project presents an opportunity for Campus-Wide Safety Synchronization. We have the opportunity to: 1. Eliminate System Silos: Designing a unified fiber/IP link that connects Fire, Code Blue, and Nurse Call into one life-safety loop. 2. Ensure Future Scalability: Engineering a "Plug-and-Play" architecture that allows new buildings to be added to the fire and safety network instantly. 3. Unified Alerting: Implementing systems that allow fire alarms to trigger automated, clear voice instructions via the intercom system for safer evacuations. 4. Regulatory Harmonization: Standardizing safety protocols so that NFPA, CMS, and Joint Commission compliance is maintained across every square inch of the NSHC footprint.	NSHC will utilize a 12-month planning window to design a sophisticated, campus-wide safety communication architecture built for growth: *Cross-Campus Infrastructure Mapping: We will conduct a technical assessment to establish a dedicated, redundant "Life-Safety VLAN" that ensures Fire, Nurse Call, and Code Blue signals have a clear, prioritized path across the entire campus. *Integrated Fire & Alert Design: We will design a system where a Fire Alarm or Code Blue triggered in any building is broadcast to centralized security hubs, mobile devices campus-wide, and digital signage, providing the exact location of the incident. *Scalable Staff Duress (RTLS) Engineering: We will develop specifications for a "Real-Time Location System" (RTLS), ensuring that a staff member's panic badge remains active and trackable as they move from the hospital to the QCC or support offices. *Inter-Building Intercom & Fire Voice Integration: We will engineer an IP-based intercom system capable of "Global Paging." This allows for automated fire evacuation instructions or emergency announcements to be broadcast across all NSHC buildings simultaneously. *Standardized Expansion Protocols: We will create a "Safety & Fire Construction Standard." This document will ensure that any new NSHC building is automatically compatible with our campus-wide fire and alert systems from day one. *Implementation & Training Roadmap: The design phase will include a multi-building training curriculum, ensuring staff are familiar with the unified fire and clinical alert tones regardless of which facility they are working in.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3T Telephone services upgrade for Norton Sound Regional Hospital	AK	The Problem NSRH is operating on a "fragile" communication foundation. Our current VoIP system is no longer supported, making us vulnerable to software crashes. Simultaneously, the physical structure of the hospital creates "RF shadows" that prevent cell phones from working in critical areas. This lack of integration means our emergency safety equipment and medical technology cannot "talk" to one another. Most importantly, without a functional repeater system, we lack a backup communication path if our internal network fails, creating a single point of failure that endangers patient care during critical incidents. The Opportunity This project presents an opportunity for Mission-Critical Communication Redundancy. We have the opportunity to: 1. Establish Dual-Path Reliability: Creating a redundant environment where VoIP and Cellular systems back each other up. 2. Eliminate Dead Zones: Installing a Distributed Antenna System (DAS) to provide 100% cellular coverage for staff and patients. 3. Modernize VoIP Infrastructure: Deploying a scalable, enterprise-grade phone system that integrates with our Electronic Health Record (EHR). 4. Enhance Safety Integration: Linking voice systems directly to hospital intercoms and nurse-call platforms for automated, high-speed emergency alerts.	NSHC will execute a comprehensive overhaul of our digital voice and cellular infrastructure to ensure maximum uptime: *Enterprise VoIP Replacement: We will procure and install a modern, cloud-hybrid VoIP platform. This system will feature advanced call-routing and encrypted messaging, providing the primary path for clinical communication. *Distributed Antenna System (DAS) Installation: We will deploy a network of cellular repeaters and internal antennas. This system serves as the secondary redundant path, ensuring that SIM-enabled devices (cell phones and tablets) function flawlessly in every room, providing a fallback if the VoIP network is interrupted. *Systems Integration: Our IT team will integrate both the VoIP and the cellular-enabled devices with the hospital’s Nurse Call and Overhead Paging systems. This allows for "smart alerts" to be sent via multiple paths, ensuring redundancy in emergency notifications. *Carrier-Neutral Design: The DAS will be designed to boost signals for all major providers (GCI, AT&T, Verizon), ensuring that every staff member, regardless of their service provider, has a reliable connection. *Cybersecurity & Encryption: The new system will include robust encryption to protect patient privacy and comply with HIPAA, while remaining accessible through multi-factor authentication. *Phased Rollout & Stress Testing: To ensure zero downtime, we will utilize a "Parallel Run" strategy where the new VoIP and DAS systems are stress-tested against various failure scenarios before the legacy system is decommissioned. This includes simulating a network failure to verify that the cellular backup path functions as intended.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3U Communication Satellite Mesh Network/Enable WiFi Calling/Emergency Response in Little Diomedes	AK	The Problem Little Diomedes is a "communications desert." Traditional copper and microwave links are frequently destroyed by ice and wind, and commercial providers often find the cost of repair to be prohibitive. When the phones go down, the village loses its ability to coordinate emergency medevacs, consult with doctors, or contact families. Satellite internet exists but is often limited to a single building, leaving the rest of the village—and first responders in the field—digitally isolated. The Opportunity This project presents an opportunity for Infrastructure Sovereignty and Resilience. We have the opportunity to: 1. Eliminate Single Points of Failure: Designing a "self-healing" mesh where if one node fails, the signal automatically re-routes through others. 2. Universal WiFi Calling: Replacing the need for a traditional landline by providing community-wide Wi-Fi that supports standard smartphone calling features. 3. Telemedicine Anywhere: Enabling a health aide to transmit vitals or conduct a video consult from a patient's home rather than only from the clinic. 4. Arctic-Hardened Design: Engineering nodes that are energy-efficient and capable of being powered by small-scale renewable sources, reducing the reliance on the island's limited fuel supply.	NSHC will utilize an 18-month planning and design phase to engineer a communication system that can survive Diomedes's unique challenges: *Topographical and RF Mapping: We will conduct a technical survey of the island's steep terrain to identify optimal "Line-of-Sight" locations for mesh nodes. This ensures maximum signal penetration into homes and along the village's main paths. *Satellite Backhaul Integration: We will design the interface between high-speed LEO satellite terminals (such as Starlink or OneWeb) and the local mesh network to ensure low-latency data flow for voice and video applications. *Self-Healing Mesh Architecture: The design will prioritize "Decentralized Intelligence." Each node will be programmed to automatically find the most efficient path to the satellite gateway, ensuring the network stays up even if several nodes are damaged by ice. *Energy-Efficient Node Engineering: We will develop specifications for nodes that require minimal power, incorporating Renewable Energy Integration (solar/wind) and high-capacity battery storage to ensure operation during winter darkness or fuel shortages. *Telemedicine and Emergency Protocol Design: We will work with NSHC's IT and Emergency departments to create "Priority Traffic" protocols. This ensures that a medical emergency call or a telemedicine video stream is always given the highest bandwidth priority on the network. *Remote Management Tools: We will design a "Digital Twin" monitoring system that allows NSHC IT staff in Nome to diagnose and troubleshoot the Diomedes network remotely, reducing the need for expensive technician travel to the island.	\$250K-\$1M	Hospital	Single Community	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3W Fire Alarm Replacement/Upgrade for NSRH, QCC, and Other Facilities	AK	The Problem Our existing fire alarm infrastructure consists of aging, standalone systems that lack communication with one another. These legacy units are increasingly prone to false positives and hardware malfunctions, and because they are not segmented, identifying the precise location of a "smoke event" in a large facility like NSRH can take precious minutes. Furthermore, the lack of remote monitoring means that facility managers cannot diagnose system health without being physically present at the specific panel, leading to reactive rather than proactive maintenance. The Opportunity This project presents an opportunity for Integrated Life-Safety Intelligence. We have the opportunity to: 1. Networked Monitoring: Centralizing oversight so that a single command center can monitor the status of every building on the NSHC campus simultaneously. 2. Precision Triage: Utilizing segmented, addressable detectors that pinpoint the exact room and type of event, allowing for targeted emergency response. 3. Real-Time Alerts: Integrating mobile app notifications for Facilities and Security teams, ensuring that critical data reaches the right people instantly, even if they are away from their desks. 4. Regulatory Compliance: Bringing all facilities up to the latest NFPA (National Fire Protection Association) standards, ensuring ongoing CMS and Joint Commission accreditation.	NSHC will execute a campus-wide fire safety modernization using a phased, non-disruptive installation strategy: Procurement of IoT-Enabled Infrastructure: We will purchase a modular, networked fire alarm control platform. This includes smart, addressable smoke/heat detectors, audio-visual notification appliances, and pull stations that are all linked to a central "Life Safety Hub." System Integration and Networking: Our IT and Facilities teams will work with specialized contractors to create a dedicated, secure fiber or wireless "safety loop" between NSRH, QCC, and support buildings. This allows for campus-wide visibility and cross-building alert protocols. Segmented Alert Programming: We will program the system to support "Zoned Responses." This ensures that an incident in one wing can be managed with specific protocols (e.g., "defend in place" for the QCC elders) without causing unnecessary panic in unrelated areas of the hospital. Mobile & Remote Oversight Implementation: We will activate IoT features, including remote diagnostics and mobile application dashboards. This allows Facilities staff to receive "Pre-Alarm" warnings on their mobile devices, identifying dirty sensors or minor faults before they trigger a full-building evacuation. Clinical and Safety Staff Training: We will conduct comprehensive drills and training sessions for all staff. This focuses on the new "Smart Notification" sounds and the mobile communication tree used during an event. Automated Data Logging: The system will be configured to automatically log all tests, drills, and events, simplifying the reporting process for fire marshal inspections and accreditation audits.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	3X Installation and Implementation of a Laundry Ozone Generator System for NSRH	AK	The Problem NSHC’s current traditional laundry processes are energy-intensive, requiring massive amounts of hot water and heavy chemical loads to meet medical-grade disinfection standards. These chemicals are not only expensive to ship to Nome but also accelerate the wear and tear on linens, leading to high replacement costs. Furthermore, traditional thermal disinfection is less effective against certain resilient pathogens, and the high heat required places a significant strain on the facility’s utility infrastructure. The Opportunity This project presents an opportunity to modernize our Infection Control and Utility Infrastructure. We have the opportunity to: *Superior Disinfection: Utilizing ozone to eliminate 99.9% of bacteria and viruses, providing a higher safety margin for patients and staff. *Arctic Resource Conservation: Reducing hot water demand by up to 90%, leading to significant savings in heating fuel and electricity. *Chemical Independence: Minimizing the need for chlorine bleach and detergents, which reduces our reliance on fragile barge-dependent supply chains. *Extended Asset Life: Ozone is gentler on fabrics than bleach, potentially extending the lifespan of hospital linens by 20–30%, resulting in long-term procurement savings.	NSHC will implement a state-of-the-art ozone disinfection system integrated into our existing laundry facility: *System Procurement & Installation: We will purchase a high-capacity ozone generator designed for commercial healthcare use. The system will be integrated with our existing washers, utilizing an injection manifold to deliver ozone gas directly into the wash water. *Automation and Digital Monitoring: The system will feature automated dosing and real-time digital monitoring to ensure that ozone levels remain at optimal concentrations for disinfection throughout every cycle. Sensors will provide data logs for compliance and safety reporting. *Cold-Water Optimization: We will reconfigure our wash protocols to leverage ozone’s ability to disinfect in cold water. This shift will drastically reduce the load on our boiler systems and lower the facility’s carbon footprint. *Staff Training and Safety Protocols: Our laundry and facilities teams will receive comprehensive training on the operation and maintenance of the ozone generator. We will implement ambient ozone monitors in the laundry suite to ensure a safe working environment for our staff. *Linen Lifecycle Tracking: As part of the implementation, we will establish a baseline for linen replacement rates and chemical costs to track the "Return on Investment" (ROI) and environmental impact over the first 12 months of operation. *Integration with Infection Control: We will coordinate with the NSHC Infection Control department to validate the disinfection efficacy through periodic swabbing and testing of linens, ensuring the system meets or exceeds all CDC and Joint Commission standards.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	4A Youth Wellness Program Expansion (“Summer-cise”)	AK	The Problem While the Nome-based "Summer-cise" program is highly successful, the logistics of a regional rollout are complex. Rural youth in our frontier villages face a "wellness vacuum" during summer break, with limited access to organized sports, nutritional education, or behavioral health support. Without a structured plan, expanding a hub-based program to 15 distinct villages risks "program dilution," where local needs—such as varying gym access or traditional subsistence schedules—are not met. The Opportunity This project presents an opportunity to design the "Summer-cise Village Blueprint." We have the opportunity to: *Scale a Proven Model: Adapting 20 years of curriculum for a multi-site, rural delivery model. *Preventive Intervention: Integrating substance use prevention and coping skills into a high-energy, fun environment. *Local Leadership Development: Designing a "Train-the-Trainer" model to empower village residents to lead the sessions. *Equity in Access: Ensuring that a child’s location in a remote village does not preclude them from the region's premier youth wellness program.	NSHC will utilize a 12-month planning window to design a scalable, culturally resonant regional expansion: *Curriculum Adaptation: We will review the existing "Summer-cise" curriculum and adapt it into a "Camp-in-a-Box" format. This includes modular lessons on physical activity, nutrition (utilizing local subsistence foods), and behavioral health (focusing on resilience and substance use prevention). *Infrastructure & Partnership Audit: We will conduct site visits to village schools and tribal offices to identify available gym spaces, kitchens for healthy snack preparation, and outdoor play areas. This ensures the program design is tailored to the actual facilities in each village. *Village Leader Recruitment Design: We will design the "Wellness Lead" position—a role for local village residents who will be trained by NSHC professionals. This phase includes creating the training modules that will ensure local leaders are equipped to deliver the health-based curriculum safely and effectively. *Logistics & Supply Chain Planning: We will map the logistical requirements for transporting program kits (sports equipment, educational materials, and healthy snacks) to 15 remote sites via the regional barge and air networks. *Evaluation Framework Design: We will develop a set of "Impact Metrics" to track youth engagement, physical activity levels, and wellness knowledge. This data will be used to secure multi-year implementation funding. *Cultural Alignment: We will collaborate with village Elders and Tribal councils to ensure the program respects and incorporates local traditions, languages, and subsistence calendars, making the wellness programming a natural extension of village life.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	4C Salt Water Distillation Planning Project	AK	The Problem Communities like Little Diomed and Wales face extreme water insecurity in late winter. Currently, the only solution is the emergency procurement of bottled water via air-freight—a model that is economically unsustainable and logistically fragile. Furthermore, these communities have historically struggled with "Best Practice" scores due to the technical complexity of their systems and high operator turnover. While NSHC’s CUAP has stabilized existing infrastructure, the region still lacks a designed, Arctic-ready solution for salt-water conversion when fresh water sources fail. The Opportunity This project presents an opportunity for Utility Mastery and Redundancy. We have the opportunity to: 1. Leverage CUAP Infrastructure: Integrating emergency distillation into the existing regional support and training network. 2. Apply Proven Success: Scaling the CUAP "Best Practice" model to include high-tech emergency water production. 3. Identify Arctic-Ready Tech: Vetting distillation units specifically designed for high-sediment, freezing maritime environments. 4. Eliminate Supply Chain Risk: Creating a blueprint that replaces \$100k+ in annual "water flight" costs with local production.	NSHC will utilize the CUAP’s regional technical assistance framework to design a robust emergency water system: *Technical Feasibility Study: We will evaluate purification technologies (MVC vs. RO) to determine which is most resilient against the specific "slush-ice" and high-sediment conditions of the Bering Strait. *CUAP Integration Planning: We will design the operational model to fit within the existing CUAP Regional Co-op, ensuring that maintenance, chemicals, and parts for the new units are managed through NSHC’s centralized supply chain. *Site-Specific Engineering: We will conduct engineering site visits to design intake systems that can operate through sea ice and identify heated housing locations near existing community tanks in Diomed and Wales. *Workforce Training Assessment: Leveraging the CUAP Training Calendar, we will identify the specific certification upgrades needed for village operators to manage desalination technology, building on our success in increasing operator retention. Energy & Regulatory Review: We will work with local utilities to model the electrical load and engage with the Alaska DEC to ensure the planned process meets all potable water standards. 2027 Implementation Blueprint: The final deliverable will be a "shovel-ready" plan, including finalized equipment quotes and a financial model for an implementation grant in 2027.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	4D Clinical-Grade Water Access Project: Point-of-Care Distillation for High-Acuity Patients	AK	The Problem Clinical and home-medical needs in five remote villages are currently met through a fragile dependency on sterile water flown from the Lower 48. This dependency creates a severe public health risk: 1. Infection Pathways: Using untreated "honey bucket" era water in medical devices or for wound care introduces pathogens directly into vulnerable patients, leading to amoebiasis, pneumonia, and meningitis. 2. Supply Chain Fragility: Weather delays in the transcontinental flight path frequently result in local "water gaps," forcing patients to choose between non-compliance with treatment or using unsafe water. 3. Exorbitant Costs: Shipping liquid weight 4,000 miles is a massive drain on tribal health resources that could be redirected to direct patient care. The Opportunity This project presents an opportunity for Regional Medical Self-Sufficiency and Pathogen Mitigation. We have the opportunity to: 1. Eliminate Life-Threatening Risks: Providing a local, verified source of pure water to prevent pneumonia and meningitis. 2. End Transcontinental Dependency: Replacing a 4,000-mile supply chain with on-site clinic production. 3. Ensure Clinical Readiness: Providing 100% availability of purified water for wound irrigation and medication preparation regardless of flight schedules. 4. Massive Cost-Avoidance: Eliminating the exorbitant air-freight fees associated with shipping sterile water from the Lower 48.	NSHC will implement a standardized clinical water production and distribution system: *Procurement of Clinical-Grade Hardware: We will purchase medical-grade distillation units and multi-stage Reverse Osmosis (RO) systems rated for high-volume clinical use and capable of removing biological pathogens. *Establishment of Clinic Hydration Hubs: Each of the target clinics will be outfitted with a dedicated production station, including the purification hardware and sterile, large-capacity storage reservoirs. *Clinic-to-Patient Distribution Model: We will implement a "Refill Program" where patients with home-based medical devices (CPAP, BiPAP, Oxygen) can pick up clinical-grade water from the clinic in sanitized containers. *Clinic Protocol Integration: We will update SOPs to include daily distillation schedules, ensuring a constant "rolling reserve" for both clinic procedures and patient distribution. *Health Aide Training: Village Health Aides will be trained on the operation and maintenance of the units and the protocols for safe water handling to prevent secondary contamination. *Environmental Health Oversight: The NSHC Office of Environmental Health will conduct periodic testing of the hub water to ensure it consistently meets purity standards for medical use and is free of pathogens like Naegleria fowleri or Legionella.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	Outdoor Exercise Equipment, Walking Path, Meeting, and Eating Space	AK	The Problem The NSHC Nome campus currently suffers from "Indoor Compression." Clinical and administrative staff spend nearly 100% of their time in windowless or high-traffic indoor areas, which impedes creative problem-solving and social bonding. Existing outdoor areas are in disrepair, lack ADA accessibility, and offer no protection from the wind or rain, making them unusable for professional workshops or healthy dining. This lack of a "third space" outside the clinical setting exacerbates workplace stress and reduces the effectiveness of organizational innovation. The Opportunity This planning project allows NSHC to design a "Campus Wellness Commons." We have the opportunity to: Decompress the Workforce: Creating a weather-protected "outdoor office" that supports mental clarity and stress reduction. Foster Collaboration: Designing modular seating and WiFi-enabled meeting zones that allow for workshops and communal dining outside the cramped breakrooms. Promote Physicality: Integrating fitness stations and walking paths that make exercise a convenient part of the workday. Ensure Inclusion: Replacing dilapidated, inaccessible infrastructure with modern, universal design that accommodates every member of our team and community.	NSHC will lead a design process focused on "Functional Resilience and Biophilic Design": Modular Collaborative Design: We will design weather-protected "hubs" featuring modular seating and tables that can be reconfigured for a private 1-on-1 meeting or a 20-person workshop. Connectivity & Technology Integration: The space will include ruggedized WiFi extenders and solar-powered charging stations, ensuring that the transition from the indoor office to the "outdoor commons" is seamless for workforce productivity. Biophilic Wellness Infrastructure: The design will include a loop of accessible walking paths interspersed with adaptive exercise stations, allowing staff to engage in "micro-workouts" during lunch or breaks. Arctic Shielding: To maximize the usable season in Nome, the design will prioritize wind-shielding glass panels and overhead radiant heating options (solar or electric) to protect users from the coastal elements. Universal Accessibility Audit: We will ensure all paths and seating areas meet or exceed ADA standards, providing equitable access for staff and visitors with mobility challenges.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Norton Sound Health Corporation	RA Administration and Operational Readiness	AK	The Opportunity NSHC is currently experiencing a period of high-impact growth, successfully managing a diverse range of innovative regional health initiatives. To sustain this momentum and ensure we are "doing the very best" for our residents, we must proactively scale our administrative support. Currently, our administrative staff handles a massive volume of complex grant reporting and specialized Arctic procurement. As we onboard new RHTP projects, there is an opportunity to move from a generalized support model to a "Grants and Logistics Center of Excellence." By adding a dedicated Grant Accountant and a Procurement Specialist, we can eliminate the risk of "logistical lag"—where projects are delayed by shipping windows or procurement red tape—and ensure that every regional investment is executed with world-class efficiency and financial transparency.	NSHC will implement a "Three-Pillar" administrative support model designed for high-performance grant management: Pillar 1: Financial Integrity (Grant Accountant): This role will focus exclusively on the RHTP portfolio, implementing advanced fund-accounting and real-time expenditure tracking. This ensures that every dollar is maximized for community benefit and that all federal "Uniform Guidance" standards are surpassed. Pillar 2: Logistical Precision (Procurement Specialist): This specialist will manage the end-to-end supply chain for regional projects. They will be responsible for navigating federal "Buy America" requirements, coordinating with Arctic barge operators for seasonal deliveries, and managing vendor relationships to ensure high-quality, cold-weather-rated materials are procured at the best value. Pillar 3: Administrative Synergy (Administrative Assistant): This role will act as the "Project Concierge," maintaining the centralized project management system and ensuring that clinical leads are supported with documentation, scheduling, and reporting. Integrated Compliance Dashboard: The team will develop a unified dashboard that tracks financial "burn rates" alongside procurement milestones. This allows leadership to see exactly where materials are in the supply chain relative to the project budget. Proactive Vendor Management: The Procurement Specialist will establish a "Pre-Qualified Arctic Vendor List," streamlining the bidding process for future projects and ensuring that NSHC always works with partners who understand the unique challenges of the Bering Strait.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Nuna Incorporated	Self-Management with Consumer-Facing Tools: A Personalized Community-Supported Digital ‘Coach’	CA	As highlighted in Alaska’s Project Narrative, 3 out of 4 Alaskans have or are at risk of chronic disease and 32-35% of adults in Alaska are obese. At the same time, over 80% of Alaska’s communities are remote, and many must travel by air or water to see a clinician. Primary and specialty medical care are concentrated in a few hubs. Alaskans face very unique challenges in living their healthiest lives. These complex logistics create high barriers to care access and support for the Alaskans living in rural and remote settings. Nuna sees an opportunity to reach Alaskans and their communities in a broad, personalized, relevant, and economically sustainable way that translates to better health outcomes. Technology has at last arrived at a point where it can facilitate and deliver highly personalized health support at-scale in a way that has been previously unfeasible. Alaska’s has an extraordinary vision for supporting rural Alaskans via telehealth, consumer-facing technology, and community grasps the transformative potential of this opportunity.	Nuna proposes using smartphone consumer-facing technology and AI to help Alaskans with, or at risk for, chronic disease-and their loved ones - live healthier lives. Most health outcomes are shaped not in the exam room, but in the time between visits. For Alaskans living with chronic diseases like hypertension, prediabetes, diabetes, obesity, and dyslipidemia, effective self-management means more than a daily checklist, an AI chat, occasional telehealth, or traditional remote patient monitoring. Long term management requires continuous, personalized support that heavily-person-supported care models cannot sustain at scale. Our approach gives each eligible Alaskan a personalized digital companion, coach, and advocate on their phone. This digital coach is an app which can text, call, and interact with Alaskans and their loved ones. It feels like a trusted friend that helps people adopt and sustain healthy lifestyle practices, support each other, connect to community resources, and connect to clinical teams when necessary. By handling day-to-day coaching, tracking, and education, Nuna helps people manage more on their own and surfaces only the most relevant summaries and alerts to clinicians—relieving some burden on overextended providers while keeping them connected to what matters most. We envision this technology as a personal health coach that also connects people to their communities as they work towards lasting health and self-management. Our approach will: -Incorporate Community: Include trusted caregivers and loved ones so they can reinforce healthy habits. -Integrate Clinically: Share concise, relevant information with care teams, so they can see trends, identify risk earlier, and intervene when needed without adding substantial documentation or monitoring workload. -Educate: Equip Alaskans with understandable, actionable information they can integrate into daily life. -Provide Relevant Devices: Pair the app with tools such as blood pressure cuffs and scales to support hypertension and diabetes management. -Maintain clear clinical boundaries: Support, but not replace, clinical judgement; the technology will summarize and share relevant information with licensed clinicians. Above all, we propose that this project should feel emotionally grounded, trusted, and relevant. Nuna is HIPAA-compliant, with robust privacy and security controls, and our app’s clinical content is overseen by our Medical Director to align with evidence-based care.	Over \$5M	Statewide	Anchorage (Municipality); Bethel Census Area; Copper River Census Area; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Matanuska-Susitna Borough; North Slope Borough; Sitka (City and Borough); Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Nunakins	Nunakins Childcare	AK	Kotzebue serves as the regional hub for the Northwest Arctic Borough, providing critical healthcare services to residents of Kotzebue and surrounding villages that are accessible only by air or seasonal travel. The region faces persistent challenges common to rural Alaska, including workforce shortages, high cost of living, geographic isolation, limited infrastructure, and elevated rates of stress-related health conditions among families with young children. A critical and often underrecognized barrier to healthcare access and workforce stability in the Northwest Arctic Borough is the lack of reliable, affordable childcare. Families with young children—particularly healthcare workers—face limited options, long waitlists, and inconsistent availability. As a result, parents are unable to maintain employment, pursue training, or accept positions in the healthcare sector. This challenge directly impacts healthcare delivery capacity, continuity of care, and long-term system sustainability. Investment in childcare infrastructure is therefore not ancillary to health—it is foundational to rural health transformation. Nunakins will seek to establish spaces available to Maniilaq healthcare providers to increase the recruitment and retention capacity of Maniilaq Healthcare Center.	Nunakins seeks to not only have a positive impact on the health and wellbeing of children and reduce negative health outcomes, but also help to build capacity for our community to recruit and retain health care providers. High-quality childcare directly improves child health and well-being by addressing social determinants of health during the most critical developmental period (birth to age five). Consistent childcare provides: • Stable, safe environments that reduce toxic stress and adverse childhood experiences • Early developmental monitoring, enabling timely referrals for speech, behavioral, or developmental support. We work closely with the Early Learning and Family Program (ILP/EI) • Predictable routines that promote emotional regulation, social skills, and resilience • Hygiene supports that reduce preventable illness and improve overall health In rural Alaska, where access to pediatric specialists is limited and medical travel is costly, early identification and prevention are especially impactful. Childcare functions as a frontline prevention strategy that reduces future strain on healthcare systems. Culturally grounded childcare programs also reinforce protective factors tied to community connection, language, and identity—recognized contributors to mental health and long-term well-being for Alaska Native children and families. The program will operate in coordination with local healthcare providers, family support services, and community partners to ensure alignment with workforce needs and child development best practices. This initiative represents a strategic, upstream investment that strengthens the health system while supporting the next generation.	\$50,000-\$250,000	Single Community	Northwest Arctic Borough	Advance to Implementation Application

Nunakins	Nunakins Family Support Center Diaper Bank	AK	Access to clean diapers is a foundational health need for infants and toddlers. Diaper insecurity is associated with increased rates of diaper rash, urinary tract infections, caregiver stress, and delayed access to childcare and healthcare services. In rural Northwest Alaska—where families face high costs, limited retail access, and transportation barriers—a regional diaper bank functions as a preventive health intervention that reduces avoidable medical visits, supports caregiver mental health, and promotes health equity for infants and young children. Diaper insecurity is closely linked to caregiver stress, anxiety, and symptoms of depression—particularly for parents of infants. In the Northwest Arctic Borough, where families already manage high living costs, housing instability, and limited childcare options, the added burden of diaper need contributes to toxic stress that negatively impacts both caregiver mental health and parent-child bonding. Families experiencing diaper need are often forced to make tradeoffs between purchasing diapers and meeting other basic needs such as food, heating fuel, or medication. In Kotzebue and village communities, where diaper prices are routinely 50–100% higher than road-system averages due to freight costs, these tradeoffs are especially acute. A single case of diapers can cost substantially more once air freight is included, and availability is inconsistent in village stores.	Access to clean diapers is a foundational health need for infants and toddlers, yet diaper insecurity remains a significant and often overlooked driver of poor health outcomes in rural Alaska. In Kotzebue and throughout the villages of the Northwest Arctic Borough, families face a convergence of challenges—high freight costs, limited retail availability, geographic isolation, and constrained household income—that magnify the health consequences of diaper need. A regional diaper bank operating from Kotzebue and extending service to outlying villages represents a cost-effective, preventive health intervention aligned with Rural Health Transformation goals of improving access, reducing avoidable healthcare utilization, and advancing health equity. When families lack sufficient diapers, caregivers are forced to ration diaper use well beyond medically recommended intervals. This practice is associated with increased rates of diaper dermatitis, skin breakdown, fungal and bacterial infections, and urinary tract infections in infants and toddlers. In rural Northwest Alaska—where primary care clinics already operate under capacity constraints and specialty care often requires medical travel—these preventable conditions contribute to avoidable clinic visits, antibiotic use, and, in some cases, emergency care. Our approach will include reaching out to health care providers and tribal leaders in each of the villages in the Northwest Arctic Borough and obtain information on the most effective way to launch regionally. The diaper bank currently operates in Kotzebue in conjunction with the local food bank, thereby consistently reaching families in need.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Northwest Arctic Borough	Deferred or Not Advanced

Nurses Diversified Systems Incorporated dba "ND Systems Inc."	2026 ND Systems Fellowship for New and Early Career Mental Health Providers RHTP Letter of Interest	AK	There is a well documented gulf between the mental health needs of our Alaskan Communities and available mental health providers. The demand far exceeds the availability of quality services and providers. There is well documented understanding that the level of burn out in mental health as well as other health related professions has led to a loss of providers and difficulty for new and early career providers entering the professions. Those that graduate with Masters in Social Work or Education with emphasis in counseling must work under supervision for on average of 3000 hours prior to being able to sit for their licensing exams. Finding supportive placement in rural communities with a living wage is difficult. Focusing on historical work of Dr. Patricia Benner's from Novice to Expert journeys it takes 2-3 years to achieve the level of competency. In many of our Alaskan organizations, new and early career providers arrive to serve and find that they, as new graduates, are actually expected to function as the experts in the organizations, resulting in poor outcomes for the organizations, the providers, and the communities. Over the past 15 years Dr. Margaret Flinter and her team have designed Fellowship programs to attract and retain new and early career Advanced Practice Clinicians (Nurse Practitioners and Physician Assistants) into Federally Qualified Health Centers providing primary care. Recent reports retention rates are 89%.	Strengthening Alaska's workforce with investment in a fully accredited fellowship model that will attract and retain new and early career providers to serve Alaskans mental health needs now and into the future. ND Systems, with funding, is well positioned to continue the journey to full implementation of the model modified for mental health developed by Dr. Flinter and the Community Health Centers team. 1. Partnering with Moses Weitzman HC - Community Health Consortium in Year One activities will also include 24 hours of targeted regulatory and accreditation consulting related to the Joint Commission standards and readiness planning for ND Systems. This will provide a path to seek National Accreditation for Alaska's first Fellowship Program. 2. Enhancing existing program initiatives, Fellows are honing purposefully focused mental health knowledge and skills to specifically address trauma focused and resiliency-based care. A model of care that uniquely addresses Alaska's high rate of suicidal ideation and intergenerational and community trauma. 3. Addressing the fragility of the healthcare payment systems for care and developing a sustainable fiscal plan to endow the Fellowship program beyond the 5 years of RHTP funding to ensure the on going functionality for the next generations of mental health providers to be fully grounded in service to Alaskans. This vision for supporting and sustaining new and early-career providers in mental health with a defined focus of trauma and resiliency-based practice model, is in line with the stated objectives of the funding stream known as “The Rural Health Transformation Program”. This is a unique model that ND Systems has internally funded for over 9 years and has proven viable and effective for attracting and retaining mental health providers.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough	Deferred or Not Advanced

Nurses Diversified Systems Incorporated dba "ND Systems Inc."	Anchored in Alaska: Modern IT Systems for Behavioral Health Access and Workforce Development	AK	Alaska’s behavioral health system depends heavily on telehealth, remote supervision, digital documentation, and virtual collaboration, yet most rural-serving organizations lack reliable technical infrastructure. Outdated communications systems, inconsistent connectivity, high VOIP costs, cybersecurity vulnerabilities, and fragmented data environments limit the ability of clinicians to serve rural and frontier communities. These gaps restrict access, impair crisis response, and create administrative burden that accelerates burnout. ND Systems’ current technology environment cannot fully support its statewide Fellowship/Residency Program, rural telehealth operations, trauma informed care tools, and data driven quality improvement. Rural clinicians often operate in low bandwidth or unpredictable field conditions without standardized mobile equipment, secure communication pathways, or reliable access to clinical systems. At the organizational level, disparate systems prevent ND Systems from aggregating actionable insights on workforce performance, telehealth utilization, care gaps, and trauma-informed outcomes. This creates a significant opportunity: modernizing ND Systems’ IT infrastructure to improve reliability, strengthen cybersecurity, expand telehealth capacity, support the rural workforce, and enable high quality, data driven behavioral health care across Alaska.	ND Systems proposes a comprehensive modernization of its technology ecosystem to strengthen behavioral health access, reliability, and workforce development across Alaska. The project has five integrated components: 1. Alaska Anchored Infrastructure ND Systems will co-locate critical systems in an Alaska based data center to ensure high availability, low latency for rural regions, improved cybersecurity, and full data sovereignty within Alaska. This will support telehealth platforms, EHR access, communication tools, analytics applications, and tele-supervision environments. 2. HIPAA Aligned SIP Communications Environment ND Systems will host its own PBX/SIP trunking to reduce VOIP costs, strengthen call routing for crisis response, and improve communications resilience across remote sites. This is not a move toward becoming a telecommunications provider but a cost saving, reliability enhancing modernization for clinical operations. 3. Mobile Rural Care Technology Kit To support clinicians who travel to remote, frontier, and offroad communities, ND Systems will deploy rugged, preconfigured, telehealth ready field kits. Kits include portable connectivity (satellite/hotspot), encrypted communication tools, telehealth peripherals, and access to tele-supervision systems, enabling high quality care in challenging environments. 4. Trauma Informed Remote Monitoring & Biofeedback Tools Adoption of wearable stress response sensors, remote biofeedback devices, and clinician dashboards will expand access to trauma and resiliency based interventions for clients who lack regular in person services. Clinicians gain real time insight into symptom patterns and treatment trajectories. 5. Cloud Assisted AI Documentation Tools To reduce administrative burden—especially for early career clinicians—ND Systems will implement AI assisted documentation that supports trauma informed charting, improves accuracy, reduces burnout, and speeds supervisory review. 6.Federated Behavioral Health Data Hub ND Systems will build a hub to unify aggregate data from telehealth systems, EHR metadata, remote monitoring tools, workforce metrics, and training outcomes. The hub provides population level insight to improve rural access, identify service gaps, strengthen supervision models, and support sustainability planning. Together these activities create a resilient, secure, data driven digital foundation for Alaska’s behavioral health workforce and the communities they serve.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough	Deferred or Not Advanced

Nurses for Nurses	Modern Health Fest	AK	Alaska’s rural and frontier health system depends on dedicated professionals who often work in demanding, high-responsibility roles with limited support. Long hours, professional isolation, limited advancement pathways, and few opportunities for connection contribute to burnout and turnover. When health care careers are not sustainable, communities lose continuity of care, institutional knowledge, and trusted relationships that are essential in small and remote settings. The core problem this project seeks to address is the lack of sustainable career pathways for health professionals serving rural Alaska. Many providers enter the workforce committed to long-term service, but without access to leadership development, mentorship, innovation exposure, and well-being resources, remaining in these roles can become difficult over time. Modern Health Fest, held in Anchorage annually, is designed to strengthen career sustainability by equipping providers with practical tools for resilience, professional growth, entrepreneurship, and expanded scope of practice. It creates space for connection, collaboration, and skill-building tailored to the realities of remote practice. By investing in the longevity, advancement, and well-being of Alaska’s health workforce, this project helps ensure that providers can build enduring careers in the communities that rely on them.	Our approach focuses on strengthening long-term career sustainability by equipping Alaska’s health professionals with the skills, support, and partnerships needed to thrive in rural and frontier practice. Modern Health Fest, hosted in Anchorage, serves as a centralized, in-state convening designed to provide practical tools and forward-looking solutions that providers can bring back to their communities. The event brings together nurses and other health professionals from across Alaska for targeted education, collaboration, and exposure to innovation. The proposed approach includes three core strategies: 1. Professional Development and Expanded Career Pathways We offer education on leadership development, entrepreneurship, certification programs, graduate pathways, and emerging models of care. By helping providers see clear advancement opportunities and diversified roles within health care, we support careers that can evolve and remain fulfilling over time. 2. Resilience and Workforce Retention Dedicated sessions focus on burnout prevention, mental wellness, sustainable workload practices, and boundary setting. By strengthening provider well-being and peer connection, we address one of the primary drivers of turnover in rural communities and help professionals build enduring careers. 3. Strategic Partnerships and Health Care Innovation Modern Health Fest intentionally partners with organizations across Alaska and beyond to introduce innovative health technologies, telehealth solutions, workforce programs, and care delivery tools. Through the exhibitor and resource space, rural providers gain direct access to new technologies and statewide resources that may not otherwise reach their communities. Attendees leave with practical partnerships and implementable solutions they can integrate locally, expanding service capacity and modernizing care delivery in remote settings. By combining professional growth, resilience support, and access to innovation, our approach strengthens workforce stability and ensures that rural communities benefit from sustainable, forward-thinking health care careers.	\$250K-\$1M	Statewide	Anchorage (Municipality)	Deferred or Not Advanced

Nurses for Nurses	Provider Pathways: Training & Startup Support Initiative	AK	Rural, remote, and frontier communities in Alaska face persistent health care access challenges, including provider shortages, limited service options, and difficulty attracting and retaining long-term clinicians. Many communities rely heavily on a small number of providers or external systems, which can create gaps in care, long wait times, and limited specialized services. At the same time, many licensed health care professionals have the skills and experience to expand services but lack access to structured training, business development support, and startup guidance needed to open independent clinics, concierge practices, or assisted living facilities. Regulatory complexity, financial barriers, and limited mentorship often prevent viable ideas from becoming sustainable community-based services. This project addresses the opportunity to empower health professionals to become locally rooted care providers and entrepreneurs. By combining training, education, and startup support, the initiative helps transform clinical expertise into sustainable health care businesses that expand access, strengthen local economies, and improve long-term system stability in underserved areas.	Our proposed approach is to create a structured Provider Pathways: Training & Startup Support Initiative that combines education, mentorship, and post-training grant support to help licensed health care professionals successfully launch sustainable practices in rural, remote, and frontier communities. The program will begin with comprehensive education and training focused on healthcare entrepreneurship, regulatory compliance, financial planning, operations management, leadership, and sustainable business models such as independent clinics, concierge practices, and assisted living facilities (ALFs). The curriculum will be practical and action-oriented, designed specifically for providers who want to expand services within their own communities. Following the training phase, participants will receive mentorship and technical assistance to refine their business plans, navigate licensing and regulatory requirements, identify community needs, and prepare for launch. Ongoing guidance will help reduce barriers, increase confidence, and improve the likelihood of long-term success. After completion of the training and mentorship requirements, eligible participants will have access to grant funding support to assist with startup costs such as equipment, initial staffing, compliance expenses, or facility setup. This phased model ensures that funding is paired with preparation, accountability, and readiness, increasing sustainability and responsible investment. By combining education, hands-on mentorship, and targeted startup grants, this approach builds locally owned health care solutions that expand access, strengthen workforce retention, and improve long-term care capacity in underserved Alaska communities.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Nurses for Nurses	Traumatic Event Debriefing Education Program	AK	Rural, remote, and frontier health care providers are regularly exposed to traumatic events, high-acuity situations, and emotionally intense patient outcomes with limited access to structured support. In many communities, formal systems for processing these experiences are minimal or inconsistent. As a result, providers often carry cumulative stress without opportunities for healthy debriefing or team-based reflection. This lack of structured support contributes to burnout, compassion fatigue, moral distress, and staff turnover. When health professionals do not have effective tools to process trauma, it can impact team communication, workplace morale, and long-term workforce stability. In small communities, losing even one provider can significantly reduce access to care and disrupt continuity for patients and families. The opportunity this project addresses is to strengthen internal resilience and team-based support within health care settings by equipping providers with practical traumatic event debriefing skills. By building structured, accessible debriefing practices into rural and frontier health systems, we can improve workforce well-being, enhance team cohesion, and support sustainable, high-quality care for the communities that depend on them.	Our proposed approach is to develop and deliver a statewide traumatic event debriefing training program that is accessible to any health care professional or community member in Alaska who is interested in learning these skills. The goal is to build a broad network of trained individuals who can provide structured, peer-based debriefing support within their own workplaces and communities. The program will offer evidence-informed education on trauma awareness, psychological safety, facilitation techniques, active listening, and structured debriefing models. Participants will learn how to lead or support post-event discussions, recognize signs of acute stress, and connect individuals to additional resources when needed. Training will focus on practical, adaptable tools that can be implemented in hospitals, clinics, emergency services, and community-based settings without requiring additional infrastructure. By creating accessible, scalable training available statewide, this project aims to build local capacity rather than relying on outside specialists. The intent is to develop a “train-the-trainer” model where participants can confidently support their own teams and help expand debriefing practices within their organizations. This approach strengthens workforce resilience, improves team communication, and normalizes structured emotional support after traumatic events. Over time, it will create a sustainable network of trained professionals across Alaska who can provide essential debriefing services where they live and work, improving well-being and supporting high-quality care in rural, remote, and frontier communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

NutriScape, LLC	Alaska NutriScape: Consumer & Professional Nutrition Content Websites	AK	Healthcare providers and Alaskan families are searching for solutions to serious and costly health problems driven by nutritional and lifestyle factors. Yet they find only fragmented answers with frustratingly vague, generic information designed not to educate, but to serve ads. Patients with questions don't know where to start. Healthcare providers do not have time to find effective nutrition resources. The result is a default to expensive disease care while prevention is neglected. This friction in finding ready resources to point patients to is at the core of why powerful nutrition interventions are neglected even when providers know what is at stake. And motivated patients have no trusted starting point for independent learning. NutriScape.NET is an ad-free site that was founded to make nutrition accessible to consumers and professionals. This project will create Alaska-specific platforms so comprehensive and frictionless that directing patients to them can become automatic. When a provider can send a patient to one trusted resource offering dietitian directories, food assistance programs, AI nutrition coaching, an Alaska menu and shopping app, telehealth nutrition services, food references, and on-demand courses tailored to Alaska, nutrition can be integrated into every patient conversation. That shift is transformational. It gives prevention-first a real chance to begin replacing a costly disease care system with one that keeps Alaskans healthier from the start.	The nutrition resources that Alaska's providers and families need often already exist — scattered across WIC, tribal organizations, the Alaska Department of Health, CDC, NIH, and hundreds of individual websites. The problem is not a lack of information. It is that no one has organized it into a single, trusted, Alaska-specific destination. This project will do exactly that. NutriScape.net is an ad-free, enterprise-scale WordPress multisite network established in 2014 to organize evidence-based nutrition information for consumers and professionals. This project will build two new Alaska-specific subdomains on that existing infrastructure. Alaska.NutriScape.NET will serve consumers with a dietitian directory, food assistance program connections, telehealth nutrition services, and Alaska-specific references addressing gardening, subsistence foods, seasonal availability, high food costs, and healthy eating with limited grocery access. AK.NutriScape.NET will serve healthcare providers and Community Health Aides with clinical references and clear use cases that help clinicians grasp a prevention-first mindset, build skills for motivating patients, and save time by directing patients to the consumer resources at Alaska.NutriScape.NET. Both sites will function as the connective tissue between rural Alaskans and every nutrition and preventive health resource available online and every live program in the state. The goal is a platform so useful that providers share it reflexively and patients return to it independently. Funding this project also establishes the digital ecosystem for hosting the nutrition education courses, telehealth dementia-focused nutrition services, and Alaska-specific AI nutrition coach and shopping applications proposed under separate but complementary LOIs. Without this platform, those projects lack a home. The project director is the creator, developer, and principal of NutriScape, LLC, having built and maintained the platform since 2014. As a Registered Dietitian Nutritionist practicing in Alaska since 1992, she brings both the clinical expertise and technical capacity to deliver this project. The platform will be optimized for mobile devices and lower-bandwidth connections common in rural communities.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

NutriScape, LLC	Nourishing Alaska: On-Demand Nutrition Courses for Alaska's Healthcare Workforce & Families	AK	Alaska's healthcare system spends heavily treating chronic diseases that nutrition education could help prevent. Heart disease, diabetes, obesity, and cognitive decline are among the state's costliest conditions, and poor nutrition is a modifiable driver of all of them. Yet the system focuses almost entirely on treatment after disease is established — medications, procedures, emergency transport — rather than prevention through nutrition. This imbalance is financially unsustainable, particularly for rural providers on thin margins under fee-for-service models. The opportunity is twofold. First, consumer nutrition education gives Alaskans knowledge and motivation to make food and lifestyle choices that reduce chronic disease risk before costly interventions become necessary. Second, Alaska's frontline rural providers — nurse practitioners and community health aides — receive minimal nutrition training, leaving them unequipped to counsel patients on the most impactful preventive strategy available. As Alaska transitions toward value-based payment models that reward outcomes over volume, providers must be equipped with effective prevention skills to succeed financially. Nutrition competence is foundational to that shift. This project builds both sides simultaneously: informed consumers who take ownership of their health, and a rural workforce trained to deliver compelling, motivational nutrition guidance as a core clinical skill — not a pamphlet handed out at checkout.	Our approach rests on a core insight: nutrition education fails at both the provider and consumer level because the messaging is divorced from motivational psychology and the science of behavior change. Conventional courses deliver bland facts and population statistics, timidly suggesting small generic changes rather than presenting the nuanced connections between nutrition and the physiology that drives disease. The result is a workforce that defaults to pharmaceutical intervention not out of preference, but because their training never demonstrated nutrition's power to change outcomes. Consumer resources are no better — heavy on what to eat, silent on why it matters, leaving people unaware of nutrition's power to transform quality of life. We will populate alaska.nutriscape.net and ak.nutriscape.net initially with curated courses from established sources, then develop original Alaska-tailored content across 11 topics for three audiences — consumers, community health aides, and healthcare providers — with language, depth, and motivational framing calibrated to each. Courses will expose learners to discoveries about the power of food and other pillars of health — sleep, movement, stress management, gut health — to improve the fundamental drivers of disease. Each topic will present compelling and often surprising ways nutrition shapes conditions people struggle with daily — cognitive decline, depression, ADHD, eating disorders, weight management, and childhood development. When people understand that what they eat can change how their brain functions, their child's attention, behavior, and intelligence, and whether a chronic condition progresses, motivation to act follows naturally. Addressing these conditions now prevents the costly diseases they lead to later. The provider track targets a fundamental shift in mindset — from treating disease to avoiding it through nutrition and lifestyle. Alaska's transition toward value-based payment demands exactly this transformation: providers who actively prevent chronic disease rather than manage it pharmacologically after the fact. These courses will give healthcare providers and community health aides the evidence, conviction, and motivational tools to make nutrition counseling a central part of every patient encounter, building permanent workforce skills and a preventive mindset where they live and work.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

NutriScape, LLC	Nourishing Rural AK: AI-Powered Healthy Menu, Shopping, & Recipe App and The AI Nutrition Advisor	AK	Nutrition is a primary modifiable risk factor for most chronic conditions, yet there is a lack of accessible self-service resources helping rural Alaskans understand how nutrition impacts their health. Online resources treat it as a bland "nice to know" topic — generic facts disconnected from the person's reality. This project deploys an AI chatbot using motivational interviewing principles to help each person understand why changes in nutrition, physical activity, and other pillars of health matter given their own conditions and goals — connecting the what to their own why. It empowers rural Alaskans to take independent action while promoting referrals to telehealth dietitian nutritionists for medical nutrition therapy that is available but underutilized. Beyond education, rural Alaskans need practical tools to act on knowledge — but generic shopping, menu, and recipe apps are not geared for health. They promote unhealthy choices through marketing and ignore healthful, bush-friendly options. With half of adults living with prediabetes or diabetes, the need is urgent — yet nothing defaults to diabetes-friendly choices or accounts for rural Alaska realities of limited selection, extreme costs, or seasonal availability. This project addresses two gaps: always-available health education connecting diet, activity, and lifestyle to quality of life, and a food planning tool linked to rural shopping with products curated for healthfulness, defaulting to diabetes-friendly options.	NutriScape will deploy two complementary AI-powered chatbot tools on the alaska.nutriscape.net platform, accessible statewide via any web browser. The Nutrition Coach uses motivational interviewing and coaching techniques to deliver personalized nutrition and lifestyle education encompassing the pillars of health. It is available on demand — whenever a person is ready to engage — eliminating scheduling barriers that cause people to lose momentum. By meeting users at the moment of motivation with motivational psychology and proven coaching techniques, the tool helps individuals understand how nutrition, physical activity, sleep, stress, and other lifestyle factors drive their health concerns. This prevention-focused approach empowers people to make informed changes before conditions progress. The chatbot draws from curated, evidence-based sources and refers users to telehealth dietitian nutritionists for medical nutrition therapy when needed. Care will be taken to avoid medical diagnosing while providing highly relevant curated nutrition education focused on the individual's health priorities. The Bush Kitchen Planner focuses on rural shopping, bush-friendly cooking, and meal planning with a baseline default toward food choices appropriate for metabolic issues and cardiovascular risk. It accounts for restricted product selection, high costs, and seasonal availability common in bush Alaska, generating meal plans, shopping lists, and substitution suggestions grounded in what rural Alaskans can actually access and afford. These are tools for personal action — and personal action is critical to health care system sustainability. When individuals prevent and manage chronic conditions through informed daily choices, downstream demand on an already strained rural health system is reduced. Community health aides and physicians will be encouraged to refer patients to these tools to reinforce guidance provided during clinical encounters. Both tools will be developed by Stephanie Figon, MS, RDN, LD, an Alaska-based registered dietitian with expertise in weight management, diabetes counseling, and AI-assisted development. A contracted developer advisor will provide code review, security auditing, and architecture oversight. The tools use retrieval-augmented generation to constrain responses to vetted, accurate nutrition content rather than generic AI output.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

NutriScape, LLC	Trace Lithium in Rural Alaska Water Systems and Mental Health Outcomes: A Study Planning Project	AK	What if a simple mineral deficiency is contributing to Alaska's devastating suicide and dementia rates? What if the answer lies in our drinking water? Most people do not realize that trace amounts of lithium are essential. Lithium exerts neuroprotective effects and improves mood. Population studies across multiple countries show that where drinking water contains more naturally occurring trace lithium, communities have lower rates of suicide, dementia, and violent behavior. A 2020 review of 15 studies confirmed this. A 2025 Nature study strongly suggests lithium deficiency may contribute to Alzheimer's pathology. A Danish population study showed 17% lower dementia rates in higher-lithium areas. Alaska's drinking water has never been systematically tested for lithium. Mental health providers need this critical community-level lithium data. Suicide in Alaska is more than double the national average and 23% of youth have seriously considered it. Without data, providers cannot evaluate whether this low-cost mineral intervention could help the patients they serve. This planning project will lay the groundwork for the first comprehensive statewide study of this critical mineral in Alaska's water, generating accessible data that could address a fundamental driver of suicide and dementia.	This planning grant will establish whether lithium data exists for Alaska's drinking water, support outreach to research partners to discuss possible study designs, and build the collaborative foundation needed for a full ecological study. It will be up to the lead investigator to ultimately propose the study and apply for grant funding to conduct the first comprehensive analysis of trace lithium in Alaska's water and its relationship to mental health outcomes. Phase 1 — Data Assessment: Research existing lithium and water chemistry data from DEC Drinking Water Watch databases, USGS water quality records, and university sources. Identify which rural and groundwater-dependent systems have been tested, which have not, and where critical gaps exist. Assess available mental health outcome data by community, including suicide rates, crisis contact volumes, and dementia prevalence. Phase 2 — Partnership Development: Establish collaborations with the Alaska DEC Drinking Water Program, UAA Division of Population Health Sciences, UAF One Health program and/or Center for Alaska Native Health Research, and the Statewide Suicide Prevention Council. Present the project concept and literature review to potential partners and identify a university-affiliated Principal Investigator to lead the full study. Phase 3 — Reporting and Handoff: Submit the planning grant final report and present findings to RHTP. It is anticipated that the Principal Investigator will apply for RHTP implementation funding in the next funding cycle to design and conduct the full study.	Under \$50,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Obtelecare Alaska PC	Strong Mothers, Strong Alaska: Expanding Maternal Care Across Rural Alaska	SC	According to the Society for Maternal Fetal Medicine (SMFM), shortages of subspecialty obstetrical care have contributed to the expansion of maternity care deserts, where high risk pregnant patients lack timely access to the advanced expertise required for complex pregnancies. MFM specialists are disproportionately concentrated in metropolitan areas, while many rural hospitals and clinics operate without local access to subspecialty maternal care. As a result, patients in rural regions often face long travel distances, delayed consultations, fragmented care, and increased risk of adverse maternal and neonatal outcomes. SMFM has identified a direct relationship between geographic access to MFM care and improved outcomes, noting that reduced access is inversely associated with preterm birth, perinatal mortality, and severe maternal complications. Obtelecare addresses the limited availability of MFM specialists by delivering a fully virtual teleMFM model that extends maternal care to rural hospitals and outpatient clinics without requiring an onsite specialist. By leveraging telehealth technology, Obtelecare enables MFM specialists to provide real time consultation, clinical decision support, and care coordination regardless of patient location.	By operating without a physical presence, Obtelecare removes common barriers to specialist recruitment and deployment, allowing rural health systems to access high risk maternity expertise quickly and sustainably. With our team of 6 board certified MFM providers, we can deploy Teladoc equipment to established locations of practice and build access to care models seamlessly. Our providers are licensed in the state and are credentialed to align with existing medical staff requirements and bylaws. For the programs that are new to telehealth, we will work with the MSO to provide a scope of practice for telehealth. Traditionally, Obtelecare can launch programs in 60-90 days based on credentialing timelines. Our goal is to provide 24/7 inpatient access to approximately 15 additional inpatient programs throughout Alaska, along with outpatient support for high-risk maternity patients in remote communities. Our program will be offered to every hospital and labor & delivery unit throughout the state of Alaska along with dedicated prenatal outpatient support in the communities that need it most. We will work with the Alaska Native Foundation and tribal communities to offer access through telehealth and virtual care for patients, without having to travel or leave their communities. Through building a consistent approach to virtual teleMFM we have a unique opportunity to work together with the Alaska Community Foundation to track outcomes and measure a significant impact to improving access to evidence based maternal care. This approach aligns with national recommendations from the Society for Maternal Fetal Medicine to expand telehealth as a key strategy for improving maternal outcomes in underserved communities	\$1M-\$5M	Maternal health	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

OCHIN Inc.	Alaska Health Information Technology Workforce Pathway Initiative	OR	Healthcare delivery in Alaska depends on digital health systems that connect patients, clinics, hospitals, and specialists across vast geographic distances. Telehealth platforms, electronic health records, health information exchange systems, cybersecurity infrastructure, and healthcare data analytics tools are essential to modern care delivery. Despite this reliance on digital infrastructure, Alaska faces a shortage of trained professionals capable of supporting these systems. Existing healthcare workforce programs largely focus on clinical roles such as nursing, medical assisting, and behavioral health services, leaving technical roles that support healthcare technology systems underdeveloped. This initiative addresses that gap by establishing a statewide Health Information Technology workforce development program designed for Alaska’s rural healthcare environment. The program will create a coordinated training pipeline connecting educational institutions, healthcare organizations, and workforce partners to prepare Alaska residents for careers supporting healthcare technology systems. Implementation will follow a phased approach: program design and partner engagement in Year 1; pilot training programs for students, adult learners, and rural providers in Years 1–2; and statewide expansion and workforce placement in Years 3–5. This strategy supports early success while building the partnerships needed for long-term impact.	The Alaska Health Information Technology Workforce Pathway Initiative will establish a three-track workforce development program designed to strengthen Alaska’s healthcare technology workforce. High School Health IT Career Pathway. This pathway introduces high school students in grades 11–12 to careers in health information technology through Career and Technical Education programs. Students will participate in a structured curriculum covering healthcare systems, electronic health records, healthcare data analytics, cybersecurity fundamentals, privacy and compliance standards, and professional career readiness. Students will earn micro-credentials and participate in applied projects, job shadowing opportunities, and mentorship experiences with healthcare organizations. Educators will participate in a train-the-trainer program enabling local delivery of the curriculum. Adult Workforce Training. The second pathway provides competency-based training for adults entering the healthcare technology workforce or transitioning careers. Participants will develop skills required for entry-level roles including: electronic health record support specialist health information technician healthcare data support analyst healthcare IT help desk specialist Training will include online coursework, applied learning exercises, and potential practicum opportunities with healthcare organizations. Rural Provider Technology Upskilling. The third pathway strengthens digital health capabilities for healthcare providers working in rural communities through role-based training tailored to the responsibilities of clinical, administrative, and technical staff. Training topics include: • telehealth systems • EHR workflow optimization • healthcare data reporting and analytics • cybersecurity awareness • digital care coordination tools Role-based learning modules will ensure that physicians, nurses, care coordinators, administrative staff, and IT support personnel receive training aligned with their day-to-day responsibilities and workflows. These trainings help providers use digital systems more efficiently, strengthen team-based care, and expand technology-enabled healthcare delivery across rural and frontier communities.	\$1M-\$5M	Statewide	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Kodiak Island Borough; Nome Census Area; Sitka (City and Borough)	Deferred or Not Advanced

Odyssey Family Practice	Odyssey Family Practice Facility Acquisition and Rural Access Expansion	AK	Odyssey Family Practice serves a federally designated Health Professional Shortage Area, where rural residents face geographic isolation, limited healthcare alternatives, and increasing demand for services. In recent years, the region has experienced significant provider turnover, creating instability and placing additional strain on the remaining practices. Existing facility space at Odyssey is fully utilized, limiting the clinic's ability to recruit additional providers, expand occupational health services, or integrate physical therapy, wound care, and additional diagnostic capacity. Simultaneously, regional workforce growth, including the anticipated LNG pipeline development, is increasing demand for comprehensive OccHealth services. Odyssey is the only full-service OccHealth provider on the Kenai Peninsula, but current space constraints restrict our ability to scale in response to employer and worker needs. The community's aging population further increases demand for chronic disease management, wound care, mobile health services, and accessible rehabilitation. Continued operation in a leased facility with high annual lease costs and multiple prior sale considerations limits long-term capital planning and diverts substantial operational resources away from reinvestment in patient-facing infrastructure and service expansion. This project addresses infrastructure instability and growing demand, supporting both population health and workforce resilience.	Odyssey Family Practice will implement a two-phase strategy to stabilize existing infrastructure and expand clinical capacity to meet rural and workforce demands. Phase 1: Secure and Upgrade Existing Facility Odyssey will acquire its current facility to eliminate infrastructure uncertainty and complete prioritized capital improvements necessary for safe clinical care, including roof replacement to address active water intrusion that has required temporary room closures and interrupted patient flow. Ownership ensures uninterrupted access to care while providing the structural control needed to complete critical repairs and support planned service expansion. Phase 2: Expand Capacity Through Construction of a Second Clinical Building A new 7000-square-foot facility will increase exam space, provider capacity, and dedicated occupational health space. Expanded space will allow the recruitment of another full-time provider, and will help redistribute patient load to reduce wait times and improve access. Dedicated occupational health suites will increase capacity for regulatory physicals, injury evaluation and recover, and employer-based medical services, strengthening support for regional employers and working families. Integration of on-site physical therapy will create a full recovery pathway for injured workers, improving return to work timelines and reducing external referrals. The expanded campus will also include the addition of diagnostic ultrasound and enhanced wound care services, localizing commonly referred services and reducing travel burden. Mobile health services will extend care delivery to homebound and assisted living residents, increase reach into areas of the community that struggle to access care. This phased approach creates an integrated rural healthcare campus capable of sustaining workforce growth, supporting an aging population, and strengthening long-term healthcare access in the region. Upon award, Odyssey is prepared to immediately initiate acquisition, with construction planning and contractor engagement to follow within the first six months. Recruitment of an additional provider will occur concurrently to ensure the expanded capacity is operational upon completion. This sequenced implementation ensures minimal disruption to existing services while accelerating increased access for rural residents and the regional workforce.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Old Harbor Alliance	Sitkalidak Healthy Harvest: Youth Learning Hub	AK	Youth in rural Alaska communities face high barriers to building healthy eating habits: limited access to affordable nutritious foods, high costs and inconsistent availability of fresh groceries, and few dedicated spaces for hands-on nutrition education and positive after-school/seasonal programming. In Old Harbor, these barriers are compounded by geographic isolation and the high cost of transporting food. At the same time, Old Harbor has a powerful opportunity: community-driven local food systems and cultural knowledge that can strengthen prevention and wellness when paired with the right facilities. The Sitkalidak Processing Plant and Sitkalidak Sunrise Farm supports local harvesting and food distribution efforts, but it is not yet optimized as an educational space where youth and families can safely learn cooking, preservation, and nutrition skills. This project addresses the opportunity to convert an existing local food system asset into a year-round youth and family learning hub—strengthening food sovereignty, preventing diet-related chronic disease over time, and reinforcing protective cultural connections through education and intergenerational activities that promote health and wellness.	Old Harbor Alliance will implement a combined capital + programming approach: 1) Processing plant improvements (capital/infrastructure): RHTP funds will support facility and equipment upgrades that enable safe youth and family instruction and expand preservation capacity. Improvements will include reconfigured food prep areas, improved insulation and interior walls, paint concrete floors, additional stainless work surfaces, improved refrigeration/freezer capacity, and preservation tools such as vacuum sealing, dehydration, smoking, and canning support equipment, along with safety, sanitation, and storage enhancements. These upgrades will allow the plant to function as both a processing facility and an educational site. 2) Installation of large-insulated yurts (capital/infrastructure): Large yurts with wood stoves will be installed as flexible classroom space for year-round educational and cultural activities tied to healthy habits. Yurts will host cooking demonstrations, nutrition education, cultural teaching sessions, agriculture camp and youth workshops that require warm, dry gathering space not available in many rural settings. 3) Youth and family programming (training/technical assistance + prevention): Programming will focus on youth ages approximately 5–18, with family participation encouraged. Core activities include: Youth-friendly cooking classes using local foods (bison, seafood, berries, local greens, garden produce and fruit) Food preservation training (freezing, drying, smoking, canning, safe packaging) Food safety and hygiene instruction; optional teen certification pathways where feasible Cultural education linked to traditional foods and intergenerational knowledge sharing Youth leadership opportunities (teen assistants, peer mentors, youth “cook teams”) 4) Partnerships and coordination: The Alliance will coordinate with the Alutiiq Tribe of Old Harbor, Old Harbor Native Corporation, and other local stakeholders (school, clinic/health partners as applicable) to align schedules, recruit participants, and connect programming to broader community wellness efforts.	\$50,000-\$250,000	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Older Persons Action Group, Inc.	2026 Older Persons Action Group Directory for Older Alaskans	AK	Since 1982, the Older Persons Action Group, Inc. (OPAG) has compiled and published the “Directory for Older Alaskans”. Editions are updated every 3 to 5 years with the 2023 edition being the last edition and the next (2026) edition is in the build stage. Budget records for the 2023 edition indicate that \$68,340 was spent to deliver 8,000 copies of the 160-page directory on 80# stock with a spiral binding. AARP contributed \$5,000; ARPA contributed \$45,580; the State of Alaska (SOA) contributed \$15,000; and the Senior Voice sold \$2,760 of advertising. ARPA funds were associated with COVID relief programs, and the historical documentation does not identify what program from the SOA contributed to the print run. The cost-of-goods to publish the 2023 edition was \$8.54/copy before distribution. Customers were only charged for shipping & handling. OPAG is seeking financial assistance to replace the ARPA funds and the State of Alaska funding that are no longer available through the same channels that were available in 2022.	The obvious question that many consumers have asked, is why bother with a printed directory when on-line directories are available. There are several answers. First, I continue to receive requests for printed copies. Second, many parts of Alaska do not have reliable internet service. And third, the on-line directories focus on the resources in a specific geographical area rather than providing statewide suggestions on services. One objective for the 2026 Directory for Older Alaskans is to develop bridging between the print and on-line mediums. OPAG is actively developing a collaborabitive with United Way Alaska 211, Connect Matanuska, LINKS, UAA, ARA, and AARP for developing the bridging. However, OPAG has the expertise to develop the printed version, and our focus is on the resources needed to deliver a quality product to the consumer.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Omada	Alaska Rural Health: Omada Virtual Chronic Disease Prevention & Management	TX	Rural and remote Alaskan communities face serious barriers to getting quality care for chronic conditions, even as these issues become more common across the state. In Alaska, 33% of adults report high blood pressure, 30% high cholesterol, 27% arthritis, 17% asthma, 10% cancer, 9% diabetes, and 6% heart disease, and cancer and heart disease together account for more than a third of all deaths. Many residents also face risk factors that raise their chances of developing chronic disease over time—for example, 82% of Alaska adults are overweight or obese, 33% of high school students are overweight or obese, and 18% of adults report no physical activity. Without intervention, one in three people will develop diabetes, 14% will develop congestive heart failure, and 11% will experience heart disease within 10 years. Omada’s evidence based virtual care model is well suited to once again break down geographic barriers and bring chronic disease prevention and management support directly to Alaska, no matter where a member lives. Although Omada’s involvement with the Fresh Start program has temporarily lapsed due to funding constraints, we’re committed to renewing this work and getting back to supporting Alaskans across the state—from larger communities to remote and off road villages.	Project Concept Approach Omada Health proposes to address Alaska's chronic disease crisis through our proven virtual-first care model, eliminating geographic barriers and delivering evidence-based prevention and management programs statewide—from Anchorage to the most remote villages. Core Programs Cardiometabolic Care: CDC-recognized Diabetes Prevention Program targeting the 82% of Alaskans who are overweight or obese, Diabetes Self-Management (DSMES) for the 9% with diabetes, and Self-Monitoring Blood Pressure (SMBP) program for the 33% with hypertension. All programs follow gold-standard clinical guidelines and are supported by 29+ peer-reviewed publications. Musculoskeletal Care: URAC-accredited virtual physical therapy addressing the 27% of Alaskans with arthritis and other MSK conditions, eliminating need for costly travel to access PT services. Alaska-Specific Solutions 100% Virtual Delivery: All services delivered via smartphone, tablet, or computer—no travel required regardless of weather, distance, or road access. Members engage on their own schedule, accommodating subsistence activities and unpredictable conditions. Connected Devices: Cellular-enabled smart scales, blood pressure monitors, and glucose meters shipped directly to members at no cost. Devices work without Wi-Fi, critical for areas with limited internet connectivity. 1:1 Human Care Teams: Each member receives a dedicated health coach (cardiometabolic) or licensed Physical Therapist (MSK) who understands Alaska's unique challenges. Care teams provide personalized support through in-app messaging and video visits. Health Equity Focus: Program designed for populations facing greatest barriers, including those with lower digital literacy, Medicare/Medicaid beneficiaries, and remote communities. WCAG 2.1 AA accessible with 8th-grade level curriculum. Expected Impact Improved health measures (blood sugar, blood pressure, weight), reduced healthcare utilization, and lower long-term costs. Our activity-based billing ensures Alaska only pays for engaged members, maximizing value. By resuming our proven partnership, we'll once again bring specialized chronic disease care to every Alaskan, regardless of location.	\$250K-\$1M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

On Demand Pharmaceuti cals Inc	Securing Alaska's Access to Essential Medications to Improve Rural Health Outcomes	MD	Alaska’s rural, remote, and frontier communities face persistent vulnerability to medication shortages that undermine efforts to deliver care as close to home as possible. More than 80% of communities are off the road system and rely on air, barge, or seasonal transport for essential medical supplies. Weather delays, low patient volumes, high operating costs, and workforce shortages amplify the impact of national drug shortages on critical access hospitals, Tribal health facilities, and small community clinics. When medications are unavailable, providers must delay care, substitute therapies, or transfer patients hundreds of miles, increasing cost, risk, and strain on already fragile rural systems. We are proposing an opportunity to partner with Alaska’s Tribal health organizations, rural hospitals, and state leaders to strengthen local medication resilience in a way that complements existing procurement and supports community-led regional planning. By establishing reliable in-state capacity to supply priority, shortage-prone medicines through a 503B sterile compounding production model designed to serve rural spokes from a central hub, this project seeks to reduce disruption, improve preparedness, and enhance the sustainability of rural health providers across Alaska.	ODP proposes establishing and operating a Shortage Response Pharmacy on Demand (SR-PoD), a 503B outsourcing facility in a major Alaska population center designed to serve rural, remote, and frontier communities through a hub-and-spoke model. The hub would supply a defined set of high-priority, shortage-prone medications to participating rural hospitals, Tribal health facilities, and community clinics based on locally determined needs and service agreements. The intent is not to replace existing procurement systems, but to add reliable in-state capacity that strengthens medication access when commercial supply chains are delayed, disrupted, or financially unsustainable. The SR-PoD uses a technology-enabled platform supporting safe, small-batch sterile medication preparation with integrated electronic quality oversight. Central to the long-term approach are Pre-Assembled Raw Materials Sequenced Packages (PARS-Paks), shelf-stable, pre-measured inputs that simplify production and support agile responses to shortages. Initial operations will establish sterile compounding capacity, with PARS-Pak-enabled agile production introduced in later phases. This SR-PoD model builds on a 2024 proof-of-concept pilot in rural Mississippi, where nearly 12,000 doses of sterile injectable medications were produced and delivered under a 503A compounding framework, demonstrating operational feasibility and informing the transition to a scalable 503B model. The SR-PoD hub would serve as a coordinated supply partner for rural providers, delivering priority medications through planned distribution without requiring each site to maintain costly infrastructure. This model supports RHTP objectives by: - Expanding access to essential medications closer to home and reducing avoidable transfers and care delays. - Strengthening rural provider sustainability by stabilizing access to frequently scarce or high-cost drugs. - Leveraging technology and shared data systems to promote quality, transparency, and accountability. - Creating a scalable platform that can expand formulary scope and spoke participation based on regional priorities. This project will follow a phased implementation approach. Early efforts will focus on partnership engagement, site selection, regulatory alignment, and establishment of the 503B facility. Later phases will operationalize services for rural partners, expand the formulary, and introduce agile production capabilities with ongoing stakeholder guidance. Onmed LLC	Connected Care	NY	Many communities across Alaska face persistent barriers to timely healthcare due to geographic isolation, provider shortages, transportation challenges, and limited local service capacity. In many rural and frontier areas, residents must travel long distances, often by air or seasonal routes, to access basic primary or urgent care. These barriers contribute to delayed treatment, avoidable emergency department use for non-emergent conditions, and poorer outcomes for people with chronic diseases. These challenges are reflected in high HPSA scores, low IMU values, broadband limitations, and elevated chronic disease burden across much of the state, all of which widen gaps in timely, lower-acuity care and strain hospitals, clinics, and a limited healthcare workforce. This project addresses that need by establishing a statewide network of telehealth-enabled CareStations in trusted community settings across Alaska. The model is designed to extend existing provider networks, improve access to primary and preventive care, support chronic disease management, and reduce avoidable emergency department use. Because CareStations are deployable, technology-enabled access points that do not require new construction or on-site clinician staffing, the network can be activated quickly, with deployment possible within 45 days.	The proposed project will deploy a statewide network of telehealth-enabled CareStations to expand access to timely primary and urgent care across Alaska’s rural, frontier, and underserved communities. CareStations are private, ADA-compliant, clinic-grade access points that connect patients in real time with licensed clinicians through secure telehealth technology. Each CareStation includes integrated diagnostic peripherals to capture vital signs, temperature, blood pressure, pulse oximetry, heart and lung sounds, and high-resolution exam imagery, enabling more comprehensive clinical evaluations. These capabilities support common acute care, preventive care, chronic disease management, and follow-up coordination with local and regional providers. The deployment concept is based on a data-driven assessment of Alaska’s healthcare access landscape, including provider shortages, medical underservice, broadband constraints, and chronic disease burden. That analysis supports a statewide network of approximately 38 CareStations across high-need communities and regional hubs. This model is designed for rapid implementation. CareStations can be deployed and operational in 45 days or less, allowing communities to respond quickly to documented care gaps, especially where residents face long travel times, limited provider availability, and delayed access to non-emergent care. CareStations will be placed in trusted community settings such as tribal health facilities, community health centers, hospitals, public health sites, workforce hubs, housing organizations, libraries, and other community-serving locations. The model is intended to strengthen existing provider networks by creating additional access points that support referrals, continuity of care, and more efficient use of healthcare workforce resources. Onward and Upward Inc	One Health Sciences Transformative Curriculum: An Evaluation, Innovation, and Expansion Project	AK	Rural Alaska needs more than downstream crisis response; it needs an upstream system that helps young people build lifelong health before problems escalate. Alaska’s RHTP identifies major needs among children and youth: 28% of Alaska children live below the federal poverty level, 13% are uninsured or underinsured, less than half of youth ages 12–17 receive needed substance use treatment, and 23% of Alaska youth have seriously considered suicide while 19% have attempted it. In the Mat-Su, the Community Health Needs Assessment highlights youth mental health and substance use as recurring and escalating concerns, with youth suicide consideration at 23.8% in traditional high schools and 41.3% in alternative high schools. There is a clear opportunity to deliver prevention-focused, school- and community-based health education that strengthens resilience, belonging, physical activity, nutrition, and family and community connection – meeting them right where they are. Founded in 2007 by social psychologist Dr. Randall Dowd, whose own childhood adversity informed a lifelong commitment to helping vulnerable youth access the protective factors he once lacked, Onward & Upward addresses a critical gap: rigorous, evidence-based health education that treats health as a science and connects mental, physical, social, cultural, and environmental wellbeing. This project will move youth health from fragmented, reactive services toward sustained prevention and lifelong healthy habits.	Onward & Upward proposes an innovative ready-to-launch, four-part Rural Health Transformation project centered on One Health Sciences education. First, we will engage the UAA Institute for Circumpolar Health Studies to conduct an external evaluation using an existing study design, generating credible evidence on implementation, outcomes, impacts, and scalability. Second, with the UAF Center for One Health Research, we will refine the curriculum into a more organized, evidence-informed, scalable model for broader Mat-Su and eventual statewide adoption. Third, we will expand delivery across committed school, Tribal, health, and community partners, including Mat-Su Borough School District sites and rural/remote partners, so more youth (especially those facing higher risk and fewer protective supports) can access prevention-focused programming. Fourth, we will integrate iPad Mini technology for the implementation of Photovoice, qualitative data collection, student reflection, and community dissemination; thereby strengthening both evaluation and technology-enabled engagement. The program is innovative, evidence-based, and student-centered. It combines health literacy, physical activity, nutrition education, mental health resilience, belonging, connection to place, and family engagement through experiential learning in Alaska’s natural and community classrooms. It directly advances Healthy Beginnings by building healthy habits for youth; Healthy Communities by expanding prevention-focused wellness and health education; Strengthens Workforce by creating health science and career exposure while training staff and partners; and Spark Technology Innovation through digital data collection, student voice, and community dissemination. It also reflects the Alaska Youth Behavioral Health Roadmap priorities: expand access, build collaboration among schools and community partners, emphasize prevention and early intervention, reduce stigma, and create healthy youth spaces and positive connections. This is not a short-term enrichment add-on. It is a transformative, sustainable program model that braids evidence-based curriculum, school partnerships, Tribal collaboration, program evaluation, and technology to build healthy habits for youth while expanding local capacity to support them. Because most partner sites are already piloted and/or committed, RHTP support would accelerate implementation immediately and position the model for broader regional and statewide expansion.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough; Nome Census Area; Petersburg Borough	Advance to Implementation Application

Ophthalmic Associates	Teleophthalmology AI supported Hub and Spoke model for Rural Alaska	AK	Rural Alaskans experience delayed diagnosis and treatment of eye disease due to limited local ophthalmology capacity and travel barriers. These delays can lead to preventable vision loss, higher downstream costs, and increased burden on families and the health system. The opportunity is to use a scalable, technology-enabled hub-and-spoke approach that equips frontline clinicians (PCPs, PAs/NPs, MAs/RNs, and optometrists) with an AI-assisted workflow to identify urgent eye conditions earlier, route referrals appropriately, and coordinate specialty care efficiently. This aligns with Alaska’s rural health transformation priorities to expand access through telehealth and digital tools and to strengthen coordination and sustainability of care delivery.	We will implement MyEyesAI as a teleophthalmology AI assistant integrated into a standardized “spoke-to-hub” workflow. Phase 1 focuses on onboarding initial spoke sites (pilot communities/clinics), defining clinical protocols, and training staff on image capture (when available), structured intake, red-flag identification, and referral packaging. MyEyesAI will guide frontline staff through consistent data collection and produce structured summaries and triage recommendations for ophthalmologist review at OA. OA ophthalmologists will provide asynchronous review (and synchronous teleconsult when needed) to: (1) advise local management when safe, (2) prioritize urgent transfers/referrals, (3) schedule appropriate in-person visits, and (4) route subspecialty needs to identified partners (pediatric ophthalmology: Bob Arnold, MD; Robin Grendahl, MD; retina: Chad Bouchard, DO; Matt Guess, MD; Scott Limstrom, MD) when indicated. Phase 2 expands to additional spokes, improves turnaround times, and adds quality metrics (e.g., time-to-triage decision, referral completeness, reduction in avoidable travel, adherence to follow-up). Phase 3 focuses on sustainability: payer alignment, workflow optimization, and regional scaling through a repeatable onboarding and training package. This approach directly supports the RHTP emphasis on technology and innovation, remote coordination, workforce enablement, and sustainable care models.	\$1M-\$5M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Optical Aleutians	construction of new exam room	AK	Optical Aleutians relocated in July 2025 to a high-visibility, lower-level facility to better serve the Unalaska community. While this new location provides the necessary square footage for expansion, it currently lacks the specialized infrastructure required to operate a full-service optometry clinic. Specifically, the space lacks a dedicated exam room, integrated plumbing for sanitation, and safe, finished flooring. Currently, eye exams must be conducted in a borrowed upstairs dental office. This creates significant barriers: it limits our scheduling based on third-party availability and creates a major accessibility hurdle for elders and handicapped patients who cannot navigate the stairs. Furthermore, the absence of running water in the suite prevents us from meeting modern clinical hygiene and infection control standards. There is a critical opportunity to transform this "raw" space into a professional, healthcare-compliant exam lane. By installing medical-grade flooring to remediate trip hazards, extending plumbing for sanitation, and constructing a sound-dampened exam room, we can provide a permanent, barrier-free health asset for the residents of Unalaska, Nikolski, and Akutan.	Our approach establishes a permanent, clinical-grade eye care center through a three-phase facility transformation: 1. Safety and Accessibility Remediation: We will repair the existing raw cement floor, which contains pits and uneven spots that present significant trip hazards for elderly and mobility-impaired patients. We will install medical-grade, slip-resistant flooring to create a level, safe, and sterile environment that meets clinical hygiene standards. 2. Sanitation and Infrastructure Integration: The space currently lacks running water, a barrier to standard infection control protocols. We have coordinated with the building owners to extend plumbing from a neighboring suite. This will allow for essential hand-washing stations and sterilization areas within the exam room, bringing the facility into compliance with healthcare regulations. 3. Construction of a Dedicated Lower-Level Exam Room: We will construct a 12x10 sound-dampened exam room on the lower level. Currently, patients must be escorted to an upstairs dental office, which is a major barrier for elders and handicapped patients due to the lack of an elevator. Moving the exam lane to the lower level provides barrier-free access, ensures patient privacy (HIPAA compliance), and grants the scheduling autonomy needed to increase the frequency of our exam runs to meet community demand. This project transforms a temporary, shared-space model into a dedicated clinical environment to provide consistent, professional care to the residents of Unalaska, Nikolski, and Akutan. Opus Behavioral Health, Inc.	Mat-Su Valley Intelligence Dashboard - Planning & Design	CO	Mat-Su providers identified real-time bed availability as their most urgent need—hours wasted daily calling while patients wait in EDs. Simultaneously, Alaska's shift toward CCBHCs and value-based care (planning grant December 2024) requires tracking 17 federally-mandated quality measures and provider benchmarking—infrastructure that doesn't exist. Conversations with Dr. Victoria Kildall (ABHA CEO), John Solomon (former ABHA CEO), Karl Soderstrom (True North CEO), and Mat-Su providers revealed these needs. While ABHA may submit their own LOI, we propose an integrated solution: Mat-Su bed registry + statewide CCBHC infrastructure. Planning designs four capabilities validated by other states: - Real-Time Bed Registry (Mat-Su urgent need): Eliminates calling (Georgia GCAL: 2 min → 7 sec) - CCBHC Quality Dashboard (State need): Tracks 17 measures for value-based care, certification (Missouri/Oklahoma) - Provider Benchmarking (State need): Confidential peer comparison (Virginia CSB, NC Child BH) - State Capacity Planning (DOH need): System visibility, resource allocation - Mat-Su pilot (True North, Day Break, Set Free, Nugen's Ranch) solves bed crisis while validating CCBHC infrastructure for Fairbanks, Juneau, Southeast expansion. Opus brings Alaska foundation: True North/Wil-a-Mootk with AKAIMS, HIE, and bedboard integrations. 3-month planning designs pilot, governance, expansion roadmap. Dashboard: https://opus-rhttp.lovable.app	This 3-month planning addresses (1) Mat-Su bed availability crisis (urgent local need) and (2) Alaska CCBHC/value-based care infrastructure (statewide strategic need), leveraging proven frameworks from Georgia, Virginia, North Carolina, Missouri, Oklahoma: Month 1: Stakeholder Engagement & Requirements Working with DOH, ABHA (Dr. Kildall), John Solomon, Mat-Su providers (True North, Day Break, Set Free, Nugen's Ranch): - Mat-Su bed registry requirements: document calling workflows, quantify time waste - Statewide CCBHC requirements: map 17 quality measures to data collection needs - Provider benchmarking framework: define confidential peer comparison methodology - Expansion planning: sessions with Fairbanks, Juneau, Southeast ensuring statewide scalability - EHR-agnostic middleware: integration specs for Qualifacts, Netsmart, Epic, Cerner Month 2: Architecture & Governance - Mat-Su bed registry architecture (Georgia GCAL model: 2 min → 7 sec) - CCBHC quality dashboard design (Missouri/Oklahoma frameworks, 17 measures) - Provider benchmarking methodology (Virginia CSB/NC Child BH models, anonymized percentiles) - State capacity planning dashboard (DOH resource allocation) - Data governance framework (access controls, privacy, HIPAA, competitive safeguards) - Expansion architecture (regional replication blueprints) - Sustainability modeling (pilot costs to statewide scaling) Month 3: Implementation Roadmap - Mat-Su pilot plan: bed registry + CCBHC tracking - Statewide expansion: Fairbanks/Juneau (Year 2-3), Southeast/rural (Year 3-4) - Partner roles, change management, performance metrics Dashboard: https://opus-rhttp.lovable.app/	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Orca Labs, LLC	Keeping Alaska Elders Home Through Coordinated Family-and-Provider Care Teams	AK	Alaska has approximately 107,000 residents 65 or older — growing over 3% annually while the working-age population declines. The 85+ cohort is projected to increase 500% by 2050. Alaska has the smallest senior population of any state, meaning care infrastructure was never built to scale. The gap is sharpest in rural communities. 82% of Alaska's communities lack road access. Specialists are hundreds of miles away. Seniors are disproportionately Alaska Native — with higher chronic disease rates and fewer professional resources. The Alzheimer's Association reports 8,400 Alaskans with Alzheimer's alone; total dementia cases reach an estimated 11,000. The impact radiates outward. More than 25,000 Alaskans provide unpaid dementia care — \$887 million in uncompensated labor annually. These caregivers are themselves at elevated risk for depression, chronic illness, and financial hardship. When they burn out, elders end up in emergency departments for preventable crises — each visit costing \$25,000–\$50,000+ when rural medevac is involved. The core problem is not willingness — it is the absence of coordination infrastructure. Family caregivers are dispersed with no shared system. Community health aides arrive without access to care plans or medication records. The person closest to the elder becomes the default coordinator regardless of capacity. The result: preventable hospitalizations, caregiver collapse, and premature institutionalization.	Orca Labs (Anchorage, AK) serves as fiscal agent, project manager, and outcomes evaluator. Alula (Vestality LLC, Virginia — veteran-owned, service-disabled veteran majority ownership) is the technology partner. Together, they will deploy a 12-month pilot serving 50–75 rural and frontier Alaska families caring for elders with dementia, Parkinson's, or other complex care needs. Orca Labs leads: partnership development with Tribal Health Organizations and Alzheimer's Resource of Alaska; family recruitment; fiscal management and RHTP compliance; outcomes measurement; and statewide expansion planning. Founder Christine Shulman brings proven Alaska transformation experience, including relocating the Tanaina Child Development Center program to Alaska Regional Hospital and securing a \$1.2M financing arrangement through Rasmuson Foundation. Alula is a live caregiving coordination platform — in production today — that solves a problem every caregiving family faces: the person who happens to live closest to mom or dad becomes the de facto care coordinator, regardless of whether they have the skills, time, or information to manage what is effectively a complex team operation. Alula replaces that accidental structure with a digital chief of staff — one that knows the players, their strengths, has the data needed to make decisions, and guides each person to do their best work. The result is that dispersed, overwhelmed family members and rotating professional caregivers function like a coordinated team instead of isolated individuals guessing at what to do next. Alula's founding team brings both the technical capability and lived experience to build this. Founder Jason Eversole previously built large-scale real-time visibility networks across fragmented supply chains at FourKites — and saw the same coordination problem in his own family's caregiving. His cofounders include a Rhodes Scholar geriatrician with expertise in dementia, an emergency medicine physician and educator, and a near-decade caregiver to parents with both Parkinson's and dementia. What this pilot funds is deploying and validating the platform in Alaska's unique environment — working with THOs, community health aides, and families to identify what adaptations are needed and implement them during the pilot period.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Orca Labs, LLC	Built to Last: Technology Deployment and Impact Measurement for RHTP Grantees	AK	Alaska's Rural Health Transformation Program represents a generational investment in the state's health infrastructure. Yet the evidence is sobering: only 13% of major government IT projects succeed as planned, more than 80% run over budget or behind schedule, and 84% experience serious implementation problems. The technology funded by RHTP is only as valuable as the organizations deploying it and rural Alaska's health organizations are among the least resourced to absorb complex technology without dedicated support. The opportunity Orca Labs addresses is not a gap in technology it is a gap in execution. Telehealth platforms, remote monitoring tools, EHR integrations, and digital care coordination systems are only transformative when they are embedded into daily workflows, adopted by frontline staff, and measured against outcomes that matter. Without that layer of support, even well-funded technology quietly fails: unused licenses, workarounds, and tools that never outlast the grant that paid for them. Orca Labs partners with RHTP-funded projects to close this gap providing the technology deployment expertise, measurement infrastructure, and sustainability planning that rural health organizations need but cannot afford to hire full-time. The result is technology that actually reaches rural Alaskans, outcomes that can be demonstrated to CMS, and local capacity that endures long after the award period ends.	Orca Labs will serve as an embedded technology deployment and measurement partner for a cohort of RHTP-funded projects — working inside grantee organizations rather than advising from a distance. The approach is built around three integrated services, each targeting a documented root cause of government technology failure. First, Technology Deployment Support. Most rural health technology fails not because the tool is wrong, but because it gets layered on top of existing workflows instead of integrated into them. Orca Labs works alongside grantee teams to map how care actually flows, then designs deployment around those realities — co-developing workflow integrations, building staff training tailored to rural settings, and staying engaged through go-live to catch friction before it becomes failure. The goal is not a successful launch. It is sustained, confident daily use. Second, Impact Measurement Infrastructure. Without a measurement system, no one knows whether the technology is working until it is too late to fix it. Orca Labs builds simple, actionable scorecards and reporting tools using systems organizations already have — no new platforms required. We establish baselines at launch, translate RHTP metrics into weekly management rhythms, and produce quarterly reports that give grantees and funders clear, credible evidence of impact. Third, Sustainability and Local Ownership. Every engagement is designed around one question from day one: when Orca Labs support ends, can this community sustain what we built together? All workflows, tools, and measurement systems are documented in plain language and owned by local staff. We train internal champions, not just end users. The cumulative output — a statewide RHTP Technology and Measurement Toolkit — will be made freely available to the Alaska Community Foundation and Department of Health for use with future grantee cohorts. This is not a new technology. It is the operational and measurement layer that makes every other RHTP technology investment more likely to succeed.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Orca Labs, LLC	Decode Alaska: Little Readers, Big Futures	AK	Eight in ten Alaska 3rd graders cannot read proficiently. Alaska ranks 49th in 4th-grade reading nationally. Alaska Native high school youth report an average GPA of 1.7 — not because they lack ambition, but because the system has lacked the tools to reach them where they are. These numbers represent children remote villages, in communities without broadband, in classrooms where a single teacher serves multiple grades and has little access to specialized literacy support. The opportunity is this: proven, self-directed reading technology now exists that requires no internet connection, no specialist, and no classroom infrastructure. Curious Learning's evidence-based apps have reached children in some of the world's most remote and under-resourced communities — and they work. At the same time, Mindplay Academy offers accessible, online professional development that can equip Alaska educators with structured literacy and dyslexia tools regardless of where they teach. What has been missing is someone to connect these solutions to Alaska's youngest rural learners at scale — with the project management rigor, community coordination, and measurement infrastructure to make it stick. That is what Decode Alaska: Little Readers, Big Futures does. This is not a pilot built in Anchorage and handed to rural communities. It is designed from the ground up for children where they are today — it starts now, with tools that are ready and a project team ready to implement.	Decode Alaska: Little Readers, Big Futures operates on two coordinated tracks, designed to reach children where they are and equip the adults around them to help. Priority 1 — Curious Learning: Devices and Apps for Rural Communities The first and highest-priority track deploys Curious Learning's evidence-based, self-directed reading apps and preloaded Android devices to children ages 4–8 in rural Alaska communities outside Anchorage, Fairbanks, and Juneau. Curious Learning's apps require no internet connection — a non-negotiable requirement for frontier Alaska — and are designed for independent, self-paced use by young children. Devices will be distributed through schools, tribal organizations, and community contacts, with lightweight onboarding for families. The intent is simple: put a working, durable literacy tool into a child's hands and let it travel — to younger siblings, to cousins, to the next family who needs it. Children in cities will have access to the free reading app as long as they have an Android device. Priority 2 — Mindplay Academy: Educator Training Statewide The second track gives Alaska teachers statewide access to Mindplay Academy's research-based professional development courses — Comprehensive Reading for Educators, Teacher Companion, and Understanding Dyslexia — delivered entirely online so geography is no barrier. This is a self guided training. CTW Reads will provide implementation coaching to help educators translate course learning into daily classroom practice, with targeted support for students with dyslexia and dyscalculia. Orca Labs leads both tracks as fiscal agent and project manager, coordinating partners, tracking KPIs, and ensuring the model is documented for statewide scale.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Organized Village of Kake	Cultural Healing House	AK	Substance use disorders continue to affect Alaska Native communities in Southeast Alaska at disproportionately high rates, yet culturally grounded treatment options remain extremely limited. Existing behavioral health services are concentrated in regional hubs such as Juneau, Sitka, and Ketchikan, requiring many rural residents to leave their families, employment, and cultural environments to receive care. For Alaska Native communities, healing has historically been rooted in relationships with family, community, land, language, and cultural responsibility. When individuals must leave these foundations in order to seek treatment, recovery efforts can be disrupted and difficult to sustain. Community leaders in Kake, working through the Organized Village of Kake and its Cultural Advisory Council, have identified the need for a recovery model grounded in Indigenous lifeways and community connection. Through community meetings, cultural consultation with Elders, and local planning efforts, a clear vision emerged. The region needs a recovery program that fosters healing through reconnection to culture, land, and a sense of belonging to community. The Cultural Healing House responds to this vision by creating the first culturally centered residential addiction recovery program in rural Southeast Alaska.	RHTP funding will support the startup, planning, licensing, and capacity-building work required to launch the Cultural Healing House, a culturally grounded residential recovery program serving rural Southeast Alaska. Once operational, ongoing services will be sustained through Medicaid billing under Alaska's 1115 Behavioral Health Waiver. The Cultural Healing House is grounded in an Indigenous understanding that healing occurs through restored relationships to family, community, land, language, and cultural responsibility. Substance use disorder in many Alaska Native communities is closely connected to colonization and cultural displacement. Recovery is therefore approached as a process of restoring the cultural and relational foundations that support wellness, rather than merely as treatment for individuals. Cultural guidance will be provided by Elders, knowledge holders, and community leaders connected to the Organized Village of Kake, who are compensated and whose participation is structured to respect their well-being. Day-to-day facilitation will be carried by trained Peer Facilitators from the community. Startup activities include establishing the 501(c)(3) under OVK governance, obtaining behavioral health licensure and Medicaid enrollment, renovating the Portage Bay facility, conducting community engagement across Southeast Alaska, developing cultural curriculum with Elders, and launching the first residential cohort. The program model draws on the teaching of S'áxt' (Devil's Club), a respected Tlingit medicine plant known for its protective and restorative qualities. Healing unfolds in three phases: Phase I — Recovery Begins: Participants complete a 90-day residential program integrating trauma-informed behavioral health support with traditional practices — harvesting Alaska Native foods, language learning, Native arts mentorship, and land-based activities. Licensed clinicians provide oversight alongside Peer Facilitators. Phase II — Adding to the Medicine: Participants transition to partner transitional housing and vocational programs, building employment-readiness while remaining connected to cultural supports. Phase III — Sharing the Medicine: Graduates return to community life with continued support and opportunities for service, many becoming Peer Facilitators who strengthen the recovery network. Governance will begin under a 501(c)(3) affiliated with the Organized Village of Kake, long-term goal TBD. -	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

Organized Village of Kake	Aging in Place – Embracing our Elders with Culture and Community	AK	Development of the Feasibility Study was closely linked to the community, starting with local interviews by Gail Cheney with Collective Change, who provided the consultant team her living ties to the community. Interviews were followed by a community open house hosted by OVK and MRV to provide a listening session to better understand the reality of the concerns facing aging seniors in Kake. Based on meetings and interviews, a summary understanding of Kake goals and aspirations was developed. Not surprisingly, the number one issue raised by residents was the critical need to find a way for aging seniors to remain in Kake and not spend the last few weeks or months of their lives in a remote institutional or hospital setting, separated from family and community. The problem to be addressed by this ACF funding is to further develop the hybrid housing model which has been proposed for Kake, refining the physical, cultural, emotional and social needs of Elders, while adding rigorous analysis of operating models, staffing, and potential operational partners. It is critical that the model proposed function well for seniors, be correctly sized, and be financially sustainable through local and partner support. At a broader level, the urgency in Kake to accommodate their elders and allow aging in place is a critical concern across many Native village settings in Alaska. We believe that the model we are developing will have applicability across the State in other remote settings.	Over the past 3 years, OVK has been working to exploring a culturally-based care model for local Elders that emphasizes local housing, holistic health approaches, traditional healing, and intergenerational support. As noted above, a range of alternatives were studied through the now completed Conceptual Design phase. The preferred hybrid model includes many of the benefits of full assisted living by providing 24-hour care, coupled with improved accessibility, support services, and socialization opportunities. The Conceptual design completed by MRV proposes either renovation of an existing building or constructing a building which incorporates both a resident wing and management living space. The design includes 4 resident bedrooms with a private bath, accommodation for a live-in manager(s), and shared dining/living/kitchen space. One of the senior bedrooms is larger, allowing the potential to function as a hospice room or respite care room on a short-term basis. As was noted above, incorporating traditional healing practices will be an essential component of day-to-day programming. Providing culturally appropriate care is not just about medical treatment but about recognizing the home and community environments as integral to well-being. Once a funding announcement is received, OVK would move forward with establishing contracts with MRV Architects and the Juneau Economic Development Council (JEDC). MRV’s role in this project will include developing the next level of design will add existing building survey for potential renovation, site analysis, site selection, plan refinement, and further building design through a Schematic 50% design level. And obtaining construction cost estimates. JEDC will then develop an improved operations and business model, based on JEDC’s understanding of reimbursement programs and regulatory requirements, as well as feedback from the OVK Council on the appropriate level of care services. Community workforce development will be a necessary and related project development step, helping to provide educational pathways and opportunities for those living in Kake to staff the facility. JEDC will identify possible operating partners (e.g., SEARHC, Consumer Direct Care Network, SAIL, Island Care/Wellness Within, Tlingit and Haida, Catholic Community Services, , State of Alaska, etc.). JEDC will also provide step-by-step implementation strategies on how to create realistic operational scenarios.	\$250K-\$1M	Single Community	Petersburg Borough	Deferred or Not Advanced

Orion Technology Consulting, LLC	RHTP Program Management Office: An Innovative Model for Billion-Dollar Community Health Investments	AK	Alaska is deploying \$272 million per year through the RHTP - over \$1.36 billion across five years. This funding flows to dozens of organizations simultaneously executing hundreds of projects spanning telehealth, IT modernization, equipment procurement, workforce training, facility alterations, and care delivery innovation. Alaska has no centralized capacity to track this portfolio. Queryon proposes a Program Management Office (PMO) to provide it. PMOs are established best practice in energy, defense, and private healthcare - keeping billion-dollar programs on track. But this discipline is rarely applied as a shared service across independent community organizations under a single federal health program, where THOs, hospitals, nonprofits, and vendors manage projects independently with shared compliance requirements and no portfolio-level visibility. The risk without one is documented. GAO found 16.8% of all federal award funds - \$1.17 trillion over five years - linked to severe, persistent audit findings. PMI research shows government organizations lose \$148 million per \$1 billion due to poor program management. Without portfolio-level tracking, projects fall behind undetected - and CMS can redistribute unspent RHTP funds starting March 2028. The opportunity: pilot a PMO purpose-built for community-driven health transformation that becomes replicable for any state managing large-scale federal health investments.	Queryon proposes to pilot an RHTP Program Management Office (PMO) - applying proven program management methodology as a shared service for community-driven federal health transformation. Large programs in energy, defense, and private healthcare use PMOs routinely. Alaska's Pikka project (\$3.1B) uses this discipline. Mayo Clinic uses it. The Army Corps of Engineers uses it. But when federal health dollars flow to dozens of community organizations - each managing projects independently - this lens is rarely applied. This pilot brings that rigor to RHTP. Queryon is positioned to deliver it. We provide project reporting for the Pikka project on Alaska's North Slope while serving 100+ Alaska nonprofit, tribal, and healthcare organizations over 20 years. Our CEO hosts The Major Project Podcast focused on \$1B+ capital programs and moderates industry panels on project controls best practices. No other Alaska firm bridges major program discipline and community healthcare context. The PMO provides: Portfolio dashboard. Centralized Power BI platform giving DOH, ACF, and CMS real-time visibility - status, spending velocity, milestones, compliance, and risk flags. Fiscal accountability. Grant tracking from allocation to expenditure. Multi-source management for braided funding. Technology partner Kahua - FedRAMP-authorized, trusted by 16 federal agencies, used by Mayo Clinic - provides the compliance backbone. Spending velocity monitoring. CMS redistributes unspent funds starting March 2028. The PMO identifies at-risk projects early enough to intervene. Organization support. Reporting templates, compliance checklists, and analyst support reducing burden on healthcare organizations. CMS reporting. Aggregated statewide data in CMS-required formats protecting future-year allocations. Staff and Budget. PMO staffed with project controls professionals - scheduling, cost, risk, compliance, analytics - scaled to the funded portfolio. PMI research establishes 0.5-1% of program spend is associated with highest probability of success at this scale. Applied to \$272M, this yields \$1.4-2.7M per year - a modest investment to protect Alaska's largest-ever health program. Pilot Deliverable. A replicable methodology guide documenting how portfolio program management applies to community-driven federal health - a model for other states.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Orion Technology Consulting, LLC	Rural Health Technology Innovation Hubs: Building Local Capacity for Alaska's Health Transformation	AK	Alaska is about to deploy \$272 million per year in RHTP funding driving hundreds of technology-dependent initiatives across rural communities - telehealth, EHR modernization, population health analytics, care coordination, and CMS outcomes reporting. There is a fundamental gap between this investment and the capacity to execute it. Rural Alaska has minimal health technology workforce. When a clinic in Bethel needs an analytics platform, or a hospital in Nome needs project reporting integrated with existing systems, there are few if any people in those communities with the technical skills to do this work. Existing IT departments at regional health organizations are already at capacity maintaining current systems (EHR support, network administration, compliance, etc) and cannot absorb dozens of new RHTP projects simultaneously. The default is to fly consultants from Anchorage, Seattle, or the Lower 48 for short engagements. They implement, they leave, and the community is left with technology it did not implement and cannot sustain. This gap is not unique to Alaska. The Rural Policy Research Institute identified technology implementation capacity as a critical barrier to rural health innovation nationwide. But Alaska's geography, connectivity challenges, and the sheer scale of RHTP investment make the problem acute. Every dollar invested in technology without corresponding investment in the people who will operate and evolve that technology is a dollar at risk.	Queryon proposes Rural Health Technology Innovation Hubs: physical offices in Alaska's regional hub communities staffed by locally hired and trained technology professionals who serve as dedicated implementation capacity for RHTP-funded initiatives in their region. WHAT EACH HUB DOES: Hires local. Each hub employs 2-3 community residents as Health Technology Associates - permanent, salaried positions recruited from the community's existing workforce. Queryon provides technology skill building via a personalized 12-24 week training program based on projects selected and skills needed for implementation - example areas of skill development such as data analytics, AI fundamentals, health data standards, and business analysis. Trains continuously. Beyond initial training, Associates participate in ongoing development through Queryon's remote learning network, peer mentorship across hubs, support from Queryon’s existing consulting team, and quarterly in-person cohort gatherings. Serves regional health organizations. Hub staff embed alongside healthcare teams at THOs, hospitals, FQHCs, and community health organizations to implement RHTP-funded technology projects - building reporting capacity, configuring systems, supporting CMS compliance data capture, and training health workers on new tools. Connects to advanced capability. When projects exceed the hub team's current skills - complex AI modeling, enterprise data architecture - Queryon's senior analysts work with the hub team, transferring knowledge while delivering results. This hub-and-spoke model mirrors the state's own healthcare delivery architecture. TARGET COMMUNITIES (Year 1 Pilot): Nome (Norton Sound Health Corp.), Bethel (YKHC), Kotzebue (Maniilaq Association), and Sitka (SEARHC) — four regional hubs collectively serving 85+ communities across the Bering Strait, Yukon-Kuskokwim Delta, Northwest Arctic, and Southeast Alaska. If pilot is successful, a targeted expansion to 8 hubs in Year 2 and 12 hubs by Year 3-4. Queryon operates a distributed workforce model, scaling capacity per-project across Alaska - the same approach proposed for the hubs. Our team has 20 years of experience delivering technology solutions to Alaska nonprofit, tribal, and healthcare organizations including serving as CIO for Anchorage Neighborhood Health Center, technology infrastructure for Peninsula Community Health Services, and selection as vendor for ANTHC Data System Capacity Development.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kodiak Island Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough)	Deferred or Not Advanced

OrthoAlaska , LLC	Alaska Primary Care Value-Based Payment & Community Outreach	AK	Rural communities experience inconsistent access, delayed diagnoses, and higher rates of preventable complications. Traditional reimbursement structures do not support proactive chronic care or outreach. APVPCO addresses these gaps through a coordinated value-based payment strategy and community engagement.	Primary Care alternative payment model (APM) development, quality metric creation, EHR interoperability, community health workers (CHW) outreach, mobile screening units, and orthopedic bundled payment modeling. Infrastructure includes actuarial modeling, regulatory review, data dashboards, and mobile diagnostic tools.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Advance to Implementation Application
OrthoAlaska , LLC	Rural Primary Care Workforce Development Program	AK	Alaska faces a severe, long-term primary care shortage, with roughly 15 of 17 primary health care areas showing a 20–40% deficit in generalist physicians. To keep pace with aging and population growth, Alaska requires hundreds more primary care physicians by 2030, driven by high turnover and reliance on out-of-state recruitment. The shortage is driven by a 29% increase in demand from an aging population, 57% from overall population growth, and high provider turnover. The shortage causes high turnover, high overhead costs for practices, and long wait times for patients. Independent primary care practices across Alaska face worsening workforce shortages, with rising operational costs and competition from larger systems. Several providers within Primary Care Associates are approaching retirement with no incoming replacements. The shortage of primary-care-adjacent specialists compounds delays for rural patients. Many out-of-state clinicians lack awareness that Alaska offers viable, long-term practice opportunities. Without targeted recruitment incentives and infrastructure, rural communities will face widening gaps.	This program stabilizes and grows Alaska’s rural primary care workforce by combining competitive incentive packages with expanded recruitment infrastructure. Providers (MD/DO/PA/NP) will receive signing bonuses and annual retention payments tied to five-year service agreements. A dedicated professional recruiter will manage national outreach, partnerships with Lower-48 residency programs, candidate screening, and placement coordination. Participating facilities must meet HRSA HPSA/MUA criteria and demonstrate sustainability beyond the five-year period. Standardized agreements outline retention expectations, reporting obligations, and eligibility criteria.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Advance to Implementation Application
OrthoAlaska , LLC	Rural Workforce Empowerment & Stabilization Initiative	AK	Rural communities across Alaska face critical staffing shortages that jeopardize access to primary care, diagnostics, triage, and chronic disease management. RWESI establishes a comprehensive "grow-your-own" workforce development system to stabilize staffing and create resilient, multi-skilled rural teams.	RWESI provides four structured workforce pathways: Administrative Excellence, Clinical Support, Diagnostic Imaging, and Nursing Mentorship. It integrates telementoring (ECHO/RTTC), training partners (AAC, UAA, AHEC), retention stipends, SHARP referrals, and simulation-based development. A full-time coordinator oversees implementation and evaluation.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Advance to Implementation Application

OrthoAlaska , LLC	Consolidation and Expansion of Primary Care Services at 4115 Lake Otis Parkway	AK	Current service fragmentation across multiple aging sites leads to fragmented and inadequate access, delays in diagnosis, inefficient care coordination, and reduced capacity to support chronic disease management. Rural patients experience long wait times, limited urgent care availability, and inadequate access to preventive services. Existing facilities do not support integrated care, modern equipment, or team-based workflows.	The project renovates and modernizes the facility at 4115 Lake Otis Parkway—an owned building with completed architectural designs and municipal permits—to house primary care, urgent care, laboratory services, and preventive technology under one roof. Renovations include structural updates, workflow-optimized layouts, ADA accessibility, updated HVAC and electrical systems, and integrated clinical technology. Upon completion, services currently operating at separate sites will be relocated into the consolidated facility. Staff will be trained on integrated team-based care and workflows. VO2 Max metabolic testing capabilities will expand early detection of cardiopulmonary disease. Improved signage will allow for easier location identification for those unfamiliar with the area. Renovation completion: August 2026 Consolidation and staff onboarding: September - October 2026 Facility launch: November 2026	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska- Susitna Borough	Deferred or Not Advanced

OrthoAlaska , LLC	Family Medicine Rural Residency Rotation	AK	Alaska faces a critical shortage of family medicine physicians practicing in rural and frontier communities. Many hospitals rely on temporary locum coverage, creating gaps in continuity, increasing costs, and reducing community trust. A major contributor is the lack of rural exposure during residency training — without immersive rural experiences, most physicians do not consider rural practice viable. At the same time, rural facilities lack the administrative capacity to host residents, coordinate logistics, or offer competitive preceptor compensation. This project solves these gaps by establishing a structured, well-supported rural residency rotation that builds a sustainable pipeline of future rural physicians.	The program will launch a coordinated Family Medicine Rural Residency Rotation model across multiple rural communities. Key components include: 1) Dedicated Residency Coordinator – A full-time coordinator will manage rural site onboarding, ACGME compliance, clinical scheduling, travel coordination, housing logistics, and resident support. 2) Preceptor Payments – Participating rural clinicians will receive competitive stipends (\$1,200–\$2,500 per rotation) to offset productivity losses and ensure high-quality teaching and mentoring. 3) Resident Support – Funding will cover rural housing, travel reimbursement, and rural practice stipends to remove financial barriers and encourage participation. 4) Training & Innovation Infrastructure – Residents will train in advanced primary care models, including chronic disease management, behavioral health integration, population health, and telehealth-supported care. 5) Rural Site Partnerships – Primary partners include the University of Washington Family Medicine Residency Programs, as well as additional partner residencies to be determined. Rural hospital partners will be engaged as training sites. 6) Program Evaluation – The program includes data tracking of retention outcomes, patient visit impact, and community health indicators.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced
OrthoAlaska , LLC	Real-Time DME Eligibility & “Same-or-Similar” Verification for Rural Alaskans	AK	Without IVR or automated vendor tools, clinics cannot verify coverage, leading to delays, increased denials, and risks to patient safety. A dedicated specialist is required to support compliant, accurate, same-day dispensing.	The project funds a full-time DME Verification Specialist to: - Perform real-time Medicare eligibility checks (NMP, HETS, clearinghouse) - Conduct “same or similar” checks - Issue ABNs when needed - Coordinate payer documentation/prior auth - Support rural spoke clinics via remote workflows - Document compliance requirements	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

OrthoAlaska, LLC	Rural Integrated Health Connectivity and Efficiency Platform	AK	The Practice manages approximately 210,000 patient visits annually across multiple specialties and locations throughout Alaska. Documentation requirements, fragmented workflows, and revenue cycle inefficiencies consume staff time and reduce clinical capacity. Administrative tasks such as eligibility verification, prior authorization, and claims management require manual effort, diverting clinicians and staff from patient care. This project will modernize clinical and operational infrastructure through AI-enabled documentation, interoperable electronic health record (EHR) enhancements, and back-office automation. These tools will integrate with Alaska’s statewide health information exchange, healthEconnect, improving care coordination and data sharing. The project could establish scalable infrastructure that could be replicated across Alaskan Accountable Care Organizations (ACOs) and Clinically Integrated Networks (CINs), supporting collaboration statewide. By reducing administrative burden and improving efficiency, the practice will increase provider capacity and expand access to care for rural Alaskans.	The Practice proposes a phased digital transformation initiative designed to strengthen care delivery, improve operational efficiency, enhance patient experience and communication, and expand access to primary care services for rural and remote Alaskans. Over a 12–18 month implementation period, we will deploy technology-enabled improvements that modernize clinical documentation, electronic health record workflows, and back-office operations. We will also introduce integrated Remote Patient and Therapeutic Monitoring (RPM and RTM) to improve patient outcomes. The project will begin with implementation of Ambient AI clinical documentation technology to reduce the time providers spend on manual charting and administrative tasks. By automating clinical note generation and documentation workflows, providers will spend more time with patients and increase care capacity without increasing staffing levels. This step directly supports workforce sustainability and allows clinicians to practice at the top of their license. Following the documentation deployment, we will implement enhanced EHR and back-office capabilities within a siloed division as an initial pilot environment. This phase will focus on implementing RTM and RPM workflows and improving clinical data capture, scheduling, operational workflows, and claims processing efficiency. This will provide an ideal environment for early implementation because it allows us to test and refine workflows before scaling across the broader organization. Once validated, back-office automation will expand across clinical divisions to improve eligibility verification, coding accuracy, claims submission, and payment reconciliation. This expansion will reduce administrative burden, improve billing efficiency, and strengthen the financial sustainability of primary care services. In the final phase, enhanced EHR capabilities will be implemented across remaining clinical divisions to support improved interoperability and care coordination. The system will support integration with Alaska’s statewide health information exchange, healthEconnect, enabling seamless data sharing and coordination with providers across Alaska’s health system. This phased approach allows implementation of proven technology solutions in a structured, scalable way while minimizing disruption to patient care and ensuring measurable improvements in provider capacity, operational efficiency, and rural care access.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Osi Vision LLC	Healthcare Enhancements for Rural Outcomes (HERO) - Service Area (i.e., HERO-Bristol Bay)	TX	Alaska faces multiple challenges and opportunities in effectively serving its rural population. Our project focuses on several of the opportunities related to rural healthcare. The rural population has a high prevalence of chronic conditions with an increased risk of episodic events where the geography and isolation from healthcare resources can add intensity to such events. Maternal health mortality and consistent elderly care are also important concerns. Many rural areas of Alaska face limited access to healthcare providers, and the limitation on resources can also create issues relating to coordination of care. Patient and caregiver education can be challenging in rural areas. Infrastructure inadequacies, whether there is a lack of infrastructure, limited infrastructure, or infrastructure inaccessibility for serving healthcare needs, must be addressed to enable efficient workflows consistently resulting in effective and secure communications in a timely manner. The rural population can benefit from commitment and use of innovation, technology, and artificial intelligence as enablers and facilitators of healthcare services and general well-being. Local workforce growth is needed to support rural areas, and the community needs are not one size fits all. Communities are unique, and solutions need to understand that uniqueness. Rural areas present a variety of challenges around sustainability of quality healthcare services for addressing unpredictable situations and timing.	The demand for healthcare is constant in the rural population of Alaska, and the specific needs of each rural community and culture are unique. The supply of healthcare provider resources is physically limited in many geographies, but resources can be expanded virtually through technology, coordination, and facilitation. However, extended accessibility will only be productive if the community knows and trusts the healthcare resources available to them. A strong facilitator component is critical for the success of each collaborative partnership, especially with respect to project management. Our project focuses on the facilitator team and the project management requirements for planning, implementing, and sustaining effective rural healthcare services that consistently result in improved outcomes. The project manager must understand and be experienced in the nuances of healthcare and be held accountable for planning, coordinating, implementing, monitoring, reporting, and accomplishing the goals and objectives of the project. Osi is uniquely qualified to serve as an effective project manager for a variety of reasons. OsiLIFE is serving rural patient populations through remote monitoring in other states, and we understand the importance of incorporating the project healthcare activities into the providers' workflow to minimize their burden and optimize patient care management. We maintain a patient-centric, case management approach in compassionately serving patient populations, and we are familiar with devices and technology as effective tools. Osi Vision is experienced in working with government customers and brings expertise in cybersecurity standards, protocols, and tools, as well as innovation, technology, and AI. Core to all Osi operations is securely capturing, analyzing, and reporting on data. We will work with the Alaska DOH at both the state and local level to partner with healthcare provider resources. We will also work with the DOH, CHAs, THOs, and their networks to identify and partner with appropriate local partners, which will include healthcare and non-healthcare resources. Logistics and problem solving can be industry agnostic, so it can be beneficial to have perspectives outside of healthcare so that solutions may look at new ways to solve old challenges. Our approach will include enhancing healthcare education, knowledge, and engagement within the communities being served with a specific focus on developing new local career opportunities.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Nome Census Area; Northwest Arctic Borough	Deferred or Not Advanced

Out Patient at Home Physical Therapy LLC	Expansion of Outpatient at home rehabilitation services	AK	Project Overview Many Alaskan communities—especially rural and remote regions—face significant barriers to healthcare access, including: • Geographic isolation and limited transportation • Scarcity of specialty providers such as PT, OT, and SLP • Long wait times for rehabilitative services • Weather dependent travel constraints • Higher rates of chronic disease, injury, and developmental needs A mobile clinic model can bridge these gaps by bringing care directly to patients in their communities or homes, supported by telemedicine for follow up and continuity. Goals of the Expansion 1. Increase access to high quality physical therapy services. 2. Expand service locations to include more cities, villages, and remote hubs. 3. Integrate telemedicine for evaluation, follow up, home exercise program monitoring, and specialty consultations. 4. Add occupational therapy and speech language pathology to offer full rehabilitative care. 5. Improve outcomes for patients with orthopedic, neurological, pediatric, and chronic conditions. 6. Reduce healthcare disparities among rural and underserved populations.	If funding was available to get skilled PT, OT and ST’s into the state via telemedicine or small mobile clinics, access for all communities can improve for specialty care that is currently not being met in the current environment. It is a requirement for governmental insurance to have a referral, even though Alaska is a direct access state. Marketing to physician groups to know that we are available to establish a clinician who then has cycling work available. If you do not have the financial backing to get established in an area, because it takes in each location approximately 6 months to integrate into the community, once established referrals will come. It just is a matter of keeping the PT full. You also need ancillary staff to field calls and go out into the community within services. The most difficulty is incentivizing the healthcare professionals to work.	\$1M-\$5M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Pacific Community of Alaska	Anchorage–Rural NHPI Community Health Worker Network Expansion	AK	Native Hawaiian and Pacific Islander (NHPI) communities served by Pacific Community of Alaska (PCA) experience persistent barriers to primary and behavioral health care, care coordination, and prevention, driven by migration patterns, limited culturally aligned services, and systemic inequities. NHPI families often navigate language, cultural, and insurance barriers while managing chronic conditions, behavioral health needs, and social drivers of health such as housing, employment, and transportation. Local health centers and clinics may have limited capacity to provide sustained, culturally grounded outreach and navigation tailored to NHPI clients’ beliefs, practices, and community structures. Alaska’s geographic isolation increases the need for care coordination while making services harder to deliver. As a result, NHPI families and other underserved communities often experience delayed care, fragmented follow-up, and preventable emergency department visits that contribute to poorer health outcomes. This project seeks to close that gap by extending the Anchorage CHW hub model to Matanuska-Susitna, Juneau, Utqiagvik, Whittier/Girdwood where PCA has relationships or reach, co-designing NHPI-focused CHW-led services with residents, faith leaders, and local partners. By investing in NHPI-centered CHW capacity and regional coordination, we aim to improve access, trust, and continuity of care for NHPI community members while strengthening the broader local health workforce.	We propose a phased expansion of the Anchorage CHW Workforce Hub, led by PCA, to Matanuska-Susitna, Juneau, Utqiagvik, Whittier/Girdwood communities, centering NHPI voices through structured listening sessions, community circles, and faith-based engagement. In partnership with local health centers, clinics, and NHPI community organizations, we will identify priority needs for NHPI residents, clarify gaps in access and navigation, and define CHW roles such as outreach, care coordination, health education, behavioral health navigation, and connection to culturally relevant social and spiritual supports. Using these inputs, we will co-design site-specific implementation plans that reflect each community’s culture, geography, and capacity, including tailored training on NHPI cultural practices, languages, and community norms. The Anchorage CHW hub at Pacific Community of Alaska will serve as a regional backbone, providing training, supervision, mentorship, and quality improvement support to rural CHWs, while leveraging existing infrastructure (including Pear Suite) for data, documentation, and care coordination in ways that are meaningful to NHPI communities. Early activities (months 1–6) will focus on engagement and needs assessment in each community, followed by piloting CHW-led services in at least two sites and detailed implementation planning and sustainability strategy for all four communities within the RHTP funding period. RHTP funds will support CHW planning and engagement time, convenings and listening sessions with NHPI community members, culturally tailored training and supervision, IT/telehealth tools, and limited consultant support for managed care alignment, evaluation, and long-term financial planning.	\$1M-\$5M	Statewide	Anchorage (Municipality); Chugach Census Area; Juneau (City and Borough); Matanuska-Susitna Borough; North Slope Borough	Advance to Implementation Application

Pacific Community of Alaska	Native Hawaiian and Pacific Islander Community Health Worker Workforce Hub in Anchorage, Alaska	AK	Anchorage and surrounding communities face major gaps in primary and behavioral health care, particularly for Native Hawaiian and Pacific Islander (NHPI) communities and other underserved populations. Expanding culturally responsive care coordination can improve access to preventive services, support chronic disease management, and reduce unnecessary emergency visits, strengthening health outcomes for NHPI families, Alaska Native/American Indian and other minority communities throughout Alaska. Community Health Workers (CHWs) play a critical role in bridging health systems and communities by providing outreach, culturally grounded response and health education, care coordination, and social needs screening. For NHPI communities in particular, CHWs who share cultural and linguistic backgrounds build trust, improve health literacy, and help families navigate complex systems of care. Pacific Community of Alaska (PCA) currently employs 4 CHWs who have demonstrated measurable impact on client engagement, care continuity, and community trust. Expanding the team by 2 additional CHWs will allow us to deepen outreach to NHPI and other high-need communities in Anchorage, strengthen partnerships with safety-net providers, and expand culturally responsive care navigation. This project supports RHTP’s Strengthen Workforce initiative by recruiting, training, and retaining CHWs while building sustainable infrastructure for a community-based CHW hub to guide future statewide expansion.	Our approach will strengthen the Anchorage CHW Workforce Hub by expanding a culturally grounded workforce, enhancing infrastructure, and deepening partnerships to better serve NHPI communities and other underserved residents across Anchorage. Workforce Development (Strengthen Workforce Initiative): We will recruit and hire 2 additional CHWs, prioritizing multilingual candidates and individuals with lived experience in NHPI communities. Building on our current team of 4 CHWs, new staff will complete comprehensive training in motivational interviewing, trauma-informed care, care coordination, managed care navigation, and health-related social needs (HRSN) screening with structured onboarding, supervision, and ongoing professional development to ensure quality service delivery and workforce retention. Infrastructure and Technology (Spark Technology and Innovation Initiative): Funding will support essential tools that enable effective CHW work, including laptops and mobile devices for field documentation, secure communication platforms, and data systems to track services and outcomes. Pacific Community of Alaska already partners with Pear Suite, a population health platform recognized by the Alaska Department of Health, which supports real-time care coordination, HRSN tracking, and reporting. Service Delivery and Care Coordination (Health Care Access and Healthy Communities Initiatives): The expanded CHW team will conduct community outreach in neighborhoods with large NHPI populations, provide culturally responsive health education, screen for social needs, connect families to essential supports, assist with chronic disease management and behavioral health navigation, insurance enrollment, and care navigation for NHPI communities Partnership Integration: PCA maintains partnerships with Providence Alaska Medical Center , Envoy Integrated Health, Anchorage Neighborhood Health Center, and the Alaska Department of Health. These collaborations enable CHWs to coordinate care across clinical providers and health plans. Technical Assistance and Implementation: The project will receive targeted support from CHW policy and program experts, including Community Health Synergy, focusing on evaluation, quality improvement, and sustainability planning. The project is ready for immediate launch, with recruitment in Months 1–2, training in Months 2–3, and full service delivery and continuous improvement throughout Months 3–12.	\$250K-\$1M	Statewide	Anchorage (Municipality); Chugach Census Area; Juneau (City and Borough); Matanuska-Susitna Borough; North Slope Borough	Advance to Implementation Application

Pacific Dataport, Inc	Aurora Health Network: Expanding Secure Health Data Exchange for Rural Alaska	AK	Healthcare providers across Alaska face significant barriers exchanging patient information across different electronic health record systems and broadband networks. Rural hospitals, clinics, and tribal health organizations frequently operate independent systems that lack standardized interoperability capabilities, limiting their ability to coordinate care, share records, and support telehealth services. Existing health information transport networks were largely built using older wide-area networking technologies and are often tied to a single telecommunications provider. Participation in these networks may require healthcare organizations to purchase bundled connectivity services, which can restrict participation for providers operating on different broadband infrastructures. The Aurora Health Network represents an opportunity to modernize Alaska’s health information exchange infrastructure by deploying a secure interoperability platform built on Cisco SD-WAN technology. The network will create a secure transport layer that allows healthcare providers to exchange clinical information across different electronic health record platforms while maintaining their existing broadband providers. This project directly supports the Alaska Department of Health’s RHTP Spark Technology Innovation initiative by expanding access to interoperable electronic health record participation and strengthening secure health data exchange across Alaska’s healthcare system.	The Aurora Health Network will establish a secure interoperability framework connecting hospitals, rural health clinics, and healthcare providers to medical records and service providers across Alaska using Cisco SD-WAN technology and encrypted connectivity. Pacific Dataport will collaborate with participating healthcare providers and their internal IT teams to deploy SD-WAN edge devices at hospitals, clinics, and other participating facilities. These devices will create encrypted network overlays that allow healthcare systems using different electronic health record platforms to exchange clinical data securely across multiple broadband providers. The network architecture will follow a zero-trust cybersecurity model, ensuring that all network traffic is authenticated, encrypted, and segmented according to healthcare data protection requirements. Cisco’s SD-WAN platform supports advanced security capabilities including end-to-end encryption, network segmentation for protected health information, centralized policy management, and continuous monitoring of network traffic. A key innovation of the Aurora Health Network is its broadband-provider-neutral design. Unlike legacy health information networks that require healthcare organizations to subscribe to bundled telecommunications services, Aurora will function as a standalone secure transport platform capable of operating over any available broadband infrastructure. This structure reduces barriers to participation and expands opportunities for rural healthcare providers to securely exchange clinical information regardless of their connectivity provider. Through this approach, the Aurora Health Network will create the technical foundation needed for interoperable electronic health records, expanded telehealth services, and improved care coordination across Alaska’s healthcare system. Pacific Northwest University of Health Sciences	Alaska Rural Service Scholars Program	WA	Alaska faces persistent challenges in ensuring equitable access to medical care across vast geography, extreme weather, and many rural and frontier communities. While the state has increased physician numbers overall, distribution remains uneven, and many rural areas rely on aging physicians nearing retirement. Communities often experience delayed diagnosis, high emergency utilization, avoidable medical travel, and disruptions in continuity due to turnover. Recruitment is costly, retention is difficult, and clinicians without preparation for rural practice or cultural humility often leave early, weakening trust and care coordination—especially in partnerships with tribal health organizations. Alaska’s Rural Health Transformation Program (RHTP) provides a rare opportunity to invest in long-term workforce stability rather than temporary staffing solutions. RHTP prioritizes workforce strengthening, primary and preventive care access close to home, and sustainable rural health infrastructure. A scholarship-for-service physician pipeline directly aligns with this intent. By supporting students committed to rural practice and preparing them through targeted training and placement, Alaska can build a durable workforce tailored to its rural needs. The opportunity is to turn time-limited RHTP resources into lasting physician capacity in communities where access is most fragile.	PNWU proposes a Scholarship-for-Service Physician Pipeline that expands and stabilizes Alaska’s rural physician workforce by aligning scholarship support with required service in underserved communities. Alaska would invest \$10M in scholarships, and PNWU would award up to \$50,000 per year (up to \$200,000 total) to students who commit to practicing in Alaska’s rural/underserved communities for one year per scholarship year received. This proven workforce lever reduces debt, influences specialty and location decisions, and creates predictable service capacity. The program includes six integrated components: 1. Targeted recruitment and selection. Criteria prioritize applicants with rural backgrounds, Alaska ties, interest in primary care or rural generalism, and demonstrated commitment to underserved populations. This increases the likelihood of long-term fit and retention. 2. Rural-focused training pathway. Scholars receive enhanced preparation in broad-scope primary care, emergency stabilization, behavioral health integration, telehealth-enabled team care, and culturally responsive practice with tribal and diverse communities. 3. Alaska clinical partnerships. PNWU coordinates with health systems, tribal organizations, and rural clinics to provide rotations that build early connections, increasing community familiarity and likelihood of return. 4. Service-obligation matching and workforce navigation. Support throughout medical school, residency, and job placement ensures scholars land in communities that match needs and readiness. 5. Retention supports. Mentorship, peer cohorts, CME, and connection to regional networks strengthen satisfaction and reduce turnover—an essential factor in Alaska’s frontier settings. 6. Measurement and improvement. Leading and outcome indicators (applications, awardees, rotations, match alignment, service years, retention, and community impact) ensure accountability and support continuous refinement. This model converts scholarship dollars into long-term, rural-placed physician capacity while advancing RHTP’s goals of access, quality, and sustainable workforce development.	\$250K-\$1M	Statewide	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Pacific Rim Counseling, Inc.	Recovery Gardens	AK	As a provider of substance use and mental health services in Fairbanks, a common community challenge we have observed is the limited availability of recovery-oriented community spaces and activities. More specifically, there is a particular need in our community for recovery-oriented spaces and social opportunities that are independent from specific recovery programs or orientations. Our community would benefit from a space where all people who share the goal of recovery can connect, without being limited by the need to agree on how recovery is achieved or committing to one specific recovery program.	Our agency would like to develop a community style teaching garden. Through this model, we would provide hands-on and supported opportunities to learn about basic gardening skills such as seed starting; plant selection; transplanting; garden planning; spacing and planting for in-ground, raised bed, and container gardens; garden maintenance; and harvesting. In order to achieve this, we would like to provide an agency-maintained teaching-oriented garden, as well as raised garden plots that can be self-managed (with available agency guidance) by participants and alumni. We would also like to be able to provide education on various forms of vegetable and fruit processing, and food preparation techniques and recipes. Our primary focus will be to develop an effective and sustainable approach within our agency first; however, long-term we are hoping to develop a method and program that we can share with other community agencies in the future, and work towards creating a greater community network of sober spaces and community partnerships.	\$50,000- \$250,000	Behavioral health/su bstance use disorder treatment	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced

Palco, Inc.	Family-Directed Maternal Health Community Support Infrastructure Pilot	AR	Alaska faces some of the nation's most severe maternal health challenges. Pregnancy-associated mortality in rural Alaska rose 184% between 2012 and 2021; Alaska Native and American Indian women experience rates of 307 per 100,000 live births, more than five times the rate for white women. Rural Alaskans must travel hundreds of miles to access prenatal care, often temporarily relocating to urban centers away from family and cultural support. After delivery, they return to communities with no postpartum services, no doulas, no lactation consultants, and no navigation support. The result: fragmented care, missed appointments, and preventable adverse outcomes. A severe shortage of community-based maternal health workers compounds these challenges. Even willing providers lack the infrastructure to formalize services or accept payment, while families face food insecurity, housing instability, and unreliable transportation driving poor outcomes far outside any clinic. Alaska's rural and Tribal communities need coordinated, community-rooted infrastructure that wraps around families across the full pregnancy and postpartum continuum, and are flexible, culturally responsive, and administratively sound. That is what Palco's Family-Directed Maternal Health Community Support pilot delivers.	Palco proposes seven integrated components delivering self-directed maternal health support across rural, remote, and frontier Alaska: 1. Enrollment & SDOH/BH Screening: Comprehensive intake using SDOH tools configured for Alaska's rural and Tribal context, identifying barriers across transportation, nutrition, housing, behavioral health, and Medicaid eligibility confirmed; MCO referral tracking initiated. Tools co-adapted with Tribal partners to reflect Alaska Native languages and community norms, not applied off-the-shelf. 2. Self-Directed Care Plan: Navigators develop individualized plans coordinating non-clinical services and goods alongside healthcare within a monthly cap of \$1,000. Families choose qualified local providers; Palco manages compliance and reporting through 12-month postpartum. Plans updated at regular intervals and aligned with Z-code data. Families drive their own care — increasing engagement and long-term outcomes. 3. Closed-Loop Referrals: Palco tracks referrals, conducts follow-ups, and provides appointment reminders. National and local partnerships with Uber, grocery vendors, and community-based organizations create an immediate resource network. Palco closes the loop on every referral so families are never handed a list and left to navigate alone. 4. Workforce & Provider Registry: Statewide registry of doulas, midwives, CHWs, and lactation consultants. Palco manages onboarding, credentialing, payroll, and earned wage access. Local hiring prioritizes Alaska Native candidates. Palco's model does not compete with ANTHC or existing Tribal workforce programs. 5. Data & Z-Code Mapping: Real-time Z-code data tracks social drivers, refines care plans, identifies service gaps, and builds population-level reporting for state and Tribal health policy. All infrastructure is mobile-accessible and offline-capable for frontier environments. 6. Hub-and-Spoke Operations: Regional Tribal health anchors serve as coordination hubs; satellite navigator networks extend reach into frontier and off-road-system communities. Designed to integrate with and amplify existing ANTHC, Southcentral Foundation, and YKHC programs, not duplicate them. 7. Sustainability by Design: From Year 1, Palco maintains a cost-and-outcomes dossier, engages Medicaid and MCO partners on reimbursement pathways, and embeds sustainability into program architecture, so infrastructure persists beyond the grant period.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough; Kodiak Island Borough; Kusilvak Census Area; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Palco, Inc.	NextGen Self-Direction by Palco	AR	Alaska faces significant gaps in access to long-term services and supports, especially for older adults living in rural, remote, and frontier communities. Many seniors experience preventable risks such as falls, food insecurity, poor oral health, and social isolation that can accelerate decline and increase avoidable medical use. Yet many are unable to access Medicaid services due to eligibility limits, geographic barriers, waitlists, or a lack of available providers. Self-direction offers a practical solution by empowering individuals to choose the services and supports that best fit their needs and, when desired, appoint a trusted family member or friend to help manage their care. This model expands capacity rather than duplicating services. It allows participants to hire caregivers directly from their own village or town, strengthening the local workforce. Participants may also purchase needed goods and services locally, supporting small businesses and improving safety and independence at home. The opportunity addressed by this project is to establish NextGen Self-Direction by Palco as a flexible, cost-effective option that fills critical gaps for seniors who are ineligible for Medicaid or unable to access traditional services. By aligning with Alaska’s RHT goals, this model extends support beyond Medicaid limits, bridges persistent provider shortages, and creates a sustainable approach tailored to Alaska’s geography, culture, and community priorities.	NextGen Self Direction by Palco offers a practical, scalable approach expanding supports for Alaskans who face provider shortages, long travel distances, and limited access to traditional services. The model empowers individuals to recruit, hire, train, schedule, and supervise their own support staff, reducing reliance on agencies that often cannot sustain a workforce in rural or remote regions. Allowing participants to hire trusted family or community members promotes cultural continuity and strengthens local caregiving networks. Participants can set worker wages within their authorized budgets, enabling competitive pay without increasing administrative costs for the state. This flexibility helps attract and retain workers in areas where standard agency rates may be insufficient. Direct support workers benefit from predictable, participant-directed schedules, improving job satisfaction and reducing turnover. The model is cost-effective. Administrative expenses are typically lower than traditional agency-based models, and participants tend to use services more efficiently when they manage their own support plans. This approach helps stretch limited resources further, particularly in remote regions where travel, overtime, and staffing premiums significantly increase service costs. Most importantly, NextGen Self-Direction improves equity and access. Individuals who previously lacked services due to workforce shortages or geographic isolation can receive reliable, consistent support. Families can remain together, elders can age in place, and local residents can participate directly in caregiving roles that reflect community values. Participants also have access to state-approved Goods & Services that enhance safety, promote independence, and help delay or avoid institutional care. Palco’s infrastructure including streamlined enrollment, compliant payroll and tax management, background checks, budgeting tools, and Navigator support ensures program integrity and simplifies participation for both individuals and the state. These tools allow participants to tailor supports to their unique needs while reducing administrative burden. In geographically and culturally diverse state like Alaska, NextGen Self-Direction is not just an optional service model. It is a strategic, sustainable solution that strengthens the HCBS system, expands capacity in underserved regions, and helps Alaskans remain safely and independently in their homes.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Palliative Care Alaska Network	Palliative and End-of-Life Education for Alaska’s Rural Communities	AK	Rural Alaskan communities often face unique barriers to palliative and end-of-life care, including geographic isolation, limited specialty resources, workforce shortages, and cultural considerations that must be thoughtfully integrated into care. To address these challenges, we propose developing a hybrid education initiative that combines accessible video-based learning with in-person training and community engagement across rural regions.	The project would include the creation of a series of high-quality educational videos designed for multiple audiences, including frontline providers, community health aides, clinicians, caregivers, and community members. Topics would include symptom management, goals-of-care conversations, advance care planning, culturally respectful end-of-life care (transition of life), grief support, and coordination of care in resource-limited settings. The videos would be designed for asynchronous access so that providers and communities in remote locations can engage with the material regardless of schedule or connectivity limitations. In addition to digital learning resources, the project would support both travel to rural communities and travel from rural communities to provide in-person education and collaborative training sessions. These visits would include case-based discussions, practical skill-building, and opportunities to engage with local providers and community members. Importantly, these sessions would also allow us to listen and learn from communities to ensure the educational materials reflect local priorities, cultural values, and existing strengths.	Under \$50,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Palmer Pain and Headache, LLC	PPH North-South Access: Expanding Provider Networks in Fairbanks and Palmer	AK	Based on CDC and NIH data, 20.9% of U.S. adults experience chronic pain. The prevalence is disproportionately higher among specific populations and demographics served by our practice. The sheer volume of the "unmet need" becomes clear as a combined population [Mat-Su Borough (117,613) and Fairbanks (95,500)] totals 213,113 Alaskans. Applying federal health benchmarks to this specific demographic illustrates a clinical gap where an estimated 44,540 residents are currently living with chronic pain (defined as pain lasting three months or longer). In the Mat-Su Borough, ~ 24,500 should individuals require pain management services, with nearly 9,500 suffering from high-impact pain that severely restricts their ability to work or complete daily life activities. In Fairbanks , ~ 19,959 residents have chronic pain, including 7,640 individuals with high-impact, debilitating conditions. A combined total of 17,049 Alaskans are currently suffering from high-impact chronic pain. With our limited staff, our practice is one of a few specialized lifeline for a population of over 44,000 potential patients. This underscores our current staffing levels are under-resourced and mathematically incapable of providing timely, quality care for profound medical needs of Alaskans with high-impact pain. Untreated chronic pain can lead to higher risk for substance use disorders, rising rates of anxiety and depression, and economic community impacts due to lost productivity and disability.	Our project is planned to scaling the human capital needed to reach these ~44,500 individuals. Palmer Pain & Headache must expand in order to reach the Alaskans suffering from chronic and high impact pain. Hiring additional providers is not merely a business expansion; it is a critical public health intervention. Increasing our provider count will allow us to transition these thousands of Alaskans from waiting lists to active recovery and healing, reducing the burden on local emergency rooms and improving the quality of life across the state in the boroughs that are served by the clinics.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Pandere Shoes	Rural Mobility and Foot Health Program	AK	Mobility loss among older adults is widely studied, but footwear is rarely tested as a direct intervention. Conditions such as swelling, diabetes, post-surgical recovery, and the use of braces frequently make standard shoes difficult or impossible to wear. Despite how common these problems are, few programs address footwear as a practical mobility solution, and coverage is limited outside of narrow diabetes programs. This gap leaves many elders relying on oversized shoes or slippers that provide little support and can increase fall risk. Yet appropriate footwear may play a critical role in whether someone can walk safely, leave the home, attend medical appointments, and remain active in their community. This project will pilot the use of properly fitted adaptive footwear as a mobility intervention for rural elders. By evaluating whether improved footwear access supports mobility and daily function, the project aims to test a simple, scalable approach to supporting independence for aging populations in rural Alaska.	This project will pilot a Rural Mobility and Foot Health Program serving rural elders who struggle to find footwear due to conditions such as swelling, diabetes, braces, or post-surgical recovery—conditions that can make it harder to walk comfortably and safely. Community clinicians, aides, or partner organizations will help identify participants and gather basic foot measurements and health history using a simple screening process. This information will be reviewed to match participants with available footwear options appropriate for swelling and changing foot volume. Participants will receive properly fitted adaptive footwear delivered directly to their homes. Because footwear can be shipped, the program can reach rural and remote communities without requiring new clinics or specialized infrastructure. The pilot will track participant feedback and basic mobility indicators to evaluate whether access to appropriate footwear improves comfort, walking stability, and the ability to safely leave the home. Findings from the project will help determine whether footwear can serve as a practical mobility intervention for rural elders across Alaska.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Matanuska-Susitna Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Wrangell (City and Borough)	Deferred or Not Advanced

Partners for Progress in Delta, Inc.	Medical Training Facility - Completion	AK	Medical training has been a constant need in our community and others. Four years ago our organization started an expansion project to specifically address this need. Half of the current new expansion is slated for a medical training wing. This will allow people from all over Alaska to have access to specialized training in the medical field at a reduced cost.	Partners for Progress in Delta, Inc has been training people for the workforce for over 20 years. We had outgrown our capacity to add training programs and we addressed that issue by adding an expansion to our current facility. Half the facility is slated for medical training with a hospital grade classroom, locker room with showers, up to date technology and an anatomage table that we currently own.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Partners for Progress in Delta, Inc.	Workforce Development - Expanding Training	AK	Affordable access to training in the Interior is non-existent. For over 20 years our facility has brought affordable training to rural communities (and to the entire state) which has put thousands of workers into the workforce. Over the years we have seen a drastic increase in the need for trained medical professionals. Several years ago we put a plan in motion to address this need. Due to this plan of expanding our facility we have been able to bring more courses to our area.	In 2025 we completed a 2500sqft expansion to our current facility. This is allowing us to greatly expand our course offerings. Specifically in medical training with our new medical wing almost at completion. We are currently holding ETT, EMT and Wilderness First Responder courses in the new facility. We hope to get this additional funding to bring even more courses to the Interior.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Path of the Heart, Inc.	Homer Healing House Community Resilience Pilot: A Rural Behavioral Health and Workforce Wellness Hub	AK	Many rural Alaska communities lack accessible spaces where individuals can gather to learn practical skills that support emotional well-being, healthier lifestyles, and long-term resilience. Prevention-focused wellness programming that addresses stress, social isolation, and behavioral health risk factors is often limited in rural and frontier communities, particularly outside of traditional clinical environments. As a result, community members and healthcare professionals often have limited access to tools that support emotional regulation, social connection, and healthier coping strategies. The Homer Healing House Rural Wellness Hub will address this gap by creating a community-centered learning and retreat environment in Homer where healthcare professionals, educators, and community members can participate in prevention-focused wellness programs that strengthen resilience and support healthier lifestyles. Alaskans seeking to improve their health through innovative smoking-cessation programming that integrates mindfulness practices, emotion regulation skills, and peer support will be served. By helping participants better understand cravings, stress responses, and behavior change strategies, the program aims to reduce tobacco use and the significant chronic disease comorbidities associated with smoking. Together, these programs will create a welcoming rural space that supports learning, connection, and the development of practical skills to improve health and wellbeing.	The Homer Healing House Rural Wellness Hub will implement a community-centered approach that combines prevention-focused wellness programming, workforce resilience training, and community gathering space within a renovated rural property in Homer, Alaska. The project will transform Homer Healing House into a functional learning and retreat environment where healthcare professionals, educators, and community members can access practical skills that support emotional well-being, healthier lifestyles, and behavioral health resilience. The approach includes three integrated program areas. First, the project will establish community wellness programming through the Alaska Healing Arts Café. This initiative will offer hands-on creative workshops that encourage reflection, social connection, and emotional expression through artistic practices such as journaling, painting, driftwood carving, and other creative mediums. These programs help reduce loneliness and strengthen social protective factors that support mental health. Second, the project will provide resilience and emotional regulation training for healthcare workers, educators, and community members. Workshops and retreats will introduce practical techniques, including Emotional First Aid, mindfulness-based stress reduction, meditation, Tai Chi, Qigong, and other evidence-informed approaches to help individuals manage stress, strengthen emotional regulation, and support trauma-informed environments in healthcare and community settings. Third, the project will pilot an innovative mindfulness-based smoking cessation initiative designed to help participants understand cravings, stress responses, and behavior change through mindfulness practices and peer support. By addressing emotional triggers and stress-related smoking patterns, the program aims to reduce tobacco use and associated chronic disease risks. These programs will be delivered through workshops, retreats, and community gatherings hosted at Homer Healing House and supported by partnerships with regional healthcare organizations, educators, and community groups. The project will begin as a regional pilot serving the Kenai Peninsula and surrounding communities, with the long-term goal of demonstrating a replicable rural wellness hub model that can support prevention-focused health programming across Alaska.	\$250K-\$1M	Private practitioner	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Pathroot Health, Inc.	Alaska ROOT: Rural Outreach & Ongoing Transformation	SC	Rural Alaska communities face persistent challenges related to geographic isolation, limited behavioral health infrastructure, and gaps in continuity of care for individuals and families affected by substance use. While prevention education and harm-reduction efforts increase awareness of overdose and fentanyl poisoning risks and expand access to tools such as naloxone, many communities still lack consistent ways to help individuals remain connected to recovery guidance after initial engagement. Alaska ROOT addresses this challenge by bridging the gap between trusted community outreach and sustained recovery engagement for individuals and families affected by substance use. Through statewide prevention education and outreach led by AK Fentanyl Response Project, communities can identify individuals and families who may benefit from additional recovery guidance. Pathroot provides structured recovery education, peer groups, and family guidance that help participants remain connected to recovery resources between formal treatment interactions. Coordinated by iEXIST, LLC, Alaska ROOT links community outreach, referrals, and recovery engagement into a more coordinated system. This approach helps rural communities strengthen behavioral health access while generating practical insights that can inform broader rural recovery strategies across Alaska.	Alaska ROOT strengthens recovery engagement in rural Alaska by connecting trusted community outreach with structured recovery resources and coordinated implementation. The initiative brings together three complementary partners: AK Fentanyl Response Project, Pathroot, and iEXIST, LLC. AK Fentanyl Response Project will conduct statewide prevention education, overdose and fentanyl poisoning awareness, and naloxone distribution across Alaska communities. Through community events, school presentations, and partnerships with Tribal organizations, local leaders, first responders, and service providers, these efforts expand awareness of overdose risks and strengthen local response capacity. This trusted outreach also helps communities identify individuals and families who may benefit from additional recovery engagement. To strengthen continuity beyond initial outreach, Alaska ROOT will introduce Pathroot’s recovery guidance tools in pilot communities in Anchorage and the Bethel Census Area. Anchorage serves as a key hub for rural and Alaska Native residents traveling for medical and specialty care, making it an important location for strengthening recovery continuity. Pathroot provides recovery education, peer groups, check-ins, and family guidance that help participants stay connected to recovery resources between treatment visits. Because these tools can be accessed remotely, individuals in rural communities can remain engaged even when local services are limited. iEXIST, LLC will coordinate project implementation and partner integration, ensuring outreach activities, referrals, and recovery engagement function as a connected system. Implementation will be guided by local relationships and carried out in collaboration with Tribal organizations and community partners to align with culturally responsive care practices. During the first RHTP implementation period, Alaska ROOT will launch this coordinated model through a focused pilot while maintaining statewide outreach engagement. Lessons from participating communities will help identify practical strategies Alaska can use to strengthen continuity of recovery engagement across rural regions.	\$250K-\$1M	Statewide	Anchorage (Municipality); Bethel Census Area	Deferred or Not Advanced

Patient Focused Telehealth, LLC	Alaska Rural Health Initiative: Improving Village-Based Infection Care and Wound Care with APTT3X	TX	Rural Health Challenge in Alaska Rural Alaska faces significant challenges related to infection management and wound care due to several factors: • Long distances between communities and hospitals • Weather-related transportation delays • High rates of diabetes and chronic wound complications • Occupational and subsistence-related injuries • Limited clinical resources in remote village clinics Healthcare providers in rural Alaska frequently must manage injuries and infections in environments where advanced medical support may be hours or days away. When early infection control is limited, these conditions can escalate and require hospital admission or costly medical evacuation (medevac). In Alaska, a single medevac flight from a remote community to a regional hospital may cost \$25,000–\$100,000 or more, depending on distance and medical needs. These events create financial strain on healthcare systems and significant disruption for patients and families who must leave their communities for treatment. Strengthening early wound management capability at the village level represents a meaningful opportunity to improve patient outcomes and reduce escalation of infections.	Integration with Alaska’s Community-Based Healthcare System Alaska’s healthcare system relies heavily on community-centered care models, particularly through the nationally recognized Community Health Aide/Practitioner (CHA/P) Program, which supports healthcare delivery in more than 170 rural communities. Community Health Aides and rural clinic providers often serve as the first and most critical point of medical care for patients experiencing injuries or infections. Providing these providers with effective tools for early infection control can strengthen the existing rural healthcare infrastructure and support better patient outcomes. Role of Telehealth in Rural Care Telehealth services are widely used across Alaska’s healthcare system to connect village clinics with regional medical providers and specialists. While Patient Focused Tele-Health, LLC does not provide telehealth services within this initiative, telehealth consultation could provide valuable clinical support for rural providers managing complex wound cases. In settings where telehealth access is available, it can complement the use of frontline wound care tools by enabling remote consultation and clinical guidance when needed. Communities Served This initiative is intended to support rural and remote communities across Alaska, including: • Alaska Native Tribal Health organizations • Community Health Aide/Practitioner (CHA/P) clinics • Rural health clinics • Village health programs • Regional tribal healthcare systems These communities represent populations that often face the greatest barriers to timely wound care and infection management. Potential Impact Strengthening infection control capability at the earliest point of care may help: • Improve early management of wounds and infections in remote communities • Reduce progression of infections requiring hospital treatment • Support rural providers managing injuries in resource-limited environments • Improve healing outcomes for patients with acute and chronic wounds • Reduce healthcare costs associated with advanced infection treatment and medical evacuation By equipping rural providers with practical infection management tools, this approach supports a more resilient healthcare system capable of delivering effective care closer to where patients live.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

PATIENTONE INC	Bridging Healthy Beginnings: Strengthening Alaska’s OB/GYN Care Continuum, RPM & Case Management	MT	Problem / Opportunity Statement Alaska faces the most acute healthcare access crisis in the United States. Over 200 communities have no road access, the state has one of the lowest physician-to-patient ratios in the nation, and rural Alaskans are hospitalized for preventable chronic conditions at rates far exceeding the national average. For patients managing hypertension, diabetes, COPD, and musculoskeletal disorders, the gap between clinic visits is not an inconvenience — it is a clinical risk. At the same time, a significant and largely untapped opportunity exists. Federal RPM and RTM reimbursement infrastructure is mature, billable, and designed precisely for this challenge — yet adoption in Alaska's rural, remote, and frontier communities remains critically low due to connectivity barriers, workforce shortages, and lack of implementation support. PatientOne exists to close that gap — delivering continuous, connected, reimbursable care to the communities that need it most.	Proposed Approach: PatientOne RPM/RTM/CCM Platform for Alaska Rural Health Transformation Alaska's rural, remote, and frontier communities face a healthcare access crisis that conventional care models cannot solve. Geography, workforce shortages, and infrastructure gaps leave thousands of Alaskans without continuous clinical oversight — particularly those managing chronic conditions where early intervention is the difference between a care management call and a medevac flight. Device-Agnostic Monitoring: PatientOne integrates with devices patients already own — Dexcom and any CGM, blood pressure cuffs, digital scales, pulse oximeters, and thermometers — eliminating procurement barriers and accelerating enrollment from day one. For patients where device interaction is a barrier, PatientOne offers continuous, contact-free passive monitoring sensors ideal for Alaska Native elder populations. Seamless EHR Integration: Using FHIR-based protocols via PatientOne's native API, Redox, or Big Sky Connect, the platform integrates bidirectionally with any EHR — removing the most common implementation barrier cited by rural providers, including Tribal Health Organizations and IHS facilities. Clinician-Built Protocols: Co-founded by a practicing clinician, PatientOne's platform delivers built-in early intervention protocols for hypertension, diabetes, heart failure, and COPD — fully customizable by each provider organization to reflect their patient population's unique needs and cultural context. Case Management Staffing: PatientOne pairs technology with dedicated RPM Case Managers — one per 150 enrolled patients — who conduct required monthly patient interactions, coordinate SDOH services, manage medication adherence, and serve as the consistent human touchpoint that drives outcomes. Where possible, we recruit locally, including training Community Health Aide/Practitioner (CHAP) program participants as village-level monitoring extenders. Sustainable Reimbursement: From the first enrolled patient, PatientOne generates billable RPM, RTM, and CCM revenue under established CMS CPT codes — ensuring the program outlasts the grant cycle. PatientOne is proven at Community Medical Center, Billings Clinic, and the International Heart Institute. We are ready to bring that infrastructure to Alaska.	\$50,000-\$250,000	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

PeaceHealth Ketchikan Medical Center	Enhancing Rural Access to Comprehensive Primary Care Through Telehealth Innovation in SE Alaska	AK	Rural and island communities in southeast Alaska face continual barriers to timely and continuous primary care. Geographic isolation requiring boat and/or air travel up to 3.5 hours, weather related disruptions, limited provider availability and long wait times make it difficult for residents to access routine, urgent, behavioral health and chronic disease follow-up care. These challenges contribute to avoidable Emergency Department (ED) use, delayed diagnoses, fragmented care, and deepening inequities for underserved populations. In 2024, 2,765 ED visits out of 8,386 were avoidable—more than a quarter of ED visits could have been cared for in primary care. The Galileo partnership will establish a comprehensive 24/7 telehealth primary care “digital medical home” that wraps around existing local clinics. Galileo’s ability to operate effectively in low bandwidth environments through text and phone-based care, combined with its culturally responsive approach and multispecialty clinicians, offers a scalable solution for rural Alaska. This model can expand same day access, stabilize chronic disease management, integrate behavioral health support, reduce unnecessary transfers and emergency visits, and strengthen continuity and coordination of care across Ketchikan and neighboring remote communities. The initiative improves patient outcomes while easing the workload on scarce local clinical staff and enhancing the long-term sustainability of rural health care delivery.	To address the challenges of primary care access, this pilot project implements a comprehensive Tele-Primary Care Expansion in partnership with Galileo, a proven virtual care provider with deep experience serving Medicaid and underserved populations. The initiative establishes a 24/7/365 virtual medical home that wraps around existing local clinics, dramatically expanding health care access while reducing reliance on travel for routine and urgent needs. Galileo’s advanced primary care model integrates urgent care, behavioral health, pediatrics, chronic disease management and multispecialty support, enabling residents to receive high quality, culturally responsive care from their home communities. The project strengthens healthy communities by ensuring residents can access timely care even in low bandwidth environments. Galileo’s platform supports phone based and text based care, making it well suited for remote islands where video connectivity is limited. This inclusive design reduces disparities for individuals with limited digital resources. A core focus is strengthening the local workforce. Virtual clinicians will coordinate closely with local providers, offering documentation, follow up and care transition support that reduces burden on overstretched staff. By stabilizing chronic conditions and managing behavioral health needs upstream, the model helps local teams focus on in person care that requires their expertise. The approach advances pay for value goals by expanding same day access, reducing unnecessary Emergency Department (ED) utilization and improving continuity—key drivers of quality and cost performance. These efficiencies contribute directly to fiscal sustainability for the region’s healthcare system, where limited staffing and high travel related costs strain budgets. Finally, the project sparks technology and innovation by bringing a modern, mobile first virtual care model to some of Alaska’s most isolated communities. This scalable approach creates a durable, equitable and community aligned pathway for delivering comprehensive primary care across southeast Alaska.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Advance to Implementation Application

PeaceHealth Ketchikan Medical Center	Improving Maternal, Fetal and Neonatal Safety with Advanced Monitoring and Teladoc Integration	AK	Rural families in our region face limited access to timely maternal, fetal and neonatal care due to geographic isolation, staffing constraints and the absence of on-site specialists. These challenges increase risks of delayed recognition of pregnancy complications, unnecessary transfers and inconsistent patient monitoring. This project presents an opportunity to implement critical perinatal surveillance, improve early detection of maternal and fetal risk and introduce neonatal Teladoc support—strengthening safety, reducing barriers to specialty care and improving outcomes for rural and remote maternal health patients. There are no nearby hospitals offering a higher level of neonatal or specialty care in the greater Ketchikan region. PeaceHealth Ketchikan Medical Center is the only realistic option for timely maternal care, especially during emergencies or weather disruptions. The hospital and its clinic on Prince of Wales Island provide critical access to care for patients who would otherwise face dangerous delays and significant barriers to care, especially for pregnant patients and newborns. The closest medical centers with Level III and Level IV neonatal services are located in Anchorage (775 miles away) and Seattle (668 air miles away) requiring at least 90 minutes of flight time under ideal conditions. The OBIX Perinatal monitoring system and Teledoc virtual systems will provide necessary tools to significantly improve rural and remote maternal care.	Our approach combines technological innovation with improved clinical workflows to strengthen maternal, fetal and neonatal care across our rural and frontier communities in southeast Alaska. Implement Advanced Perinatal Monitoring We will deploy the OBIX Perinatal Data System with centralized fetal monitoring, automated maternal risk alerts and E-tools for fetal heart rate and uterine activity assessment. This creates real-time visibility for clinicians, supports early identification of complications and standardizes high-reliability perinatal care across locations. Create Streamlined Documentation Full integration with our enterprise EHR reduces documentation burdens, decreases risk of transcription errors and enables a cohesive, team-based approach to maternal and fetal care. These efficiencies help support provider retention by making workloads more manageable. Expand Neonatal Specialty Access with Teladoc Consults Neonatal Teladoc capabilities provide immediate access to certified neonatologists for newborn assessments, stabilization guidance and care decision support. This reduces unnecessary transfers, supports local birth services and ensures infants receive timely specialty care without leaving their community. Leverage Technology to Strengthen Access and Care Remote monitoring, telehealth connectivity and AI-assisted assessment tools extends the reach of clinical maternal health expertise across isolated communities like Prince of Wales and other areas accessible only by boat or small aircraft. These tools support ongoing care needs for chronic disease management and behavioral health follow-up by improving coordination and continuity of care. Support Workforce Recruitment, Retention and High-Reliability Practice Standardized monitoring, clinical alerts and remote specialist support reduce the cognitive load on local teams and enable clinicians to practice at the top of their license. Improved workflows, reduced transfers and real-time expert consultation help rural providers feel supported, improving job satisfaction and retention. Strengthen Rural Health Sustainability By improving early detection of complications, decreasing avoidable transport costs and maintaining local obstetric and newborn services, the project supports long-term sustainability of healthcare delivery in rural and frontier regions. Enhanced care pathways for maternal health contribute to a stronger, more resilient local health system.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Advance to Implementation Application

PeaceHealth Ketchikan Medical Center	Remote Monitoring for High-Risk Patients Across In-Facility, Post-Acute and Community Care	AK	Southeast Alaska’s rural, remote and frontier communities face unique realities: long travel distances, severe weather, workforce constraints and limited ability to keep eyes on a patient between encounters. As a result, patient clinical decline is often detected too late. That pattern contributes to avoidable transfers, Emergency Department visits and hospitalizations that are disruptive for patients and challenging for rural teams already stretched. These challenges provide a critical opportunity to use cloud-based analytics and exception-based workflows to help clinicians monitor larger geographies with a hub-and-spoke model, focusing attention to rising risks rather than relying on episodic check-ins. In facilities, patients can deteriorate between routine checks and care teams may lack consistent ways to identify early risk signals. In the post-acute period, days and weeks after discharge are a high-risk window where gaps in follow-up, limited access to timely reassessment and delayed recognition of worsening trends can drive preventable readmissions. At home, high-risk chronic patients are often without a mechanism to detect early warning signs before problems become crises, especially when specialty care and in-person monitoring are limited. A remote monitoring approach can support early risk detection, timely outreach and escalation pathways that are clinically appropriate and operationally realistic.	We will implement an Alaska-rooted, hub-and-spoke Remote Monitoring Pilot Program designed to support rural, remote and frontier communities across three care settings through a phased rollout with clear operational ownership and delivery capacity. The program will be structured so Alaska-based teams can operate it reliably using cloud-based predictive analytics and scalable exception management that prioritizes attention to patients whose health is deteriorating. This process enables centralized monitoring across large rural geographies with escalation to local care teams as appropriate. Phase I (launch immediately): In-facility monitoring across hospital and Skilled Nursing Facility/Long Term Care setting. We will deploy short-term continuous monitoring for appropriate inpatient and facility-based cohorts to support earlier detection of patient deterioration and more timely clinical response. Initial rollout will start with a defined footprint and cohort and then scale up to full utilization over 6 to 12 months based on staffing capacity and operational readiness. Phase II (staggered start 6–12 months after Phase I): Post acute discharge monitoring and advanced care at home. We will extend monitoring for a defined period after discharge, supported by structured outreach and clear escalation pathways. This reduces avoidable readmissions by enabling timely intervention during a high-risk window when rural follow up is often delayed by distance, weather and workforce constraints. Phase III (staggered start 6 to 12 months after Phase II): Community monitoring for defined high-risk, complex and chronic patient cohorts. We will support longitudinal monitoring for patients with unstable trajectories or frequent exacerbations, enabling earlier identification of worsening trends and more efficient care close to home through exception-based workflows and clear escalation pathways. Full implementation across all settings is planned over three years. Year 1 will focus on launching Phase I for in-facility monitoring, operational quality, establishing hub-and-spoke operating model, and preparing clinical workflows, staffing patterns, and necessary reporting to initiate Phase II on a staggered schedule. This approach aligns with the Rural Health Transformation Program’s intent to strengthen the rural health system over time through sustainable solutions, locally informed care delivery and responsible stewardship of public funds.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Advance to Implementation Application

PeaceHealth Ketchikan Medical Center	Rural Surgical Transformation: Expanding Access and Modernizing Care	AK	Rural and island communities in SE Alaska face persistent barriers to accessing timely, high quality surgical care. Geographic isolation, reliance on boat and air travel, frequent weather disruptions and limited on site specialty services create delays that place patients at greater risk for complications and poorer outcomes. Many residents must travel long distances to urban centers for procedures that could be safely performed locally if modern surgical capabilities were available. This contributes to care inequities, higher costs and significant strain on patients and families. Our surgical infrastructure—lighting, booms, integration systems and specialty tools—is aging and no longer aligns with today’s standards and minimally invasive procedures. Lack of advanced technology limits the region’s ability to recruit and retain skilled surgeons, further restricting local access to essential and emergent care. The opportunity is to integrate the operating room through advanced imaging, robotic assisted surgery, updated urology equipment and remote consultation technology. These upgrades support rural health transformation goals by expanding local access, improving clinical quality, strengthening the workforce and reducing preventable patient travel. With modern tools and capabilities, PeaceHealth Ketchikan Medical Center can provide safer, more effective surgical care and deliver more procedures locally ensuring equitable access for rural, remote and frontier communities.	Improving Ketchikan’s surgical environment to overcome long standing access barriers and transform delivery of specialty care for our remote, rural communities is a top priority. This strategy advances Alaska’s Rural Health Transformation initiatives by improving access, strengthening the workforce, ensuring sustainability and accelerating innovation. 1. Modernize Surgical Infrastructure Replacing aging surgical booms, lighting and overhead equipment with modern Amico systems will improve safety, illumination and infection control. These upgrades ensure a reliable, advanced operating environment for high quality surgical care and aligns with the Health Care Access and Healthy Communities priorities. 2. Implement Advanced OR and Safety Technology The Olympus 4K Ultra High Definition Operating Room Integration System unifies imaging, data, documentation and workflow functions into a single platform. Automated safety features reduce risks of human error, while real time remote consultation capabilities allow specialists outside the region to support local surgical teams. This advances the Spark Technology & Innovation initiative by enabling virtual expertise and improving care quality in a rural setting. 3. Expand Minimally Invasive and Complex Surgical Capabilities The Velys orthopedic robotic assisted system, a da Vinci robotic surgical platform and urology lasers will dramatically expand the types of surgeries locally available, reducing the need for patients to travel long distances for surgery. These investments support Healthy Communities and Pay for Value & Fiscal Sustainability by improving outcomes and reducing costly medical travel. 4. Enhance Patient Safety with Surgical Capable Beds Four new radiographic compatible, surgical capable beds will improve higher acuity patient care and ensure safe positioning, transport, and imaging during procedures. This strengthens patient safety and supports the Healthy Beginnings initiative for maternal and surgical care. 5. Strengthen Workforce Capacity and Recruitment Modern technology and robotic capabilities make Ketchikan a more competitive site for recruiting and retaining skilled surgeons, anesthesiologists, and OR staff—directly supporting the Strengthen Workforce initiative. Our approach creates a surgical program that expands access to high quality care, enhances safety, reduces preventable patient travel and ensures long term sustainability for rural and frontier residents in southeast Alaska.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Advance to Implementation Application

PeaceHealth Ketchikan Medical Center	Advancing Rural Alaska Care Through Infusion Expansion and Technology Upgrades	AK	Rural and island communities in southeast Alaska face persistent barriers to timely and reliable specialty care. Patients who need infusion therapy for oncology, autoimmune conditions, hydration, or chronic disease management often encounter long wait times or must travel by ferry or plane to receive essential, recurring treatments—travel times can total up to 5.5 hours to Anchorage. Weather disruptions, transportation costs and the physical strain of travel frequently delay care, increase the risk of complications and place significant financial and emotional burdens on patients and families. Ketchikan Medical Center’s current infusion capacity and clinical technology are not sufficient to meet rapidly growing patient needs. Restricted space, aging monitoring systems, limited digital infrastructure and gaps in emergency communication tools create vulnerabilities in a rural hospital environment where specialty resources are scarce and rapid response capability is critical. These challenges limit the hospital’s ability to safely manage complex patients locally and adds significant strain to an already stretched rural workforce. The opportunity to double infusion capacity and modernize key clinical technologies to deliver more services close to home, enhance patient safety, reduce preventable travel, and strengthen long-term sustainability of care is critical to expanding access to essential infusion services for rural and remote residents.	Our proposed approach addresses the shortage of local infusion capacity and need for advanced clinical technology through a coordinated, phased strategy designed to expand essential services and strengthen long-term rural health system resilience. PeaceHealth Ketchikan Medical Center’s proposed infusion center expansion project is ready to launch, expenses total approximately \$6,800,000. 1. Expand Infusion Center Capacity We will double the number of infusion chairs from four to eight, reconfigure clinical workspace and improve scheduling efficiency to meet growing demand for oncology, immunotherapy, hydration and chronic disease infusions. This expansion enables more patients—particularly those traveling from Prince of Wales and other island communities—to receive recurring, time-sensitive care close to home. Increased capacity minimizes treatment interruptions due to weather or transportation barriers and improves comfort, safety and continuity of care. 2. Modernize Clinical Monitoring and Technology Infrastructure The project upgrades essential patient monitoring systems, digital workflow tools and communication infrastructure to meet contemporary safety and reliability standards. Advanced monitoring technology supports earlier detection of patient deterioration, improves clinical documentation and strengthens care coordination. Enhanced digital infrastructure increases emergency readiness and reduces avoidable transfers, critical improvements in a rural hospital with limited specialty care backup. 3. Support Rural Care Delivery Through Integration and Workforce Training New systems will be fully integrated into existing clinical workflows with comprehensive training for nurses, physicians and support staff. This approach ensures smooth adoption and maximizes the effectiveness of new tools. Improved communication pathways between Ketchikan and neighboring rural communities further strengthens coordination, referral processes and continuity of care. 4. Build Long-Term Sustainability and System Resilience By expanding local service availability and reducing reliance on out-of-community travel for essential treatments, the project enhances the stability and sustainability of rural health care delivery. Increased efficiency, reduced emergency transfers and improved chronic disease management support better long-term outcomes and ensure that high quality specialty care remains accessible to geographically isolated Alaskans beyond the grant period.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

PeaceHealth Ketchikan Medical Center	Advancing Technology to Improve Rural Access and Care	AK	Rural and remote communities in the greater Ketchikan region rely on PeaceHealth Ketchikan Medical Center, a small nonprofit hospital with a limited clinical workforce. Due to the small critical access hospital, staffing constraints contribute to delayed response times, gaps in patient monitoring and the need to transfer patients out of the community for care that could be delivered locally with the right technology. This project presents a critical opportunity to strengthen patient safety, expand access and improve care efficiency by implementing advanced clinical tools. An advanced patient monitoring system (\$350K) will enhance real time awareness and reduce response delays. MRI upgrades (\$360K) will expand local diagnostic capability, reducing costly and disruptive off island referrals. Outpatient Teledoc systems (\$30K for two Teledoc systems) in Ketchikan and Craig will increase same day access to primary and specialty care without requiring travel. These improvements will also strengthen our partnership with Ketchikan Indian Community (KIC) by increasing confidence that high quality, technologically supported care can be delivered locally—reducing the need for patients to leave the community and supporting KIC’s goal of keeping care close to home. These technological advancements address workforce limitations while building a more resilient, sustainable rural health system that improves patient outcomes and attracts community partnerships.	To address consistent patient access, quality and workforce challenges in the greater Ketchikan region, this project implements a coordinated modernization of patient monitoring, diagnostic imaging and virtual care infrastructure. Together, these upgrades strengthen clinical responsiveness, expand same day access and reduce reliance on costly out of community patient transfers for rural, remote and frontier residents in southeast Alaska. The approach begins with a comprehensive overhaul of patient monitoring capabilities throughout PeaceHealth Ketchikan Medical Center. The project replaces aging, fragmented systems with 18 Philips MX100 transport monitors and transitions the hospital to the advanced PIC 4 central monitoring platform. Standardized, interoperable equipment ensures every clinical department has dependable, real-time visibility into patient status. MX100 devices enable seamless transitions between bedside and transport monitoring, reducing data loss and improving safety during patient movement. PIC 4 unifies data from bedside, wearable and specialty monitors into a single, accessible platform, strengthening early detection, response times and care coordination. To expand access beyond the hospital walls, the project deploys outpatient Teledoc units in clinics in Ketchikan and Craig. These systems provide virtual primary and specialty care, remote triage and follow up support for residents who face long travel times, limited provider availability and weather-related disruptions. By integrating virtual care into local workflows, the approach reduces delays, supports chronic disease management and ensures patients remain connected to care teams even when in person visits are not feasible. The project also upgrades the hospital’s diagnostic capacity through advanced MRI technologies, including Deep Resolve for accelerated imaging, SEMAC for metal artifact reduction, and FREEZEit for motion robust sequences. These enhancements improve image quality, reduce scan times and allow more complex studies to be performed locally—supporting earlier diagnosis and reducing the need for travel to distant facilities. Collectively, these investments create a more responsive, accessible and sustainable regional health system capable of meeting the needs of Southeast Alaska’s most remote communities.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

PeaceHealth Ketchikan Medical Center	Improving Quality Care and Connection for Long-term Care Patients in Southeast Alaska	AK	New Horizons, located within the PeaceHealth Ketchikan Medical Center (PKMC), faces an urgent need to replace 27 aging long term care beds that no longer meet the comfort, positioning or safety needs of acute rehabilitation, LTC and elder patients living with chronic disease, mobility limitations and cognitive impairments. Outdated beds increase fall and pressure injury risk, safety risks that can contribute to avoidable hospital transfers and place strain on staff—threatening care quality and sustainability in a region with limited healthcare resources. At the same time, residents need more meaningful and culturally relevant engagement than traditional activities can provide, especially individuals who are bed bound or living with dementia. Limited access to enrichment services in rural Alaska further widens this gap. The Obie Interactive Engagement System presents a key opportunity to address this challenge by delivering adaptable, multisensory programming that reduces isolation, supports emotional well-being and encourages gentle movement. Its portability ensures equitable engagement for residents of all mobility levels, including those who cannot join group activities. Together, replacing outdated beds and integrating the Obie Interactive Engagement System addresses critical safety, comfort and engagement needs for medically fragile patients who rely on New Horizons as their regional long term care and acute rehabilitation provider.	New Horizons will address the critical need for updated long term care infrastructure and enriched resident engagement by replacing 27 aging hospital beds with specialized long term care beds and integrating the Obie Interactive Engagement System into daily programming. As the region’s primary long term care provider, New Horizons serves approximately 25 residents whose needs range from elder care to extensive rehabilitation as they recover from complex medical events. These residents and patients rely on New Horizons for high-quality, person-centered support. Existing beds have reached the end of their functional lifespan; replacing them with specialized modern, long term care models will enhance comfort, therapeutic positioning and overall care consistency for those living with chronic disease, cognitive impairment or mobility limitations. The project is structured for rapid completion within four to 6 months of award, ensuring timely improvement in the daily experience of rural residents who depend on remaining close to family and community support. To further strengthen resident well-being, New Horizons will implement the Obie Interactive Engagement System as a core enhancement of its activities program. The system will be incorporated into both group and individual sessions, expanding access to meaningful, multisensory engagement. During group programs, Obie will facilitate cooperative games, memory activities, culturally relevant content and movement-based exercises that foster social connection and reduce isolation. For residents who are bedbound or have limited mobility, Obie’s portability allows staff to provide personalized, room-based engagement tailored to individual abilities, preferences and cultural backgrounds. Activity staff will receive training to use Obie’s diverse therapeutic tools—including motion activated games, cognitive exercises and sensory stimulating activities—ensuring flexible, adaptable programming that meets the holistic needs of Alaska’s elders. Operationally, integrating updated LTC beds and the Obie system strengthens sustainability by improving staff efficiency, reducing setup time and supporting a home like, person centered environment aligned with New Horizons’ mission and statewide elder care priorities.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

PeaceHealth Ketchikan Medical Center	Improving Regional HazMat Preparedness and Decontamination Capability in Rural Southeast Alaska	AK	PKMC must be prepared to independently manage hazardous material exposures due to geographic isolation, severe weather, and limited transport options that often delay transfers to higher level care. Current decontamination resources are insufficient to safely manage chemical, biological or environmental contamination, increasing the risk of staff exposure, contamination of clinical areas and disruption of essential services. The hospital plays a central role in regional emergency response and relies on multiple communication channels—including dedicated two way radios—to maintain real time coordination across clinical units, security, the emergency department and incident command. This system ensures uninterrupted information flow during power outages, storm or system failures, a critical need in a rural environment where external communication can be disrupted. These challenges create a timely opportunity to strengthen emergency readiness. Expanding decontamination capacity while integrating equipment into established communication systems will allow the hospital to manage hazardous events more safely, maintain uninterrupted care and enhance sustainable rural health infrastructure across its remote service area.	Ketchikan Medical Center (PKMC) will implement a comprehensive, ready to launch approach that expands decontamination capacity, strengthens staff readiness and integrates operations into the hospital’s established emergency communication systems. • Purchase nine 3M Versaflo PAPRs, fifteen HazMat suits, a portable decontamination shower and four 300-gallon chemical resistant containment tanks, enabling staff to conduct safe, rapid decontamination without risking exposure or contamination of clinical areas. • Ensure radios support integration with the hospital’s internal emergency response and the 24/7 Level IV trauma center operations. • Configure radios with designated channels for Emergency Department, labor and delivery, security, engineering and Incident Command. • Implement channel priority levels and establish emergency broadcast and lockdown capabilities. • Install charging stations at strategic points to ensure high readiness. • Train all applicable clinical and non clinical staff, including department leaders, charge nurses, security and ED personnel. • Conduct scenario based drills aligned with emergency procedures, such as mass casualty events, hazardous weather disruptions, and internal emergencies. • Validate competency and update standard operating procedures (SOPs) for radio use.	Under \$50,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

PeaceHealth Ketchikan Medical Center	Rural Workforce Resilience & Readiness Pilot Program	AK	Rural critical access hospitals face consistent workforce and safety challenges, including high risk, low frequency clinical events, limited opportunities to maintain competency, fragmented communication systems, and process changes that outpace educator capacity. Small, geographically isolated teams must manage neonatal emergencies, trauma, airway crises, sepsis, and behavioral health events with limited specialty access and constrained training resources—creating gaps in consistency, increasing onboarding demands and straining hospitals working to sustain essential services. This project addresses these challenges by pairing Elemeno’s just in time clinical support platform with high fidelity simulation mannequins. Elemeno provides immediate, evidence-based guidance, micro learning and procedure refreshers at the point of care, helping clinicians stay prepared for low volume, high acuity events. Its hub and spoke model extends standardized maternal, child health, emergency and EMS workflows across regional partners. High-fidelity simulation enables realistic practice of rare but critical scenarios, improving time to intervention, teamwork and readiness. Together, these tools modernize training, reduce reliance on resource intensive education and strengthen rural workforce resilience—offering a scalable, sustainable model to standardize care and improve outcomes across southeast Alaska’s remote communities.	To address gaps in clinical competency, care consistency and workforce sustainability across rural Alaska, PeaceHealth Ketchikan will implement Elemeno Health’s microlearning and communications platform, paired with clinical simulation mannequins. Together, these tools create a continuous learning environment that reinforces skills with hands on practice. Elemeno includes a national library of 40,000+ peer developed job aids, enabling rapid access to clinical guidance. High fidelity simulation mannequins allow rural hospitals with low patient volumes to routinely practice high risk scenarios, reinforcing skills and team coordination so staff remain prepared to deliver safe, expert care when emergencies occur. 1. Rural Workforce & High-Risk Events PeaceHealth Ketchikan will deploy Elemeno learning across L&D, ER, ICU, OR, Med/Surg, and Ambulatory services in Ketchikan and Prince of Wales. Staff will have 24/7 access—on any device—to concise multimedia job aids that translate policies into actionable guidance. Use cases include high risk protocols, behavioral health workflows, rare trauma events, equipment refreshers, onboarding standardization, and skills reinforcement. To strengthen competencies in low volume settings, the project includes purchasing modern simulation mannequins (obstetric, pediatric, trauma, airway). These allow staff to practice high acuity scenarios and reinforce learning through Elemeno micro training, supporting retention and readiness. 2. Regional Hub and Spoke Coordination Ketchikan Medical Center (KMC) will serve as the regional knowledge hub with tailored Elemeno learning sites for community partners. Spoke sites will support referral pathways, “who to call/when” workflows, community resource directories, substance use disorder guidance, youth services navigation, and cross agency care coordination. Anticipated partners include the Ketchikan Wellness Coalition, Ketchikan Indian Community, Residential Youth Care, and treatment providers. 3. Leveraging Elemeno’s Shared Resources Elemeno’s national shared resource network enables rapid implementation, adoption of proven rural and academic workflows, and reduces administrative burden. Over time, KMC will contribute to Alaska specific best practices to support statewide learning. Together, Elemeno and enhanced simulation capacity will provide a scalable system for real time clinical support, hands on skill development and strengthened workforce readiness.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

Pear Suite, Inc.	Launching an Alaska Community Health Worker Provider Network and Managed Services Hub	HI	Community-based organizations and CHWs play a critical role in helping residents navigate healthcare and social services. However, many CHW programs operate outside of traditional healthcare delivery systems and lack the operational infrastructure needed to partner with healthcare providers, tribal health organizations, and health plans. Barriers include limited access to clinical compliance support, billing infrastructure, contracting pathways, and standardized documentation systems. These gaps make it difficult for community-based organizations to sustainably participate in care coordination initiatives or value-based care models, even when their services significantly improve health outcomes in rural communities. Without an entity designed to support CHWs and community-based organizations with the operational infrastructure needed to collaborate with healthcare systems, we won't be able to enable community providers to participate in Medicare and Medicaid reimbursement pathways. Although Alaska does not yet have a Medicaid reimbursement pathway for CHW services, many stakeholders anticipate this evolving. Health plans have also expressed strong interest in contracting with coordinated CHW networks rather than managing individual contracts with multiple organizations or independent CHWs. This project addresses the opportunity to establish the operational backbone needed to support coordinated community-based care statewide.	This project will implement a Community Health Worker Provider Network that enables community-based organizations to participate more effectively in Alaska's healthcare ecosystem through shared operational infrastructure, clinical alignment, and coordinated care workflows. The provider network will operate through Pear Suite Provider Group PC, a friendly PC-MSO entity already established in Alaska to support CHWs and community organizations with the administrative and operational capabilities needed to partner with healthcare providers and health systems. Through this network, participating community-based organizations will gain access to shared infrastructure that supports clinical compliance, documentation standards, billing readiness, and contracting pathways. The model allows CHW programs to maintain their community-based operations while participating in coordinated care initiatives through standardized workflows and shared reporting tools. The network will also integrate referral coordination with statewide resource systems such as FindHelp and Alaska 211, helping CHWs connect residents with services related to housing, transportation, food access, behavioral health, and other social determinants of health. Interoperability planning with the state's Health Information Exchange will help align community-based coordination with broader healthcare data systems. In rural communities with limited provider capacity, CHWs will also be able to connect residents with board-certified primary care providers through telehealth partner Rocket Doctor, expanding access to clinical services when local providers are unavailable. Pear Suite has implemented similar provider network models in other states, where community organizations are able to participate in Medicare and Medicaid reimbursement pathways through shared infrastructure. While Alaska does not yet have a formal Medicaid reimbursement pathway for CHWs, establishing the provider network infrastructure now ensures that community-based organizations will be ready to participate as reimbursement models emerge. Health plans have also expressed interest in contracting with coordinated CHW networks rather than managing contracts with multiple individual providers. The proposed hub provides the governance structure and operational backbone needed to support these partnerships while strengthening coordinated care across Alaska's rural and frontier communities.	\$250K-\$1M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Pear Suite, Inc.	Scaling Alaska’s Community Health Worker Workforce Through Training and Credentialing Infrastructure	HI	Alaska’s rural and frontier healthcare systems increasingly rely on CHWs to support care coordination, address social determinants of health, and help residents navigate healthcare and social service systems. However, the growth of this workforce is limited by the lack of consistent training pathways, accessible credentialing support, and shared infrastructure to support workforce development across geographically dispersed communities. Today, CHW training across Alaska is often delivered through locally developed programs that vary in scope, supervision practices, and documentation standards. While these programs are rooted in strong community expertise, the lack of coordinated training infrastructure makes it difficult to scale workforce development statewide or align training with emerging healthcare system needs. Geographic isolation and limited training capacity further restrict access to workforce development opportunities for rural and frontier communities. As Alaska continues to explore CHW credentialing and expanded care coordination models, there is a growing need for accessible, culturally responsive training pathways that prepare CHWs to work alongside healthcare providers while remaining rooted in their local communities. Without shared infrastructure to support training, credentialing assistance, and workforce development, Alaska risks underutilizing a workforce that could significantly expand access to care across rural and frontier regions.	This project will establish a coordinated Community Health Worker training curriculum and learning management system (LMS), as well as a credentialing assistance “help desk” designed to expand workforce development opportunities across Alaska. The initiative will start with co-developing CHW training curriculum alongside Alaska-based organizations, healthcare providers, and community leaders to ensure the content reflects the cultural, linguistic, and regional realities of Alaska’s communities. The program will combine Pear Suite’s LMS and experience deploying training programs across the country, with curriculum contributions from local subject matter experts, community organizations, and healthcare partners. This infrastructure will allow training to be delivered through hybrid and remote learning pathways, making workforce development accessible to individuals and organizations across rural and frontier regions. In addition to virtual learning, the initiative will support partnerships with community organizations, healthcare systems, and local agencies to provide field-based training opportunities that complement classroom instruction and allow CHWs to gain practical experience working with care teams. Pear Suite will also provide credentialing assistance through a help desk model to support CHWs and community organizations as Alaska develops its statewide credentialing framework. Drawing on experience training over 10,000 CHWs nationwide and working with leading CHW training experts, including the authors of Foundations for Community Health Workers, the project will help Alaska build a scalable and sustainable workforce development system capable of preparing CHWs to support care coordination and improve access to healthcare across the state.	\$250K-\$1M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Pear Suite, Inc.	Integrating Community-Based Care Into Alaska’s Health Information Infrastructure	HI	Across Alaska, healthcare providers, community-based organizations, CHWs, and care navigation programs play essential roles in helping residents access medical care and social services. However, these partners often operate in separate systems with limited shared visibility into referrals, outreach activities, or service completion. Healthcare providers frequently do not know whether patients successfully connect to community services, while CBOs and CHWs often lack access to the information needed to coordinate care effectively. Although Alaska has invested in statewide clinical data infrastructure through its Health Information Exchange (HIE), most existing systems are designed primarily for hospitals and clinical providers. Community-based care providers delivering essential services, such as housing navigation, transportation support, food access, and care navigation, often operate outside of these systems. This project addresses the opportunity to better integrate community-based care coordination into Alaska’s broader health information ecosystem. By connecting healthcare providers, CBOs, and CHWs through shared referral workflows and data exchange aligned with the HIE, the initiative will strengthen collaboration across healthcare and social service systems. This improved connectivity will help rural and frontier residents access coordinated support more efficiently while enabling providers and community partners to better track service delivery and outcomes.	This project will establish a community-integrated care coordination framework that strengthens collaboration between healthcare providers, community-based organizations, CHWs, and Alaska’s statewide health information infrastructure, which could include referral platforms like Find Help. Working in partnership with healthEconnect Alaska, local service providers, and care navigation partners, the project will convene key stakeholders to define shared workflows for referrals, outreach activities, service documentation, and reporting of social needs outcomes. These convenings will help identify how community-based service providers and CHWs can participate more effectively in coordinated care while aligning with Alaska’s existing Health Information Exchange infrastructure. The initiative will support the development of standardized coordination workflows that allow healthcare providers to refer individuals to community services while enabling CBOs and CHWs to document outreach, service delivery, and referral completion. These workflows will create greater visibility into whether individuals successfully connect to services and where additional follow-up may be needed. The project will also explore interoperability pathways that enable community-based service data to align with Alaska’s broader health information ecosystem. Technical partners will provide expertise in designing integration models that allow organizations with varying levels of technical capacity to participate without replacing their existing systems. In addition to infrastructure alignment, the project will include training and technical assistance to support adoption among participating organizations. Community providers, care navigation programs, and healthcare partners will receive support in implementing shared referral workflows, documenting service delivery, and participating in coordinated care models. Through stakeholder engagement, infrastructure alignment, and workforce training, the project will establish a scalable coordination framework that strengthens connectivity between healthcare providers and community-based services. This approach will help rural and frontier communities across Alaska improve access to coordinated care and social services while building a foundation for long-term cross-sector collaboration.	\$50,000-\$250,000	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Peninsula Allergy & Asthma Center LLC	Advancing Rural Allergy and Asthma Care Through Digital Innovation	AK	Communities in rural Alaska face persistent barriers to timely, coordinated healthcare due to geographic isolation, transportation limitations, extreme weather, and unreliable telecommunications infrastructure. These structural challenges directly affect specialty access and chronic disease management, particularly for patients requiring frequent follow-up, medication coordination, and ongoing monitoring. While telehealth can mitigate distance barriers, its effectiveness is limited by inconsistent broadband capacity and outdated communication systems. Within our clinic, an aging phone and internet platform results in dropped calls, limited bandwidth for virtual visits, difficulty transmitting medical records, and fragmented communication between patients and care teams. These infrastructure limitations contribute to delayed care, missed appointments, follow-up gaps, and inefficient coordination across providers. Staff manage a high call volume manually while also spending significant time obtaining and reconciling medical records from multiple care settings. This administrative burden reduces clinical capacity, strains workforce sustainability, and limits our ability to proactively manage chronic disease. Without automated patient engagement tools and interoperable data exchange, opportunities for early intervention, preventive care, and value-based coordination are constrained—ultimately increasing the risk of avoidable emergency department visits and hospitalizations.	Our clinic will implement a phased infrastructure modernization strategy to strengthen rural specialty access, care coordination, and workforce efficiency in alignment with Alaska’s Rural Health Transformation Project (RHTP). First, we will replace our outdated phone platform with a cloud-based, integrated system designed to reduce dropped calls, improve call routing, and streamline scheduling and triage workflows. Enhanced call management tools will allow staff to prioritize urgent clinical needs, reduce hold times, and improve real-time communication between patients and care teams. Second, we will modernize our internal internet network infrastructure. These improvements will stabilize connectivity, support high-quality telehealth visits, and enable faster, secure transmission of medical records. Reliable internet access will expand virtual specialty access for patients in remote areas and reduce disruptions that currently limit telehealth effectiveness. Third, we will implement eClinicalWorks (eCW) Healow Genie to automate and enhance patient engagement. Healow Genie will generate appointment reminders, proactive outreach alerts, and risk stratification reports identifying patients at risk for missed visits or poor medication adherence. The platform will manage routine patient interactions—including appointment scheduling, prescription refill requests, bill payment, referral coordination, and test result access—through AI-supported automation integrated with our phone system. This 24/7 functionality will reduce administrative burden while enabling earlier intervention and improved chronic disease management. Finally, we will integrate with HealthEconnect Alaska, the state-designated Health Information Exchange, to enable secure, interoperable data sharing across care settings. Participation in the HIE will improve referral coordination, reduce duplication of services, and strengthen continuity of care. Collectively, these investments will expand rural specialty access (Health Care Access), support preventive chronic disease management (Healthy Beginnings and Healthy Communities), enhance workforce sustainability through operational efficiencies (Strengthen Workforce), advance interoperable, data-driven care (Spark Technology & Innovation), and promote value-based sustainability by improving coordination and reducing avoidable emergency department utilization (Pay for Value).	Under \$50,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Peninsula Allergy & Asthma Center LLC	Expanding Rural Allergy Clinic Capacity to Improve Access to Advanced Specialty Testing	AK	Inaccurate penicillin allergy labeling affects about 10% of the population, yet more than 95% of these labels are incorrect (Blumenthal et al., 2024). Unverified labels drive use of broad-spectrum antibiotics, increasing costs, toxicity, antimicrobial resistance, longer hospital stays, and risk of MRSA, VRE, and C. difficile infections. Despite these harms, most patients never receive formal evaluation, and rural communities face added barriers, as drug allergy testing and supervised challenges are rarely available outside academic centers. Similarly, inappropriate food allergy diagnosis leads to unnecessary dietary restrictions and avoidable healthcare costs. Without access to oral food challenges (OFCs)—the diagnostic gold standard—patients rely on sensitization testing alone, resulting in overdiagnosis (Greiwe et al., 2020). Barriers to OFCs, including time, space, and staffing constraints, disproportionately affect rural areas and unnecessary food avoidance increases nutritional risk and financial strain, especially for families experiencing food insecurity. Works Cited Blumenthal, K. G., Smith, L. R., Mann, J. T. S., et al. (2024). Reaction risk to direct penicillin challenges: A systematic review and meta-analysis. JAMA Int. Medicine, 184(11), 1374–1383. Greiwe, J., Oppenheimer, J., Bird, J. A., et al. (2020). AAAAI work group report: Trends in oral food challenge practices among allergists in the United States. JACI: In Practice, 8(10), 3348–3355.	To address limited rural access to definitive drug and food allergy evaluation, our clinic will expand clinical space, monitored procedure capacity, and staffing to support comprehensive drug and food allergy evaluation and challenges. This expansion will establish our clinic as a regional specialty hub delivering evidence-based allergy diagnostics locally for rural communities within the Kenai Peninsula Borough. The project includes renovation of space to create dedicated challenge rooms equipped for continuous monitoring and emergency response. Increased procedural capacity will enable timely penicillin allergy evaluation, including risk stratification, direct oral challenge when appropriate, and skin testing when indicated. Removing inaccurate β-lactam allergy labels will allow safe use of first-line antibiotics, reducing antimicrobial resistance, hospital utilization, and unnecessary medication costs. Expanded oral food challenge (OFC) capacity will provide definitive diagnosis of suspected food allergies, particularly in pediatric patients. By increasing monitored challenge appointments and staffing support, we will reduce reliance on sensitization testing alone, prevent unnecessary dietary restrictions, and improve nutritional and psychosocial outcomes. Standardized protocols aligned with national guidelines will ensure safe, high-quality care. To maximize reach, in-person challenge services will be integrated with telehealth screening and follow-up. Patients will complete virtual pre-evaluations to determine eligibility, reducing unnecessary travel. Post-challenge follow-up and education will also be delivered via telehealth when appropriate. The clinic will strengthen referral partnerships with regional primary care providers and hospitals through streamlined pathways for drug delabeling and food allergy evaluation. Provider education will support appropriate referrals and reinforce the benefits of accurate allergy diagnosis.	Under \$50,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Peninsula Allergy & Asthma Center LLC	From Crisis to Prevention: Reducing Emergency Utilization Through Proactive Asthma Specialist Care	AK	Asthma care in rural Alaska is constrained by limited access to in-office pulmonary function testing and the high cost and logistical burden of hospital-based diagnostics, as well as delayed medication access. Many rural clinics lack on-site testing, requiring reliance on symptoms and physical exam findings or referral for costly hospital-based body box testing that involves facility fees and long wait times. These barriers delay diagnosis and severity assessment, increasing the risk of misdiagnosis and inappropriate treatment and contribute to preventable exacerbations, greater systemic corticosteroid use, and higher emergency department visits and hospitalizations (Global Initiative for Asthma, 2025). Medication access challenges further compound the problem. Rural pharmacies often maintain inconsistent stock of controller inhalers and do not carry high-cost biologic therapies. Patients requiring advanced treatment must depend on out-of-state specialty pharmacies, facing prior authorization delays, complex coordination, and extended shipping times vulnerable to weather disruptions. Together, these systemic gaps delay treatment initiation and continuity, undermine disease control, and drive avoidable acute care utilization among patients with severe asthma. Works Cited Global Initiative for Asthma. (2025, November 15). Global strategy for asthma management and prevention: 2025 update [PDF]. https://ginasthma.org/wp-content/uploads/2025/11/GINA-2025-Update-25_11_08-WMS.pdf	Our approach transforms asthma care in the Kenai Peninsula Borough by expanding local capacity, standardizing evidence-based management, and delivering comprehensive care close to home. This project addresses critical gaps in diagnostic access, medication availability, patient education, and advanced therapy access—shifting care from reactive, emergency-driven treatment to proactive chronic disease management. 1. Expand Local Diagnostic Capacity We will obtain a PulmOne MiniBox, a compact pulmonary function testing system that measures lung volumes without requiring a traditional hospital-based body plethysmography “body box.” Conventional body box testing requires costly, space-intensive hospital infrastructure and the enclosed chamber can also be poorly tolerated by children and elderly patients. The MiniBox uses flow-interruption technology to deliver accurate lung volume measurements in an outpatient setting, expanding timely access to advanced pulmonary diagnostics. 2. Standardize Evidence-Based Management All patients will receive individualized asthma action plans and structured education on inhaler technique, trigger avoidance, and self-management. These protocols will be embedded into routine workflows to ensure consistent, guideline-aligned care. 3. Establish In-Clinic Medication Dispensing We will obtain dispensing licensure and develop an in-clinic dispensing program to maintain on-site inventory of essential controller inhalers and coordinate biologic therapy distribution. This will reduce delays caused by inconsistent rural pharmacy stock and out-of-state specialty shipping, improve adherence, and support timely initiation of advanced therapies. 4. Strengthen Workforce Capacity Staff will be trained in pulmonary diagnostics, asthma education, and medication coordination to ensure continuity and high-quality care. 5. Improve Access and Engagement Same-day diagnostics, education, and dispensing will reduce travel burden. Telehealth follow-up and reminder systems will promote continuity, particularly during winter travel disruptions. 6. Monitor Outcomes and Sustainability We will track action plans, medication access, biologic initiation, emergency visits, hospitalizations, and oral steroid use to guide quality improvement and ensure long-term sustainability. This integrated model improves access, enhances quality, reduces emergency utilization, and advances health equity for rural Alaskan communities.	\$50,000-\$250,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Penn Foster Career School	Alaska’s Rural Health Workforce Pipeline: Expanding Accredited, Career Pathways	UT	Alaska faces persistent workforce shortages across primary care, behavioral health, allied health, and support roles. Rural and frontier communities are disproportionately affected due to geographic isolation, recruitment challenges, and limited local training capacity. Strengthening workforce pipelines is essential to achieving RHTP goals related to access, value-based care, and long-term fiscal sustainability.	Penn Foster Group will partner with Alaska-based entities to deliver accredited, competency-based training programs aligned with high-demand health occupations. Proposed offerings include medical assistant, medical billing and coding, pharmacy technician, behavioral health technician, health information technology, and other allied health pathways identified by state and regional partners. Key components: • Online and hybrid training models adaptable to low-bandwidth environments • Employer-aligned curricula mapped to Alaska licensure and certification requirements • Career pathway frameworks supporting entry-level to advanced role progression • Data tracking to measure completion, credential attainment, and employment outcomes • Technical assistance for employers implementing earn-and-learn or apprenticeship models	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Penn Foster College	Strengthening Alaska’s Rural Health Workforce Pipeline: Expanding Accredited, College Pathways	AZ	Alaska faces persistent workforce shortages across primary care, behavioral health, allied health, and support roles. PeopleAK	Community Intelligence & Workforce Platform: Building the Foundation for Rural Alaska Health	AK	Currently, no statewide, community-validated source of health information exists to guide strategic investment, and programs collectively invest hundreds of millions annually in rural health and workforce systems with persistently poor outcomes because investment is reactive, siloed, and often disconnected from community-defined priorities. Community leaders across rural Alaska describe “vendor overload”: an accumulation of disconnected vendor relationships, each with its own intake process, data requests, and reporting requirements layered onto communities whose administrative capacity is already exhausted. The communities most in need of coordinated support bear the greatest burden of fragmentation. The RHTP creates an unprecedented opportunity to build coordination infrastructure that has never existed: a community-validated intelligence platform connecting community voice, program and asset inventories, and grantor-facing analytics in one authoritative system. Phase 1 is a 12-month pilot with one partner community that proves the engagement model, data governance approach, and platform functionality under real rural Alaska conditions, producing a Community-Endorsed Initiative Roadmap and community-owned Capacity Profile that directly govern investment sequencing. Year 2 expands via a small ramp-up cohort using pilot-tested onboarding and consent criteria, ensuring subsequent RHTP investments are guided by what communities have chosen—not what vendors have proposed.	Phase 1 is a 12-month pilot delivered with one partner community to test, validate, and refine a repeatable model for community-led priority setting and a purpose-built intelligent platform that makes resulting data actionable for administering grantors and communities alike. The pilot includes four sequential, overlapping components. Community Listening Sessions (Months 1–3) are facilitated by PeopleAK navigators alongside locally identified community liaisons. Sessions are held in community spaces at community-determined times, accessible via video for remote participants, conducted in plain language, and compensated for community members in advisory roles. Plain-language session summaries are returned to the partner community within 30 days. Concurrent Structured Needs Assessments (Months 2–5), led by a software and platform developer with experience in rural Alaska in coordination with PeopleAK, cover eleven rural health domains aligned to RHTP priorities from workforce stability and Medicaid sustainability to behavioral health capacity and capital infrastructure. The partner community receives a Community Capacity Profile owned by the community and shared with grantors through the platform only with community consent. Community Prioritization Workshops (Months 4–7) translate findings into a Community-Endorsed Initiative Roadmap. This governance-signed action plan becomes the governing document for subsequent program investments. No initiative is scoped for a community without a signed roadmap in place. Replication & Collaboration Mapping (Months 7–10) documents what worked, what must change, and what is required to scale, producing a pilot replication toolkit and identifying opportunities for regional or hub-based collaboration as additional communities join through a small ramp-up cohort. The platform (Months 3–11) is built and tested through the pilot, providing grantors with real-time dashboards, initiative tracking, compliance reporting tools, and investment gap analysis. Community modules include a Profile Portal, a searchable asset directory, and a connection hub. The platform is mobile-first, low-bandwidth compatible, plain language, and bilingual. The Community Health Index, a composite scored profile across 10 evidence-based community health elements weighted by population health contribution, maps community-identified gaps directly to RHTP initiatives to ensure data drives program sequencing.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Perfecting Peds LLC	Comprehensive Medication Management for Alaska's Rural High Risk Pediatrics	DE	Medication-related problems are a silent driver of avoidable pediatric utilization in rural and frontier settings. Children with neurologic disorders, behavioral health comorbidities, asthma, rare genetic conditions, and medical complexity frequently take multiple high-risk medications prescribed by different specialists. In remote communities, prescribers often lack integrated visibility into the full medication regimen. The opportunity is to create a scalable, technology-enabled pediatric medication optimization layer that sits across existing providers, strengthens local care delivery, and reduces preventable emergency department visits and hospitalizations tied to medication issues. This is particularly relevant in Alaska, where transportation to tertiary centers is costly and disruptive, and a single avoidable inpatient event carries significant financial and social impact.	The project will deploy Remote Pediatric Comprehensive Medication Management serving Medicaid beneficiaries ages 0 to 24 in rural and frontier communities. The approach includes: Identification and Stratification High-risk pediatric members are identified through claims analysis, referral, and clinical risk indicators. Children with high utilization, polypharmacy, neurologic or behavioral complexity, and technology dependence are prioritized. Pharmacist-Led Medication Optimization Board-certified pediatric pharmacists perform full medication reconciliation, indication review, therapeutic duplication screening, pharmacokinetic dosing assessment, safety monitoring verification, and deprescribing evaluation. Recommendations are evidence-based and aligned with pediatric clinical pathways. Family-Centered Engagement Each family receives a structured Medication Action Plan that clarifies what the child is taking, why, how to monitor response, and what to do if symptoms change. Education is culturally appropriate and delivered virtually to eliminate travel burden. Provider Integration Medication recommendations are documented and communicated to local primary care and specialty clinicians. The program augments provider capacity rather than operating independently. Ongoing Monitoring Children remain on panel for longitudinal oversight, titration monitoring, side-effect assessment, and rapid response to clinical change. The model is built to integrate within Medicaid payment structures and support long-term adoption following demonstration of cost and quality impact.	\$1M-\$5M	Pharmacy	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Petersburg Medical Center	Alaska Independent CAH Network (AKICN) Shared Medical Office Planning Project	AK	In proposing this project, the AKICN member hospitals are responding to shared problems we face. Our hospitals serve exclusively rural and remote populations with extremely limited or zero peer providers to refer to locally, and each operates in a HRSA-designated Rural Health Professional Shortage Area. As unaffiliated, community-owned hospitals, each contends with outstanding infrastructure and capital needs with no clear funding source; operating from facilities a decade or more past their useful life. PMC and CCMC serve populations with no road access to other providers, while SPH serves communities both on and off the road system. Alaska’s BRFSS data shows a significant intersection between elevated chronic disease burden and other health outcome disparities in rural/remote communities with limited access to routine and specialized services and screenings. When our hospitals struggle to recruit positions or maintain service lines, the cost to rural Alaskans is immediate. The absence of local services forces patients to travel to other regions for care – incurring significant costs for airfare, transport, and lodging on top of procedure costs – or make difficult decisions to delay or forego care. We are also responding to opportunities. Community-owned hospitals cycle critical resources into each of our local economies, through employment and investments in training and professional development as well as our provision of comprehensive healthcare.	Through this immediately actionable project, AKICN will establish an AKICN Shared Medical Office capable of reducing cost inefficiencies and expanding access to clinical care, including by recruiting family medicine and emergency physicians. While our independent status intensifies challenges from rising costs and workforce shortages, it also allows greater responsiveness to emerging health needs and priorities in the communities we serve. The purpose of Critical Access Hospitals is improving rural and remote Americans’ access to healthcare by keeping essential services alive in our communities. With the places we serve hit particularly hard by inflation and cost volatility over the past five years, we are confident in the potential for this planning project to materially strengthen our rural workforce foundation and ultimately contribute to achieving the State’s third RHTP goal. Building the infrastructure needed for the proposed Shared Medical Office to launch a Rural Residency Rotation in the subsequent project year supports bringing early-career physicians to our remote service areas to experience the high quality of life and unparalleled sense of purpose practicing in rural Alaska offers. The Shared Medical Office will enable a range of projects to reduce all AKICN hospitals’ overall costs, enabling a framework for meaningful and consistent identification of resource sharing opportunities. Through the proposed planning project, the AKICN member hospitals will establish the infrastructure, staffing, and budget needs of a Rural Health Network Shared Medical Office. This includes developing data sharing agreements, staffing plans, and a multi-year budget; recruiting qualified applicants for AKICN Medical Director and Residency Coordinator roles to be hired by the final quarter of this project period, in order to launch the Shared Medical Office and Rural Residency Rotation program in a subsequent implementation project. A dedicated Network Director will coordinate project activities, convening AKICN hospital leadership to effectively leverage the potential of this partnership. While PMC will provide grant accounting and reporting, all governance and decision-making are shared. The problems we face are significant, but our opportunity lies in joining forces to confront them head-on to achieve the AKICN members’ vision that community-owned rural hospitals are the sustainable source of comprehensive modern healthcare Alaskan families depend on every day.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough; Petersburg Borough	Advance to Implementation Application

Petersburg Medical Center	Petersburg Medical Center Behavioral Health Department Launch Project	AK	Alaska has profound, well-documented unmet behavioral health (BH) needs. DPH estimates that nearly one fifth of Alaskan adults have a depressive disorder; the CDC reports that suicide is the leading cause of death for Alaskan youth and young adults (third nationally). An Alaska Native Epidemiology Center study found that 18% of White people and 28% of Alaska Native people statewide had experienced ACEs in four or more categories, an inflection point for health effects stemming from childhood trauma. Alcohol-related disorders are the leading cause of emergency department visits for Alaskan adults under age 65 – even in 2020 (Vital Records), with a state rate of alcohol-induced death three times the national rate. The Alaska Epidemiologic Profile reported nine of the state’s ten leading causes of death can be associated with substance misuse as a potential contributing cause (DBH) and recent estimates show the annual cost of harms and adverse outcomes related to alcohol misuse was \$2.4 billion. Petersburg Borough is a HRSA-designated Health Professional Shortage Area. In recent years, State BRFSS data has shown our region has an alcohol-related death rate higher than the state average and the highest prevalence of self-reported binge drinking. There is no local inpatient or intensive outpatient SUD treatment and currently no more than four practicing BH professionals of any kind. The need to expand preventative, screening, clinical, and specialty BH care access is undeniable.	In this immediately actionable project, PMC will leverage a decade’s investment in incremental BH expansion to establish a fully operational Behavioral Health Department. In the first RHTP budget period, the proposed project will (1) establish dedicated full-time leadership, (2) recruit an additional clinician whose professional experience complements existing gaps in the continuum of care, (3) expand access to PMC’s current telepsychiatry provider for provider consultation and periodic in-person services, (4) connect primary care providers with relevant BH training onsite, (5) plan a BH internship for new BH providers pursuing licensure to launch in 2027, and (6) work closely with hospital leadership to identify and prioritize new telehealth, hybrid, and onsite service line additions to be added within the following three years. The project is designed to build full spectrum BH access within the only local medical provider for those living in remote communities in and around Petersburg Borough. PMC’s healthcare services are provided through our Joy Janssen Primary Care Clinic, 12 inpatient hospital beds, and 24-hour Emergency Department; a State-licensed Medicare-certified Home Health agency and Long Term Care Unit with a five-star rating from Medicare’s Nursing Home Compare; school-based and outpatient behavioral health; visiting specialties; full-service lab, imaging center with same-day diagnostic testing; on-site licensed drug and pharmacy compounding rooms; and a robust Community Wellness program providing nature-based outdoor childcare and summer camps, community- and school-based suicide and substance use prevention activities, and falls prevention programming for older and disabled residents. PMC also provides our community with overnight observation stays and infusion services, such as chemotherapy, blood transfusions, and monoclonal antibodies, and is soon to open the Borough’s first local MRI services. Each of these service lines is a potential referral point for behavioral health services, once expanded access has been established. Given our region’s seasonally fluctuating population and Southeast residents’ preference for traveling by boat to nearby providers over a flight outside, PMC serves unduplicated individuals far in excess of U.S. Census and Alaska Department of Labor estimates for our Borough’s total population. Service expansion within our hospital system has the potential for outsized impact in our region and the state as a whole.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Petersburg Borough	Advance to Implementation Application

Petersburg Medical Center	Petersburg Medical Center Home & Community-Based Services Expansion Planning Project	AK	Southeast Alaska has one of the nation’s highest populations of older adults and has been among the fastest growing for more than a decade. In 2025 the Department of Labor estimated a quarter of Petersburg Borough’s population was over age 65, with the relative population of 65+ year-old residents projected to remain at or above 25% through at least 2035. The Alaska Commission on Aging reports Alaskan seniors living below the poverty line increased in the last decade. Rapid increases in the availability of specialized Home Health, HCBS, and Long Term Care are needed statewide, but most of all in remote communities like ours, where these services have been closing, consolidating, or struggling to gain a foothold under burdensome and contradictory federal regulations for well over a decade. For our communities, it is essential to meet the needs of this population; to empower older adults to live as long as possible in their own homes, reduce the strain family caregiver faces, and prevent unnecessary or accelerated transfers into higher-cost, institutionalized care far away. It is deeply unjust when rural Alaskans are denied access to the HCBS that can enable continued independent living and end of life care in the communities they chose to spend life in. PMC’s Home Health team is determined to act on the unprecedented opportunity offered by Alaska’s Rural Health Transformation Program and reduce the stark divides between rural and urban access to these essential services.	In this immediately actionable project, PMC will conduct internal, community, and regional planning in preparation for a three-year expansion of vital Home and Community-Based Services (HCBS) by developing necessary infrastructure, equipment, supplies, and CMS service line additions. Capital investment in a wheelchair converted van and purchase of safety supplies/wellbeing activities for those with Alzheimers Disease and Related Dementias (ADRD), combined with coordinated planning by the project team, prepare us to launch the HCBS our region currently lacks, including Transportation, In-Home Services, Respite and more; and enable expansion of PMC’s limited Adult Day Services program. HCBS can prevent people’s institutionalization and sustain local caregivers by establishing supports they have a right to – but currently zero access. The project is led by a team of highly qualified PMC providers, including the Home Health Manager, who will oversee integration of nursing-centered service lines and inpatient respite; Home Health Patient Navigator, to coordinate service line requests to CMS and travel by boat among 12 nearby communities, conducting in-person and remote outreach to identify telehealth and remote monitoring opportunities and priorities; and Quality Improvement Coordinator, who will work with local partners to conduct mobility assessment in the city of Petersburg and support development of referral/billing protocols and risk/liability parameters. Additional staff time supports timely completion of the AI enhancements to the EMR, project data collection and monitoring, and communication about new service lines and opportunities for public comment. Finally, the project invests in a unique position designed to bridge the planned comprehensive HCBS expansion with patients’ lived reality. The Coverage Integrity Navigator will serve patients in Clinic, Emergency, Long Term Care, Home Health, and community settings. Consider a rural resident in their 70s who walked into PMC’s Clinic never having applied for Medicare. It is not enough to point this person to online forms, or even to write off their bill. What they need is someone to sit down with them and listen. To hear the full range of their challenges and walk beside them in accessing coverage, enrolling with a provider, and connecting with food, housing, or transportation supports if needed. The bridge is as needed as the service to prevent needless suffering and emergencies.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Petersburg Borough; Wrangell (City and Borough)	Advance to Implementation Application

Petersburg Medical Center	Petersburg Medical Center Telehealth Integration Program	AK	It’s hard to overstate the impact of telehealth access in communities like ours. Rural Alaskans often go without needed healthcare when it requires lengthy, costly, logistically complicated travel; or delay that travel until a health condition has become more acute and expensive to treat. Access to specialist care in the places we live is vital. Straightforwardly, telehealth saves lives in rural and remote Alaska. Remote access to providers improves outcomes whether experiencing stroke, complications of chronic disease, or behavioral health conditions. It reduces the potential dangers of polypharmacy for patients with complex medication management needs and increases patients’ sense of privacy and willingness to seek care for stigmatized physical or behavioral health conditions in tightknit places. The potential for impact when expanding use of telehealth in rural healthcare is nearly unparalleled. However, the benefits of telehealth can be undermined by multiple factors. The importance of relationship and data exchange between local and remote providers; the cost of launching services that may take 12-18 months to stabilize and self-sustain; the gaps in small hospitals’ existing billing, coding and EMR systems that make long term sustainability impossible if not resolved; the need for building "soft” infrastructure, like referral pathways and community education, without which service uptake will flounder, and more. These are challenges our project strives to address.	In this immediately actionable project, PMC will establish two positions needed to integrate telehealth usage, technological infrastructure, and consistent referral, coding, billing, and patient care practices across all departments. Within the first RHTP budget period, the project will integrate telehealth service line development into our EMR, establish remote service days for primary care and integrative health, and build out new telehealth specialties focused on urology and endocrinology (prioritized due to high prevalence of diabetes morbidity/mortality). PMC’s healthcare services are provided through our Joy Janssen Primary Care Clinic, 12 inpatient hospital beds, and 24-hour Emergency Department; a State-licensed Medicare-certified Home Health agency and Long Term Care Unit with a five-star rating from Medicare’s Nursing Home Compare; school-based and outpatient behavioral health; visiting specialties with out-of-town providers; a full-service lab and imaging center; on-site licensed drug and pharmacy compounding rooms; and a robust Community Wellness program providing suicide and substance use prevention activities, falls prevention programming for older and disabled residents, and nature-based outdoor childcare and summer camps. PMC provides our community with overnight observation stays and infusion services, such as chemotherapy, blood transfusions, and monoclonal antibodies, and is soon to open the Borough’s first local MRI services. Given our region’s seasonally fluctuating population and Southeast residents’ preference for traveling by boat to nearby providers over a flight outside, PMC serves unduplicated individuals far in excess of U.S. Census and Alaska Department of Labor estimates for our Borough’s total population. The project will be implemented by a Telehealth Program Coordinator who will manualize protocols, roles, and referral pathways, deliver provider training and tech uptake, and identify clinically-driven priorities for new service lines. A Telehealth Access Facilitator will schedule with providers and patients, deliver appointment support, and coordinate follow-up care. Other critical roles include remote Nurse Practitioner and Physician care delivery, timely completion of EMR integration, project data collection, and community outreach about new services. The planning team is confident that this planned infrastructure supports rapid parallel planning and service additions, achievable within the 2026 RHTP project period.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Petersburg Borough	Advance to Implementation Application

Petersburg Medical Center	Petersburg Medical Center Maternal Health & Early Childhood Planning Project	AK	It is not possible to describe this problem more clearly than Alaska’s Department of Health did in illustrating it for CMS: “Families living off the road system face provider shortages, long travel distances, and unreliable transportation, often requiring pregnant women to leave their communities and temporarily relocate prior to delivery to access facilities equipped for labor, delivery, and high-risk monitoring, which creates emotional, financial, and logistical strain. After birth, mothers and infants often face isolation and limited support for needs such as lactation, nutrition and pediatric needs.” Like many rural and remote Alaskan communities, those in our Borough face the high costs and increased isolation and stress of having to leave home to give birth. In many of the state’s communities, however, a Tribal Health System provider with hub OBGYN interoperability serves all residents. For those living in and around Petersburg Borough, this context is reversed. The community-owned Critical Access Hospital provides primary, emergency, and other healthcare for all residents, including beneficiaries of the regional Tribal health consortium (SEARHC). While we cherish our role, this context uniquely exacerbates the challenges of reengaging postpartum individuals and their newborns in services. The best way to bridge this is to offer these families value, through services that have an immediate impact on family wellbeing as well as the longterm health of their child.	In this immediately actionable project, PMC’s Primary Care Clinic will launch lactation services and engage the Community Wellness Program in assessing the viability and priorities for a future expansion of clinic-linked, community-based services designed to improve maternal and infant health. There is currently no breast pump rental offered in Petersburg Borough, WIC no longer serves the Southeast region from Juneau, and PMC saw an average of 31 infant patients per year in recent years, so rapid service launch is vital. The plan of action (including budget and staffing needs) generated during this project period will inform further potential service expansion beginning mid-2027. Launch of lactation services will be led by Kellii Wood, RN, CLC, BSN; a Petersburg mother and healthy lactation advocate who has also been a dedicated part of PMC’s Grow-Our-Own pipeline partnership with UAA School of Nursing. Her insight into the challenges new parents encounter in our Borough and commitment to expanding access to the services they need are key to project success. Ms. Wood will oversee the development of charting practices, patient protocols/policies, and program inventory; work with an IT specialist to ensure timely integration into PMC’s Cerner electronic medical record; and partner with the Clinic leadership and PMC Public Relations to deliver patient and provider education. Concurrent with the development and launch of lactation consulting services, Clinic and Community Wellness leadership will assess sustainable opportunities to address prenatal, postpartum, and early childhood health gaps in our service area through community-based services such as home visiting or other structured outreach (diaper pantry, quarterly baby shower, etc.). The State’s RHTP approach embraces Healthy Beginnings and Health Care Access working hand in hand to deliver lifelong health and wellbeing. As sole provider of most healthcare in our service area, and given our region’s seasonally fluctuating population and Southeast residents’ preference for traveling by boat to nearby providers over a flight outside, PMC serves unduplicated individuals far in excess of U.S. Census and Alaska Department of Labor estimates for our Borough’s total population. RHTF investment in the proposed project has the potential for outsized impact in our service area and region as a whole.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Petersburg Borough	Advance to Planning

Petersburg Medical Center	Petersburg Medical Center Critical Medical Equipment & Training Request	AK	PMC’s proposed omnibus capital equipment and training investment directly addresses some of our state’s most significant health disparities for rural Alaskans. Alaska’s BRFSS data demonstrates a significant intersection between elevated chronic disease burden and other health outcome disparities in our rural and remote communities with limited access to routine and specialized services alike. Cancer is Alaska’s leading cause of death, yet fewer Alaskans served by Medicare receive mammogram screenings than the national average. Our Department of Health reports colorectal cancer as the state’s second highest type of cancer death, but nearly a third of Alaskans 50-75 years old do not meet colorectal cancer screening guidelines. Heart disease causes nearly one in five deaths in Alaska and roughly a third of adults in the state have high blood pressure. In each of these high mortality areas, rural families like those we serve face unique challenges accessing the prevention, screening, and monitoring needed to address their risk. Residents of the Southeast region of the state, where PMC is located, have the state’s highest death rate from diabetes. Our Borough also has one of the state’s highest proportions of senior residents, at one in four individuals. In this project, PMC has an unprecedented opportunity to solve gaps across each of these health disparities, transforming access to modern prevention, diagnostic, and treatment technology, within a single funding period.	In this immediately actionable project, PMC will coordinate medical equipment purchases – and related training and EMR integration – across the hospital’s ER, Primary Care Clinic, Imaging, and Laboratory. A detailed line item budget of high-priority needs is ready for the State’s review. Direct project costs include oversight in each department, IT, purchasing, and data collection, with administrative costs usually assessed in an indirect rate covered by PMC. All personnel involved in execution of project objectives have been engaged in planning, budget development, and review. In addition to capital equipment investments, the project establishes three new positions, each sustainable through billing by the end of the project period with no further RHTF request. These include a Nurse Educator to integrate new technology and equipment into workflow; an experienced onsite MRI Technician to implement PMC’s new MRI service line; and an MRI Tech Aide/Registrar anticipated to be a local CNA or Medical Assistant hire trained onsite through this project. The project directly addresses gaps described above by investing in our Borough’s sole provider of nearly all health services. PMC’s services are provided through our Joy Janssen Primary Care Clinic, 12 inpatient hospital beds, and 24-hour Emergency Department; State-licensed Medicare-certified Home Health agency and Long Term Care Unit with a five-star rating from Medicare’s Nursing Home Compare; school-based and outpatient behavioral health; a visiting specialties program coordinating local care with out-of-town providers; full-service lab, imaging center with same-day diagnostic testing, and licensed drug and pharmacy compounding rooms; and a robust Community Wellness program providing suicide and substance use prevention, falls prevention for older and disabled residents, and nature-based outdoor childcare and summer camps. PMC provides overnight observation stays and infusion services, such as chemotherapy, blood transfusions, and monoclonal antibodies, and is opening the area’s first local MRI services. PMC serves unduplicated individuals far in excess of U.S. Census and Alaska Department of Labor estimates for our Borough’s total population. Given our region’s seasonally fluctuating population and Southeast residents’ preference for traveling by boat to nearby providers over a flight outside, RHTF investment in the proposed project will have an outsized impact in our service area and greater region.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Petersburg Borough	Deferred or Not Advanced

Petersburg Medical Center	Petersburg Medical Center Replacement Health Campus Design Project	AK	Rural Alaskans are routinely expected to settle for less access to comprehensive healthcare in the places we actually live, fewer preventative screenings and service types, and lower quality, aging buildings that cost more to maintain and cannot support the tech demands of modern healthcare. The absence of local services often forces rural Alaskans to travel to other regions for healthcare – incurring significant airfare, transport, and lodging expenses on top of procedure costs – or make the impossible decision to delay or forego care based on the financial, caregiving, or other access barriers created by the need to travel. Most rural Alaskans, like those PMC serves, also live in HRSA-designated Health Professional Shortage Areas. Health professionals want to work in modern, well-equipped, functional facilities built to comply with current patient safety regulations and support innovation. Recruitment challenges are made much worse when our facilities are all but held together by duct tape. Alaska’s Critical Access Hospitals sustain access to healthcare by keeping essential services in rural communities. With those very communities hit hardest by inflation and cost volatility, community-owned CAHs like PMC face uphill battles trying to fully fund urgently needed infrastructure and capital improvements. Yet as a provider uniquely governed by and responsive to the people we serve, there is simply no alternative: we will keep working toward a solution on every front possible.	With all local healthcare for Petersburg Borough currently located in a facility past its functional life, the danger of losing full access to local care in this area is imminent. In this immediately actionable project, PMC will engage an architect to rapidly bring designs for both a new hospital and Long Term Care center to 100% completion. Funding will cover the direct costs of developing a community-informed plan for this state-of-the-art, emerging tech-centered health campus, reflecting current and future needs of our service area. The health campus site is shovel-ready (Phase 1) with the first of three health campus buildings completed in 2025. The proposed design project will happen in parallel with PMC’s continued development of the full funding stack required to begin construction, materially improving our ability to qualify for a diversified range of construction funding sources. PMC’s healthcare services are provided through our Joy Janssen Primary Care Clinic, 12 inpatient hospital beds, and 24-hour Emergency Department; State-licensed Medicare-certified Home Health agency and Long Term Care Unit with a five-star rating from Medicare’s Nursing Home Compare; school-based and outpatient behavioral health; visiting specialties program; full-service lab, imaging center with same-day diagnostic testing; on-site licensed drug and pharmacy compounding rooms; and a robust Community Wellness program providing youth suicide and substance use prevention activities, falls prevention programming for older and disabled residents, and nature-based outdoor childcare and summer camps. PMC provides overnight observation stays and infusion services, such as chemotherapy, blood transfusions, and monoclonal antibodies, and is soon to open the Borough’s first local MRI services. Given our region’s seasonally fluctuating population and Southeast residents’ preference for traveling by boat to nearby providers over a flight outside, PMC serves unduplicated individuals in excess of U.S. Census and Alaska Department of Labor estimates for our Borough’s total population. When complete, the PMC Health Campus will comprise a Wellness Center (Phase 2, completed in 2025 on schedule and under budget), expanded Long Term Care with integrated Home Health Services and Youth Programs for an innovative full spectrum model of care (Phase 3), and Hospital with Emergency Department and Primary Care Clinic (Phase 4).	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Petersburg Borough	Deferred or Not Advanced

PGA Solutions	Expanding Access to Creative and Therapeutic Learning in Rural Alaska	AK	Rural Alaska communities face limited access to early childhood education, affecting long-term health, development, and well-being. Our project addresses this gap by providing high-quality preschool programs at our Homer learning center, integrating family engagement, nutrition, and health education. We will train staff, purchase new learning tools for children, and improve facility infrastructure to enhance program quality, support healthy development, and align with RHTP goals of expanding access, quality, and sustainability while advancing CMS priorities for preventive care and community-based health initiatives.	Rural Alaska communities face significant gaps in early childhood education and supportive services, which directly impact long-term health, developmental outcomes, and community well-being. Many families in remote and frontier regions lack access to high-quality preschool programs that integrate health, nutrition, and family support. Girassol Learning Center, based in Homer, Alaska, seeks to address this opportunity by expanding its early childhood education programs to serve more children and families with comprehensive, community-centered support. Our project focuses on strengthening program quality and sustainability through multiple strategies. We will provide specialized training for staff, enhancing their ability to deliver developmentally appropriate curriculum, integrate health and wellness concepts, and respond to the unique needs of rural children. New learning tools and educational materials will be purchased to create interactive, engaging, and culturally responsive classroom environments. We will also improve the facility infrastructure to support a safe, accessible, and stimulating learning environment, including enhancements that promote hygiene, mobility, and flexible learning spaces. These efforts align directly with Alaska RHTP goals, addressing access, quality, and sustainability of health-related services in rural and frontier communities. By embedding health education, family engagement, and preventive care practices into our preschool programming, we are strengthening early childhood outcomes, supporting healthy beginnings, and creating a replicable model for community-based interventions. This approach also supports CMS priorities by integrating preventive care, promoting healthy development, and building local capacity to sustain long-term improvements in health and wellness. Ultimately, our project positions Girassol Learning Center as a hub for early childhood education and wellness, addressing critical gaps in rural Alaska while fostering community resilience, workforce development, and lasting positive impacts on children and families.	\$50,000-\$250,000	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

PGA Solutions	Rural Clinic Technology Integration and Systems Efficiency Initiative	AK	Rural and frontier healthcare providers across Alaska face operational and technology barriers that limit their ability to deliver efficient, coordinated care. Many small clinics operate with limited administrative staff and little access to systems analysts or technical experts who can support implementation and optimization of health information technologies. As a result, clinics often rely on fragmented systems for scheduling, documentation, communication, and patient records, creating inefficiencies that increase administrative burden and reduce time for patient care. These challenges are acute in rural communities where recruiting specialized technical staff is difficult and providers must manage both clinical and operational responsibilities. Without support to evaluate workflows, integrate digital systems, and train staff, rural clinics struggle to fully use electronic health records, telehealth platforms, and other tools designed to improve care coordination. This project will strengthen rural healthcare delivery by providing systems analysis, workflow optimization, technology integration, and staff training for clinics serving remote and frontier communities. These improvements will increase provider capacity, strengthen care coordination, and support sustainable healthcare services in rural communities.	This project will strengthen rural healthcare delivery in Alaska by improving clinic operations, expanding the effective use of digital health technologies, and building workforce capacity in clinics serving remote and frontier communities. The project aligns with the CMS Rural Health Transformation Program’s goals to improve sustainable access to care, strengthen the rural workforce, and advance technology-enabled healthcare delivery across Alaska’s rural health system. The project will begin with operational and workflow assessments at participating clinics to evaluate administrative processes, health information system use, and care coordination practices. These assessments will identify inefficiencies, technology gaps, and opportunities to improve clinical workflows, data sharing, and communication across providers and care settings. Findings will inform tailored improvement plans that reflect each clinic’s staffing capacity, existing infrastructure, and role within Alaska’s regional hub-and-spoke healthcare delivery system. Based on these assessments, the project team will provide targeted technical assistance to optimize digital health tools, including electronic health record systems, telehealth platforms, scheduling systems, and secure provider communication tools. Implementation activities will focus on improving interoperability, strengthening data management practices, and enabling more efficient coordination between rural clinics, regional health hubs, and specialty care providers. The project will also support workforce development by providing training and hands-on technical support for clinic staff. Training will focus on practical use of digital health systems, workflow optimization strategies, and operational practices that allow providers and support staff to work more efficiently in resource-constrained rural environments. By strengthening staff capacity to manage technology-enabled care delivery, the project will help rural clinics sustain improvements beyond the grant period. Through these activities, the project will improve operational efficiency, strengthen care coordination, and expand access to technology-enabled care services in rural communities. By supporting technology adoption, workforce capacity, and coordinated healthcare delivery models, the project will contribute to long-term system transformation and improved health outcomes for rural Alaskans.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

PharmaSmart International LLC	RHTP: Pharmasmart Screening + SDOH + EHR Prevention (Hypertension/Diabetes)	MI	Rural, remote, and frontier communities in Alaska face persistent barriers to timely preventive care—long travel distances, limited workforce capacity, weather-related disruption, and fewer routine touchpoints with primary care. As a result, hypertension and diabetes risk often go undetected or unmanaged until complications occur, increasing avoidable emergency visits, hospitalizations, and long-term costs. This project addresses the opportunity to shift screening and prevention upstream by expanding access to clinically validated BP and metabolic risk screening in convenient community settings, capturing SDOH barriers that affect follow-through, and ensuring results are integrated into the EHR so local care teams can act on findings, coordinate referrals, and support sustained risk reduction over time.	We will implement an EHR-connected, community-based screening and prevention model that brings clinically validated hypertension and diabetes risk screening to rural and frontier settings, while ensuring results translate into follow-up care. Core approach Deploy Pharmasmart screening stations in accessible local sites (community pharmacies where available, village clinics/tribal facilities, regional hubs, local community centers, and mobile outreach events). Standardize screening workflows to capture clinically validated BP, pulse, weight, and BMI (with repeat BP measurement when indicated) plus brief diabetes risk screening and prevention education. Capture SDOH factors at the point of screening (e.g., transportation, food access, housing stability, connectivity, medication affordability) with the ability to be further customized, to identify barriers and route people to appropriate local resources. Integrate results into participating EHRs (or secure reporting pathways where needed) so care teams can review findings, trigger referrals, and document follow-up without manual re-entry. Establish closed-loop follow-up with local clinical partners (telehealth or in-person as appropriate) for elevated BP and diabetes risk, including referral to prevention and management supports. Provide data to enable the tracking outcomes and performance metrics (screening volume, abnormal results, successful follow-ups/referrals, and improvements over time) to guide iteration and support scale. This approach is designed to be practical in low-resource environments, scalable across multiple communities, and focused on converting screening into measurable improvements in prevention and chronic disease control.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Pharos Capital Group	Pharos Capital - Healthcare Impact Investing for Underserved Communities	TX	We will defer to our other pending applications for more detailed descriptions that are individualized to each unique project. Our intent to apply here at the parent level is in effort to provide flexibility and support to our organizations as they navigate the RHT process.	We will defer to our other pending applications for more detailed descriptions that are individualized to each unique project. Philips North America LLC	PHILIPS partnering with the State of Alaska on improving pregnancy health literacy and outcomes.	DC	Over the past three years in working in other States, we have found that the majority of pregnant women do not use the State-offered website for maternal health but instead, use their phone for research and education. Our app resides on their phone and can be their direct and trusted source for maternal health guidance. Many pregnant women are not aware of preventative steps they should be taking once they become pregnant. Our goal is to ensure the app helps pregnant women become better prepared during their pregnancy, have better awareness of what resources are available, and where to actually go to get those resources. The success we have shown in Michigan, Arkansas, and New York are the best examples of reaching our goal.	We currently have 15% of pregnant women in the State that are users on our app. The app is free and the add downloads to any phone using iOS or Android. Once we enter into a contract with a state department, such as Department of Health, we then prompt the user within the app to confirm their State of residence. The user then receives updated content that expands with additional resources available specifically in their State, in addition to the content already provided to the user. Due to the significant limited number of locations for prenatal care, the app can guide users to the nearest locations based on incorporating state location sites within the app.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Physician Research Institute	Early Alzheimer’s Dementia Detection and Care Pathway Mapping in Rural Alaska	MD	In 2020, ~8,400 Alaskans age 65+ were living with Alzheimer’s (AD), a number projected to double by 2030 and quadruple by 2050. Mortality rates from Alzheimer’s disease have significantly increased over time, with more deprived counties showing a 34% higher mortality rate compared to less deprived areas. Many older adults are at elevated risk of developing mild cognitive impairment (MCI), and already ~12–18% of people age 60+ have MCI. However, outside urban hubs, limited specialty access and advanced diagnostics can delay recognition until functional decline is evident. Because ~45% of dementia cases may be preventable or delayed by addressing modifiable risk factors, Alaska has a major opportunity to shift upstream. MINT-AD uses demographics, routine health history, baseline cognition, and social determinants to stratify individuals into low/medium/high risk of cognitive decline with a 90% accuracy. Opportunity: Costs are substantial; Medicaid spending for Alaskans 65+ with AD/other dementias is ~\$119M, while unpaid caregiving is valued at ~\$887M annually. PRISM moves the front door of dementia prevention into primary care and trusted community settings so higher-risk, cognitively normal adults can be identified and enrolled in structured, evidence-informed lifestyle supports. Even delaying progression by ~2 years for a modest cohort (e.g., ~1,000 Alaskans) could save millions in direct medical and long-term care costs while preserving caregiver and workforce capacity.	This 12-month demonstration and launch is designed to stand on its own by establishing the operational infrastructure needed for long-term impact. If Year 1 targets are met, Alaska can scale PRISM in Years 2–3 using the same implementation playbook. Phase 0 (Months 0–4): PRISM stand-up. We will finalize MOUs/LOIs with two core sites plus one to two additional partner sites; map site workflows; define a minimal dataset; conduct train-the-trainer sessions; complete go-live checklists; and activate consent, data governance, and secure data handling processes. Phase 1 (Months 4–12): Launch + screening ramp. We will embed screening into routine primary care and community touchpoints; deploy outreach and recruitment materials; and operationalize MINT-AD risk tiering to stratify participants into low/medium/high risk with defined referral rules and follow-up pathways. Phase 2 (Months 6–12, in parallel): Intervention start. Once cohorts enroll, participants begin a POINTER-informed multidomain lifestyle pathway designed for ongoing follow-up beyond Year 1 as the program scales. Check-ins occur monthly or every 6–8 weeks, caregiver education/support is activated, and progress tracking uses low-burden engagement (phone/SMS prompts and optional wearable-enabled capture where feasible). Phase 3 (Month 12): Transition planning. We will complete implementation documentation (workflow maps, training materials, governance templates, reporting dashboards) and finalize a sustainability and replication plan for additional rural sites, contingent on Year 2–3 funding.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Pillars of Care Assisted Living, LLC	Fire Sprinklers	AK	Our assisted living home currently lacks automatic fire sprinklers, creating a serious life safety gap for our vulnerable residents—many with mobility limitations or cognitive impairments or developmental disabilities—in a remote rural Alaskan community. This project presents a high-impact opportunity to install life-saving sprinklers, dramatically improving resident safety, ensuring continuity of care, and protecting our essential role in Alaska's limited rural long-term care network.	Our proposed approach is to install a comprehensive automatic fire sprinkler system throughout the entire assisted living home, designed and installed in full compliance with NFPA 13 standards for healthcare occupancies and applicable Alaska building/fire codes. Key steps include conducting a professional fire-protection engineering assessment and hydraulic design to ensure optimal coverage, water supply adequacy, and minimal disruption during installation. The installation will be phased or conducted in sections to maintain resident safety and minimize care interruptions. This process will also involve post-installation acceptance testing, inspection, staff training on system operation and response protocols, and securing permits, inspections, and final certification from the local authorities having jurisdiction.	\$50,000-\$250,000	Home-and community-based services provider	Single Community	Kodiak Island Borough	Deferred or Not Advanced
Pinnacle Integrated Medicine, Inc.	Alaska Provider Network (APN) Rural Health Transformation Coordination Project	AK	1. Strengthen Maternal & Childhood Development (Healthy Beginnings) by Funding Training (Strengthen Workforce) in Lactation Support and Maternal Depression & Childhood Development SCREENINGS. 2. Improve PCP access by investing in rural CNA/CHA/LPNs & IMAGING (Health Care Access). 3. Use RPM/CCM to Increase access to specialized services (Health Care Access), Deploying consumer-facing digital tools (Spark Technology and Innovation) that Evaluates and Pilots emerging health technologies (Spark Technology and Innovation). 4. DEPLOY MOBILE MEDICAL CLINICS (Health Care Access). 5. Strengthen TRIBALLY LED CARE (Health Care Access). 6. CONDUCT PROVIDER GAP ANALYSES (Health Care Access). 7. Integrate analytics across multi-payer health and data systems by Empowering providers' use of EARLY STAGE INTERVENTION AI tools for care delivery (Spark Technology and Innovation). 8. Deliver TA for SUCCESSFUL VBC PARTICIPATION (Pay for Value) to Establish innovative care models to support regional care coordination (Pay for Value). 9. Support VBC and APM INFRASTRUCTURE (Pay for Value) by building infrastructure to support provider participation in VBC (Healthy	1. Screenings: MNA & ACP will provide TA for Lactation Support and Maternal Depression & Childhood Development Screenings. 2. CNA/CHA/LPN & Imaging: MS & MNA will train case managers, supporting home health & hospice (HHH) solutions aided by telemedicine and mobile X-rays. X-Ray, CT imaging, Cyclotron and Nuclear Pharmacy through KMG in Homer and VI in the Valley to keep care local. 3. RPM/CCM: Expanding ECG aligns with CMS's Health Technology and ASTP/ONC criteria for patient-facing apps, one of CMS's top priorities. 4. Deploy mobile medical clinics: Kabo, MVHS and SALA will deploy mobile clinics to patients with no access to care, including discharged homeless. 5. Tribally led care: The Knik Tribe, who will fund buildout, will deploy a multi-specialty clinic for its 10K+ members. 6. Conduct provider gap analyses: APN & HUB have access to statewide data with provider analyses, geo-mapping and analytics core to our service offering. 7. Early-Stage Intervention AI: APN will deploy its Predictive Analytics AI models and ECG devices with real-time EMR Alerts for early acute risk patient intervention. 8. TA for successful VBC participation: APN will help develop State VBC solutions. HUB will support by designing benefits that align incentives. 9. APM Infrastructure: APN will implement HITECH-Cert EHRs as needed to ensure interoperability and build APIs in new and existing EHRs for claim and RPM integration. 10. Establish APMs: MNA & HUB will design and implement DPC benefits, educate employees, and navigate the unique aspects of Alaska's DPC legislation to ensure compliance while maximizing access. - Communities).
10. ESTABLISH APMs for preventative and chronic disease management (Pay for Value).
11. Integrate and store patient health data in the HIE (Spark Technology and Innovation).
12. Create TELEHEALTH-ENABLED SPECIALTY CARE access programs (Spark Technology and Innovation).
11. HIE: APN will leverage its integration expertise and provide API integrations from provider’s EMRs to the State HIE.
12. Telehealth-enabled specialty care: Troy’s operational telemedicine will expand, working with rural clinics. ACP will guide a cloud-based HIPAA-compliant VoIP UCaaS platform. Data archiving, integrated video, messaging, file sharing, recording, AI-enabled support and higher data fidelity will provide collaboration with patients, enabling mobile and unmanned care models such as dental clinics and health kiosks. MNA will deploy Endocrinology In-Person/Telemedicine clinics with training for dietitians and educators, in partnership with the State of Alaska’s Healthy Start Program, the use of CGM Monitoring, and new VBC/DPC models. Offering enhanced training, structured mentorship, tele-consultation support, and professional development.

Pioneer Peak Farm	HomeCookin Caregiver Nutrition Support Pilot	AK	Family caregivers in Alaska provide essential daily care for individuals living with dementia, developmental disabilities, chronic illness, and age-related conditions. In rural and communities these caregivers often function as an extension of the health care workforce. Despite their critical role, caregivers frequently experience high levels of stress, time constraints, and limited access to convenient, nutritious food options. These pressures can lead to caregiver burnout, declining health for both caregivers and those they care for, and increased reliance on emergency services or institutional care. In Alaska’s remote communities, where workforce shortages and geographic barriers already strain the health system, strengthening caregiver capacity is an important opportunity to support community-based care and improve long-term health outcomes. This project addresses the opportunity to support caregiver wellbeing through a preventive, community-based nutrition support program that provides nutritionally balanced prepared meals to caregiver households. By reducing daily meal preparation burdens and improving access to healthy food, the program aims to help caregivers maintain their health and resilience while continuing to provide essential care at home. The pilot will explore how caregiver-focused nutrition support can serve as a scalable strategy to strengthen community health systems and support sustainable care in Alaska’s rural and frontier communities.	The HomeCookin Caregiver Support Pilot will test a community-based model designed to support family caregivers through improved access to nutritious prepared meals and practical nutrition support. The program will provide weekly distributions of nutritionally balanced prepared meals for caregiver households supporting individuals with dementia, developmental disabilities, chronic illness, or age-related conditions, and other households with special circumstances. Meals will be designed to support overall wellness. By reducing the time and effort required for meal planning, grocery shopping, and food preparation, the program helps relieve daily pressures on caregivers, allowing them to focus more fully on providing care while maintaining their own health and wellbeing. The pilot will initially serve caregiver households in the Matanuska-Susitna Valley, with program design intentionally developed to inform future expansion to additional rural and frontier communities. Meals will be prepared through the existing HomeCookin program infrastructure and distributed through flexible pickup locations and regional delivery partnerships to maximize accessibility. A key component of the project will be workforce development. Culinary arts and nutrition students will participate in menu development, food preparation, and nutritional analysis under program supervision. This provides hands-on training opportunities while helping build a pipeline of professionals interested in community health, food systems, and preventive care initiatives. The pilot will also collect program data and participant feedback to evaluate caregiver participation, satisfaction, and perceived impact on caregiver wellbeing and household food access. These findings will help determine the feasibility and effectiveness of caregiver-focused nutrition support as a scalable strategy to strengthen community-based care. By integrating nutrition access, caregiver support, and workforce development, this pilot will test an innovative approach to improving health system sustainability and supporting families providing essential care across Alaska’s rural and frontier communities.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Pioneer Peak Farm	HomeCookin Postpartum Nutrition Support Pilot	AK	Family caregivers in Alaska’s rural communities often experience significant challenges during the postpartum period. New mothers must recover from childbirth while caring for a newborn, often with limited support systems or having additional children to take of in the home. The postpartum period is a critical window for maternal health. Adequate nutrition, rest, and support can significantly influence recovery, mental health, breastfeeding success, and long-term wellbeing for both mother and infant. However, many families face time constraints, financial pressure, and geographic barriers that make consistent access to healthy meals difficult during this time. This project addresses the opportunity to support maternal recovery and early family health by providing nutritionally balanced prepared meals to postpartum mothers. By reducing the burden of meal preparation and improving access to healthy food, the program aims to support maternal recovery, reduce stress during the postpartum period, and contribute to healthier outcomes for mothers and infants in rural Alaska.	The HomeCookin Postpartum Nutrition Support Pilot will test a community-based approach to supporting maternal recovery by providing nutritionally balanced prepared meals to postpartum households during the critical early weeks following childbirth. Participating mothers will receive weekly distributions of prepared meals designed to support postpartum recovery, energy needs, and overall maternal wellbeing. Meals will focus on nutrient-dense ingredients that support healing, sustained energy, and breastfeeding where applicable. By reducing the time and effort required for meal planning, grocery shopping, and cooking, the program helps families focus on recovery, infant care, and household stability during the postpartum period. The pilot will initially serve families in the Matanuska-Susitna Valley and Eagle River, where existing infrastructure can support meal preparation and distribution. A workforce development component will engage culinary and nutrition students in menu design, food preparation, and nutritional analysis. This provides hands-on training while helping build workforce capacity in community health, nutrition, and preventive care initiatives. Program feedback and participation data will be collected throughout the pilot to evaluate feasibility, participant satisfaction, and potential health and wellbeing benefits for postpartum families.	\$50,000-\$250,000		Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced
Pioneer Peak Orthopedics	Capturing Patient Outcomes	AK	We would like to track outcomes for patients across a series of different treatments and surgeries to see how successful their recovery process is and what leads to a more successful outcome for patients. We have identified 40 areas of service that we would like to track to see what affects patient outcomes during and after treatment. With a diverse population and a population that spans thousands of miles, we are looking to capture the best treatment options for patients who don't always have access to immediate medical care.	We would like to bring a research assistant on board to help develop, manage and quantify patient responses. Our plan is to identify questions pertaining to each treatment we offer and follow the patient for up to 1 year after treatment. Factors we will be looking at will be recovery times, rates of infection, environmental factors, social supports.	Under \$50,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Pioneer Peak Orthopedics	Outreach to remote Practicioners	AK	We would like to travel to to Barrow, Bethel and Nome twice a year to meet with and train Practitioners. We see and service any patient who is transferred from Northern Alaska as Wasilla AK and Fairbanks AK are the closest major hospital systems. Often times, there are simple and effective treatments that can be made to stabilize an Orthopedic injury. We would like to train: Shoulder, hip knee arthroscopy and management following surgery Telehealth optimization for postoperative follow-up Fracture and rotator repair of shoulder Gain an understanding of perioperative management for those from remote areas (as in how long they need to stay, when they need to return and what imaging can be done).	Identify practitioners that treat orthopedic injuries in each community. Set up clinics to meet and educate providers. We would train on a particular topic per visit. We would also help to establish clinic needs in order to effectively treat, stabilize and provide follow-up care for orthopedics injuries. The goal is to establish relationships that make it easier for remote Alaskan's to receive care so there is a direct line of communication between their community Provider and the Specialist.	Under \$50,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Matanuska-Susitna Borough	Deferred or Not Advanced
Planned Parenthood Great Northwest Hawaii Alaska Indiana Kentucky	Expanding Telehealth Access and Patient Navigation for Rural Alaskans	WA	Rural and remote communities in Alaska face significant barriers to accessing timely health care. Geographic isolation, limited local provider capacity, travel complexities, and weather-related disruptions often make it difficult for patients to obtain essential preventive and reproductive health services. These barriers have led to reduced utilization of preventive and basic sexual and reproductive health care, such as STI testing and treatment, birth spacing and pre-pregnancy health optimization, cervical cancer screening, and other preventive health services. In addition, there is often limited coordination to support patients who need to travel for in-person evaluation or treatment when telehealth alone is not sufficient. At the same time, there is a strong opportunity to expand access through improved telehealth infrastructure, better care coordination, and partnerships with trusted community organizations. We have seen significant development of at home testing and hybrid healthcare providing more opportunity than ever to reach patients that have been historically marginalized from traditional healthcare services. This project aims to address established gaps by capitalizing on evolving technology paired with formal wrap around and navigation services rooted in deep trust and connections to community.	Our approach focuses on expanding telehealth access, strengthening patient navigation, and building partnerships with community-based organizations to improve access to care for rural and remote Alaskans. First, we will invest in telehealth infrastructure, including hardware, software, EMR integration, and dedicated telehealth clinicians. This will allow patients in rural communities to access services such as STI screening and treatment, birth control counseling and prescribing, pregnancy testing and counseling, cervical cancer screening coordination, and preventive reproductive health services without needing to travel long distances. Second, we will develop a rural patient navigation and case management program. Nurses and care coordinators will support patients who require in-person evaluation or treatment at our Anchorage or Fairbanks health centers by helping coordinate appointments, travel logistics, and follow-up care. This will ensure continuity of care and reduce delays for patients who need higher levels of care. Finally, we will strengthen relationships with local healers, community health organizations, and other trusted partners to ensure care models are culturally responsive and community-informed. These partnerships will help keep as much care as possible within local communities while ensuring patients can access additional services when needed.	\$1M-\$5M	Clinic	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough)	Deferred or Not Advanced

Plus Eightys Remain In Alaska (PERA)	Treasure Our Oldest Alaskans, Keep Them Healthy, And Keep them Here (TKK)	AK	In the past Alaska was a young person’s game. People hunted the land, made their money, and then left for warmer climates or closer connection with family. But that has changed: In 2010 there were 1,240 people in the FNSB out of 97,581 (12.7%) 80 or older; by 2025 that had risen to 2,332 people 80+ out of 97,803 (24%). (2010 and 2025 Alaska Population Overview, Alaska Department of Labor and Workforce Development). The trend for coming years is for the elder population to continue to grow. Problem As this group expands in population so does the need to address their physical and mental health needs. At older ages, health is shaped not only by physical and social environments but also by the stressors related to ageing. Exposure to adversity, significant loss in intrinsic capacity, a decline in functional ability, and a reduced sense of purpose after retirement lend themselves to psychological distress. Social isolation and loneliness, too, which affect about a quarter of older people, are key risk factors for mental health conditions in later life. (Data from WHO Commission on Social Connection. Geneva: World Health Organization; 2025.) Opportunity In our interactions we find many seniors retain a keen curiosity. On-going curiosity presents an opportunity to craft experiences that keep the mind seeking and engaged, making days filled with discovery and meaning and leading to improved and sustained mental health for our oldest urban and rural residents .	People who do the same thing day after day tend to atrophy, with severe consequences to mental and physical health like depression, anxiety, and anger. (Research summary at https://news.columbia.edu/news/why-being-bored-can-be-hazardous-your-health) Our approach is to maintain and enhance the mental health of senior community residents (+80s) through sustained and intensive travel experiences. Travel can be a profound practice in mindfulness, offering moments of mental clarity that are hard to achieve in the state of drift and idleness often found in older people. We purposefully want our seniors to waking up in a different place, where the sights, sounds, and even the air feels unfamiliar. This shift from the norm will be incredibly refreshing for the mind. It disrupts the automatic pilot mode that many senior seniors are on, leading them to become more aware and present. Moreover, a change of scenery can provide the mental distance needed to relax and recharge, giving the mind a break from the constant barrage of thoughts and worries that come with aging. In this way, travel serves as a mental reset. It offers a chance to break free from the constraints of routine, allowing seniors to return home with a refreshed perspective, renewed energy and a positive mental outlook. The experiences gained while traveling often stay with them, providing a lasting sense of rejuvenation long after the trip has ended. The results of quantitative studies showed that travel improves the physical and mental health of the elderly. Scores for cognitive function, daily activities, and vitality are higher among elderly travelers compared to non-travelers. Additionally, the quality of life and well-being scores of elderly travelers were significantly higher compared to those who did not travel and travel experiences for the elderly are often associated with better life satisfaction, a sense of peace, and purpose in life. (The Role of Travel in Enhancing Domains of Health for Seniors: A Review. At: https://pmc.ncbi.nlm.nih.gov/articles/PMC12309315/) Transformative Potential for Health Care: TKK does not structurally transform rural health care delivery. Instead, it proposes to implement a novel practice with evidence-based benefits within the health care system. TKK’s project workproduct – the template for this practice - is intended for use beyond the Plus Eighties Remain in Alaska (PERA) organization and to be integrated into other projects.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Nome Census Area; Northwest Arctic Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

PNC IT	PNC AI – Alaska Statewide Rural Healthcare Intelligence Platform	AK	Healthcare providers across Alaska face growing workforce shortages and increasing demand for care. Workforce projections estimate the state will need more than 9,400 new healthcare workers annually to meet future demand, while rural communities already experience limited provider availability and geographic barriers to care. Administrative documentation, patient intake, and care coordination consume significant provider time. National studies estimate physicians spend nearly two hours on administrative work for every hour of direct patient care, contributing to clinician burnout and limiting the number of patients providers can serve. At the same time, rural healthcare systems remain far behind in adopting technologies that could improve efficiency. A 2025 survey of 972 rural healthcare leaders found only 8% of rural community and critical access hospitals use AI-driven analytics, compared with 65% of hospitals nationwide. This project addresses that gap by establishing the PNC AI Rural Healthcare Intelligence Platform, designed to become Alaska’s first statewide HIPAA-compliant artificial intelligence infrastructure for healthcare providers. The platform will provide secure tenant-isolated environments with strong data governance and compliance controls, allowing rural clinics, tribal health organizations, and healthcare systems across Alaska to adopt AI tools safely while improving efficiency, expanding provider capacity, and strengthening healthcare access statewide.	PNC IT will develop and deploy the PNC AI Rural Healthcare Intelligence Platform, a secure artificial intelligence infrastructure designed specifically for healthcare environments. The platform will provide a centralized AI environment that integrates with existing healthcare technology systems while maintaining strict privacy, security, and compliance protections. Initial deployment will occur with pilot partners including Upstream Family Medicine, Aurora Maternal Fetal Medicine, and the Ninilchik Traditional Council, allowing workflows to be tested and refined within real-world rural healthcare environments. Lessons learned during the pilot phase will inform broader expansion to additional healthcare providers across Alaska. Key components of the project include: HIPAA-Compliant AI Infrastructure PNC IT will deploy secure cloud-based infrastructure designed to host healthcare-compliant AI models capable of supporting clinical workflows while protecting patient data and maintaining strict HIPAA compliance. AI Clinical Workflow Tools The platform will support AI-assisted documentation, patient intake automation, telehealth workflow support, and administrative process automation. These tools will reduce provider documentation time, streamline operations, and allow clinicians to focus more time on patient care while maintaining human oversight. Integration with Healthcare Systems PNC IT will integrate the AI platform with commonly used healthcare systems including electronic medical records and telehealth platforms used by participating healthcare organizations. Security and Compliance Framework The platform will include strong security controls such as HIPAA-compliant data handling, secure authentication, role-based access control, and audit logging to ensure responsible and secure AI use. Training and Workforce Enablement Healthcare staff will receive training on safe and effective AI use in clinical environments. Training will emphasize data privacy, human oversight, and appropriate clinical application. Through this approach, rural healthcare providers across Alaska will be able to safely adopt emerging AI technologies without needing to independently build complex infrastructure, expanding care capacity while strengthening long-term healthcare system sustainability. The platform is designed to scale across Alaska, allowing additional rural clinics, tribal health organizations, and healthcare systems to join over time.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Denali Borough; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Sitka (City and Borough); Wrangell (City and Borough)	Deferred or Not Advanced

Polaris Transitional and Extended Care	Alaska Long Term Care Value Based Incentive Program	AK	Rural and frontier health care providers operate in an increasingly fragile environment. At the same time, these facilities serve patients with complex medical needs who rely on local care options following hospitalization or when long-term services are required. When rural providers struggle financially or experience quality challenges, communities risk losing critical access to care close to home. Currently, there are limited mechanisms within existing reimbursement structures to directly incentivize and support measurable quality improvement in rural post-acute settings. Providers are expected to improve outcomes such as reducing avoidable hospital readmissions, strengthening care transitions, and improving patient experience, yet they often lack the financial flexibility needed to invest in staff development, quality infrastructure, and care coordination efforts that drive these improvements. This project presents an opportunity to align financial incentives with measurable quality outcomes. By introducing a targeted quality-based incentive program, rural providers will be rewarded for achieving defined performance benchmarks that improve patient outcomes and strengthen care delivery. This approach supports providers in making meaningful quality improvements while helping stabilize essential health services in rural and frontier communities.	The proposed project will implement a Quality-Based Incentive Program designed to improve care outcomes while strengthening the long-term sustainability of rural and frontier health care providers. The program will establish a structured framework that rewards measurable quality improvements without altering the existing Medicaid reimbursement methodology. The first phase of the project will focus on a small trial of this program at two local facilities in Anchorage. Polaris Transitional and Extended Care and Centennial Post Acute. During this phase, participating providers and clinical leaders will collaborate on identified quality metrics that reflect meaningful improvements in patient outcomes and care delivery. Priority measures will focus on areas such as reducing avoidable hospital readmissions through the improvement in identified quality metrics. These measures will be selected based on their relevance to rural providers, the ability to measure performance consistently, and their potential to improve patient experience and clinical outcomes. Incentive payments will be distributed based on the achievement of defined performance benchmarks or demonstrated improvement from baseline. This structure ensures that providers at different starting points can participate meaningfully while maintaining a strong focus on measurable quality outcomes. Finally, the project will include ongoing monitoring and evaluation to assess program effectiveness and identify opportunities for refinement. Data collected throughout the program will inform adjustments to the incentive structure and quality measures over time. The intent is to demonstrate a scalable and sustainable model that the state can continue to support beyond the initial grant period. Through this structured approach, the program will align financial incentives with improved care delivery while supporting the stability of rural health care providers and preserving access to essential services in remote communities.	\$1M-\$5M	Other	Statewide	Anchorage (Municipality)	Deferred or Not Advanced

Preeclampsia Foundation	Alaska Safe Mothers Blood Pressure Program	FL	Preeclampsia is a deadly condition of pregnancy; rates are rising. Preeclampsia rose 19% from 2014-2018 (Source:https://www.bcbs.com/media/pdf/HOA-Trends-Pregnancy-Childbirth_2020.pdf) and gestational hypertension and preeclampsia now affect 1 in 7 hospital births in the U.S (https://archive.cdc.gov/www_cdc_gov/media/releases/2022/p0428-pregnancy-hypertension.html?utm_source=chatgpt.com). It is also an expensive burden, costing 3x more to treat a patient with preeclampsia than one without, and impacting the U.S. healthcare system by over \$2B annually (Source: https://pubmed.ncbi.nlm.nih.gov/28708975/). In Alaska, hypertension in pregnancy affects 14.5% of births compared to 10.4% nationally (https://health.alaska.gov/media/wrbjik3l/2024-alaska-vital-statistics-annual-report.pdf. p29). Well-established clinical risk factors for preeclampsia such as obesity, diabetes, and chronic hypertension disproportionately affect non-Hispanic Black, American Indian or Alaskan Native, and Hispanic populations (https://www.ajog.org/article/S0002-9378(20)30769-9/fulltext). Many rural counties are “maternity care deserts,” without obstetric services, leaving pregnant patients reliant on remote services without specialized staff. Rural women with preeclampsia experience higher rates of severe maternal morbidity, emergency C-sections, and infant complications, and are less likely to receive postpartum follow-up for blood pressure monitoring (https://pmc.ncbi.nlm.nih.gov/articles/PMC5135522/).	Our approach is a strong community-led solution designed for rural and frontier Alaskans: “Alaska Safe Mothers Blood Pressure Program.” The Preeclampsia Foundation’s Cuff Kit Program is a proven solution marrying a pregnancy-validated blood pressure device with patient education materials that are evidence-based to get women's attention and promote understanding of preeclampsia. More than 70,000 kits have been distributed across the United States and Canada since 2020. The Journey Pregnancy is an AI-driven remote patient monitoring smartphone app and companion provider dashboard developed by Eimage Solutions Technology. Continual monitoring is the key to successfully identifying hypertension and preeclampsia before it becomes acute, and this technology is robust and unique in its ability to do so. The app is the first of its kind to inform patients in real time of their risk for preeclampsia through a proprietary "Preeclampsia Score," a wellness score developed with National Science Foundation support intended to educate patients about preeclampsia and initiate conversations with their care team, serving as more accessible tool to anticipate preeclampsia risk than blood tests and biomarker tools. The app also provides: personal virtual doula Aria, kick and contraction counters, health tips, connectivity to wearable devices, article repositories, and more. As a collaborative team, we will follow processes already in place through similar successful projects funded by the National Science Foundation, HHS, Black Ambition, and the State of Arizona. Our process includes: •Patient recruitment in collaboration with Golden Heart Community Midwifery and other clinical partners. •Patients will enter their blood pressure, heart rate, mood, pregnancy symptoms, and other health information in The Journey Pregnancy App; AI-driven insights will provide support to monitor risks for preeclampsia. •Care teams can follow the patients' vitals in real time on the provider dashboard, if they choose. •Patients will be guided to do digital check-ins on the app with The Journey Pregnancy’s personal virtual doula, Aria •Clear instructions for patients are provided regarding what to do if their readings are abnormal.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Premera Blue Cross	Statewide Access to Virtual Advanced Primary Care for Rural Alaskans	WA	Alaskan residents, especially those living off the road system, face persistent barriers to accessing timely, high-quality primary care – particularly in communities where workforce shortages, geographic isolation, and limited specialty access create significant barriers to timely care. As of 2025, various think tanks estimate Alaska’s shortage of primary care physicians to be between 170 and 350 (Robert Graham Center; HRSA). In addition, national survey data indicates that over 40% of Alaska adults report barriers to receiving timely primary care, including long wait times, travel distance, and provider availability (Commonwealth Fund). Premera Blue Cross Blue Shield of Alaska is uniquely positioned to address this challenge. Serving Alaska since 1952, Premera covers nearly 150,000 Alaskans, contracts with more than 80% of provider groups statewide, and has invested extensively in rural workforce development, behavioral health infrastructure, and community provider capacity. Aligned with Alaska Rural Health Transformation Program priorities, this project proposes a scalable statewide solution which expands access to advanced, integrated primary care by leveraging Premera’s Kinwell clinical infrastructure and virtual first care model designed to reach rural and off-road communities across Alaska.	To address Alaska’s persistent primary care access challenges, Premera proposes expanding access to advanced primary care by deploying Kinwell Advanced Primary Care through a scalable, virtual first care delivery model. This approach is designed to overcome provider shortages, geographic isolation, and access disparities—particularly for rural, remote, and off road communities. Kinwell delivers advanced primary care that integrates comprehensive medical services, behavioral health, care coordination, and population health management into a single clinical model. Through this project, Premera will extend Kinwell’s established clinical infrastructure to Alaska, enabling residents statewide to access high quality primary care through telehealth. Kinwell currently operates a statewide virtual clinician model in Washington, with a dedicated team experienced in delivering virtual care for patients who face geographic and transportation barriers to improve access, continuity, and outcomes—experience that will be directly applied in Alaska. The project will focus on three implementation activities. First, Premera will complete licensure, credentialing, and operational readiness activities required for Kinwell providers to deliver care in Alaska. This includes establishing telehealth infrastructure, integrating care coordination, regulatory compliance, and enabling participation in Medicaid and Medicare programs. Second, Kinwell’s virtual clinics will begin providing statewide primary care services, offering same-day and next-day appointments. Kinwell operates independently of any specialty or tertiary care organizations, allowing it to focus on whole-person primary care and guide patients to high-value follow-up care when needed. A distinguishing feature of the Kinwell model is its use of integrated digital clinical tools including PicassoMD, for real time specialist “curbside consults” and fully virtual Shared Medical Appointments to support effective management of chronic conditions. Third, Premera will leverage its population health analytics infrastructure to identify high-risk patients, proactively manage chronic disease, and coordinate care across providers. This approach is designed to complement and extend existing Alaska provider capacity by functioning as a scalable virtual hub that expands access, strengthens care coordination, and supports long-term system sustainability.	\$1M-\$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Presbyterian Hospitality House	Complex Care Program	AK	Presbyterian Hospitality House (PHH) is prepared to fill the gap in Alaska’s continuum of care for complex care residential homes. With co-occurring behavioral health, medical, and other problems, this population is at extreme risk of out-of-state placement, inappropriate and/or frequent change of placements, and hospitalization. Medical conditions that require specialized care and staffing ratios prevent these individuals from accessing residential treatment programs, while co-occurring behavioral health problems prevent their use of assisted living or skilled nursing facilities. Working in conjunction with the State of Alaska, Presbyterian Hospitality House (PHH) is prepared to serve these youth in a family-style, home environment where youth receive round-the-clock care and support from a multi-disciplinary team capable of addressing the medical, behavioral, and other conditions that affect these youth.	For 38 years, PHH has provided high quality residential treatment in a family-style, homelike setting – augmenting this foundation will guide the approach to delivering high quality, complex care residential services. This service is provided in medium-to-large single-family homes with the capacity for five recipients, and private living quarters for live-in staff; traditionally a married couple who act as on-site administrators. Support staff come to the home throughout the week to aid in the care and treatment of the youth placed in the home. Complex care residential would take place in this same home environment; augmented with increased staffing for safe ratios, specialization of the home for monitoring, intervention, or treatment, and added care coordination to ensure continuity between members of the multi-disciplinary team. The initial phase of this project would be setting up one complex care residential home in the Matsu Valley due to proximity to strong agency relationships and medical resources in Anchorage. Subsequent phases would be setting homes up in other rural centers such as Fairbanks, Kenai, and Juneau. Allying with the State of Alaska in developing and following new Complex Care Residential Home licensing regulations and payment methodologies ensures that the service will be permanently sustainable.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Presbyterian Hospitality House	AI & Resiliency Conference	AK	Alaska faces a significant behavioral health crisis driven by isolation, workforce shortages, and high exposure to trauma. Many rural residents live far from behavioral health centers, leaving clinicians to cover large regions with limited access to consultation, peer support, or training. Rural communities experience higher unmet mental health needs, reduced access to specialty care, and increased provider burnout. These challenges are intensified by high rates of adverse childhood experiences, depression, anxiety, and suicide, especially in Indigenous communities. Clinicians often manage crises, trauma treatment, substance use, and family systems while carrying heavy documentation burdens, contributing to workforce instability and inconsistent care. Trauma-informed practice improves engagement and outcomes, yet rural providers receive far less trauma-specific training, creating gaps in standards and confidence. At the same time, ethical, HIPAA-safe AI tools can reduce administrative burden and improve efficiency—an important opportunity in rural Alaska, where even small gains in provider capacity increase access. The AI & Resiliency Conference responds to these challenges by offering unified trauma-informed training, culturally grounded frameworks, system-level implementation planning, and ethical AI workforce tools to expand rural mental health services without increasing burnout.	The AI & Resiliency Conference is a three-day, single-track statewide convening of approximately 200 behavioral health professionals, tribal partners, educators, child welfare staff, and agency leaders in Anchorage. Rather than dividing participants into specialty tracks, the conference uses a shared plenary model, so all attendees receive the same trauma-informed framework, cultural context, implementation guidance, and AI workflow training. This structure promotes statewide consistency in practice and reduces fragmentation across regions. The conference features a renowned national trauma keynote speaker alongside an Alaskan clinician trainer, Alaska-based rural practitioners, tribal speakers addressing historical trauma and community resilience, and Alaska Native cultural performers who provide grounding and context for healing. Programming emphasizes applied learning and implementation. Participants engage in live demonstrations, facilitated discussions, panels on rural service delivery challenges, and guided action-planning sessions. Agencies and regional groups develop written implementation plans, identifying priority changes, workflow adjustments, leadership responsibilities, and timelines. A central innovation of the conference is training in ethical, HIPAA-safe AI workflows. AI is presented as a workforce support tool, not a replacement for clinicians. Participants learn how to use non-identifying AI applications to aid in the development of Group, Individual, and Family Psychotherapies. AI’s ability to create documentation templates, organize treatment plans, prepare supervision summaries, develop psychoeducation materials, and support administrative functions such as onboarding and quality assurance will be highlighted. Health services research shows that reducing documentation burden can reclaim 20–30 percent of clinician time. In rural Alaska, this reclaimed capacity translates directly into added appointments, outreach, and crisis response availability.	\$50,000-\$250,000	Statewide	Anchorage (Municipality); Bethel Census Area; Chugach Census Area; Denali Borough; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Skagway (Municipality); Southeast Fairbanks Census Area; Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Presbyterian Hospitality House	Emergency Stabilization & Assessment Centers	AK	There is a lack of short-term community care Emergency Stabilization & Assessment Center for youth experiencing homelessness, mental health, emotional or behavioral crisis. The PHH ESAC will offer 24/7 supervision, providing immediate stabilization, symptom reduction, and rapid connection to community-based support services. According to the State of Alaska Response for the RHTP 75% of Alaskan youth experience mental health conditions. This program is intended for youth to stay a maximum of 30 days for youth ranging from 12-18 years old.	Presbyterian Hospitality House will operate a two 5 bed Emergency Stabilization & Assessment Centers that will be open 24/7 in Fairbanks and the Mat Su area. The ESAC’s will be focus on rapid stabilization and trauma informed care to deescalate crisis, decrease unnecessary psychiatric hospitalization, decrease homelessness and connect the youth to community services. Professional staff will provide immediate assessment and intervention, 24-hour monitoring, counseling, and peer support with individual care decisions prioritizing a strength-based environment. At the point of referral or intake, staff will work with various resources when limited collateral information is given. Collaboration with families and referrals to the proper resources. The ESAC will meet the basic needs of the youth in a safe and secure residential setting. Youth will have access to food, clothing, and hygiene items in addition to showers and laundry. Youth will establish contact with their family/guardian. Transportation will be available. The program will employ Clinical staff to provide the needed assessments and therapy, Case managers to coordinate services and aftercare, Teaching staff will provide therapeutic interventions and full-time night monitors to ensure safety. Administrative staff will support the needs of the program. Staff will use an electronic health record system. We already have the needed staff for outcomes data reporting.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Matanuska-Susitna Borough	Deferred or Not Advanced
Presbyterian Hospitality House	PHH Youth & Family Wellness Center	AK	Presbyterian Hospitality House (PHH) is pleased to send this Letter of Intent describing our plans to establish the PHH Youth and Family Wellness Center in the Mat-Su area. This opportunity will address the need to improve behavioral health and mental health in youth and families. PHH would like to offer the opportunity to increase the availability of early intervention and prevention programs and expand comprehensive, integrated management across behavioral health programs.	PHH’s approach will be a collaborative, team-based, and highly individualized care planning process for youth and families in a safe, supportive, and enriching environment. The Wellness Center will include a full gym for physical activity, a commercial kitchen for nutrition education, a computer lab for academic support, a garden area and baseball field, clinical office space to include telehealth space, and dedicated group rooms for in person therapeutic services. Expanding the knowledge of youth and families regarding resources in the communities as well. PHH will hire and maintain a professional workforce for administrative oversight, program directing, clinical therapy and other needed positions as deemed appropriate for a Wellness Center.	\$1M-\$5M	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Presbyterian Hospitality House	TTH Rural Hub Expansion	AK	Currently, there are over 3,000 Alaskan youth that are removed from their homes annually due to trauma, addiction, or behavioral health crises. For youth in rural Alaska, this often means a traumatizing displacement, sometimes being medevaced thousands of miles to larger hospitals and can even mean being sent out of state for treatment. The gap in distance that occurs as a result, severs ties to the family, culture and community which are all things that are essential in long term healing. Furthermore, there is a lack of regionalized “step-down” placement options that prevent youth from transitioning safely back to their home villages, leading to high recidivism and over reliance on emergency departments, detention centers, and high-cost acute care. Presbyterian Hospitality House has identified this funding opportunity as a transformative opportunity to expand and regionalize the effective and replicable Therapeutic Treatment Home (TTH) model. By establishing regional hubs with dedicated program and clinical teams, in Juneau, Kodiak, Valdez, Kotzebue, Nome, and Utqiagvik we will create a sustainable regional system of much needed care for Alaskan youth and families. This initiative shifts the paradigm from displacement for care, to care within the youth’s community and culture, ensuring Alaska’s most vulnerable youth can heal without losing their sense of place.	Presbyterian Hospitality House plans to implement a phased “hub-and-spoke” expansion to deliver Therapeutic Treatment Home (TTH) services into six regional hubs. Leveraging 66 years of experience serving over 160 Alaska communities, our approach prioritizes high quality behavioral health services, local workforce development, and strengthening cultural and family ties. In year one, we focus on expansion into Juneau, Kodiak, and Valdez. Year two will see expansion into Kotzebue, Nome and Utqiagvik. Each regional hub will be anchored by a team designed to support the needs of each respective region. These regional staffing teams will be composed of a Rural TTH Specialist, Rural TTH Program Manager, Rural Clinical Supervisor, Behavioral Health Clinician and Behavioral Health Clinical Associates (mentors). The staffing team will support up to five TTH homes in each regional hub. The TTH homes will be local, licensed foster homes that have received the training and have the expertise to be designated as TTH homes in accordance with “Alaska Behavioral Health Provider Service Standards”. Until fully staffed, oversight will be managed through PHH’s existing sites in Wasilla, Fairbanks, and Kenai. We will use a robust supervision-travel model combined with remote supervision, where a Rural Clinical Supervisor and Therapeutic Treatment Home Manager conduct frequent on-site rotations to each hub. By year 5, we will transition into physical regional offices. RHTP funds will facilitate this transition by covering office leasing, furniture, supplies, high speed satellite and telehealth technologies. To prioritize a sense of community, support, and collaboration, we will host monthly TTH Hub meetings, where meals will be provided to our TTH families, youth, and staff. These meetings will offer an opportunity for training, team building, moral support, collaboration, and prevent isolation-based burnout that is common in rural areas. Our sustainability approach is built on a bridge to the Medicaid strategy. RHTP funds will act as start-up funds for infrastructure and recruitment. Then as hub teams solidify, we will have the necessary components to offer services that lead to sustainable Medicaid billing.	\$1M-\$5M	Statewide	Anchorage (Municipality); Chugach Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Primary ENT, L.L.C. (dba ENT Urgent Care)	Pediatric and Family Home Ear, Nose, and Throat camera with AI and specialty virtual care	MN	Rural and remote communities across Alaska face major barriers to timely ear, nose, and throat (ENT) care. Common conditions such as ear infections, hearing problems, chronic nasal congestion, allergies, and sleep-related breathing disorders often require specialty evaluation. However, families in many regions must travel long distances or wait months for appointments, creating delays in diagnosis and treatment. These delays can lead to preventable complications, missed school for children, lost work time for parents, and increased healthcare costs. Community health organizations and primary care clinics carry much of this burden but often lack easy access to ENT specialty support. This project proposes a community-centered model that brings specialty ENT evaluation closer to home. Families—initially focusing on households with children—would receive access to a connected ear, nose, and throat imaging device linked to a secure digital platform. Using the device, families can capture images of the ear, nose, and throat and complete a guided symptom assessment. These findings are reviewed through an AI-supported triage system with the ability to escalate cases to virtual ENT specialists when needed. When in-person care is required, the program supports coordination with local clinics and regional referral centers.	Our proposed approach is to shift the starting point of ENT, Allergy and Sleep specialty care from distant clinics to the patient’s home using connected medical technology and specialist-guided digital tools. The project will pilot a home-based ENT care model using a connected ear, nose, and throat camera that allows families to capture high-quality images and videos of the ear canal, nasal passages, throat, and of breathing. These images/videos upon patient permission will be sent to our virtual platform where they are reviewed using AI-supported symptom assessment tools developed and supervised by board-certified ENT specialists. By combining connected imaging with structured symptom questionnaires and AI-assisted triage, families can receive rapid guidance on whether a condition can be managed at home, requires virtual specialist evaluation, or should be referred for in-person care. Our exclusive connected hardware partner, FOND Circle, has sold over 2 million remote devices already. The pilot will initially focus on rural Alaska families with children, as pediatric ENT conditions such as ear infections, hearing problems, nasal obstruction, and sleep-related breathing disorders are common and often difficult to access specialty care for in remote communities. Participating families will be provided with the connected ENT camera and access to a secure digital platform that enables 24/7 symptom assessment, image submission, and escalation to virtual specialty care when appropriate. When in-person evaluation or procedures are necessary, the program will coordinate referrals with local community health clinics, tribal health systems, and regional specialty providers. This approach supports existing healthcare infrastructure rather than replacing it, helping community clinicians access specialty input when needed while reducing unnecessary travel for patients. Over time, the pilot will evaluate outcomes such as reduced travel burden, earlier diagnosis of ENT conditions, improved care coordination, and patient satisfaction. Data from the pilot can inform expansion to additional rural communities and integration with existing telehealth programs. By combining connected diagnostic tools, specialist-guided AI triage, and coordinated referral pathways, this project aims to bring high-quality ENT care closer to home for rural Alaska families and create a scalable model for improving specialty care access in remote regions.	\$250K-\$1M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Prince of Wales Equal Housing	Rural Adult Foster Care Pilot and Medicaid Access Navigation Program	AK	Rural communities on Prince of Wales Island face significant barriers to accessing health and long-term support services. Families often provide unpaid care to vulnerable adults with disabilities, chronic health conditions, or functional limitations while navigating the complex Medicaid eligibility and waiver enrollment process. In Alaska, this process can take months or even years, and there is currently no funded system to support families during this waiting period. Without structured assistance, applications are delayed, documentation is incomplete, and individuals go without coordinated care. This gap increases caregiver burnout, preventable health decline, crisis intervention, Adult Protective Services involvement, and unnecessary institutional placement outside the community. Rural provider shortages and geographic isolation further compound these challenges. This project addresses the opportunity to create a structured Rural Adult Foster Care Access & Stabilization Pilot that supports families during the Medicaid application process. By providing care coordination, application assistance, and modest caregiver stabilization support, the project will reduce service gaps, improve timely access to health coverage, and prevent avoidable crises while building sustainable rural health infrastructure.	Prince of Wales Equal Housing will implement a Rural Adult Foster Care Access & Stabilization Pilot to bridge the gap between caregiving need and Medicaid service enrollment in rural Southeast Alaska. The approach includes three integrated components: 1. Structured Care Coordination The project will establish a dedicated Grant Administrator/Program Director to develop compliant policies, fiscal oversight systems, and outcome reporting aligned with Alaska and federal requirements. Participating households will receive individualized care coordination to assist with Medicaid applications, waiver documentation, physician certifications, Social Security enrollment, and referrals to primary and behavioral health providers. Applications will be tracked to ensure accuracy, completeness, and timely submission, reducing avoidable processing delays. 2. Caregiver Stabilization Support Families providing care to vulnerable adults during the Medicaid eligibility process will receive modest monthly stipends to offset caregiving-related costs. Care Coordinators will provide monthly monitoring, documentation assistance, appointment tracking, and risk screening to prevent health deterioration. This structured support reduces caregiver burnout, prevents unnecessary institutional placement, and allows individuals to remain safely in their home communities while awaiting formal services. 3. Data Collection, Oversight, and Sustainability Planning The pilot will implement measurable performance indicators, including Medicaid application completion rates, time to eligibility, crisis event reduction, and caregiver retention. Financial controls and reporting systems will ensure transparency and accountability. Data collected during the pilot will inform sustainability planning, policy recommendations, and potential future integration into Alaska’s long-term care framework. By combining administrative infrastructure, direct navigation assistance, caregiver stabilization, and measurable oversight, this approach strengthens rural health access, improves continuity of care, reduces preventable crises, and builds scalable infrastructure for frontier communities experiencing provider shortages and geographic isolation.	\$50,000- \$250,000	Multi- Community or Participating in Regional Hub-and- Spoke	Haines Borough; Petersburg Borough; Prince of Wales- Hyder Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

Prince of Wales Health Network	Prince of Wales Health Network Mobile Integrated Health (MIH) Program	AK	Prince of Wales Island is a geographically isolated, roadless region with limited access to acute and specialty healthcare services. Residents face significant barriers including transportation challenges, high rates of chronic disease, and frequent reliance on emergency medical services for non-emergent needs. We would like to explore the possibility of putting infrastructure in place to help residents with preventive and non-urgent healthcare related needs. The population of POW is aging with 20% of the population being 65 years or older, which is putting a strain on our medical services.	Funding through the Alaska Rural Healthcare Transformation Grant will support program planning, workforce training, clinical equipment, telehealth capabilities, and initial implementation. The program will be designed to be sustainable and scalable, with a focus on innovative ways to meet the needs of community members, improving patient outcomes, and strengthening the rural healthcare continuum on Prince of Wales Island. The Prince of Wales Health Network is committed to transforming rural healthcare delivery through innovative, patient-centered models that reflect the unique needs of island communities. We believe this MIH program aligns strongly with the goals of the Alaska Rural Healthcare Transformation Grant and represents a meaningful opportunity to improve health equity and system resilience in Southeast Alaska.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Prince of Wales-Hyder Census Area	Advance to Implementation Application

Programs for Infants and Children	Alaska Infant Learning Program specialized electronic record: Shared platform	AK	Currently, Alaska’s 15 Infant Learning Programs each serve different regions and use their own systems to document services. Implementing a unified documentation system would streamline workflows, reduce administrative burdens, and allow skilled providers to spend more time delivering services to infants and toddlers. Many ILP programs also lack sufficient knowledge and resources to bill third-party payers for eligible services. A comprehensive electronic record would include: • Documentation of all ILP-specific actions, evaluations, IFSPs, and transitions. • Integrated billing functionality, including posting payments and reconciling accounts. • Automated protocols to transfer data directly into the State of Alaska ILP Database. Working together to design and implement an electronic record is what has been identified as a top priority for many ILP programs.	The project will implement a statewide, unified electronic documentation and billing system for all 15 Infant Learning Programs. The approach includes: Needs Assessment & System Design: Conduct a thorough review of current documentation practices, billing capabilities, and workflow challenges across all programs. Utilize current ILP workforce to design a user-friendly, standardized system that meets ILP-specific requirements. Technology Development & Integration: Develop or customize an electronic record system that includes comprehensive ILP documentation, integrated billing, and automated data transfer to the State ILP Database. Ensure interoperability with existing state systems and third-party payers. Training & Support: Provide extensive training to ILP staff on the new system, including documentation standards, billing processes, and data management. Offer ongoing technical support to ensure smooth adoption. Pilot & Phased Implementation: Pilot the system in selected regions to refine workflows, then roll out statewide in phases, incorporating feedback and lessons learned. Evaluation & Continuous Improvement: Monitor usage, service delivery efficiency, and billing accuracy. Use performance data to make ongoing system improvements and support sustainability.	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Programs for Infants and Children	PIC: Efficiency and IT Innovation in Early Intervention	AK	Programs for Infants and Children, Inc. (PIC) has utilized an Electronic Health Record (EHR) system since 2008. While functional, the current platform was not designed to meet the unique geographic, regulatory, and service delivery needs of Alaska’s Infant Learning Program (ILP). This project will modernize and customize the EHR to better align with Alaska’s early intervention system, improving efficiency, compliance, and service quality.	1. AI-Enhanced Documentation Integration of AI tools within the existing EHR to generate draft progress notes and evaluation summaries based on provider-entered data. Providers will review and finalize notes, significantly reducing documentation time while maintaining clinical integrity and compliance. 2. Streamlined Evaluation Reporting Development of structured skill-marking tools within the record (e.g., marking observed skills during routines-based or developmental assessments) that automatically generate a base evaluation report. This reduces repetitive writing and improves consistency across providers. 3. Electronic Signature Capture Implementation of tablet- and phone-based signature capture for IFSPs, consent forms, and required documentation, increasing efficiency and improving access for families in remote communities. 4. Client-Level Workflow Automation Creation of automated workflows and alerts at the child level to track required timelines (evaluation, IFSP development, reviews, transitions), reducing missed compliance deadlines and strengthening quality assurance. 5. Full API Integration with the Alaska State Database Development of a complete API connection to the Alaska ILP state database to eliminate dual data entry and ensure real-time, accurate data reporting. 6. Secure Inter-Program Data Transfer Enable secure transfer of child records between Alaska ILP programs operating on the same platform when families relocate, reducing service disruption and paperwork burden. 7. Integrated Language Translation Embed translation functionality across forms and family-facing documents so materials are available in families’ primary languages, improving access and equity. 8. Hardware enhancements Utilize hardware to interface between providers, families, and electronic records.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Lake and Peninsula Borough	Advance to Implementation Application

Programs for Infants and Children	Infant Learning Program Expanded Eligibility for Programs for Infants and Children	AK	Alaska’s Infant Learning Program (ILP), the state’s system under Part C of the Individuals with Disabilities Education Act (IDEA), currently has the most restrictive eligibility criteria in the nation. As a result, many infants and toddlers with developmental delays do not qualify for early intervention services during the most critical period of brain development and growth. Without access to these supports, children in both urban and rural communities miss opportunities to receive therapies and early childhood services that help build the foundational skills needed for success in school and later in life.	The project would use a phased systems-development approach to gradually expand eligibility for Alaska’s Infant Learning Program (ILP) while ensuring the workforce and service infrastructure can support the increased number of children served. The approach balances policy change with workforce development so that access expands without overwhelming providers or reducing service quality. First, Programs for Infants and Children (PIC) would establish a multi-year expansion framework that identifies workforce capacity, service gaps, and regional needs in both urban and rural communities. This planning phase would include data analysis, provider capacity assessments, and collaboration with ILP programs, universities, and training partners. Second, eligibility would be expanded incrementally using a tiered approach. As workforce capacity grows, eligibility criteria would gradually move toward serving children with developmental delays of 25 percent or greater. This phased approach allows programs to responsibly increase access while maintaining service quality and provider sustainability. Finally, the project would include ongoing evaluation and system improvement. Data would be used to monitor workforce growth, service access, and child outcomes to ensure the expansion improves access to early intervention services across Alaska while maintaining high-quality services for families. PIC would work closely with Raviant, a consultant who has been working on expanding ILP services for the past 2+ years. PIC’s individual project combined with their expertise in organizational change would all but insure a successful launch of ILP eligibility expansion.	\$1M-\$5M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Lake and Peninsula Borough	Deferred or Not Advanced

Programs for Infants and Children	Programs for Infants and Children Recruitment and Retention of Highly Qualified Staff	AK	Alaska does not currently have sufficient pre-service training programs within the University of Alaska system to prepare professionals for the specialized services required by the Infant Learning Program under IDEA Part C. As a result, there is a significant shortage of qualified providers, including Occupational Therapists, Physical Therapists, Speech-Language Pathologists, Social Workers/Behavioral Health providers, and Developmental Therapists (Early Childhood or Special Educators). Recruitment and retention of these professionals is a persistent challenge. Vacant positions often take many months—and sometimes more than a year to fill, leaving programs understaffed and reducing access to services for infants and toddlers with developmental delays. Because the workforce pool in Alaska is limited, strategies that support recruitment and incentivize retention of existing staff are critical to maintaining and expanding services.	To address Alaska’s shortage of specialized early intervention providers, this project will implement a comprehensive workforce strategy focused on competitive compensation, recruitment, workforce development, and retention of professionals needed to deliver services required under Individuals with Disabilities Education Act Part C. A key component of this approach is ensuring Infant Learning Programs can offer salaries and benefits that are competitive with other healthcare, education, and behavioral health employers in the community or region. Salary disparities often draw providers away from early intervention to hospitals, schools, or private practice. Supporting competitive compensation will help PIC recruit and retain qualified professionals, particularly in rural and high-cost areas. Recruitment strategies will include signing bonuses, relocation assistance, and student loan repayment or tuition assistance for hard-to-fill positions such as Occupational Therapy, Physical Therapy, Speech-Language Pathology, Developmental Therapy, and Behavioral Health. The project will also create paid internships or residency opportunities to attract new graduates to early intervention. Often if a student completes an internship with us they express a desire to work for us when they graduate. To strengthen the workforce pipeline, the project will partner with the University of Alaska System to expand practicum placements, increase exposure to early childhood disability services, and support distance supervision and tele-mentoring for students and providers in rural communities. We would also like to develop a mentoring program to help providers meet the Highly Qualified definition required by the State of Alaska ILP program. We believe helping to grow our own providers is more beneficial than only attracting workers from the lower 48. Retention strategies will include service-based retention bonuses, rural service incentives, continuing education support, and mentorship opportunities to reduce professional isolation and burnout. Together, these strategies will stabilize the workforce and improve timely access to early intervention services for infants and toddlers with developmental delays across Alaska.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Lake and Peninsula Borough	Deferred or Not Advanced

Programs for Infants and Children	Strengthening Rural Access to Early Intervention Services	AK	Families with infants and toddlers in rural areas of the state often don’t have equal access to ILP services due to distances from hub ILP program. Staffing changes in schools, health clinics, as well as Infant Learning Program staff creates challenges to building lasting relationships that build trust in rural communities. Because of this challenge, families may not know or understand what Early Intervention services are and that services are available to them at no cost.	Families with infants and toddlers in rural Alaska face persistent and systemic barriers to accessing services through the Alaska Infant Learning Program (ILP). Geographic distance from hub-based ILP programs limits timely, consistent service delivery, often requiring extensive travel, weather-dependent access, and high logistical costs. These barriers delay identification and intervention during the most critical period of brain development. In addition to geography, frequent staffing changes within schools, health clinics, and ILP programs disrupt continuity of care and undermine relationship-building efforts. In rural communities, trust and long-term relationships are foundational to family engagement. When providers change frequently, families may disengage or decline services, resulting in missed opportunities to support developmental progress early—when intervention is most effective and cost-efficient. This project will strengthen rural access to early intervention by stabilizing service delivery models, investing in community-based partnerships, and building sustainable local capacity. Strategies may include tele-intervention expansion, cross-system staffing collaboration, community health worker partnerships, and targeted workforce recruitment and retention supports. The goal is to ensure infants and toddlers with developmental delays—regardless of geography—receive equitable, timely, and culturally responsive services that improve outcomes and reduce the need for more intensive services at school age. By addressing structural access barriers and prioritizing relationship-based service delivery, this initiative will promote developmental equity for Alaska’s youngest children and reinforce the state’s commitment to early intervention as a cost-effective, prevention-focused investment.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Lake and Peninsula Borough	Deferred or Not Advanced

Project GRAD Kenai Peninsula	THRIVE KP	AK	Youth in rural Kenai Peninsula communities encounter barriers to regular physical activity, mental health support, and organized afterschool programs that encourage healthy growth. More than 21% of Kenai Peninsula Borough residents are under age 18. Communities like Nanwalek, Port Graham, Tyonek, Ninilchik, and Seldovia face additional difficulties due to geographic isolation, transportation issues, and limited youth development and behavioral health services. Economic and health indicators highlight the need for prevention-focused youth programs. Census data show that over 10% of borough residents live in poverty, and about 15% of residents under age 65 are without health insurance. The Alaska Kids Count Data Book reports that around 14% of Alaska children live in poverty, and nearly one-third reside in households with unstable employment. Youth health data further emphasize prevention needs. Alaska Youth Risk Behavior Survey results show that about 37% of Alaska high school students report ongoing feelings of sadness or hopelessness, and only about 23% meet recommended daily physical activity levels. Schools often serve as the main gathering place for youth and families in rural communities but frequently lack resources to provide structured wellness programs outside the school day. THRIVE KP addresses these gaps through school based afterschool programming and in school counseling that promote physical health, positive relationships, and healthy lifestyle habits.	THRIVE KP will implement a school-based youth health and wellness initiative designed to increase physical activity, strengthen supportive relationships, and promote mental health awareness among Alaska Native youth. The program will begin in three pilot communities—Nanwalek, Port Graham, and Tyonek—with plans to expand to Ninilchik and Seldovia. These communities face limited access to youth wellness programming and behavioral health supports, while schools remain the most reliable gathering place for youth and families. Afterschool programming will occur twice per week for approximately two hours per session and will be delivered primarily by locally recruited Afterschool Health Coaches. These community members will receive training and ongoing mentorship from an itinerant school counselor and a community health and wellness coordinator who rotate among participating communities to support program delivery. Programming will focus on four key areas that support youth wellbeing and prevention. Physical activity programming will increase youth participation in regular exercise through structured activities aligned with the Presidential Youth Fitness Program. Statewide data show that fewer than one in four Alaska youth meet recommended daily physical activity levels. The itinerant school counselor will lead social-emotional learning and relationship development activities (both during and after school hours) that strengthen communication skills, emotional awareness, and peer support while helping youth build positive connections with mentors and community members. The community health and wellness coordinator will provide nutrition and healthy lifestyle education integrated into program activities to encourage lifelong wellness habits. Family and community engagement activities will encourage parents and caregivers to participate in wellness events and reinforce healthy behaviors at home. The program will also create youth leadership opportunities through peer mentorship, team activities, and community wellness projects, encouraging students to take an active role in promoting healthy lifestyles in their schools and villages. By expanding access to physical activity, strengthening supportive relationships, and promoting healthy lifestyle habits, THRIVE KP advances the goals of the Rural Health Transformation Program’s Healthy Communities initiative and supports healthier rural communities across the Kenai Peninsula.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Providence Health & Services-Washington	Advanced Prenatal Access: Implementing a Hybrid OB Access Model in Seward & Anchorage	WA	Pregnant patients in the Seward service area face significant barriers to timely and safe obstetric care due to geography, distance, and unpredictable Alaskan weather. The nearest hospital with full obstetric and surgical delivery capability is approximately 90–125 miles away, and travel can become unsafe or impossible because of winter storms, avalanche conditions, and seasonal road or marine disruptions. Because Providence Seward Medical Center does not have OB surgical delivery capability, routine prenatal care may be delayed, urgent maternal-fetal evaluations may be deferred, and unplanned local deliveries can occur when transfer is not possible. These conditions increase the risk of preventable maternal and neonatal complications and disrupt continuity of care for mothers and newborns. This project addresses a critical rural access and safety gap by strengthening local prenatal access and maternal-fetal monitoring without building a full OB department.	With targeted RHTP investment, Providence Seward Medical Center proposes implementing a Hybrid OB Access Model with Providence Alaska Medical Center that expands local prenatal services while integrating continuous specialty obstetric support through the continuum of care. The model includes structured in person prenatal care such as vital sign and symptom assessment, fetal heart tone monitoring, limited point-of-care ultrasound, nonstress testing, routine prenatal laboratory collection, and comprehensive patient education. Limited OB triage capacity will supplement outpatient clinic hours to reduce unnecessary travel to Anchorage. Telehealth partnerships with an OB and/or maternal-fetal medicine provider will support virtual prenatal visits, real-time review of local assessments, collaborative care planning, early identification of complications, and provider-to-provider consultation. Periodic onsite OB specialist visits further extend specialty expertise into the rural setting without requiring permanent surgical OB capacity.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough	Advance to Implementation Application

Providence Health & Services-Washington	Coordinating to Drive Redesign and Sustainability of Alaska's Graduate Medical Education Programs	WA	Alaska faces a critical shortage of physicians, driven by longstanding structural underfunding of Graduate Medical Education (GME), limited residency capacity, and challenging primary care payment models. Alaska currently trains far fewer residents than any other state—only 4.91 GME trainees per 100,000 residents, compared to a national average of 35.42—resulting in a workforce pipeline that cannot meet statewide needs. Despite having one of the nation’s highest retention rates—75% of Alaska Family Medicine Residency (AKFMR) graduates remain in Alaska, and half practice in rural areas. Strengthening AKFMR presents a significant opportunity. Because where physicians train strongly predicts where they practice, expanding and sustaining GME in-state is one of Alaska’s most effective strategies for building a long-term workforce. Over 25% of the state’s practicing family physicians trained at AKFMR, serving both Anchorage and rural communities. RHTP funding also presents the opportunity for collaboration and partnership among health care providers statewide, with guidance from the State of Alaska. We view the State of Alaska as having the opportunity to come alongside partners to design the future of GME, incentivize growth, and sustain the program.	One approach to strategically growing Alaska’s physician workforce is by developing a Rural Track Program (RTP) that expands Alaska Family Medicine Residency (AKFMR) capacity and leverages existing rural clinical partnerships. Under RTP requirements, more than half of a resident’s training must occur in a designated rural community, typically during the second or third year of residency. AKFMR already has strong clinical relationships in these communities, positioning the program to launch rural track program without needing to build new partnerships from scratch. Another idea includes the creation of new Anchorage-based family medicine clinic training, in which residents complete a substantial amount of training at community-based local continuity clinics, for example Southcentral Foundation (SCF), or Anchorage Neighborhood Health Center (ANHC). These sites already provide high-quality primary care training and would distribute educational load across multiple clinical partners, creating operational benefits while reducing teaching capacity strain on AKFMR’s main clinic. Providence would appreciate exploring training partnership opportunities through both local and statewide design planning. Through the above-mentioned ideas, partnering with other entities also submitting GME- focused LOIS, and shifting a portion of training to community sites and rural locations, AKFMR can increase its total training capacity without overwhelming existing infrastructure. This approach simultaneously strengthens rural clinical pipelines, aligns with state and federal priorities for rural workforce expansion, and positions Alaska to grow toward a sustainable GME program. Providence Health & Services-Washington	Dual-Eligible Value-Based Care (VBC) Model Design and Readiness Initiative	WA	Alaska’s dual-eligible population represents a critical opportunity to advance integrated care and fiscal sustainability, yet current payment and delivery structures remain fragmented across Medicare and Medicaid. This fragmentation results in misaligned incentives, limited accountability for outcomes, and avoidable cost growth particularly for individuals with complex medical and social needs. The State of Alaska has identified Pay for Value: Fiscal Sustainability as a core RHTP initiative, including the need to develop foundational capabilities for integrated care for dually eligible Alaskans. However, a statewide VBC model tailored to Alaska’s dual population has not yet been fully designed or operationalized. This project addresses that gap by positioning Providence as a strategic partner to support the State in designing a scalable, data-driven, and Alaska-specific VBC approach. Providence has an impressive track record of design of alternative payment models combined with execution and results, across our system footprint. We are seeking to partner with the state to bring statewide alternative payment model and clinical pathway solutions to this vulnerable population.	Providence proposes to serve as the State’s partner in designing a statewide value-based care model for dual-eligible Alaskans, beginning with a focused planning and readiness phase. Phase 1: Analytics, Opportunity Identification, and Co-Design -Conduct a robust review and analysis of available Medicare and Medicaid claims and encounter data to identify: High-cost and high-need subpopulations; Drivers of avoidable utilization; Opportunities for improved care coordination and alignment. -Assess existing delivery, contracting, and care management capabilities across Alaska. -Co-design a VBC framework with State partners that aligns incentives between the state Medicaid plan, providers, and communities. -Define programmatic goals, performance measures, and payment mechanisms aligned with Alaska’s Pay for Value: Fiscal Sustainability initiative. This phase will result in a clearly articulated statewide VBC model, implementation roadmap, and readiness assessment to support future phased deployment. The approach is intentionally collaborative and designed to complement—not replace—existing regional and Tribal delivery systems.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Providence Health & Services-Washington	Implementing Remote Patient Monitoring Reimbursement to Drive Sustainability & Positive Outcomes	WA	Remote Patient Monitoring services include the collection and analysis of patient physiological data using digital devices to remotely monitor and manage a patient’s health conditions. This is a powerful tool in the prevention and treatment of chronic conditions, and efficient chronic disease management can lead to a decrease in years of potential lives lost (YPLL). For example, according to the 2021 Primary Care Needs Assessment, diseases of the heart lead to a mean YPLL of 7.8 years. By focusing on incentivizing chronic disease management, this program can decrease YPLL through appropriate management of hypertension and other diseases of the heart. Additionally, the state of Alaska currently does not reimburse for this service for Medicaid patients. Providence has been providing these services for our Medicare population where analyses and peer reviewed publications have shown better control of chronic diseases and reduced total cost of care.	Remote Patient Monitoring is a powerful tool in the prevention treatment of chronic conditions like heart failure, diabetes, chronic obstructive pulmonary disease, and hypertension, reducing readmissions and the overuse of the emergency department. These services are covered by Medicaid when they are ordered by a qualified healthcare provider, defined as a physician, advanced practice registered nurse, or physician assistant. This project would introduce Remote Patent Monitoring (RPM) reimbursement for four specific disease states: Congestive Heart Failure, Hypertension, Diabetes Mellitus, and Chronic Obstructive Pulmonary Disease. Providence Medical Group already has an established infrastructure and full integration with our EHR and has contracted with Cadence as a vendor solution for this service since early 2024 for the Medicare population. The population of focus would include empaneled patients with Medicaid as the primary partner with a diagnosis of one of the four disease states mentioned above.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Chugach Census Area; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area	Advance to Implementation Application

Providence Health & Services-Washington	Improve Continuity of Care in Rural Alaska via Community Connect	WA	Providence currently offers Community Connect to healthcare provider organizations throughout Alaska. We specifically work with organizations who might otherwise not be able to afford the tools to fully integrate their electronic medical record system with other hospitals and providers. This includes pushing health data to the state’s shared HIE, HealthEConnect. We pass the incremental costs associated with adding additional caregiver practices to tools Providence invests in so that patients throughout Alaska benefit from their local providers having access to clinical content and continuity of care they might otherwise only see in urban areas. We currently support the following clinics and hospitals as users of the Providence EHR via our Community Connect program: Alaska Women’s Care, Alaska Pediatric, Seward Community Health, Central Peninsula Hospital, Northstarr Cardiothoracic, Iliuliuk Family and Health Services, Alaska Neurology Center, Anchorage Neighborhood Health Center, Alaska Neurological, and South Peninsula Hospital. As part of this proposal, we’d open the door to groups like Cordova Community Medical Center, Bartlett Regional Hospital, and Alaska Heart and Vascular Institute where they serve vital communities, are eager to move to a shared and integrated platform, but the expense to deploy makes it unattainable.	We propose using RHTP funds to aid rural healthcare organizations in the deployment and services related to moving from aging EMR systems to available shared systems. Community Connect improves collaboration across healthcare organizations first by creating a single shared patient record for participating providers within the shared EHR, but also by providing the tools necessary for data sharing with other Epic facilities via CareEverywhere and more broadly via integration with the State’s HIE and other services such as TEFCA.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Juneau (City and Borough)	Advance to Implementation Application

Providence Health & Services-Washington	Seward Community Care Hub: Advancing Health Through Coordinated Social Support Services	WA	Adverse social determinants of health—housing instability, food insecurity, and unsafe living conditions—are significant barriers to health outcomes, especially in remote and rural Alaska. In Seward, the emergency department often serves as the frontline of care for residents that are impacted by several of the above adverse determinants of health. Unfortunately, many of Seward’s social services are not coordinated to best serve the community efficiently and effectively. This project would serve as the missing infrastructure to transform a fragmented social services landscape into a centralized hub model.	Providence Seward Medical Center (PSMC) proposes to lead the development of a coordinated social services hub in Seward designed to address critical social determinants of health, including housing instability, food insecurity, and unsafe living conditions. The hub will integrate essential services such as emergency and transitional housing support, community meal and food access programs, and domestic violence prevention and response services. This model will function as a central coordination point, aligning healthcare, social services, and community-based resources to better serve vulnerable populations. This project will require strong collaboration across local and municipal government, faith-based organizations, non-profits and tribal partners, law enforcement and emergency services, state and federal funding entities, and private philanthropy. In the first year, PSMC will focus on foundational development and partnership alignment, with the following outputs: Conduct a community needs assessment and service gap analysis; Establish a multi-agency governance and leadership structure; Formalize partnership agreements (MOAs/MOUs) across key stakeholders; Identify and secure physical location(s) for hub services; Develop a phased implementation plan (transitional housing, food services, domestic violence support); Initiate pilot programs for highest-priority needs (e.g., food access or navigation services); Secure initial staffing model and workforce plan; Begin funding alignment and grant acquisition strategy.	\$1M-\$5M	Hospital	Single Community	Kenai Peninsula Borough	Advance to Implementation Application
Providence Health & Services-Washington	Strengthening Rural Alaska Imaging Access Through Remote Technology	WA	MRIs and CTs are critical pieces of imaging equipment for hospitals and clinics that provide key information to healthcare providers for effective patient treatment. There exists a nationwide shortage of radiology technologists, especially those with training in MRI and CT. All locations in Alaska (both Providence and non-Providence facilities) are struggling to hire MRI and CT techs. Valdez had to stop performing MRIs in September 2024 because of staffing, and other locations struggle to provide access to care because of this same issue. As a result, patients often lose access to essential imaging services, hindering timely diagnosis and care. The Virtual Cockpit (VC) platform addresses this gap by enabling experienced technologists in Anchorage to remotely operate scanners in rural areas—providing immediate, reliable imaging access while reducing workforce strain and ensuring continuity of care.	The purpose of this project is to launch a program called “Syngo Virtual Cockpit” (VC), where we will be able to operate MRI and CT scanners from a distant location, removing the barrier of staffing from why a patient cannot get access to the care they need. The MRI and CT techs will 'remote in' from a distant 'steering client', while onsite personnel, trained in positioning, MRI safety, IV placement and patient experience, will assist the patient. Providence is well equipped for this project as we have 14 MRI/CT scanners across Alaska including Anchorage, Seward, Valdez and Kodiak. We share a common Electronic Medical Record and have a shared IT team that supports our network and applications. We also have the relationships across the different communities and hold expertise in project management, which will contribute towards the success of this project implementation.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough; Kodiak Island Borough	Advance to Implementation Application

Providence Health & Services-Washington	Transitions of Care Value-Based Payment Pilot for Rural and Frontier Alaska	WA	Hospitals and SNFs serving rural Alaska face persistent challenges related to extended lengths of stay, delayed access to physical and occupational therapy, and limited financial incentives to transition patients efficiently to lower-acuity settings. Traditional fee-for-service reimbursement models often do not support timely therapy initiation or coordinated discharge planning, particularly for patients returning to remote communities. This misalignment contributes to avoidable utilization and acute hospital stays that may exceed what is required clinically. Higher utilizations and longer hospital stays result in higher costs to the Alaskan healthcare system and poorer patient outcomes. There is a clear opportunity to test a value-based payment approach that aligns financial incentives with timely, high-quality transitions of care and improved post-acute outcomes.	This project proposes a Transitions of Care Value-Based Care (VBC) pilot that introduces an extension payment model to support post-acute care delivery and accelerate safe transitions from hospitals to SNFs, home, or rural post-acute partners (for example, inpatient rehab facilities and/or critical access hospital swing beds serving as rehab). Key components include: -A value-based extension payment to address gaps in PT/OT access within SNFs -Data-sharing and analytics support to identify transition-ready patients earlier -Incentives tied to reduced length of stay, successful discharge to home or community-based care, and reduced readmissions -Structured collaboration between hospitals, SNFs, and rural post-acute providers The model is explicitly designed to test alternative payment methodologies for hospitals, aligning with RHTP’s Pay for Value initiative by shifting focus from volume-driven utilization to outcomes, efficiency, and fiscal sustainability.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Advance to Implementation Application

Providence Health & Services-Washington	Alaska Statewide Health Interoperability Assessment Framework	WA	Alaska’s health care system faces longstanding challenges related to geography, workforce shortages, and fragmented delivery systems. These challenges are compounded by inconsistent interoperability practices, variable health IT maturity, and a lack of shared statewide standards for data exchange, governance, and technical architecture. Providence was a key contributor to CMS’s most recent interoperability standards, which require the use of HL7 FHIR (Fast Healthcare Interoperability Resources) APIs to improve data exchange, reduce administrative burden, and streamline prior authorization. As Alaska advances RHTP initiatives, particularly efforts to support value-based care and fiscal sustainability, Alaska-based providers must be able to exchange clinical, administrative, and quality data reliably across organizations and regions. Without a coordinated, statewide approach to interoperability that embraces new technologically advanced standards, providers risk duplicative investments, limited scalability, and exclusion from value-based payment models that depend on timely, accurate data sharing. This project addresses the opportunity to create a shared interoperability foundation that aligns technical standards with Alaska’s RHTP goals and reduces barriers for providers, public health works, payers, and the vendors that support them statewide. Establishing this foundation is a necessary first step, upon which Alaska can layer more complex solutions.	This project proposes a conceptual, statewide initiative to assess current interoperability capabilities across Alaska’s health care ecosystem and to establish a common set of interoperability standards, architectural principles, and requirements to guide future investments. Key components of the concept include: -A statewide interoperability assessment examining existing health IT systems, exchange methods, data standards, and governance practices across providers, payers, and partners. -Development of recommended statewide interoperability standards, including data exchange frameworks, minimum technical requirements, and alignment with national standards, ASTP/ONC interoperability requirements, and Health Tech Ecosystem initiatives where appropriate. -Definition of a reference architecture that can be used by providers, vendors, and partners to support scalable, interoperable solutions across Alaska, with targeted use cases such as quality measurement, patient risk profiling, care management, census/notification, and other priority workflows. -Identification of optional pilot opportunities to test and validate selected standards or approaches in representative settings (e.g., rural clinics, regional hubs, or cross-organizational care coordination scenarios), without committing to full implementation at this stage. The project is intentionally focused on planning, alignment, and standards development — including a shared statewide interoperability approach — rather than procurement or system replacement.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Providence Health & Services-Washington	Developing the Alaska Healthcare Workforce via School Based Career Education and Awareness	WA	Research has clearly shown that individuals pursue careers based upon role models and interest that is established early in one’s lives (e.g., middle / high school age). Given the significant need for healthcare workers in Alaska, it is essential that we create knowledge and interest in these careers that wouldn’t happen otherwise. Through school-based career education and awareness, the School Ambassador Program assigns current healthcare workers to high / middle schools to build and maintain career education. This is accomplished through building awareness and knowledge with students, staff, and faculty, and by providing shadowing and mentoring, alongside other activities, in and out of the classroom.	This funding would support School Ambassador Program expansion throughout Anchorage and in rural Alaska. Current healthcare employees (nurses, technicians and other staff) would be assigned to one high school or middle school and subsequently partner with local school personnel to offer presentations, shadowing and other experienced-based learning opportunities. Ambassadors are expected to commit to the role for one academic year and spend about 3-hours/month on the program. Data is collected from pre- and post-career exploration surveys to assess interest in working in healthcare. Data has shown that interactions with an Ambassador, and/or other mentors, may help solidify the future plans of students who already feel like they will pursue a career in healthcare and interactions with an Ambassador, or others, may help influence students to pursue a career in healthcare who may have previously been unsure. Overall, our School Ambassador Program is a promising model for the healthcare industry to achieve engagement with K-12 partners, with the central goal of providing students more exposure, knowledge, awareness and understanding of healthcare careers.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough; Kodiak Island Borough	Deferred or Not Advanced

Providence Health & Services-Washington	Hub to Home Alaska: Regional Care & Chronic Disease Pilot	WA	Alaska’s health care system faces persistent challenges related to fragmentation, rising costs, and misaligned fee-for-service incentives—challenges that are especially acute for rural patients with complex and chronic conditions. Anchorage based providers function as regional anchors for specialty and tertiary care, yet coordination across organizations, payers, and care settings remains inconsistent. At the same time, chronic disease management activities essential to improving outcomes—such as care coordination, patient education, and longitudinal monitoring—are often under supported financially. The Rural Health Transformation Plan identifies Pay for Value: Fiscal Sustainability as a critical priority, highlighting the opportunity to align payment with outcomes and support regional care models that improve coordination and reduce avoidable utilization.	This project will pilot an integrated regional care coordination and chronic disease management model that aligns care delivery, data, and payment across providers and payers. Key elements include: -An Anchorage based hub and spoke specialist care coordination network -Standardized referral, transition, and follow-up workflows across participating organizations -One to two evidence based chronic disease management programs tailored to rural settings -Telehealth enabled touchpoints and proactive longitudinal care management -Data informed performance tracking and shared accountability -Alternative payment methods (e.g., PMPM care management, bundled or hybrid value-based arrangements) that reduce reliance on fee-for-service reimbursement The pilot will generate operational, clinical, and financial learnings to support broader statewide replication.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Providence Health & Services-Washington	Preparing for a Sudden Cardiac Arrest Events: Launching Project ADAM in Rural Alaska Schools	WA	Response to Sudden Cardiac Arrest is often delayed in community settings and survival rates decrease with each minute of delayed defibrillation. Immediate CPR, coupled with immediate and correct use of an Automated External Defibrillator (AED), can double or triple a person’s chance of survival. Project ADAM was launched to get systems into place in communities across the country to offer the best chance of survival to people who suffer Sudden Cardiac Arrest. This project would equip local rural community members to efficiently respond to cardiac arrest through awareness, training, standardized protocol implementation, and AED deployment.	The ADAM Project would establish the Alaska Children's Hospital as the statewide hub to guide rural school nurses and staff in attaining a Project ADAM Heart Safe School designation. This is attained when a school meets criteria as assessed by the Project ADAM team. Local team members must complete drills to respond to sudden cardiac arrest events with CPR, AED use, and cardiac emergency response. Project ADAM focuses on the response team creation, preparation, and implementation of drill test logistics, practice and skills. A core team of clinicians coordinates the program and will administer the Heart Safe School designation when the site meets criteria with redesignation every two years. The program would be maintained through partnerships with Alaska Children’s Heart Center, school districts, tribal health organizations, and integration into existing school health programs.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Providence Health & Services-Washington	PROOF (Payment, Reform for Outcome, Oversight and Financial Sustainability)	WA	Recently, the State of Alaska has expressed interest in exploring opportunities to transition Medicaid into a value-based reimbursement model. As the state’s leader in VBC (Value Based Care) Medicare models, we have the opportunity to lead the change with the adoption of this positive one-sided risk program. In doing so, we will have a stronger focus on providing high quality care for low income and vulnerable community members across Alaska, including rural Alaskans. A one-sided risk will spur efficiency improvements, provide long-term financial sustainability and improve access for vulnerable Alaskans.	The Primary Care PROOF project is designed as a reintroduction of a prior demonstration project, transitioning Medicaid reimbursement from fee-for-service to a value-based approach. The proposal for this project is a capitated and one-sided positive PMPM, in addition to standard FFS (Fee-for-Service) reimbursement. The goal is to evaluate TCOC (Total Costs of patient Care) savings attributed to reducing unnecessary or overutilized care, aligning with the state’s goal of transitioning FFS Medicaid to a value-based reimbursement model. At conclusion, it can be determined through a comparable means analysis if the cohort and variable groups showed statistical significance for cost savings with the goal of expanding this demonstration project to a full 2-sided risk reimbursement model for the State of Alaska.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Providence Health & Services-Washington	Purchasing Equipment to Enhance Hospital Infrastructure in Anchorage	WA	It is difficult, if not impossible, to integrate technology and reimagine health care delivery with aging equipment. We need to be able to invest in both spaces to care for the growing needs of our communities. Many factors such as vendors, shipping, logistics, delivery can all lead to extreme costs of replacement or new equipment availability. In addition, the financial circumstances that exist in the current uncertain healthcare industry limit the long-term investment of dollars towards equipment, especially to areas that may not see high patient use of critical but specialized equipment. Due to the many factors in the high cost for equipment purchases, this LOI represents a high dollar figure investment of RHTP funds. We view this LOI as an exhibit on what hospitals in Alaska need to deliver the best care possible in their communities. Whether this LOI is selected for further funding or not, we hope the State of Alaska finds this information helpful in advocating for RHTP fund use to meet the capital and equipment needs for hospitals and facilities in Anchorage. We will meet the need for equipment in Anchorage through purchasing equipment that has been identified by local leaders as instrumental to hospital and programmatic operations for the safety of patients and the caregivers who deliver the care.	Equipment needs in Anchorage are wide ranging, demonstrated by examples highlighted below. To best serve our patients based in Anchorage, travelling to Anchorage for care, or receiving virtual services from Anchorage, a variety of equipment is needed across Providence Alaska Medical Center (PAMC), Providence Imaging Center (PIC), and Providence Saint Elias Specialty Hospital. At PAMC, a catheterization lab needs updated equipment totaling \$2.5M. The cath lab diagnoses and treats heart and vascular conditions using minimally invasive, image-guided procedures, ensuring Alaskans can receive life altering care at a trusted facility. Items such as blood bank freezers (\$40,000) and radio communications (\$1.9M) are also needed. The overall equipment needs at PAMC total \$11.7M. At PIC, new mammography machines are needed, totaling \$990,000, crucial to ensuring patients across the state have access to early diagnosis and treatment. Overall, a total of \$6.5M is needed for equipment expenses at PIC. At Providence Saint Elias Specialty Hospital, which focuses on long-term rehabilitation, examples of need include ceiling lifts in patient rooms, totaling \$120,000, ensuring patient and provider safety. The total need at St. Elias is \$650,000. Behavioral Health is also in need of equipment purchases, including vehicles to transport residential patients, and a fridge and freezer, all totaling \$115,500. Overall, equipment needs in Anchorage, across all sites, total \$19M.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough; Kodiak Island Borough	Deferred or Not Advanced

Providence Health & Services-Washington	Purchasing Equipment to Enhance Rural Hospital Infrastructure in Kodiak	WA	It is difficult, if not impossible, to integrate technology and reimagine health care delivery with aging equipment. We need to be able to invest in both spaces to care for the growing needs of our communities. One of the biggest needs in CAHs is keeping facilities and equipment up-to-date, which is difficult in rural areas due. Many factors such as vendors, shipping, logistics, delivery can all lead to extreme costs of replacement or new equipment availability in rural areas. In addition, the financial circumstances that exist in the current uncertain healthcare industry limit the long-term investment of dollars towards equipment, especially to areas that may not see high patient use of critical but specialized equipment. Due to the many factors in the high cost for equipment purchases for rural areas, this LOI represents a high dollar figure investment of RHTP funds. We view this LOI as an exhibit on what rural hospitals need to deliver the best care possible in their communities. Whether this LOI is selected for further funding or not, we hope the State of Alaska finds this information helpful in advocating for RHTP fund use to meet the capital and equipment needs for rural hospitals. We will meet the need for equipment in critical access communities through purchasing equipment that has been identified by local leaders as instrumental to hospital and programmatic operations for the safety of patients and the caregivers who deliver the care.	Equipment needs are wide ranging, demonstrated by examples highlighted below. In Kodiak, needs include an advanced X-ray (RAX) fluoroscopy, which would provide diagnostic insights and treatments, estimated at \$1.3M. Other examples of needs include: An OB Hugs System (\$283,000) and OB badge readers (\$130,000) ensuring safety for our youngest patients, and delayed egress doors for Chiniak Bay Elder House (\$101,351), ensuring our facility is safe and updated for our elder patients. The overall equipment needs in Kodiak total \$17.4M. More information on needed equipment is available upon request.	Over \$5M	Hospital	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Providence Health & Services-Washington	Purchasing Equipment to Enhance Rural Hospital Infrastructure in Valdez	WA	It is difficult, if not impossible, to integrate technology and reimagine health care delivery with aging equipment. We need to be able to invest in both spaces to care for the growing needs of our communities. One of the biggest needs in CAHs is keeping facilities and equipment up-to-date, which is difficult in rural areas due. Many factors such as vendors, shipping, logistics, delivery can all lead to extreme costs of replacement or new equipment availability in rural areas. In addition, the financial circumstances that exist in the current uncertain healthcare industry limit the long-term investment of dollars towards equipment, especially to areas that may not see high patient use of critical but specialized equipment. Due to the many factors in the high cost for equipment purchases for rural areas, this LOI represents a high dollar figure investment of RHTP funds. We view this LOI as an exhibit on what rural hospitals need to deliver the best care possible in their communities. Whether this LOI is selected for further funding or not, we hope the State of Alaska finds this information helpful in advocating for RHTP fund use to meet the capital and equipment needs for rural hospitals. We will meet the need for equipment in critical access communities through purchasing equipment that has been identified by local leaders as instrumental to hospital and programmatic operations for the safety of patients and the caregivers who deliver the care.	Equipment needs are wide ranging, demonstrated by examples highlighted below. In Valdez, needs include equipment such as Sonosite portable system (\$19,000), a compact, point of care ultrasound system, contributing to ease of use for caregivers and allowing patients to stay close to home for their imaging needs. Other needs include a dental chair and accompanying equipment (\$100,000), allowing us to partner with a dentist to provide dental care, especially to patients with no dental resources. The overall equipment needs in Valdez total \$506,000. A full list of equipment needs is available upon request.	\$250K-\$1M	Hospital	Single Community	Chugach Census Area	Deferred or Not Advanced

Providence Health & Services-Washington	Transforming Rural Care: Technology Modernization & Enabling Technology Access for Virtual Services	WA	Severe workforce shortages in rural Alaska mean that many of our Critical Access Hospitals (CAHs) are chronically understaffed, resulting in increased length of stay (LOS), care coordination gaps, deferred care, and increasing the need for patient travel from Kodiak, Seward, and Valdez to Anchorage for specialty care. Aging technology equipment in rural communities creates challenges in virtual specialty care provision and adversely impacts patient and provider satisfaction and clinical safety. Overarchingly, these challenges threaten rural residents’ overall health and wellbeing and prevent patients from staying in their home communities for specialty care. This transformative project seeks to modernize rural technology equipment and enable technology access for virtual services. Subsequently, virtual services could be delivered via an urban-rural hub and spoke model.	This hub and spoke model comprises two principal approaches: Rural Technology Modernization and Enabling Technology Access for Virtual Services. Rural technology modernization will upgrade clinical communications platforms, nurse call systems, and high-acuity patient monitoring to ensure technologies are stable and secure across CAHs, with Providence Alaska Medical Center (PAMC) as a hub. This modernization, coupled with enabling technology access for virtual services, will allow real-time collaboration between onsite teams and urban specialty teams, to promote the highest quality care close to home. As an example of what might be included in virtual telehealth services, virtual case management would allow telehealth-based case managers to perform pre-discharge virtual visits and coordinate post-hospital services. Following technology modernization, the “Bridge Program” would transition patients in the hospital awaiting long term care placement out of the hospital to a Skilled Nursing Facility (SNF) 4-6 weeks sooner while continuing to work on long term care placement. Coupled, rural technology modernization and technology access to enable virtual services targets persistent barriers such as workforce shortages, discharge delays, aging equipment, safety, and deferred care, while aligning with Alaska DoH priorities of implementing innovative care and technology across the state.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough; Kodiak Island Borough	Deferred or Not Advanced

Provision Ministries	Empower Through Access: Transportation and Supportive Housing for Mat-Su Residents	AK	One of the most persistent barriers to health care access in rural Alaska is the lack of reliable transportation. Rural challenges are not defined solely by distance. Many Alaskans face poor road maintenance, difficult terrain, and a shortage of transportation providers willing or able to reach their location with sufficient staffing and appropriate vehicles. These barriers often result in missed medical appointments, delayed treatment, and worsening health conditions. In the Matanuska-Susitna Borough, many working-age adults rely on transportation assistance to attend substance use treatment programs, behavioral health appointments, maternity and postpartum care, physical therapy, dialysis treatments, and other critical medical services. Some individuals also experience cognitive or behavioral limitations that make it difficult to safely navigate transportation systems or engage with the community independently. Community organizations and health providers consistently report that transportation barriers and housing instability are among the most common reasons individuals miss appointments, fall out of treatment, or struggle to maintain stability. Provision Ministries was created as a grassroots effort to address these gaps by improving transportation access and exploring supportive housing options for residents who face barriers to stable housing and consistent care.	Provision Ministries proposes to develop coordinated community-based transportation services that connect individuals with health care providers, clinics, treatment centers, and other essential services throughout the Matanuska-Susitna Borough. The project will begin by acquiring up to five transportation vans to provide safe and reliable transportation for residents traveling to behavioral health services, substance use treatment programs, maternity and postpartum care, dialysis treatments, physical therapy, and other medical appointments. Transportation services will prioritize affordability and reliability in areas where existing options have struggled to keep pace with population growth and limited service availability. Grant funds would support the acquisition and operation of vehicles, including the high cost of insurance required for medical transportation services and supplemental driver wages, while prioritizing volunteer drivers whenever possible. In addition to transportation services, Provision Ministries plans to develop small micro-unit supportive housing within a building previously operated as an assisted living home in the Mat-Su Borough. The property owner has indicated willingness to make the building available through purchase or lease. The project would complete necessary roof repairs and renovate the building to provide small supportive housing units designed to work alongside existing housing voucher programs. Together, these efforts aim to improve access to care while supporting long-term stability for individuals who face barriers to transportation and housing.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Ptarmigan Pediatrics LLC	: Pediatric Diagnostic Excellence & Early Intervention Initiative	AK	This proposal aims to bridge the specialist care gap in rural Alaska by integrating advanced screening technology directly into the primary care setting. By eliminating the logistical and financial hurdles of travel, we can ensure early intervention and improved outcomes for high-risk pediatric and respiratory patients. Key Initiatives Vision Screening (Pre/Non-Verbal): Utilizes automated screeners to detect amblyopia, strabismus, and refractive errors in infants and children with developmental delays. This non-invasive method prevents permanent vision loss where traditional charts fail. Universal Hearing Evaluation: Employs Otoacoustic Emission (OAE) screeners as a safety net for newborns (including home births) and children with speech delays. We will implement a universal protocol for ages 4–6 to ensure school readiness. Non-Invasive Jaundice Monitoring: Using Transcutaneous Bilirubinometers (TcB), clinicians can measure jaundice through the skin. This replaces painful heel-sticks, reduces outpatient lab costs, and ensures safe monitoring during the first two weeks of life. Objective Asthma Management: Integrating Pulmonary Function Testing (PFT/Spirometry) allows for "gold-standard" asthma care. Real-time, objective data enables immediate medication adjustments, reducing emergency room visits.	This initiative addresses the "lost follow-up" crisis in rural Alaska caused by travel costs and logistics. By bringing specialist-level diagnostic tools into the primary care setting, we can provide immediate, life-altering interventions without requiring patients to travel. Our patient population is 16,500 which is approximately 55% of the pediatric population in our catchment area. All patients in age and disease appropriate groups with benefit from testing. A \$60, 000 investment with provide screening tools, supplies, maintenance of equipment and training for staff. Core Screening Initiatives Vision (3 Automated Screeners): Targets infants and non-verbal children. By using light-based detection rather than traditional charts, clinicians can identify amblyopia and strabismus early, preventing permanent vision loss. Hearing (3 OAE Screeners): Acts as a safety net for newborns (including midwife births) and children with speech delays. Universal screening at ages 4, 5, and 6 ensures students enter school without undiagnosed hearing impairment. Jaundice (2 TcB Bilirubinometers): Provides non-invasive, instant monitoring of newborn jaundice through the skin. This eliminates painful heel-sticks and saves families thousands in outpatient lab fees during the critical first two weeks. Respiratory (2 PFT/Spirometry Machines): Establishes the "gold standard" for asthma care. By using objective lung function data rather than subjective reports, clinicians can adjust medications in real-time, significantly reducing ER visits. Expected Impact This equipment transition shifts the burden of care from the patient to the clinic, ensuring that geography is no longer a barrier to essential pediatric and respiratory health outcomes.	\$50,000-\$250,000	Clinic	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

Ptarmigan Pediatrics LLC	Digital Transformation of Rural Care at Ptarmigan Pediatrics	AK	This grant proposes a dual-layered technology infusion: 1. A Custom Integrated Portal: A user-friendly interface that sits between our EMDs and Phreesia, allowing for seamless scheduling, document sharing, and messaging without the clunky limitations of a standard EMR portal. 2. Ambient Clinical Intelligence (DAX): AI-powered voice technology that securely captures patient encounters in real-time, allowing providers to remain fully engaged with the child and family while the AI generates high-quality, clinical notes. This transformation will protect the 55% of the region's children we serve by ensuring their providers are present, focused, and administratively efficient.	1. The Integrated Portal (The "Digital Front Door") Unlike standard EMR portals, this system will offer a "one-tap" experience for Alaskan parents. • Benefits: Reduces "phone tag" for 16,500 patients, allows for digital intake via Phreesia before the family leaves their home, and provides a secure platform for sharing Speech and Behavioral Health results instantly. • Infrastructure: Includes dedicated server space and enhanced IT support to ensure 100% uptime in rural connectivity environments. 2. Nuance Dragon Ambient eXperience (DAX) DAX is a sophisticated AI that "listens" to the visit (with parental consent) and converts the conversation into a structured note. • Benefits: Increases "eye contact time" between the pediatrician and the child. For pediatric behavioral health, this is transformative, as it captures the nuances of the interaction that are often lost when a provider is typing. • Productivity: By reducing charting time by up to 50%, providers can see 1-2 more patients per day or spend that time on complex care coordination.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Ptarmigan Pediatrics LLC	Medical Support Staff Retention Initiative	AK	The health of 16,500 children is not maintained by physicians alone; it is maintained by the "village" of support staff who answer the phones, score the assessments, coordinate the referrals, and welcome the families. At Ptarmigan Pediatrics, we recognize that our support staff are the guardians of our clinic's efficiency and our patients' comfort. The Support Staff Retention Initiative is a direct investment in the stability of rural Alaskan families. By removing the financial "gross-up" burden from our clinic's operating budget, we can focus our resources on clinical excellence while ensuring our staff feels the full weight of our appreciation. We are asking the RHTP to help us keep this village intact, ensuring that the faces our children see today are the same faces they will trust throughout their childhood.	This grant requests a 10% annual retention fund, fully "Grossed Up" to cover all tax liabilities. This ensures that our 39 staff members receive the full value of their bonus, insulating them from the high cost of living in Alaska. By providing these bonuses strategically (1–4 times per year), we create a consistent "pulse" of appreciation and financial security, making Ptarmigan Pediatrics the employer of choice in a competitive market where primary care often struggles to match specialty-clinic wages. Our staffing model accounts for current needs and the necessary growth to meet the demands of our 16,500-child catchment area. Staffing & Salary Projections • Current Full-Time Employees (FTE): 33 • Current Part-Time Employees: 2 • Planned New Hires (FTE): 4 • Total Anticipated Workforce: 39 • Total Anticipated Base Salary: \$1,945,000 The "Zero-Burden" Bonus Model To ensure the 10% bonus feels like a true reward, the grant includes the "Gross-Up" (approximately 30% for taxes/FICA) and the 4% 401(k) match.	\$250K-\$1M	Private practitioner	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

Ptarmigan Pediatrics LLC	Strategic Initiative for Pediatric Workforce Sustainability in Rural Alaska	AK	Ptarmigan Pediatrics is seeking grant funding to onboard a newly graduating pediatric resident to address a looming primary care shortage in our catchment area. Currently serving 16,500 patients—representing 55% of the local pediatric population—our clinic is the cornerstone of child healthcare in the region. With a significant portion of the local physician workforce nearing retirement within the next 5–10 years, this recruitment is a proactive measure to prevent a "care cliff." We are requesting a total investment to cover initial salary support, a significant retention-based sign-on bonus, and essential technological infrastructure (including AI-driven clinical tools) to ensure the new provider reaches self-sustainability within 9 months while maintaining high patient throughput.	The health of our community’s children is dependent on the foresight of our recruitment efforts today. By supporting this grant request, the Rural Health Transformation Project will enable Ptarmigan Pediatrics to secure a dedicated new physician, stabilize the local medical workforce against upcoming retirements, and leverage cutting-edge AI technology to ensure sustainable, efficient care. Ptarmigan Pediatrics is requesting a one-time investment of \$333,606 to bridge the 9-month "ramp-up" period for a new pediatric resident. This total includes \$164,500 for 70% of the \$235,000 base salary and \$44,063 for benefits and taxes. To ensure long-term retention in rural Alaska, we include a \$105,635 grossed-up sign-on bonus and \$5,000 for relocation. Finally, \$14,408 is allocated for essential infrastructure, including EMR licensing and Nuance DAX AI tools to maximize clinical efficiency. By month 9, the provider will be self-sustaining through patient revenue.	\$250K-\$1M	Clinic	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

Ptarmigan Pediatrics LLC	Pediatric Specialty Access Planning Initiative - Expanded Telemedicine Capabilities (PSAPI)	AK	In rural Alaska, "telemedicine" is often limited to basic sick visits. Complex pediatric conditions—such as Fetal Alcohol Spectrum Disorder (FASD), speech delays, and neuropsychological needs—require multidisciplinary teams and objective data (vitals, growth charts). Currently, families must travel to urban hubs for these evaluations, often resulting in deferred care or incomplete diagnoses. While basic telemedicine (video chat) is widely available, complex pediatric evaluations—such as Fetal Alcohol Spectrum Disorder (FASD) or Speech Therapy—often require a "hybrid" approach where a local provider collects physical data (vitals, growth, neuro-physical observations) while a remote specialist conducts the assessment. Our goal is to evaluate the feasibility of expanding telemedicine capabilities to include these complex medical condtions. The PSAPI planning year requires a total of \$20,000. The majority, \$12,600, funds the NP Coordinator for 12 months of research and four intensive field visits. \$6,200 is allocated for travel, lodging, and per diem to assess remote site readiness firsthand. The final \$1,200 covers administrative costs, including legal reviews of MOUs and platform trials. This focused investment ensures that the high-cost hardware and implementation phases in Years 2 and 3 are built on a sustainable, clinically sound, and community-verified foundation.	The Pediatric Specialty Access Planning Initiative (PSAPI) is a strategic one-year project designed to solve the "specialty gap" in rural Alaska by creating a robust telemedicine bridge between urban specialists and remote clinics. A central component of the plan is the formalization of "Sister Site" agreements. These partnerships ensure that remote clinics are equipped and staffed to provide essential hands-on data, such as vitals and growth charts, while the specialist manages the clinical diagnosis from the Wasilla hub. By conducting onsite audits of clinical workflows and hardware requirements, the project moves beyond simple video calls to high-fidelity assessments for nutrition, lactation, and behavioral health. The ultimate goal is to transition from this planning phase into a sustainable, insurance-reimbursed model that eliminates the need for families to endure expensive and exhausting travel for routine specialty care. By June 2027, the project will produce a clear roadmap for equipment procurement and site readiness, ensuring that geography is no longer a barrier to "gold-standard" pediatric medicine The first year (July 2026 – June 2027) will be dedicated to building the "Human Infrastructure" required for Year 2 implementation. 1. Expert Project Coordination (Nurse Practitioner) We will utilize a Nurse Practitioner (NP) with extensive experience in community relations and distant clinic operations to lead the planning. • Coordination: Identifying "Sister Sites" (remote clinics/schools) and establishing Memorandums of Understanding (MOUs). • Research: Identifying HIPAA-compliant platforms that can handle the high-definition video required for neuropsychological observation. • Workflow Design: Determining how height, weight, and vitals will be integrated from a remote site into the patient's medical record. 2. Sister-Site Feasibility Tours The NP Coordinator will conduct 3–4 site visits to remote medical facilities. These 2-day trips are essential to audit: • Connectivity Gaps: Testing broadband for "lag-free" speech therapy or counseling. • Clinical Space: Evaluating if local rooms provide the privacy needed for lactation or neuropsychological testing. • Relationship Building: Meeting local staff to ensure the "Train-the-Trainer" model is sustainable in Year 2.	Under \$50,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Planning

Ptarmigan Pediatrics LLC	: Ptarmigan Pediatrics Community Summer Health & Wellness Fair	AK	Ptarmigan Pediatrics identifies a critical opportunity to address the geographic and systemic barriers that prevent rural families from accessing essential health and safety resources. In many rural regions, healthcare is fragmented; families often travel significant distances to multiple locations for basic needs like vaccinations, developmental screenings, and safety education. This fragmentation leads to lower health literacy and deferred preventative care, ultimately increasing long-term health risks for children. By hosting a comprehensive Summer Health Fair, we aim to collapse these barriers, transforming our clinical site into a centralized community hub. The event provides a "one-stop shop" where over 35 local entities—ranging from emergency services to educational non-profits—can engage with residents in a high-visibility, trusted environment. This project represents a strategic shift from reactive office visits to proactive community engagement. By consolidating vital services into a single, accessible day, we can significantly boost preventative care rates and foster direct connections between families and the support networks they need. Funding this initiative as a three-year renewable partnership allows us to move beyond a one-time event, establishing a predictable cornerstone of rural health that builds multi-generational trust and improves the overall well-being of our region’s youth.	In rural Alaska, health outcomes are heavily influenced by environmental and social factors. This fair directly addresses key SDOH categories: • Access to Healthcare & Health Literacy: By bringing 35+ providers to a central, visible location, we eliminate "navigation barriers." Residents can meet specialists and non-profit leaders face-to-face, reducing the intimidation factor often associated with institutional healthcare. • Social and Community Context: Isolation is a significant health risk in rural areas. This event builds "social capital" by gathering residents in a safe, celebratory environment, strengthening the community fabric. • Neighborhood and Built Environment: Hosting the event in the center of the "medical community" helps residents mentally map out where resources are located, ensuring they know where to turn during a crisis. A grant of \$10,000 per year would cover advertising, special event items, DJ and music, health/safety giveaways, sanitation and provision of food for attendees.	Under \$50,000	Private practitioner	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Ptarmigan Pediatrics LLC	Alaska Remote Community Speech & Language Support Program	AK	This proposal outlines a one-year outreach initiative to send 2–4 certified Speech-Language Pathologists (SLPs) to remote communities in Western Alaska three times during the year. The purpose of the program is to train parents, caregivers, educators, and community members in practical, culturally responsive strategies to improve speech and language development for children from preschool through middle school. By building community capacity and leaving behind sustainable materials and tools, this program will strengthen communication outcomes in regions where consistent speech-language services are limited. Project Overview • Serving Rural Alaskans: Directly serves families in Western Alaska by removing the need for expensive travel to urban hubs and providing services in familiar community settings. • Concept Approach: Three multi-day outreach trips (Fall, Winter, Spring) featuring workshops, classroom demonstrations, and the distribution of permanent support toolkits. • Sustainability: Knowledge and physical materials (manuals, games, and visuals) remain in the community, supplemented by remote teleconsultation between visits.	Primary Goal: To increase community capacity to support speech and language development for children ages 3–13. Objectives: 1. Conduct three multi-day outreach visits during one calendar year. 2. Train parents and community members in evidence-based language strategies. 3. Provide take-home materials and classroom toolkits to sustain efforts. 4. Offer follow-up consultation between visits as needed. Program Structure Service Model The program will include three outreach trips (Fall, Winter, Spring). Each trip will include: • 3–5 days on-site per visit • Parent and caregiver workshops • Classroom strategy demonstrations • Small group consultation sessions • Distribution of speech and language support materials Staffing Each visit will include 2–4 licensed Speech-Language Pathologists with experience in early childhood and school-based practice. The total funding request for this one-year initiative is \$69,060. A significant portion of this budget (\$36,000) represents the Clinical Opportunity Cost, ensuring the home clinic remains sustainable while its specialists are deployed to the field. Approximately 26% of the remaining funds are dedicated to the logistical realities of Alaskan travel, while \$9,000 is invested directly into permanent materials that stay within the community to ensure a lasting legacy of support.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Ptarmigan Pediatrics LLC	Bringing clinical diagnostics home - Fiberoptic Endoscopic Evaluation of Swallowing	AK	Currently, when one of our 16,500 pediatric patients requires a swallow study, they must be referred to an urban hospital (Anchorage, Fairbanks, or Seattle) for a modified barium swallow study (MBSS) . For 50 patients annually, the estimated societal and system costs are up to \$190,000 per year for hospital fees, travel, lodging/meals, and lost wages for parent/guardian. Some of the benefits of FEES: • Real-Life Testing: Unlike MBSS, which uses barium-coated "fake" food in an intimidating X-ray suite, FEES allows the SLP to use the child’s actual breastmilk, formula, or favorite home-cooked foods in a familiar clinic setting. • No Radiation Exposure: FEES uses a light-based camera, making it safe for repeated follow-up studies to monitor a child’s progress without cumulative radiation concerns. • Immediate Biofeedback: The SLP can show the parent the video immediately after the scope, helping them visualize why their child is coughing or choking. This drastically increases "buy-in" for therapy and safety maneuvers.	The Pediatric FEES Implementation Project is a four-year strategic plan to transition Ptarmigan Pediatrics from diagnostic dependence to self-sufficiency • Phase 1 (Planning & Mastery): Intensive clinical training for two Speech-Language Pathologists (SLPs). • Phase 2 (Capitalization): Procurement of a state-of-the-art pediatric FEES tower and specialized procedure chair. • Phase 3 (Operationalization): High-volume clinical testing (50+ patients/year). • Phase 4 (Sustainability): Full integration into clinic operations, funded by specialized billing and reimbursement : The entire 3-year grant request for the FEES program (\$115,000) is less than the cost of just one year of travel-based MBSS studies for our population.	Under \$50,000	Clinic	Statewide	Matanuska-Susitna Borough	Deferred or Not Advanced
Ptarmigan Pediatrics LLC	Ptarmigan Pediatrics Community Health Education Series	AK	In rural Alaska, "health" is often hindered by a lack of access to specialists. This program brings those specialists directly to the people. • Access to Experts: Residents gain face-to-face time with content specialists they might otherwise never meet due to travel or insurance barriers. • Resource Navigation: A primary goal is teaching parents how to access existing local resources, effectively strengthening the entire rural health ecosystem. The Ptarmigan Pediatrics Community Health Education Series is an investment in the most valuable resource in rural Alaska: informed parents and caregivers. By funding this project, the RHTP will foster a more resilient, educated, and self-reliant community.	This program transitions our clinic from a site of reactive medical treatment to a center for proactive community education. • Year 1 Planning Phase (July 2026 – Sept 2026): This critical three-month window will be dedicated to curriculum development, securing partnerships with content specialists (e.g., OB/GYNs, nutritionists, and safety experts), and establishing a recruitment pipeline for attendees. • Operational Phase (Oct 2026 – Sept 2027): Monthly 2–3 hour classes open to the public. While initially free, specialized courses involving certifications (like CPR) may include a nominal fee to cover materials.	Under \$50,000	Clinic	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Ptarmigan Pediatrics LLC	Standardizing Pediatric Preventative Diagnostics in Rural Alaska	AK	In rural Alaska, "lost-to-follow-up" is a significant clinical risk. Traditional lab models require sending samples to central hubs, often resulting in multi-day delays. Furthermore, adolescent sexual health is often underserved due to the stigma of "opt-in" testing. This project creates an opportunity to set a new standard of care where diagnostic excellence is built into the routine well-visit, regardless of a family's proximity to an urban center. This initiative represents a paradigm shift in how we approach pediatric health in rural Alaska. By integrating advanced point-of-care diagnostics and a universal, stigma-free screening model for adolescents, Ptarmigan Pediatrics is moving beyond traditional reactive medicine toward a high-efficiency, preventative standard of care. This project not only addresses the immediate geographic barriers our 16,500 patients face but also establishes a fiscally responsible, self-sustaining clinical framework that will serve the community for years to come. We are committed to ensuring that every child in our catchment area—regardless of their proximity to an urban center—has access to the rapid, high-quality diagnostic data required for a healthy future.	We will install a localized diagnostic suite within the clinic: • Metabolic/Lipid: Two Piccolo Xpress machines for immediate CMP and Lipid panels. • Hematology: A Cytochip system for CBCs. • Diabetes Screening: DCA Vantage for hgbA1c. • Universal STD Screening: Implementation of the Aptima system to offer universal multiswab testing for all patients aged 15–18 during well visits. By making this "universal" rather than "requested," we remove the barrier of patient/provider discomfort and increase detection rates. • Access: By utilizing point-of-care machines like the Piccolo and DCA Vantage, we provide "same-visit" results to families who travel long distances, eliminating the need for follow-up travel or phone calls. • Quality: Immediate data allows for "real-time" clinical interventions—such as nutritional counseling for an elevated hgbA1c or immediate treatment for a positive STD screen—greatly improving health outcomes. • Sustainability: The project utilizes established CPT codes for laboratory reimbursements. Once the initial hardware and first-year supplies are funded, the revenue generated from high-volume screening will cover all future reagent costs and staff time.	\$250K-\$1M	Clinic	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Ptarmigan Pediatrics LLC	The Clinical Continuity & Rural Stability Initiative	AK	In rural Alaska, the greatest threat to pediatric health is provider turnover. When a clinician leaves, families often face long travel times, fragmented care, and delays in medical and behavioral health diagnoses. This grant seeks to bridge the gap between financial reality and the need for long-term patient stability. By providing 100% upfront funding for incentives, payroll taxes (gross-ups), and 401(k) matches, this grant ensures that Ptarmigan Pediatrics can guarantee a stable medical home for 55% of the catchment area’s children without straining the clinic's operating budget.	This project requests \$1,677,960 in upfront funding to establish a three-year retention program for 25 essential clinical staff members, including pediatricians, nurse practitioners, and behavioral health specialists. By fully funding these incentives—including all "gross-up" tax obligations and 401(k) matching—this grant removes the financial burden from the clinic's operating budget, ensuring clinical continuity in rural Alaska. To ensure the intended incentive reaches the provider’s pocket (\$25k, \$15k, etc.), the grant absorbs the \$191,100 in annual tax liability. Providers receive the full net incentive amount upfront to maximize the immediate retention impact. The clinic does not retain any portion of the grant for operations; instead, the associated "gross-up" tax funds and employer matches are held in a Restricted Tax Reserve Account. These funds are disbursed annually to satisfy tax and fee obligations in the specific year they are reported to the IRS, ensuring the clinic remains compliant without straining future cash flow. To promote long-term financial health, we have included a 4% match on these supplemental wages. Requesting the full \$1,677,960 in Year 1 allows Ptarmigan Pediatrics to maintain a strong balance sheet while providing staff with the psychological security of knowing their three-year incentive is already secured. Each incentive is treated as a 3-year loan that is forgiven in equal monthly installments (\$1/36th\$) provided the provider remains employed. If a provider leaves before the 36-month term, the unforgiven portion of the grant must be repaid by the provider. These recouped funds are held by Ptarmigan Pediatrics in a "Future Provider Fund" used specifically for the recruitment and onboarding of a replacement. This creates a self-sustaining cycle that protects the patient population's access to care regardless of individual staff changes.	\$1M-\$5M	Clinic	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Ptarmigan Pediatrics LLC	The Ptarmigan Feeding & Eating Wellness Initiative	AK	The nonprofit arm will operate within Ptarmigan Pediatrics to provide a "one-stop" clinical home. Our approach integrates various specialties to treat the "whole child": • Registered Dietitian (RD): Clinical nutrition management and growth monitoring. • Occupational Therapist (OT): Addressing sensory processing and oral-motor mechanics. • Future Expansion: Integration of SLPs (swallowing), Lactation Consultants (infant feeding), and Mental Health providers (ARNP/Psychology) for eating disorder management. To ensure the clinic does not rely solely on grants: • Hybrid Revenue: Providers will maintain a percentage of general pediatric cases within their scope of practice to ensure full schedules and consistent billing revenue. • Insurance Integration: We will bill private and state (Medicaid) insurance to create a sliding-fee scale for the uninsured.	Our model utilizes a Hybrid Clinical Model. To maintain financial solvency, providers carry a dual caseload: specialized feeding/eating disorder cases and general pediatric cases within their scope of practice. Key Personnel & Staffing Plan • Project Director / Registered Dietitian (RD): Leads clinical nutrition, growth monitoring, and grant compliance. • Lead Occupational Therapist (OT): Specialized in oral-motor mechanics and sensory processing. (Salary: \$120,000). • Post-Doctoral Psychology Fellow: Provides specialized counseling and eating disorder intervention. (Salary: \$90,000). • Practice Support Specialist: A full-time navigator (\$20/hr) managing scheduling, authorizations, and bookkeeping. The initial grant is requested to "seed" the two most critical roles: <table><thead><tr><th>Position Role</th><th>Justification</th></tr></thead><tbody><tr><td>Project Director / RD Clinical Oversight & Nutrition</td><td>Will manage grant compliance, coordinate the multidisciplinary team, and provide medical nutrition therapy.</td></tr><tr><td>Lead OT (Feeding) Sensory & Motor Specialist</td><td>Will implement high-level feeding protocols (e.g., SOS Approach) and train junior staff.</td></tr></tbody></table> Foundations often ask: "Why are you seeing general patients if the grant is for eating disorders?" Here is how we answer that in the proposal: "To ensure the clinical and financial health of the nonprofit, providers will maintain a 'Hybrid Caseload.' While the primary focus remains on feeding and eating disorders, providers will see general pediatric patients within their scope of practice. This strategy serves three purposes: 1. Clinical Competency: Ensures providers maintain broad pediatric skills. 2. Financial Stability: Fills schedule gaps to maximize insurance revenue, reducing long-term dependency on grants. 3. Community Access: Addresses the general shortage of OT, Speech, and Dietitian services in the region."	Position Role	Justification	Project Director / RD Clinical Oversight & Nutrition	Will manage grant compliance, coordinate the multidisciplinary team, and provide medical nutrition therapy.	Lead OT (Feeding) Sensory & Motor Specialist	Will implement high-level feeding protocols (e.g., SOS Approach) and train junior staff.	\$250K-\$1M	Clinic	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Public Consulting Group LLC	Alaska Rural Health Fellowship: Growing & Sustaining the Rural Workforce	MA	Rural, remote, and frontier communities across Alaska face persistent health workforce challenges that limit access to care, strain existing providers, and threaten long-term system sustainability. Chronic vacancies, high turnover, and reliance on short-term or external staffing solutions make it difficult for communities to maintain consistent, community-responsive health and public health services. At the same time, there is a significant opportunity to strengthen Alaska’s rural health ecosystem by investing in workforce pathways that prepare professionals for rural practice, embed them within communities, and support long-term retention. PCG currently manages a statewide fellowship program in New York State that demonstrates how paid, structured fellowships—paired with hands-on placement, targeted projects, and sustained support—can expand workforce capacity while improving service delivery. This project adapts that proven fellowship model to Alaska’s unique rural and frontier context. By placing paid fellows with Alaska-based partners and engaging them in targeted fellowship plans that directly support community members, the project addresses immediate workforce needs while building durable pipelines that reduce dependence on temporary staffing and strengthen local health systems over time.	Our proposed fellowship model applies the proven structure of PCG’s New York State fellowship project, recruitment, paid placement, training, and ongoing support, while tailoring the program to Alaska’s rural, remote, and frontier landscape through strong partnerships with Alaska-based organizations. Fellows will be hired into paid fellowship roles and placed with local host organizations through targeted fellowship plans that align community needs, organizational priorities, and fellow skillsets. These placements are intentionally designed so fellows support both systems-level workforce initiatives and direct, community-facing projects related to health care access, public health, and service coordination. The fellowship follows a two-phased approach. In Phase One, fellows increase immediate workforce capacity by supporting priority initiatives such as workforce planning, operational improvements, service coordination, and projects that bring health and public health resources closer to rural and frontier communities. In Phase Two, fellows focus on longer-term capacity building by strengthening systems, documenting processes, supporting staff development, and advancing strategies that reduce reliance on short-term or external staffing solutions. PCG will provide a strong program backbone informed by best practices from prior fellowship programs including structured onboarding, professional development, peer learning, and ongoing technical assistance. PCG staff are prepared to be on-site in Alaska to support partner engagement, fellow success, and program implementation, ensuring placements remain responsive to local conditions. While the core “bones” of the fellowship are established, the Alaska program will be built collaboratively with Alaska-based partners to ensure cultural relevance, operational feasibility, and meaningful community impact. Public Policy Lab	Elevating Rural Older Adults' Health Care Experiences in Alaska	NY	Alaska's population is aging rapidly, yet policymakers and service providers lack accessible qualitative insight into how older Alaskans, particularly Alaska Native elders and residents of rural and frontier communities, experience aging, navigate health care systems, and manage chronic conditions in daily life. Quantitative data can show where systems fall short. It cannot explain how those failures are lived, why they recur despite intervention, or what residents do when formal support is unavailable. For a state as geographically and culturally distinct as Alaska, that explanatory gap has direct consequences for policy design and service delivery. This project addresses the gap by documenting older adults' experiences through in-depth qualitative interviews and integrating their perspectives into The People Say, a national research platform focused on aging and health systems. By elevating rural Alaskans' firsthand accounts of navigating care, managing health needs, and accessing community services, the project provides decision-makers with the grounded insight needed to identify where systems are failing, why, and what changes would meaningfully improve access, quality, and the sustainability of care.	The project builds on The People Say's established research infrastructure, a national qualitative platform with a proven methodology deployed across 15 states. The approach pairs rigorous in-depth research with a structured dissemination platform designed to make lived experience accessible and actionable for policymakers, health system leaders, and community organizations. First, PPL will work with Alaska-based partners, including state agencies such as the Alaska Department of Health's Commission on Aging and community organizations, to identify rural and frontier communities where older adults face significant barriers to health care. Partners will help guide recruitment and ensure the project reflects local priorities and conditions that outside researchers could not anticipate. Second, trained researchers will conduct in-depth, semi-structured interviews with older adults living in rural Alaska. Interviews explore how residents access care, manage chronic conditions, coordinate services, and interact with Medicare, Medicaid, and community-based programs. The aim is to capture how policies and health systems function in practice from the perspective of people who use them daily. Third, interview data will be analyzed through an iterative qualitative process to identify patterns around access, system navigation, care coordination, and community resilience. Cross-location synthesis enables researchers to distinguish Alaska-specific challenges from those that cut across rural and frontier contexts nationwide. Findings will be shared with Alaska partners to support local interpretation and ground truth. Finally, interviews and analysis will be integrated into The People Say platform as curated video clips, transcripts, and tagged qualitative data aligned to a structured research taxonomy. This format allows policymakers, health administrators, and advocates to explore Alaska's rural health realities directly and compare them with evidence from other states, enabling both local application and national learning.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

PwC US Consulting LLP	AI-Powered Expenditure Tracking and Real-Time Anomaly Detection Platform	FL	Beginning March 2028, CMS will evaluate Alaska's RHTP fund utilization and may redistribute unobligated or mismanaged funds to other states. Alaska's \$272 million annual allocation — \$1.36 billion over five years — is at risk if expenditure patterns cannot be tracked, validated, and reported at scale. This is not hypothetical: CMS has redistributed funds in other federal programs when states could not document effective stewardship. Alaska's RHTP will fund dozens of subrecipients, creating significant financial monitoring requirements across a dispersed and administratively diverse portfolio. The challenge is structural: subrecipients use different financial systems, report on different cycles, and operate under varying levels of admin capacity. Financial anomalies detected months after expenditure leave DOH with limited corrective options. This project addresses that structural challenge with technology. Palantir Foundry provides an integrated, automated expenditure tracking and anomaly detection platform — the same infrastructure powering financial oversight at HHS, CDC, and VA. PwC configures the risk models, integrates with ACF's GrantInterface, and designs the governance layer. The result is continuous, automated financial visibility across all subrecipients — enabling DOH to act early, before anomalies become audit findings. This platform is the data infrastructure that independent evaluation and grants administration functions depend on to operate effectively.	PwC and Palantir propose deploying Palantir Foundry as the automated expenditure tracking and anomaly detection infrastructure for Alaska's RHTP. This is a technology platform engagement — focused on data integration, automated monitoring, and real-time financial visibility — designed to complement and enable human-led oversight functions. Component 1 — Expenditure Tracking Platform (Palantir Foundry): Deploy a centralized platform integrating subrecipient financial data — budgets, expenditure reports, invoices, drawdown requests — with project milestones, deliverable completion, and performance metrics. Integrate directly with ACF's GrantInterface through API connections and structured data feeds, enabling automated ingestion of award data and budget allocations. This eliminates dual data entry for subrecipients and ensures DOH has a continuously updated view of fund utilization across the full portfolio. Component 2 — AI Anomaly Detection (Palantir AIP + PwC Risk Models): Deploy machine learning models identifying expenditure anomalies including: unusual spending velocity; costs inconsistent with project scope; duplicate expenditures across subrecipients; performance-expenditure mismatches; and vendor payment irregularities. PwC designs the risk model logic; Palantir AIP provides the AI/ML engine. All anomaly alerts flow to DOH and ACF for structured human review — the platform surfaces signals, human reviewers determine response. False positive rate targeted below 15% with 90%+ detection sensitivity for material anomalies. Component 3 — Real-Time Dashboards & Automated CMS Reporting: Deploy dashboards providing DOH leadership, ACF, and the Advisory Council continuous visibility into fund utilization, risk indicators, milestone tracking, and portfolio-level performance. Automate quarterly and annual CMS reporting, reducing manual burden on DOH staff and ensuring consistent, audit-ready documentation across the grant period. Component 4 — Governance Integration: Design data governance and access control framework ensuring DOH, ACF, tribal health organizations, and subrecipients access only appropriate data. Tribal subrecipient data governed per ANTHC protocols and tribal data sovereignty requirements. Establish structured alert-to-review workflow connecting platform outputs to DOH and ACF decision-makers.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

PwC US Consulting LLP	Alaska HIE Transformation & Last-Mile Interoperability Strategy	FL	Alaska's RHTP investments in value-based care, telehealth, and chronic disease management share a common dependency: health data must flow across the full continuum of care. HealthEConnect Alaska provides statewide infrastructure, but five documented gaps limit HIE effectiveness for RHTP purposes. First, behavioral health data sharing remains limited to basic clinical summaries, not full bidirectional BH or SUD record exchange. Alaska's CCBHC demonstration launches Q3 2026, making HIE connectivity for ABHA member organizations a time-sensitive priority. Second, crisis services data exchange is insufficient. Alaska documents the closure of its only short-term adolescent psychiatric crisis center and a suicide rate more than twice the national average. Crisis units, mobile teams, and EmPATH facilities produce clinical data that rarely reaches follow-up providers — a gap RHTP Initiative 2 directly targets. Third, correctional health is disconnected. Individuals with BH and SUD conditions are disproportionately represented in Alaska's correctional population, yet no health data from Department of Corrections facilities reaches community providers at discharge. Fourth, many rural and frontier providers lack ONC-certified EHRs, preventing HIE participation entirely. Fifth, rural providers lack the analytics infrastructure required for Initiative 4 value-based arrangements — a prerequisite the initiative explicitly identifies as an eligible use of funds	PwC and Converge Health will execute an integrated, four-workstream engagement pairing Converge Health's interoperability expertise with PwC's rural EHR implementation experience, financial planning, gap analysis, and program management capability. • Workstream 1 — Statewide HIE Gap Assessment & Environmental Scan (Converge Health-led, Months 1–9): A comprehensive assessment mapping all provider types — acute, ambulatory, behavioral health, crisis, EMS, tribal, corrections, and community-based organizations — against HIE connectivity status, data types, interoperability standards, and governance structures. Deliverable: a prioritized interoperability roadmap aligned to all six RHTP initiatives, approved by DOH and healthEconnect Alaska. • Workstream 2 — EHR Adoption for Non-Connected Rural Providers (PwC-led, Months 4–24): Technology readiness assessments for providers outside the HIE. Evaluation of ONC-certified EHR options for low-bandwidth environments, business case development, financial planning, and implementation support — prioritizing providers serving Alaska Native and rural medically underserved populations. • Workstream 3 — Last-Mile Interoperability Implementation (Converge Health-led, Months 6–30): Phased implementation across five domains: (a) Behavioral Health — full data integration beyond clinical summaries aligned with 42 CFR Part 2; (b) Crisis Services — data exchange for stabilization units, mobile crisis teams, and EmPATH facilities; (c) Correctional Health — reentry data exchange connecting DOC facilities to community providers; (d) EMS — bidirectional AURORA-Elite ePCR and HIE integration; (e) Tribal Health — data governance co-design with ANTHC and tribal organizations preserving tribal data sovereignty. • Workstream 4 — VBC Analytics & Program Governance (PwC-led, Months 6–36): Population health analytics for risk stratification, care gap identification, and RHTP outcomes reporting. Program governance design for DOH, ACF, and healthEconnect. Medicaid administrative match analysis, post-RHTP operations planning, and rural provider VBC readiness support for Initiative 4 participation.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

PwC US Consulting LLP	Federated Population Health Data Platform with AI Analytics	FL	Alaska's health data sits in silos — Medicaid data in Conduent's MMIS, clinical data across Cerner, RPMS, and Epic, healthEconnect, behavioral health systems, and social services data — with no unified platform integrating them while respecting tribal data sovereignty. Without this integration, Alaska cannot deliver risk stratification, care coordination, and value-based care central to RHTP's goals. Alaska's own milestones make this urgent now: HIE expansion is (Q1 2026), interoperability (Q2 2026), EHR investments (Q3 2026), and risk stratification (Q4 2026). The infrastructure to support all six RHTP initiatives must be in place within this window. PwC and Palantir have done this before. Foundry powers federated health data integration for CDC, VA, HHS, and 35+ US health systems — including rural operators Lifepoint Health and HCA Healthcare. Critically, Foundry overlays and connects to existing systems — healthEconnect, Conduent's MMIS, Gainwell's provider enrollment, Cerner and RPMS at tribal sites — through 200+ pre-built connectors. This is the same approach proven at NHS England, where the Federated Data Platform integrates with dozens of existing systems without requiring costly migrations. Existing investments are preserved and enhanced, not displaced. PwC, as Palantir's strategic partner, provides healthcare domain expertise, CMS compliance, and Alaska stakeholder engagement to deploy this proven technology in Alaska's unique context.	PwC and Palantir propose deploying Palantir Foundry as the data federation and analytics platform, with PwC providing health care domain expertise, implementation management, and stakeholder engagement. Phase 1 — Data Foundation & Governance (Months 1-4): Build the data ontology mapping health system entities into Foundry's semantic object model. Co-design tribal data governance framework with ANTHC. Execute data-sharing agreements with healthEconnect, Medicaid systems, and providers. Begin initial data connections — healthEconnect integration via CRISP Shared Services/TEFCA is a days-to-weeks effort given Foundry's existing FHIR/HL7 connectors. Phase 2 — Integration & Initial Analytics (Months 3-12, overlapping with Phase 1): Deploy federated data connections to Medicaid administrative systems, tribal health organizations and providers. Leverage Foundry's native OMOP-to-FHIR conversion for EHR data normalization. Configure operational decision-support views — near-real-time, actionable information (resource allocation status, care coordination gaps, population health trends by borough) that enables corrective action, not just reporting. Deploy initial rules-based risk stratification models using integrated multi-source data. Phase 3 — AI-Enabled Use Cases (Months 8-24, parallel with Phase 2): Layer Palantir's AI Platform (AIP) for operational AI use cases mapped to RHTP initiatives: #1Healthy Beginnings → maternal health risk prediction; #2 Health Care Access → patient throughput optimization and AI-powered referral management to reduce days-to-appointment; #3 Healthy Communities→ chronic disease population segmentation and care gap identification; #4 Pay for Value → VBC performance monitoring and revenue cycle optimization; #5 Workforce → AI-driven staffing optimization and skill-mix matching; #6 Spark Tech → automated RHTP performance monitoring and CMS reporting. All use cases governed by clinical expert oversight and responsible AI framework. Phase 4 — Optimization & Sustainability (Ongoing from Month 12): Continuously iterate on decision-support logic, risk stratification parameters, and operational ML model configurations using Alaska-specific data patterns — refining pipelines, adjusting thresholds, and engineering prompts for AIP rather than retraining foundational models. Train DOH and healthEconnect staff through a Centre of Excellence model mirroring NHS FDP's training infrastructure. Transition to sustainable operations.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

PwC US Consulting LLP	Independent Evaluation and Program Integrity for Alaska RHTP	FL	CMS requires ongoing performance measurement and independent end-of-grant evaluation for RHTP. To maintain \$272 million in annual federal funding and avoid redistribution beginning March 2028, Alaska must demonstrate measurable progress across all six initiatives. PwC proposes to serve as an independent evaluation and monitoring partner that supports DOH in demonstrating impact while reinforcing transparent oversight and responsible stewardship of federal funds. Large-scale federal investments benefit from clear controls, structured monitoring practices, and defined escalation pathways that help identify compliance risks, documentation gaps, or unusual spending patterns early, before they develop into audit findings or funding disruptions. DOH needs an independent partner who can deliver credible, CMS-aligned findings while strengthening accountability and continuous improvement. PwC will develop a defensible CMS-aligned evaluation framework; deploy performance dashboards and reporting tools; validate submitted data; and implement a fraud, waste, and abuse function that applies risk-based monitoring and advanced analytics to identify anomalies in reporting or expenditures. Where potential concerns arise, PwC can support structured FWA review and fact-finding processes consistent with government oversight expectations, reinforcing confidence in program	PwC proposes to serve as Alaska’s independent third-party evaluator for RHTP through four integrated components that strengthen accountability, support continuous learning, and advance measurable improvements in rural health outcomes. Evaluation Approach: PwC will build a practical evaluation framework aligned with CMS requirements and Alaska’s RHTP metrics. We will define how progress is measured, what data is collected, and how outcomes are assessed across all initiatives. Because Alaska’s rural communities have small populations and may have limited data, we will use methods suited to these settings, combining quantitative analysis with interviews, project reviews, and community input. Our approach will respect tribal sovereignty while providing a clear picture of program performance. Performance Measurement and Monitoring: PwC will establish dashboards, standardized quarterly reporting, and data validation protocols to strengthen the reliability of reported results. Site monitoring tools will combine virtual engagement with targeted in-person reviews appropriate for Alaska’s geography. PwC will apply risk-based monitoring and analytics to identify anomalies and flag potential compliance concerns early. These activities are designed to reinforce existing State oversight by highlighting areas that may warrant additional documentation review, technical assistance, particularly in rural settings where administrative capacity may be limited. Program Integrity and Fraud Prevention: PwC can implement an FWA function that combines advanced analytics with confidential reporting mechanisms. A secure hotline or reporting portal allows stakeholders to raise concerns safely, supported by clear review and escalation protocols to address issues promptly and fairly. This approach emphasizes preventative awareness, early detection of irregular patterns, and structured review processes, rather than duplicating DOH’s existing processes. Learning and Final Evaluation: PwC will implement a structured feedback loop to provide actionable insights . Periodic reports will highlight effective practices and emerging challenges. At the conclusion of the grant period, PwC will conduct CMS’ required independent evaluation and provide recommendations to sustain transformation efforts statewide. Where monitoring identifies recurring documentation or control weaknesses, findings can inform targeted technical assistance to strengthen compliance capacity among subrecipients.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

PwC US Consulting LLP	Regional Health Care Delivery Planning	FL	Alaska's RHTP application envisions coordinated regional delivery plans aligning funded projects for maximum community impact. Alaska's regions vary dramatically in infrastructure, provider availability, tribal health system integration, population needs, and organizational capacity. DOH identified regional planning workshops for Spring/Summer 2026 as a near-term milestone, but no single organization has the combined national planning expertise and local Alaska knowledge to facilitate effective planning across all regions. Effective regional planning requires structured facilitation, rigorous gap analysis, multi-stakeholder governance design, and alignment of diverse proposals into coherent strategies while maintaining local ownership and cultural responsiveness.	PwC leads regional delivery planning in partnership with local partners (e.g., Hospital systems, Alaska Primary Care Association). Provider & Service Gap Analysis: Systematic assessment of provider availability, service capacity, and access barriers across Alaska's regions. Map provider-to-population ratios by care type (primary, behavioral, oral, specialty, emergency, HCBS). Identify priority gaps for RHTP investment using both quantitative data and community input. Community-Led Planning Workshops: Design and facilitate engagement sessions in each region. Ensure participation from tribal health organizations, hospitals, community health centers, borough governments, social service agencies, and community members. Incorporate culturally responsive facilitation — including Alaska Native community engagement protocols and interpretation services. Regional Delivery Plan Development: Synthesize gap analysis and community input into actionable plans for each region. Define priorities, project sequencing, partnership structures, accountability frameworks, and performance metrics. Ensure plans are realistic given regional capacity and RHTP funding constraints. Portfolio Coordination: Support DOH in ensuring regional plans align with statewide RHTP goals. Map individual LOIs and project proposals against regional plans to identify gaps, overlaps, and complementarities. Advise DOH on portfolio balancing across initiatives and regions. Local partners will provide Alaska community planning experience, established DOH relationships, and cultural fluency. PwC brings national health system planning, network adequacy analysis methodology, and multi-state RHTP implementation perspective.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

PwC US Consulting LLP	RHTP Grants Administration Support, Subrecipient Readiness TA, and Compliance Monitoring	FL	ACF serves as subrecipient administrator for RHTP. PwC has significant experience in end-to-end grant program strategy, design, standup, and execution. PwC will flex our toolkit to ACF’s RHTP operating model, enhancing ACF’s approach to specific grant management workstreams (e.g., process design, financial controls, application review, monitoring analytics, fraud controls, compliance monitoring, and readiness assessments). Our role would reinforce, supplement, and enhance existing structures by providing additional resources, visibility, analytics, and monitoring, and not replace existing functions. This project will focus on decreasing the barriers that applicants face in accessing and effectively using RHTP funding by helping ACF to create readily accessible and easy to understand grants management processes; enable consistent oversight across the RHTP program; meet operational and document-driven Federal and CMS funding requirements, including cost support and expenditure tracking, procurement and vendor documentation, performance reporting, subrecipient monitoring, and audit-ready record retention (including Single Audit readiness where applicable). In addition, the project will provide pre-award readiness support and Technical Assistance (TA) for applicants. Many smaller rural organizations need this support to participate meaningfully in the program.	PwC will support DOH and ACF's grants administration infrastructure. We will align processes to end-to-end federal funding expectations: readiness, award set-up, monitoring, reporting, and closeout, grounded in 2 CFR 200 principles and audit-ready documentation. Our support can adapt to ACF’s operating model, augmenting ACF’s day-to-day grants administration and/or providing DOH portfolio-level oversight and monitoring. Pre-Award Readiness TA: Assess applicant organizational readiness for federal grant management. Provide targeted TA to help organizations develop realistic project scopes, budgets, financial controls, register in SAM.gov/UEI, and understand CMS requirements. Prioritize outreach to small rural and tribal organizations with limited federal grant experience. Award Set-Up & Subaward Terms: Establish standard subaward templates and grant file checklists (e.g., budget, reporting, documentation expectations, and roles). Create a grants calendar and procedures for clear communication of requirements across subrecipients. SubAward Monitoring Framework: Design risk-based monitoring protocols scaled to subrecipient size and risk level, with a lighter-touch for established organizations and a deeper-dive for first-time grantees. Develop site monitoring tools adaptable to Alaska's geography. Focus monitoring on documentation completeness for cost support/allowability, procurement and vendor files, subaward compliance, payment validation/reconciliation, and performance reporting, in alignment with 2 CFR 200 and CMS requirements. Create corrective action and escalation pathways. These activities support early identification of compliance gaps and provide structured feedback to strengthen subrecipient controls over time. Financial Controls & Compliance: Design expenditure tracking systems meeting CMS and Single Audit Act requirements while minimizing administrative burden. Build compliance analytics dashboards with real-time visibility into spending trajectories, milestone progress, and risk indicators across subrecipients. Define drawdown and payment procedures, including required reviews/reconciliations to reduce risk of improper payments. Ongoing Subrecipient TA: Deliver continuous support for organizations on reporting, procurement, change requests, budget modifications, and federal compliance questions. Facilitate peer learning among subrecipients. Develop template tools (reporting forms, budget tracking sheets) adapted for Alaskan orgs.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

PwC US Consulting LLP	Smart Health Infrastructure Implementation Support: Data Integration & Administrative Burden Relief	FL	Alaska's RHTP is a once-in-a-generation chance to fix what's broken. SHN resolves the transaction-layer problem — connecting every provider and payer through a single real-time network. PwC builds what the technology alone can't: the Medicaid policy framework to authorize it, the data integration work to connect it to systems already in use, and the provider adoption infrastructure to make it last. The complexity here is real. Alaska's rural facilities run a fragmented mix of EHR platforms — MEDITECH, CPSI, RPMS, and others. Each connects to six or more payer systems through separate portals. SHN replaces that fragmentation with a single connection point. But moving from fax-based workflows to real-time transactions requires hands-on integration at every facility — mapping data fields, testing payer connections, validating claim formats, retraining billing staff. Alaska also needs a dedicated policy track. Authorizing SHN as an approved Medicaid transaction utility and enrolling managed care organizations before launch — none of that happens automatically.	Workstream 1 — Federal Authorization and Medicaid Setup (Months 1–9): We work with Alaska DOH and the Division of Public Assistance to authorize SHN as Alaska's Medicaid transaction utility. We prepare the CMS Advanced Planning Document and structure the project to qualify for up to 90 percent federal matching funds under existing health IT provisions — materially reducing Alaska's net RHTP cost. Managed care organization enrollment is secured before go-live. Workstream 2 — EHR and Data Integration (Months 3–18): We lead the technical integration between SHN and the EHR systems running across Alaska's rural facilities — field mapping, workflow redesign, payer connection validation, and claims format testing at every site, whether they run MEDITECH at a Critical Access Hospital or CPSI at a rural health clinic. We don't leave facilities to self-configure. Workstream 3 — Provider Onboarding and Adoption (Months 6–24): We design and run the adoption strategy across all six deployment regions. Training built for low-bandwidth settings and no dedicated IT staff. Facility-level savings reporting so every provider sees their actual cost reduction each quarter. Adoption coordinated through Alaska Primary Care Association, ASHNHA, and the Alaska Medical Association. Target: 30 percent provider enrollment by end of Year 1	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

QAWALANG IN TRIBE OF UNALASKA	Unalaska Health and Wellness	AK	Youth in rural Alaska communities face unique health challenges shaped by geographic isolation, limited access to preventive health education, and the intergenerational impacts of historical trauma. In Unalaska, opportunities for youth to engage in structured wellness programming that connects physical health, behavioral health awareness, and cultural identity remain limited. At the same time, many Qawalangin Tribal members live in Anchorage while maintaining strong ties to their Tribal community. Youth living off-island may have fewer opportunities to participate in culturally grounded programs connected to their Tribe. This project addresses the need for accessible, culturally responsive youth wellness programming that supports healthy habits, strengthens health literacy, and builds connections between youth, families, and healthcare systems. By integrating cultural teachings, prevention education, and practical health knowledge, the program will help youth better understand how to care for their physical and mental health while maintaining strong cultural and community connections. This effort also presents an opportunity to strengthen community capacity by providing behavioral health and prevention trainings for community members, helping ensure that youth and families have access to supportive, informed networks both in Unalaska and among Tribal members living in Anchorage.	The Qawalangin Tribe proposes a combined youth wellness model that integrates culturally grounded programming, health literacy education, and prevention-focused community training. The project will support youth and families by promoting healthy habits, increasing understanding of healthcare systems, and strengthening culturally responsive wellness practices. The program will focus on several core strategies. First, the Tribe will develop culturally responsive educational materials and workshops that help youth and families better understand how to access and navigate healthcare services, including primary care and behavioral health resources. These materials will incorporate culturally relevant teachings and community knowledge to ensure the information is meaningful and accessible. Second, the project will support youth wellness programming that promotes healthy lifestyles, including activities focused on physical activity, mental wellness, and nutrition awareness. Cultural teachings and community traditions will be incorporated into programming to reinforce the connection between cultural identity and overall well-being. These activities will be offered to youth and families in Unalaska while also creating opportunities for Tribal members living in Anchorage to participate through coordinated programming, gatherings, or virtual engagement. Third, the project will strengthen community capacity through training opportunities that equip community members with practical tools to support youth health and safety. Trainings may include First Aid, SBIRT (Screening, Brief Intervention, and Referral to Treatment), and ASIST Suicide Intervention Training. These trainings will help youth leaders, educators, and community members recognize early warning signs of behavioral health concerns and respond appropriately. Finally, the Tribe will collaborate with local partners, schools, and healthcare providers to ensure programming aligns with community needs and supports stronger connections between youth, families, and healthcare services. By integrating cultural knowledge, health education, and prevention strategies, the project will promote long-term healthy habits while strengthening community resilience among Tribal youth and families in both Unalaska and Anchorage.	\$50,000- \$250,000	Multi- Community or Participating in Regional Hub-and- Spoke	Aleutians West Census Area; Anchorage (Municipality)	Advance to Implementati on Application

R.E.A.C.H. 907 - Restoring, Empowering Alaska's Children and Homes	Expanding Youth Behavioral Health Services Access via Workforce Development in the Mat-Su Valley	AK	Youth behavioral health needs in the Mat-Su Valley continue to grow, while workforce shortages limit access to care. Families frequently experience long waitlists for services, and providers face high caseloads and burnout. The opportunity addressed by this project is to expand workforce capacity and strengthen the infrastructure needed to deliver these services sustainably in a rural environment. This is our vision and dream. This LOI takes us a step closer to this vision. Psychotherapy (individual and family): 6–8 clinicians serving 150–200 clients (currently at 2.5, with a 3rd joining in June, 2 LPC-S provide oversight) Outpatient/intensive outpatient wrap-around services: 32–40 behavioral health clinical associates (currently at 17 clinical associates providing TBHS, PSS, CRSS) Case management and intensive case management: 6 case managers for 150-200 clients (2.5 currently) School-based therapeutic behavioral health services: 40-60 youth supported by clinical associates (17 associates currently, as mentioned above) Therapeutic treatment home services / foster care: 25-30 youth supported in 10–15 homes over 1–3 years (just launched, 2 homes onboarding) Future phase: Complex residential care for youth with lifelong behavioral health challenges. We have 4 clients now needing wrap-around school-based TBHS services. Ready to hire more associates.	This project will implement workforce expansion designed to strengthen access to youth behavioral health services in the Mat-Su Valley. REACH 907 will expand its clinical and direct service workforce by hiring mental health clinicians, behavioral health clinical associates, and support staff who work together to develop further outpatient behavioral health services and residential therapeutic foster care support. These roles provide coordinated care for youth with complex behavioral health needs. Clinicians deliver therapy and treatment planning, behavioral health clinical associates support skill development and daily therapeutic activities, and case management and foster care staff support family engagement and coordination of services. The project also supports workforce supervision, recruitment, and onboarding processes needed to grow a rural behavioral health program responsibly. REACH 907's proposed approach is a continuum of care that closes gaps for families. As youth and families engage in behavioral health services, their level of care often fluctuates based on changes in home and environmental dynamics. A comprehensive continuum of care ensures service gaps are closed, allowing youth and families to receive the appropriate level of care as needs increase or decrease. Proposed Continuum of Care - Prevention & Early Intervention: Trauma-informed camps (current) Mentoring clubs (current) Outpatient therapy (current) Stabilization: Intensive outpatient services: IT, CM, ICM, TBHS, CRSS, PSS, etc (current) School-based therapeutic behavioral health services (current) Partial hospitalization (new, establishing) Residential:	\$250K-\$1M	Behavioral health/substance use disorder treatment	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

Therapeutic foster care (new, establishing)

Crisis stabilization (future phase)

Higher Acuity:

Residential long-term complex care (future phase, may be dependent upon the state’s own licensure)

Inpatient services (possible future phase)

R.E.A.C.H. 907 - Restoring, Empowering Alaska's Children and Homes	Modernizing Clinical Infrastructure for Youth Behavioral Health Services	AK	As demand for youth behavioral health services grows, clinical infrastructure must evolve to support expanding workforce capacity. REACH 907’s current documentation system and limited clinical workspace create inefficiencies that increase administrative burden and slow service delivery. The opportunity addressed by this project is to modernize clinical infrastructure so staff can deliver services more efficiently while maintaining compliance and quality of care. Improved systems will support growing service demand while strengthening coordination across outpatient and therapeutic foster care programs. By investing in technology and infrastructure improvements now, REACH 907 can support workforce expansion and increase access to behavioral health services for youth in the Mat-Su Valley and surrounding rural communities.	This project will provide a more efficient clinical technology infrastructure to support expanding behavioral health services for youth. Funding will support the transition from the current EHR system to a more robust and sophisticated EHR system, including system implementation, data migration, and staff training. This upgrade will improve clinical documentation workflows, strengthen reporting capabilities, and reduce administrative burden on clinical staff. The project will also support limited facility modifications that create HIPAA-compliant workspaces for additional clinical staff. These improvements allow REACH 907 to expand workforce capacity while maintaining privacy, compliance, and safe clinical environments. Together, these improvements strengthen operational efficiency and allow clinicians to dedicate more time to direct care while supporting the growth of youth behavioral health services	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

R.ehabilitati ve E.ducational A.daptive L.iving Solutions	Rebuilding Capacity: Alaska Rural Brain Injury Rehabilitation and Return-to-Work Network	AK	Adults with acquired brain injury in Alaska frequently experience long-term unemployment, social isolation, and increased reliance on public systems after discharge from medical rehabilitation. While clinical rehabilitation addresses physical and cognitive impairments, Alaska lacks programs that bridge the transition from rehabilitation to sustainable employment and community participation, leaving many individuals without a pathway to rebuild work capacity and independence. The need is urgent in Alaska, where traumatic brain injury rates are approximately twice the national average and nearly three times higher among Alaska Native populations. Geographic isolation, workforce shortages, and fragmented services further limit access to coordinated recovery pathways, particularly in rural and frontier communities. REAL Solutions proposes to address this gap by launching Alaska’s first Transitional Return-to-Work (tRTW) rehabilitation program for adults with brain injury. The program will begin with a pilot cohort in Anchorage, where existing infrastructure and partnerships allow immediate implementation. The pilot will establish protocols and training resources supporting expansion through a hub-and-spoke network with partners in Kenai, Mat-Su, Fairbanks, and other regions. By creating a coordinated pathway from rehabilitation to employment, the project expands provider capacity and improves access to brain injury recovery services across Alaska’s rural and frontier communities.	The project will launch Alaska’s first Transitional Return-to-Work (tRTW) rehabilitation program for adults with brain injury, addressing the gap between medical rehabilitation and sustainable employment. The program provides structured interdisciplinary services that rebuild cognitive capacity, physical endurance, self-management and vocational readiness required for successful return to work and community participation. The program will begin with a pilot cohort in Anchorage, where REAL Solutions has secured facility space, equipment, administrative infrastructure, and clinical partnerships allowing immediate implementation. Participants will engage in coordinated rehabilitation activities designed to restore work tolerance, executive function and independence. Services include functional work simulation, life skills development, adaptive wellness activities, environmental modification strategies, and coordination with vocational rehabilitation systems and employers. Unlike traditional outpatient rehabilitation, the tRTW model focuses on translating clinical recovery into real-world outcomes. Therapists work with participants to rebuild work endurance, address cognitive and environmental barriers, and support transition to sustainable employment. Short-term transitional housing may be available for individuals who require a structured environment while rebuilding independence and vocational capacity. The Anchorage pilot will serve as the initial hub for a statewide hub-and-spoke rehabilitation network. During the pilot phase, the program will refine treatment protocols, referral pathways, outcome measures, and training resources that support implementation in other communities. Following the pilot, the program will expand through partnerships in Kenai, Mat-Su, and Fairbanks, with the goal of supporting additional rural and frontier communities across Alaska. Regional partners will receive training, telehealth consultation, shared protocols, and coordinated program support. The hub will deploy rotating rehabilitation clinicians to rural communities to provide direct services, mentor local providers, and support program implementation where specialty staff are limited. By combining a launch-ready pilot with a structured replication strategy, the project establishes a scalable statewide model that expands access to brain injury rehabilitation while strengthening coordination among rehabilitation providers, vocational systems and community partners across AK	\$250K-\$1M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Radiology Services - UT, LLC	Closing Alaska's Invisible Healthcare Gap	TN	~60% of Alaska's 583 dentists operate CBCT scanners, generating ~50,400 scans per year. These produce 3D medical imaging capturing far more than teeth—yet virtually none are interpreted by a board-certified radiologist. An estimated 252,000 unread scans have accumulated over five years on dental computers across Alaska. Research shows 77% of CBCT scans contain incidental findings. Our clinical data identifies carotid artery calcifications—a leading stroke precursor—at 3.1%. These scans also capture head and neck cancers, airway pathologies, and other serious conditions dentists are not trained to diagnose. Three barriers created this gap: radiologists are in-demand, salaries exceed \$1 million, making interpretation cost-prohibitive; technical integration is too expensive for small offices; and individual practices generate too few scans to secure radiology contracts. No solution has existed at the right price and scale to bridge dental imaging to medical radiology—until now. The consequences are severe, especially in remote Alaska. Catching carotid stenosis presymptomatic means medication for hundreds of dollars. Missing it means a stroke—in communities hours from emergency care by air, that is often fatal or permanently disabling, costing hundreds of thousands. Early-stage head and neck cancer has survival above 80%. By Stage IV, survival drops below 40% and treatment exceeds \$200,000. The imaging already exists. The pathologies are already captured. They have not been read.	Radiology Services-UT will deploy its secure cloud-based teleradiology platform to connect Alaska's dental practices to board-certified, Alaska-licensed medical radiologists for CBCT interpretation. The program operates in two phases. Phase 1 — Backlog Clearance: We onboard Alaska's ~350 CBCT-equipped practices and read the estimated 252,000 unread scans accumulated over five years. Each scan is interpreted by a board-certified radiologist reviewing the full anatomical volume—not just the dental area of interest, but the complete head and neck region. Where pathology is identified, the report includes medical referral recommendations. Time-critical findings are flagged for expedited review and immediate notification. Phase 2 — Ongoing Interpretation: We continue interpreting all new scans at enrolled practices. At ~50,400 scans per year and \$80 per read, ongoing annual cost is \$4,032,000, establishing radiologist interpretation as the permanent standard of care. How it works: Our software is installed remotely—a process proven across hundreds of dental offices, including one in Alaska. It is compatible with all CBCT machines and dental software platforms. Once installed, it configures a secure cloud connection to the practice's existing system. No new hardware, no on-site visits required. DICOM files are transmitted via encrypted connection, interpreted by our radiologist, and a report is returned. The practice simply continues taking scans as normal. Budget: At \$80 per scan all-inclusive, the backlog costs \$20,160,000. First-year ongoing interpretation adds \$4,032,000. Total first-year cost is \$24,192,000—~8.9% of Alaska's \$272 million RHTP award. The \$80 covers integration, transmission, interpretation, reporting, and administration. This requires no construction, no equipment purchases, and no workforce relocation—leveraging existing infrastructure and existing imaging to deliver specialist care to every corner of Alaska immediately.	Over \$5M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Railbelt Mental Health & Addictions	Technology Upgrades	AK	Rural Alaskans face barriers to timely, high-quality behavioral health care due to geographic isolation and limited resources. This project will invest in modern behavioral health technology to improve client access, streamline administrative processes, and efficiently track outcomes. Integrating multiple platforms into a single system will enable providers to serve more clients, enhance the quality of care, and support sustainable services in rural and remote communities.	Our approach leverages modern behavioral health technology to improve access, quality, and efficiency in rural communities. A new EHR system with integrated state AKAIMS functionality will eliminate duplicate data entry, streamline administrative tasks, and consolidate multiple platforms into a single interface. Combined with hardware upgrades, technical assistance, and staff training, this system will enhance care coordination, allow providers to serve more clients, and support sustainable, high-quality behavioral health services locally.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Yukon-Koyukuk Census Area	Advance to Implementation Application
Railbelt Mental Health & Addictions	Building Capacity for Certified Community Behavioral Health Clinic (CCBHC) Status	AK	While Railbelt Mental Health & Addictions (RMHA) has operated an outpatient Behavioral Health clinic for many years, we still struggle with service gaps. Both residents of Nenana and the Deali Borough have recognized, through community needs assessments, that Behavioral Health care is an ongoing concern. Residents in the Railbelt Mental Health & Addictions service area can face significant barriers to accessing timely behavioral health care due to the region’s rural and frontier geography. Long travel distances, limited transportation, workforce shortages, and extended wait times often delay treatment for individuals experiencing mental health or substance use challenges. These barriers can lead to worsening conditions, increased reliance on emergency services, and limited continuity of care, particularly for vulnerable and low-income populations. This project addresses the opportunity to strengthen the region’s behavioral health system by preparing RMHA to pursue the Certified Community Behavioral Health Clinic (CCBHC) designation. The CCBHC model will improve access through same-day assessments, 24/7 crisis services, and expanded care coordination, while providing comprehensive, integrated care regardless of ability to pay. By increasing service capacity and improving coordination between providers, the project will help reduce emergency department use and ensure residents in these rural communities can receive timely, high-quality behavioral health care close to home.	At this stage, funding would support a structured approach to refining the project concept, including conducting needs assessments, gathering stakeholder input, and identifying key priorities. It will also allow us to determine the specific requirements and steps necessary to become a Certified Community Behavioral Health Clinic (CCBHC). Additionally, funding would support early coordination with community partners and other stakeholders to ensure alignment and collaboration, as well as strengthen administrative readiness by establishing necessary systems, protocols, and planning structures, positioning the project for a successful full application and eventual implementation.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Yukon-Koyukuk Census Area	Advance to Planning

Raviant LLC	Alaska Early Intervention Transformation: Infrastructure, Assessment and Implementation Readiness	OR	Alaska's Infant Learning Program (ILP) serves children birth to three with developmental delays through 15 provider programs statewide. Alaska uses a 50% delay threshold for eligibility — one of the nation's most restrictive. Alaska's Part B special education program uses a 25% threshold leaving children with moderate delays ineligible for early intervention but eligible for special education at age three. Many children who receive ILP services achieve typical development and don't need special education preK-12, which presents a significant cost avoidance opportunity. Preliminary financial modeling indicates break-even within 5-8 years of expanded eligibility, after which the state realizes sustained cost avoidance. Responsible, phased, multi-year expansion requires: 1) a comprehensive, evidence-based picture of where the system stands today — workforce capacity, service delivery variation, data infrastructure, and family experience across all 15 programs; and 2) the governance, financial modeling, readiness criteria, and implementation planning infrastructure to steer sustainable expansion. This project addresses both. Using the ECTA/DaSy System Framework and Active Implementation Frameworks, Raviant — with key partners AILPA and the ILP state office — will build the transformation infrastructure that Alaska's ILP system needs to expand eligibility responsibly, beginning the first increment by 2028-2029. https://health.alaska.gov/media/5pqbncwa/alaska-ilp-part-c-report.pdf	This is one of two coordinated proposals Raviant is submitting under RHTP. The companion project addresses ILP workforce pipeline development. The Raviant team and subcontractors bring specialized expertise in Part C regulation and service delivery, early childhood systems consultation, technical assistance and implementation science. The project runs two parallel tracks, structured within the ECTA/DaSy System Framework and Active Implementation Frameworks. Both frameworks treat system-building as iterative rather than sequential — the Active Implementation Frameworks' Exploration stage develops governance, workforce, data, and financial drivers concurrently through improvement cycles. The ECTA/DaSy Self-Assessment is itself a governance-building process: conducting it collaboratively with providers, AILPA, and the state office generates shared understanding and aligned ownership that the transformation infrastructure depends on. The two tracks are mutually reinforcing — assessment findings inform infrastructure and planning decisions, while the developing KPI and readiness frameworks inform assessment. Track 1: System Assessment. A rigorous statewide current state assessment using the ECTA/DaSy Self-Assessment — evaluating Alaska's ILP system across governance, finance, workforce, data systems, and accountability components. Supplemented by provider surveys and interviews across ILP programs, family experience input gathered with AILPA, and structured benchmarking against peer and high-performing states. Conducted collaboratively to generate shared understanding alongside diagnostic findings. Track 2: Transformation Infrastructure. Running concurrently from project launch: governance structure and decision-making framework development; AILPA formation as a legal entity and future RHTP lead applicant; KPI framework and monitoring dashboard; financial model refinement and credentialing with caseload projections under multiple expansion scenarios. In the project's second half, assessment findings ground the workforce needs estimates, readiness criteria, and implementation plan — including supports at provider, program, and state levels. RHTP funds the planning, coordination, and infrastructure work. The growing operational cost of serving more children will be carried by Medicaid, federal Part C dollars, and state general funds. A core project deliverable is documenting the Medicaid billing and rate reform pathway that makes this financing model viable.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Raviant LLC	Building Alaska's Early Intervention Workforce: Pipeline Development and Professional Pathways	OR	Alaska's Infant Learning Program (ILP) serves children birth to three with developmental delays through 15 provider programs statewide. Alaska uses a 50% developmental delay threshold for eligibility — one of the nation's most restrictive — creating an inequitable gap with the state's own special education program, which uses a 25% threshold. A companion RHTP project is building the transformation infrastructure and assessment foundation for responsible, phased eligibility expansion. Realizing that opportunity has a direct workforce implication. Preliminary modeling — subject to validation through the companion assessment project — suggests that eligibility expansion could roughly double the number of qualified early intervention providers needed statewide. Alaska's current workforce pipeline is insufficient to meet that demand. Meeting the workforce demands of an expanded ILP system requires activating available pathways into early intervention practice. Alaska has multiple routes — master's level academic programs, transfer pathways for professionals in related fields such as occupational therapy, physical therapy, and speech-language pathology, and in-service training for those with bachelor's degrees — each of which can be strengthened, streamlined, or reactivated to grow the pool of qualified providers. This project addresses the supply side of Alaska's workforce challenge directly, laying the pipeline foundation that responsible eligibility expansion requires.	This LOI is one of two coordinated proposals Raviant is submitting under RHTP. The companion project addresses ILP transformation infrastructure, system assessment, and implementation readiness. Together they lay the foundation for Alaska's multi-year ILP eligibility expansion effort. The Raviant team and subcontractors bring specialized expertise in Part C regulation and service delivery, early childhood systems consultation, technical assistance and implementation science. AILPA contributes provider community perspective and direct knowledge of workforce conditions across Alaska's ILP programs — ensuring pipeline development reflects the system's actual needs and regional realities. Core workstreams include: UAA curriculum development and revised program design for the early childhood special education master's program, drawing on prior experience building the original program — producing a package ready for UAA's internal approval and accreditation process; mapping UAA's internal governance pathway, accreditation requirements, and enrollment thresholds; employer commitment development with ILP provider programs to signal hiring demand and support UAA's enrollment viability case; student funding mechanism mapping identifying scholarship, stipend, and service commitment pathways; transfer and articulation pathway development within the UA system; partnership exploration with PT, OT, SLP, and early childhood special education programs in the Pacific Northwest and broader American West — including articulation agreements, distance delivery, and structured practicum and clinical rotation placements in Alaska; and in-service training pathway development for bachelor's-level professionals in adjacent fields. Program design will incorporate federal service commitment requirements applicable to RHTP-funded workforce development, ensuring pipeline graduates are positioned to serve rural and remote communities where need is greatest. All workstreams are informed by workforce needs findings from the companion project, ensuring pipeline development is connected to the system's actual expansion timeline and regional workforce gaps.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

RDC LLC	Fire Protection Enhancement	AK	RDC LLC owns and operates medical office space that houses specialty healthcare clinics serving patients in Fairbanks and throughout Interior Alaska. One of the buildings currently lacks a modern fire suppression system, as it was constructed before sprinkler systems were commonly required in commercial medical facilities. This presents a safety concern for both patients and healthcare providers working within the building. Many patients visiting specialty clinics have mobility limitations and may rely on wheelchairs, crutches, or other assistive devices, making rapid evacuation during a fire or emergency more difficult. This project presents an opportunity to upgrade the building’s fire suppression infrastructure by installing a modern sprinkler system. Improving the building’s safety systems will help ensure that healthcare providers can continue operating in a safe, compliant environment while protecting patients who rely on this facility for specialty medical care, including those traveling from rural and frontier communities across Interior Alaska.	To address this safety concern, RDC LLC proposes to install a modern fire suppression system in the medical office building that currently lacks sprinkler protection. The project will involve designing and installing a building-wide sprinkler system that meets current fire safety standards and protects both patients and healthcare providers occupying the facility. The first step will include working with fire protection engineers and licensed contractors to assess the building and design a system appropriate for the structure. Once the design is finalized, the project will move into the installation phase, which will include integrating sprinkler lines, installing fire suppression equipment, and connecting the system to the building’s existing fire safety infrastructure. Careful coordination will occur with the healthcare clinics operating within the building to minimize disruptions to patient care during installation. Once completed, the upgraded fire suppression system will significantly improve building safety, particularly for patients with limited mobility who may require additional time or assistance during emergency situations. This improvement will allow the facility to continue safely supporting specialty healthcare services for patients traveling from Fairbanks and rural communities across Interior Alaska.	\$250K-\$1M		Statewide	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced
REACH, Inc.	IT Modernization Plan Phase II – EHR with HIE Integration	AK	REACH is a 170-employee behavioral health provider serving rural Alaska communities with an annual revenue of roughly \$10.9 million. Like many community-based service organizations in Alaska, REACH, Inc. (“REACH”) has been forced to maintain operations and provide top-quality service while relying on aging and outdated technology that has often served as a barrier to success instead of as an asset. As part of REACH’s IT Modernization Project, REACH wants to prioritize the acquisition of an Electronic Health Records system with a Health Information Exchange integration.	REACH, Inc. is in the early exploratory phase of this project. At this stage, funding would support obtaining a Project Manager or Specialized Consultant to manage and oversee project development activities like data collection and research, conducting outreach to other organizations and providers for system referrals, implementation planning, IT consultations, etc.. REACH knows that it is looking for an EHR system that – (1) has a high-quality patient access portal, (2) has a high degree of customization, (3) is compatible with record keeping and documentation requirements for Federal Part C services, and (4) has billing capabilities. Integration with the Health Information Exchange is also a system requirement, as it is important that REACH is able to coordinate and confer with other providers and programs easily, especially when providing services in rural communities.	\$50,000-\$250,000	Home-and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

REACH, Inc.	REACH, Inc. – Supported Employment Program Expansion – Teen Internship Program	AK	REACH, Inc. currently operates a successful Supported Employment Program in Juneau, AK that connects individuals with developmental disabilities with career paths that suit their abilities, talents, and interests. REACH coaches work with local employers and provide on-the-job support and training to individuals at no cost to employers. REACH’s current program only serves adults (ages 18+) currently enrolled with and receiving services through REACH. However, work-eligible teens (ages 14+) who are currently receiving services through the Individuals with Disabilities Education Act (IDEA) Part B are approaching their Secondary Transition wherein they will soon begin partaking in transition assessments and services and outlining appropriate measurable postsecondary goals. Alaska’s Part B Annual Performance Report reported that significantly more of these individuals pursued employment after high school as opposed to pursuing higher education. This pilot project aims at utilizing REACH’s Supported Employment program model, in coordination with the individual, family, and school system, to allow teenagers receiving services under this program to participate in internships with local businesses and organizations, including REACH itself.	Utilizing REACH’s existing Supported Employment model, an Employment Specialist would participate in Secondary Transition planning along with the teenager receiving services, the teenager’s family and/or caregivers, and the school system in order to begin identifying the individual’s needs, abilities, interests, and skills. At the appropriate time (as determined by the Secondary Transition team) the Employment Specialist would assist the teen with: - Working to prepare a resume or employment application and develop interview skills; - Exploring interests through volunteer opportunities, job tours, or job shadowing; and finally – - Procuring an internship opportunity with a local business or organization that matches the teen’s talents and interests. Just as with REACH’s existing Supported Employment Program, the Employment Specialist would remain available to help the teen navigate: - Getting to know their employer; - Meeting their coworkers; - Understanding workplace culture; The Employment Specialist is also responsible for – - Partnering with local businesses and organizations; - Providing on-the-job training and support for the teen, their coworkers, their employer, and their circle of support; - Providing support through job coaching; - Advocating for the teen through any problems with their employer; and - Regularly checking-in on the teen to ensure continued success. This expansion of REACH’s Supported Employment program is intended to set teens with disabilities up for success through early intervention, job training, and exposure. This program is still in the very-early developmental phases, and REACH would like further planning to be completed prior to launch. Some questions to be addressed in the planning and program development phases include: - Are there any clearances necessary to successfully operate this program? - At what age can teenagers begin to work in the disability services field? - Is this a billable service and does age affect this? - Does REACH need to work with the Department of Vocational Rehabilitation (DVR)? - How will transportation needs be addressed? At this stage, funding would support obtaining a Project Manager to oversee initial project development including data collection, establishing necessary partnerships (with the school systems, local	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

businesses and organizations, potentially DVR?), strategic planning activities, and operations coordination.

REACH, Inc.	IT Modernization Plan Phase I – Cybersecurity, Organization Hardware, and Accounting Software	AK	REACH is a 170-employee behavioral health provider serving rural Alaska communities with an annual revenue of roughly \$10.9 million. Like many community-based service organizations in Alaska, REACH, Inc. (“REACH”) has been forced to maintain operations and provide top-quality service while relying on aging and outdated technology that has often served as a barrier to success instead of as an asset. Last year, REACH experienced a “security incident” that put client data at risk, and in response REACH immediately hired an Information Technology (IT) and Cybersecurity Consultant, seeking to ensure that client data was secured as quickly and efficiently as possible. While preliminary cybersecurity efforts to initially secure data have been made, REACH would like to grow from maintaining operations in spite of technical constraints to expanding services utilizing advanced technology as a tool to better serve individuals and communities in Southeast Alaska. Phase I of REACH’s IT Modernization Plan includes top-level cybersecurity updates that will ensure further security incidents don’t occur; long overdue hardware upgrades for staff that will improve administrative efficiency; and the replacement of REACH’s outdated and siloed financial system with a modern, cloud-based accounting system designed for nonprofits that is intended to improve fiscal stability, support evidence-based management, and free up resources for clinical services.	Cybersecurity In addition to REACH’s standard IT maintenance, in the 2027 Fiscal Year (beginning in July 2026) REACH will add a Chief Information Security Officer who will -- in addition to infrastructural projects like Managed iPad and Mobile Device management, network segmentation, installation of surveillance systems in brick-and-mortar locations, server room UPS refreshes, and refreshes to network peripherals – be providing on-going staff training on enterprise risk including policy, end-user training, and best practices. Sage Intaact for Nonprofits – Accounting Software Purchase & Implementation As part of REACH’s IT Modernization Plan REACH plans to replace their legacy accounting platform (described by REACH’s CFO as ‘outdated and siloed’) with Sage Intaact for Nonprofits, a modern, cloud-based system that is intended to improve fiscal stability, support evidence-based management, and free up resources for clinical services. This project includes the purchase of Software Licensing, an Implementation Consultant that will ensure the system is configured correctly and aligned with REACH’s healthcare workflows, and hands-on staff training that includes online courses, on-site workshops, and follow-up support to build proficiency and to help achieve a smooth transition between platforms without disrupting service delivery. Additionally, this project requires travel from consultants and key staff who will conduct on-site configuration and training at REACH’s remote facilities; an annual maintenance and support subscription that covers product updates, security patches, customer support, and user communities; data migration and integration; cybersecurity enhancements; and a temporary project manager (for a period of four months) who will coordinate between internal departments, consultants, and the software vendor, as well as oversee tasks, manage timelines, and monitor budgets. Staff Hardware Upgrades REACH’s IT Maintenance company has a maximum upgrade timeline of five years post-installation. Due to budget constraints, REACH has hardware dating back to 2013 that has yet to be upgraded. REACH’s past-due upgrades include 21 computers and 8 laptops. Additionally REACH needs two video conferencing systems for conference rooms.	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

REACH, Inc.	REACH – Establishing an Internal Transportation Department – Transportation Phase I	AK	REACH, Inc. serves 60+ individuals with developmental disabilities who are ISW/IDD Waiver recipients, some of whom live on-site in REACH’s residential group homes. Both ISW and IDD Medicaid Waivers mandate that transportation services be provided to these individuals in accordance with all activities outlined in their Individualized Service Plan, which can include doctor’s visits, daily exercise, employment, various therapies, etc. Currently, REACH is experiencing a shortage of both staff and vehicles. This shortage is resulting in excess time spent coordinating transportation responsibilities day-to-day, disrupting the schedules of both the staff and the individuals. Individuals are forced to carpool to activities, requiring the individuals to spend more of their personal time in transit. Staff occasionally have to utilize their own personal vehicles to ensure individuals are successfully transported to their destination. Despite being chronically short-staffed, REACH has had to turn down job applicants who did not have a drivers license as they would be unable to provide this necessary and in-demand service.	REACH Inc. seeks funding to establish a dedicated, Medicaid-compliant transportation department that provides reliable, all-weather, handicap-accessible mobility for ISW/IDD Waiver recipients and individuals with disabilities throughout Juneau. This initiative fills a long-standing service gap in evening and weekend transportation, ensuring clients receive consistent, dignified, and specialized access to community participation, medical appointments, employment, and essential daily activities. To launch the proposed program, REACH will invest in a purpose-built accessible fleet and necessary technology consisting of multiple AWD Ford Transit 350 high-roof vans equipped with ADA-compliant lifts and Q’Straint securement systems. Vehicles will be shipped via Alaska Marine Lines and outfitted with in-vehicle tablets and RouteGenie dispatching software to support efficient routing, real-time tracking, and Medicaid-compliant manifesting. Meeting Alaska’s regulatory and safety requirements is essential for operational integrity. Funding will support mandatory PASS driver training, CPR/First Aid certifications, background checks, commercial transportation insurance tailored for vulnerable-population services, and Medicaid provider enrollment. Because Medicaid reimbursements are delayed at program start-up, REACH requests runway support for the first 180 days. This includes competitive wages for multiple drivers and a Program Director, along with early-stage fuel costs and specialized maintenance for lift-equipped AWD vehicles. This temporary buffer ensures uninterrupted service delivery during the critical launch phase while billing cycles stabilize. The projected investment for full implementation ranges from \$1.11 million to \$1.50 million. Once operational, the department will sustain itself through Medicaid reimbursement via standard waiver trips (T2003) and specialized paratransit trips (T2003-CG), consistent with Alaska DHSS FY26 Juneau regional rate schedules.	\$1M-\$5M	Home- and community-based services provider	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

REACH, Inc.	REACH, Inc. – Community Outreach, Training, and Education	AK	In many of the rural communities REACH serves, and even in Juneau, there are no comparable services available locally to adequately communicate the array of supports available for individuals with developmental disabilities, or to provide guidance regarding need-to-know information, common practices, or generally to raise awareness about developmental disabilities and how to support and care for disabled individuals in the community. Currently, REACH’s presence in these communities is limited, and even in Juneau opportunities for community education and trainings can be rare. Additionally, all communities in Alaska have one or more Health Professional Shortage Area (HPSA) designations for a variety of healthcare fields, especially in rural communities – this makes it difficult to find skilled presenters who can provide trainings and educational services even on a limited or one-time basis.	“Better community education leads to better community integration.” Naomi Studevan - REACH, Inc. Executive Director The purpose of this project is to, through the utilization of the FTE coordinator, grow community audiences for participation in education and training opportunities, document barriers to access, and acquire and coordinate skilled presenters to provide these opportunities. Additionally, due to the access barriers we are currently aware of, especially those facing communities more rural than Juneau, the coordinator will oversee the creation and development of virtual training and education opportunities, potentially one day through a secure online course platform. This will allow members of these rural communities to participate without being forced to travel to an out-of-town location. Potential topics for training and education include: ADLs, IADLs, and Levels of Support (Activities of Daily Living and Instrumental Activities of Daily Living); Care Coordination; Medicaid Services and Advocacy; Support Plan Development; First Aid and CPR; Mental Health (various); Supported Decision-Making; Assistive Technology; Disability Advocacy; and more. The State’s Rural Health Transformation Proposal references proven models such as the Community Health Aide/Practitioner (CHA/P) and Behavioral Health Aide/Practitioner (BHA/P) programs that train local residents to deliver frontline care – in communities outside of Juneau where REACH only has a semi-regular presence, the eventual development of community frontline care for individuals with disabilities serves as an admirable long-term goal for Community Outreach and Education.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

REACH, Inc.	REACH, Inc. – Community-Wide Transportation Startup – Transportation Phase II	AK	In addition to the transportation challenges REACH is facing as an organization (detailed in the proposal for REACH - IT Modernization Plan - Planning) Juneau’s disabled community is encountering service gaps in the community transit system – Capital Transit does not operate 24/7 and is often unavailable for extended evening and weekend hours, leaving individuals who lack mobility or the ability to drive with very few options for moving from place to place. Phase II of REACH’s Transportation as a Service Plan is a Community-Wide Transportation Start Up that seeks to fill this gap in transportation services for disabled individuals in Juneau.	Phase II of REACH’s Transportation as a Service Plan is still in early stages of development, but some logistics have been identified to ensure continuity of transit services and availability for individuals with disabilities. In order to cover the gaps in existing services, REACH’s Transportation Department will need to add 4-5 high-capacity vans that can hold 12-15 passengers, and 5-6 rabid response minivans. A mix of full-time and part-time staff will be necessary to ensure 24/7 coverage or extended evening/weekend hours. This project strengthens Juneau’s transportation equity infrastructure by expanding ADA mobility access and ensuring that no individual with disabilities is left without safe, reliable transportation—regardless of weather or time of day. At this stage of project development funding would support planning efforts such as – - Updates to Juneau’s Coordinated Human Services Transportation Plan to incorporate project logistics; - A federal transit specialist to consult on REACH’s planned funding streams, coordination efforts, and Medicaid billing practices; - A project manager to coordinate with and gather information from local transit agencies and other community organizations in order to ensure project design is efficient and encompassing of existing efforts; etc.	\$1M-\$5M	Home- and communit y-based services provider	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

REACH, Inc.	REACH, Inc. – Growing a Skilled Workforce – Professional Development	AK	As stated in the State’s Rural Health Transformation proposal, “all communities in Alaska have one or more Health Professional Shortage Area (HPSA) designations . . . and most rural areas experience high staff turnover and rely on temporary workers (1).” REACH, Inc. is not an exception to this element of healthcare operations in Alaska. REACH is consistently seeking skilled workers (in medical, mental health, and behavioral health), and has a recurring need for staff with experience in offering co-occurring support (developmental disability plus an additional disability). Seeking employees who have experience or have already received training for these roles is pulling from too small of a bucket, even in Juneau. REACH believes these skills need to be a standard part of employee development for disability service professionals. By implementing professional development as a core-responsibility of all REACH staff positions, REACH can select from and contribute to the growth of a larger employment pool in each community where it operates. REACH wants to set the standard for pursuing Disability Services as a professional career by hiring staff with the understanding that REACH will be supporting and contributing to their growth within the profession.	In pursuit of becoming a leading employer in Alaska’s community-based healthcare industry, REACH strives to help employees grow and develop further than simply mastering the core functions required of their position, and instead seeks to develop Subject Matter Experts that enrich their communities, the organization, and especially the individuals they serve. REACH hopes to support professional development opportunities for staff that include trainings on: grief, sexuality, aging, de-escalation, medication, mandated reporting, leadership, and cultural responsiveness. Employees seeking to expand their professional portfolio should be able to receive in-home care provider and caregiver training, become a certified nursing assistant, and pursue DSP certification. In an effort to provide the best care possible and meet the unique needs of rural communities, REACH would like staff to be able to access education on community coordinating and research sharing, as well as navigating Medicaid. REACH’s Infant Learning Program seeks to develop a highly trained and specialized staff who can identify developmental needs in children earlier, can provide more expertise and guidance to families and caregivers, and who can assess community needs and be conscious of cultural factors in the development of response plans and in job performance. ILP staff will have access to trainings and educational opportunities in infant and early childhood mental health, specialty feeding support certifications, sensory/motor disorders, and more, as well as leadership development training for the purpose of retaining highly qualified professionals in the field and maintaining a positive team culture and high quality program oversight. Essentially, REACH seeks to be a responsive employer that invests in its employees’ success. Disability services is a multi-faceted field and areas for growth are limitless. REACH seeks professional development funding to support core functionality, yes, but also to support its employees in the pursuit of knowledge and skill-development that they believe will contribute to their growth as a service provider, REACH’s organizational success and service capacity, and community care and well-being.	\$50,000-\$250,000	Home-and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

REACH, Inc.	REACH, Inc. ILP – Ensuring Successful Transition of Services through Increased Care Coordination	AK	The Individuals with Disabilities Education Act (IDEA) obligates states to have policies and procedures in place to support fair and equitable education for individuals with disabilities. IDEA Part C, which the Infant Learning Program operates under, supports infants and children with developmental delays or disabilities from birth to their third birthday, while IDEA part B includes protections for children ranging from ages three through 21. Under Part B, a child traditionally transitions to special education services offered through the school district, while some transition to community-based outpatient therapy, or the family or caregivers choose not to enroll the child in additional services under Part B at all. REACH, Inc. has found that it is in this transition from Part C to Part B that individuals and their families and caregivers who were receiving services under Part C either struggle to appropriately coordinate care and services under Part B, or fail to enroll in Part B supports altogether, leading to these children falling through the cracks instead of receiving the support they need to thrive. This is especially prevalent in rural communities where access to case management, programming, and supports is limited, and with high-risk individuals and children involved with foster care or Child Protective Services (CPS).	This project, through the use of a “Family Services Coordinator,” will continue to provide case management and coordination services for an additional 6 months after a child turns 3 to ensure a smooth transition for the individual and their families and caregivers from Part C services to Part B supports, as opposed to all ILP services ending on the child’s third birthday. This project will feature an emphasis on the rural communities REACH serves, as there is often little-to-no case management assistance available in these communities for families who need ongoing support. In the final three months of the child’s enrollment in the Infant Learning Program, the child’s primary ILP coordinator (and eventual Family Services Coordinator) will begin to work with the full ILP team on developing and executing the beginning stages of a Transition Plan. They will assist the family in meeting with the school district or new outpatient therapy program, developing an IEP or treatment plan, outlining the logistics of the transition, and ultimately ensure the individual and their family or caregivers feel support from parties on both sides of the transition and can communicate positively to ensure their child’s needs are being met. The Family Services Coordinator will have a minimum of two contacts a month with the family where they ensure that the family is connected to and appropriately utilizing medical, therapeutic and educational services, and ensuring that these services are fully meeting the family’s needs. If the family’s needs are not being met, the Family Services Coordinator will help connect the family with better resources. Additionally, Infant Learning Program and other Early Learning community-based services are typically provided in-home in the child’s natural environment. The transition from Part C to Part B services also involves a transition from in-home to clinic services, which the Family Services Coordinator will help the individual and their families and caregivers prepare for, including confirming that transportation is available and appointments are conveniently scheduled to incorporate a variety of factors, transportation included.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

REACH, Inc.	REACH, Inc. ILP – Expanding Eligibility for Alaska’s Infant Learning Program – Pilot Project	AK	Since IDEA Part C’s nationwide implementation in 1986, Alaska has utilized an eligibility criteria that includes a 50% developmental delay cutoff for ILP eligibility. Alaska is one of only three states that have restricted eligibility to this degree, as federal policy does not limit states at this threshold. The ILP (Part C) 50% eligibility is in conflict with Alaska’s less restrictive special education (Part B) program, which supports children and youth aged three through 21 with a 25% delay in one area of development, or a 20% delay in two or more areas of development, meaning that many children who experience a developmental delay don’t become eligible for support until age 7. Early intervention is crucial for supporting the long-term health and wellness of our state’s most vulnerable youth. Children with disabilities are at increased risk for adversity and adverse childhood experiences and life events. By providing intervention to infants and children with lower percentage delay, they will have increased opportunities for skill development and require less specialized education services, thus decreasing the total number of children needing intensive services at older ages. Additionally, a lower eligibility threshold will better align Early Intervention and Special Education, allowing for a seamless transition from ILP to special education services.	Lowering the eligibility threshold would increase the current REACH ILP by an average of around 40%. For this reason, it is recommended that the expansion from 50% to 25% developmental delay is done incrementally, to allow for the development of the necessary provider workforce and supporting infrastructure over time, monitoring anticipated and actual increases in children needing and receiving services. For REACH, this looks like gradual addition of at least 4 FTE direct service providers who will also travel to provide services in the rural Southeast communities, and the implementation of a new data management system for documentation, child records, and improved billing functionality and separate accounting processes for this expanded cohort of children. Currently approximately 20% of infants and children are eligible for ILP through clinical opinion, 20% through established conditions, and the remaining 60% enroll through developmental delay. Through expansion of services in conjunction with the lower percentage delays, providers will be able to quickly and easily refer families for services without the concern that a referral may be declined for lack of sufficient developmental delay, allowing enrollments to grow through increased provider referral rates. RHTP funding will be utilized for implementation to support operations as REACH 1) explores opportunities to expand the state’s Medicaid plan for developmental therapies; 2) enrolls more children in programming; and 3) explores additional paths for billing developmental therapies.	\$1M-\$5M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

REACH, Inc.	REACH, Inc. ILP – Expanding Outreach to Rural Communities	AK	In their most recent needs assessment, the Children and Youth with Special Healthcare Needs (CYSHCN) Advisory Committee identified “increas[ing] or promot[ing] equitable access to medical and pediatric specialty care and family supports” as their priority. The 2021-2022 National Survey of Children’s Health estimated that 18.9% of Alaskan children fall into this category – of this group more than 20% of families found services or specialist care difficult obtain, likely due to the large rural population, geographic challenges, and long-standing healthcare access needs that make the Rural Health Transformation Program necessary. In the State of Alaska’s RHTP Proposal, the state specifically notes AN/AI youth lacking access to culturally appropriate screenings. Communities with a REACH presence already have a higher percentage of children who meet the Alaska standards for school readiness than the state average. This project aims to continue supporting infant and toddler development while also providing long-term supports for caregivers and families in these rural communities, ensuring consistent care coordination through transitional phases.	1 FTE Rural Services Coordinator will travel at least monthly to communities outside of Juneau (above) to develop community partnerships with local clinics, schools, child care centers, and families. Through these partnerships, the Rural Services Coordinator will create opportunities to host no-cost developmental screenings for children ages 0-3, provide community education on early intervention services, and facilitate and address community concerns contributing to the development of needs-based operation strategies for rural communities. The Rural Services Coordinator will serve as the initial case manager for families in need of early intervention support – referring them to the Infant Learning Program, connecting them with additional resources, and working with them to develop an individualized family service plan. Additional hearing and vision screeners will be purchased as part of this project for use in these rural communities. The Rural Services Coordinator may host community outreach health fair events, work with other local organizations serving families and children to provide screenings, set-up office hours for families to come ask questions and receive information, and other activities based on community needs. The Rural Services Coordinator will work with broader ILP and REACH staff to discuss and address community needs in order to develop a larger community-oriented service plan to ensure that families in these communities have access to the support and services necessary to promote healthy infant development and ensure smooth care coordination.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Ready.net	Closing Alaska's Rural Telehealth Gap: Ready Pods for Libraries & Community Sites	DC	Alaska received the second-largest RHTP allocation in the nation because the need is acute. With vast distances between communities and rural healthcare access erosion, Alaskans in rural areas face critical barriers to telehealth, behavioral health, maternal care, chronic disease management, and workforce development. Alaska's RHTP application calls for investing in telehealth infrastructure, expanding consumer-facing digital health tools, and testing new delivery modalities. The opportunity is clear: Alaska needs physical telehealth access points in the communities where residents already gather, not more brick and mortar locations they can't reach. The gap: currently, no turnkey, fleet-managed, compliance-ready telehealth station exists in the Alaska market. Existing telehealth kiosk vendors target hospitals and pharmacies, not libraries and community sites. Basic acoustic booths deployed in other states lack clinical-grade video, fleet management, compliance reporting, or behavioral monitoring. Alaska has the funding, the need, and the framework to deploy a statewide network of community telehealth access points, but needs the right technology partner to deliver it as a turnkey solution. Ready Pods fill this gap; purpose-built for exactly the kind of rural health transformation Alaska envisions under Initiative 6 (Spark Technology & Innovation) and Initiative 2 (Health Care Access), with cross-cutting benefits for workforce development and healthy communities.	Ready proposes deploying Ready Pods, turnkey telehealth and workforce development stations, across Alaska's rural communities, managed through the BOSS/Pods fleet management platform with geospatial site selection powered by GAME and RAD. PHASE 1 - SITE SELECTION & PLANNING (Months 1–3): Ready uses GAME (Geospatial Asset Management Engine) and RAD (Ready Address Database) to analyze healthcare access gaps, broadband availability, and population data across Alaska's boroughs and census areas. We produce a rank-ordered deployment recommendation. We then work collaboratively with the Alaska Department of Health, Tribal Health Organizations, Alaska Community Foundation, Schools Health & Libraries Broadband Coalition (SHLB), and local library systems to finalize deployment sites, quantities, and phasing based on community priorities and consultation. PHASE 2 - PROCUREMENT & DEPLOYMENT (Months 3–9): Ready fabricates, upcycles, and ships Pods to selected sites. Ready conducts broadband assessments at each site if needed, configures telehealth and training app integrations (compatible with AFHCAN telemedicine infrastructure or commercial platforms), applies Alaska DOH branding, and commissions each unit. Site hosts receive operational training, playbooks, and ongoing helpdesk support. PHASE 3 - OPERATIONS & MONITORING (Ongoing): BOSS/Pods provides the State with a real-time admin dashboard showing fleet status, utilization metrics, session data, maintenance requests, and impact KPIs. Community members book sessions through the Ready Pods mobile app or walk-up QR booking. ARC (Automated Reporting & Compliance) generates formatted reports aligned with CMS RHTP requirements. Ready provides ongoing platform support, software updates via over-the-air delivery to the edge controller in each Pod, and helpdesk support for site hosts. Each Pod supports telehealth (primary care, behavioral health, maternal health, specialty consults), workforce development (vocational training, job interviews, certifications), and community health education (idle-screen resource displays). The BOSS platform tracks all utilization automatically, providing Alaska with the data needed to demonstrate RHTP outcomes to CMS. Ready is working with a current state partner to deliver ~100 Pods, with first deliveries Spring/Summer 2026, providing a direct operational proof case.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Recover Alaska	AURORA: Alaska’s Unified Response on Reducing Alcohol Harms Through Data and Community Action	AK	We propose the AURORA initiative to address a critical gap in Alaska’s public and behavioral health systems: the lack of a coordinated, data-informed statewide strategy for reducing alcohol-related harms. As noted in the federal proposal, Alaskans with behavioral health and substance use disorders in rural communities are a key target population, yet Alaska currently lacks a coordinated statewide strategy for addressing alcohol-related harms despite alcohol remaining the state’s most significant behavioral health challenge. While numerous organizations work on prevention and treatment, these efforts are often fragmented across systems, limiting Alaska’s ability to effectively address harms and contributing to disparities in health outcomes. AURORA will build Alaska’s first coordinated statewide strategy for reducing alcohol harms. The project will integrate data mapping, community engagement, and cross-sector collaboration to create shared understanding and coordinated action. Through statewide data integration and locally grounded engagement, AURORA will generate actionable insights supporting improved prevention, treatment access, and recovery systems across Alaska. This project aligns with the RHTP Healthy Communities and Health Care Access Initiatives, particularly potential work focused on strengthening statewide data collection, conducting community-level needs assessments, and improving cross-system coordination to guide resource allocation and health planning.	AURORA will unfold across three interconnected phases that operate simultaneously and inform one another. Phase 1: Statewide Data Gathering and Systems Mapping Recover Alaska will conduct a statewide settings-of-harm assessment that integrates data across multiple systems including emergency departments, hospitals, law enforcement, behavioral health services, and public health surveillance, highlighting alcohol-related gaps in services, coordination, and prevention infrastructure. Findings will be translated into Community Alcohol Impact Profiles that provide regional stakeholders with actionable information. Phase 2: Community Engagement and Local Systems Planning Recover Alaska will partner with three diverse rural communities to pilot a structured engagement process that connects local knowledge with statewide data. Through facilitated listening sessions, data-sharing conversations, and collaborative planning processes, communities will identify their priority alcohol-related challenges and develop locally grounded strategies. Community Champions will be trained to facilitate dialogue, interpret data, support ongoing engagement and serve as local connectors between community priorities and statewide systems. To ensure lessons emerging from these pilots are shared statewide, AURORA will produce a podcast documenting the project’s community-based work. Episodes will feature Community Champions, local leaders, and practitioners discussing how alcohol harms manifest in their communities and what solutions they are developing. This platform will enable continuous knowledge exchange across Alaska’s widely dispersed regions and help other communities learn from the pilot experiences in real time. Phase 3: Statewide Coordination and Strategy Development Insights from the statewide assessment and community pilots will inform the work of the AURORA Task Force, a cross-sector body composed of tribal health organizations, behavioral health leaders, treatment providers, educators, policymakers, and community representatives that will synthesize findings to develop Alaska’s first coordinated Statewide Alcohol Harm Prevention Strategy. At the same time, each pilot community will begin implementing community-led interventions addressing their locally identified priorities. These phases function as an iterative system rather than a linear process, allowing data, community insights, and statewide coordination to continuously inform one another.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Recover Alaska	Statewide & Regional Survey of Alaskan Perspectives on Alcohol and Alcohol-Related Harms	AK	Recover Alaska proposes a project aligning strongly with RHTP Healthy Communities, Health Care Access, and Healthy Beginnings Initiatives. As noted in the State of Alaska’s federal proposal, Alaskans with behavioral health and substance use disorders in rural communities are a key target population, yet Alaska lacks current statewide and regional data on public perceptions of alcohol harms, treatment access, and recovery. The first representative survey addressing these issues was commissioned by Recover Alaska in 2018 but has not since been updated. The absence of current data creates a major barrier to effective planning and accessibility to potential funding streams to increase accessibility. Without reliable information it is difficult to identify where treatment access gaps exist, how public perceptions of recovery may be changing, and which communities face the greatest barriers to care. This project will address that gap by conducting a new statewide survey of Alaskan adults that produces both statewide and regionally valid findings. The survey will measure alcohol consumption patterns, awareness of alcohol-related health risks, perceptions of treatment access, and attitudes toward recovery. The resulting dataset will provide critical evidence to inform behavioral health policy, guide investment decisions, and support improved access to treatment and recovery services across Alaska.	Recover Alaska will partner with an experienced national public opinion research firm to conduct a representative statewide survey of Alaska adults. The survey will complete approximately 1,450 interviews with Alaska residents age 18 and older. Sampling will be structured to produce statistically valid results across Alaska’s seven public health regions. The survey will use a mixed-mode methodology designed to reach residents across Alaska’s diverse urban, rural, and remote communities. Participants will have the option to complete the survey online, by telephone, or through a mailed questionnaire. Outreach will include mailed invitations, reminder mailings, text invitations, and telephone follow-up to ensure participation from all communities. Survey questions will build on the 2018 Recover Alaska survey while incorporating updated topics relevant to the RHTP Health Care and Healthy Communities Initiatives, such as alcohol consumption patterns, awareness of health risks associated with alcohol use, perceptions of recovery, experiences seeking treatment, and barriers to accessing care in rural areas. The project will include four phases: 1) Survey development and cognitive pretesting will refine questions and ensure clarity for respondents. 2) Data collection will follow using the mixed-mode methodology. 3) Survey responses will be weighted to produce a representative sample of Alaska’s adult population. 4) Data analysis will include regional comparisons and demographic analysis. The project will produce a comprehensive analytic report describing statewide trends and regional differences. Findings will be shared with policymakers, health systems, tribal organizations, and community partners to support evidence-based decision-making. By providing reliable statewide and regional data, the project will strengthen Alaska’s ability to address alcohol harms through targeted prevention, treatment, and recovery strategies, supporting evidence-based programming and data collection called informing RHTP Healthy Beginnings, Health Care Access, and Healthy Communities Initiatives.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Recover Alaska	State-Wide Recovery Community Organization	AK	Alaska currently lacks a statewide recovery infrastructure capable of supporting and connecting the grassroots recovery initiatives emerging across rural communities. This project presents an opportunity to establish Recover Alaska as the state’s first statewide Recovery Community Organization, to strengthen and connect community-led recovery efforts across Alaska. In this role, Recover Alaska would provide technical assistance, data, coordination, and shared tools to support the development and sustainability of local RCOs and grassroots recovery initiatives. RCOs are uniquely suited to Alaska’s rural context because they rely on the expertise of people with lived experience rather than clinicians, allowing communities with limited clinical workforce to build recovery support services locally. RCOs can also provide navigation and peer support services that help individuals access assessments, treatment, and recovery resources—services critical for connecting people to care. This project aligns with the RHTP initiative focused on strengthening community-based health systems and care coordination, particularly potential projects related to expanding community-based workforce capacity, improving service navigation, and strengthening regional collaboration. By supporting locally governed recovery organizations and building statewide coordination, this model will strengthen recovery infrastructure and expand access to peer-led recovery supports across Alaska.	The approach focuses on four complementary strategies: 1. Establish Recover Alaska as a statewide Recovery Community Organization Recover Alaska will obtain certification through Faces & Voices of Recovery and develop the governance, ethical standards, and peer leadership structures required of a statewide RCO. This will position RAK to serve as Alaska’s recovery systems backbone organization supporting local recovery initiatives statewide. 2. Conduct a statewide recovery infrastructure assessment. Recover Alaska will map existing recovery resources and grassroots initiatives across Alaska, including recovery groups, peer services, recovery housing, tribal recovery programs, and justice-related recovery supports. We will include a rural listening tour that coincides with RAK’s AURORA project – a statewide and regional data-gathering and organizing project – to identify regional priorities, leadership, and opportunities for local RCO development. These activities will produce Alaska’s first Recovery Landscape Report, statewide recovery resource map, and rural gaps analysis, improving coordination and visibility of services. 3. Develop the Alaska Recovery Ecosystem framework. Using the assessment findings, Recover Alaska will create a statewide recovery system blueprint defining the roles of RCOs, treatment providers, prevention organizations, tribal health systems, and peer workforce pathways. This framework will guide the development of locally governed RCOs and strengthen the continuum of care between treatment, recovery support services, and community-based prevention. 4. Provide technical assistance and network development for emerging RCOs Recover Alaska will support grassroots organizations and recovery leaders in forming local RCOs through technical assistance, connection to trainings, and shared infrastructure. Recover Alaska will develop a "How to Start an RCO in Alaska" toolkit. Support may also include nonprofit development guidance, peer workforce training, governance support, and sustainability planning according to each partner's needs. The first two strategies represent the first year of foundational work. Strategies three and four would follow in subsequent years. Future phases could expand the recovery ecosystem by launching the Alaska Recovery Network, advancing a statewide Recovery Policy Agenda, expanding peer workforce development, and building additional sustainable funding pathways for recovery organizations.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Relevant LLC	Stories & Wisdom Rural Behavioral Health Transformation	WA	Rural, remote, and frontier communities in Alaska face some of the most severe behavioral health challenges in the nation. Mental health conditions affect approximately 20% of adults and nearly 75% of youth. Alaska’s suicide rate is more than twice the national average, and drug overdose deaths continue to rise sharply, with the state ranking sixth in the United States. At the same time, dementia care and research remain heavily focused on pharmacological interventions that may slow disease progression but do little to address the psychosocial burdens of isolation, loneliness, and caregiver burnout that shape quality of life. These challenges are compounded by geographic isolation and workforce shortages that limit access to care. Many residents must travel hundreds of miles, sometimes over multiple days due to weather and transportation barriers, to reach specialty services, and 65% of rural counties have no practicing psychiatrist. Behavioral health programs have also been reduced or remain insufficient in many rural areas, contributing to delayed care and worsening outcomes. Across suicide prevention, substance-use recovery, and dementia care, a critical and under-addressed driver of poor outcomes is social isolation. There is a significant opportunity to deploy low-bandwidth, community-centered digital tools that strengthen social connection, extending behavioral health support and aligning with Alaska’s Health Care Access and Spark Technology and Innovation initiatives.	We propose a scalable, consumer-facing model, the Stories & Wisdom Rural Behavioral Health Transformation Initiative, that treats connection as care to address the hidden epidemic of social isolation driving poor health outcomes in rural communities. Our neuroscience-informed, gamified digital storytelling platform (STORIES®) and data analytics engine (WISDOM®) empower patients and caregivers to share lived experiences in structured, facilitator-led sessions that foster connection and belonging—core determinants of behavioral health. In the STORIES® experience, a small group of participants and a trained facilitator join from any browser-enabled device. The facilitator guides turn-taking, models simple, personal, and authentic (SPA) storytelling, and provides technical support. On their screen, participants see a Prompt Card and their hand of Response Cards and during their turn, they pair a Response Card with the Prompt Card to create a statement and answer, “Why is this true for you?” by sharing a personal story. As they share, other participants provide live feedback through four reactions: “Pausing to reflect,” “Learnt something new,” “I’m with you,” or “Inspired to act,” fostering dialogue. All stories are transcribed, and reaction data is captured for analysis on our WISDOM® platform. Using AI, WISDOM identifies themes, assesses sentiment, and generates insights that can inform state health improvement plans and targeted interventions. Our model integrates neuroscience research from Dr. Paul Zak (Claremont Graduate University), Dr. Barbara Oakley (Oakland University), and Dr. Uri Hasson (Princeton University) demonstrating that storytelling triggers oxytocin and dopamine, biological mechanisms that build trust and empathy. The proposed initiative also builds on over 22 national awards for digital innovation and real-world deployments across military, healthcare, and corporate environments, where 92% of participants reported feeling more connected and post-session well-being scores increased by over 30%. Our technology is low-bandwidth, browser-based, HIPAA-compliant, and accessible across all devices, making it ideal for rural environments with limited infrastructure. Our approach directly supports Alaska’s RHTP priorities by: (1) Expanding access to behavioral health services through culturally appropriate telehealth for youth and adults and (2) Empowering providers with AI-driven insights to identify emerging risks and tailor care.	\$1M-\$5M	Behavioral health/su bstance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Remote Hands	Rural Health Support Services: Local Workforce for Health Technology, Home Support & Care Navigation	AK	Rural Alaska faces a fundamental support gap that undermines health system investments and strains limited clinical resources. When a patient's blood pressure monitor stops transmitting data, when an elder needs help navigating benefits enrollment, when someone is discharged from the hospital but needs in-home support—the current options are either expensive fly-in services (\$2,000+ per visit) or overburdened clinical staff performing non-clinical tasks. This gap affects multiple RHTP priorities simultaneously: health technology goes unused, care coordination breaks down, hospital readmissions increase, and clinical workforce capacity is consumed by tasks that don't require clinical training. Meanwhile, capable local residents in these same communities lack employment opportunities. The opportunity is to build local workforce capacity that can meet diverse community health support needs—from technology troubleshooting to home-based assistance to care navigation—keeping service delivery local, reducing costs dramatically, and creating sustainable employment in rural communities.	Remote Hands Alaska proposes to expand its proven rural workforce model to address health-related support needs across three service categories: 1. Health Technology Support: Local technicians deploy, troubleshoot, and maintain remote patient monitoring devices, wearables, telehealth equipment, and assistive technology. Working with live video guidance from remote experts, they provide same-day support that would otherwise take weeks. 2. Home-Based Support Services: Chore services, respite care support, and in-home assistance for elders and individuals with disabilities—services currently difficult to access in rural communities. This extends existing Senior and Disability Services programs by providing the local workforce infrastructure to deliver them. 3. Care Navigation & Benefits Support: Hospital discharge coordination, benefits enrollment assistance, and connection to social services through platforms like GetHelp. Local navigators help community members access programs they qualify for but struggle to enroll in. The model works because it already exists. Remote Hands currently operates a network of 80+ certified local technicians across 56 rural Alaska communities under a \$1.2M AFN Tribal Broadband Connectivity Program contract. We propose to: • Develop health-specific training curriculum with our nonprofit partner T3 Alliance • Train 75-100 individuals annually through regional hub training events • Employ trained workers as on-call, part-time Remote Hands technicians • Provide centralized dispatch, quality assurance, and remote expert support • Build referral relationships with healthcare organizations, tribal health, and state programs	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Renal Care 360	AI-Enabled Early Detection & Chronic Care Management for Kidney Disease in Rural Alaska	TN	Project Concept Opportunity Chronic kidney disease affects approximately 1 in 7 Americans, yet up to 90% of cases remain undiagnosed until advanced stages. Late diagnosis leads to kidney failure requiring dialysis, with annual costs exceeding \$90,000 per patient and significant burdens on rural communities. Alaska’s rural populations face additional risks due to limited access to specialty care and long travel distances. There is a critical opportunity to improve early detection, patient engagement, and chronic disease management using scalable technology that supports local providers.	Project Concept Approach RC360° will deploy an integrated program consisting of: 1. Integration of a proprietary predictive analytics platform into partner health systems’ electronic medical records 2. Screening of patient populations to identify undiagnosed CKD and high-risk individuals 3. Risk stratification and clinical decision support dashboards for providers 4. Enrollment of eligible patients into AI-enabled chronic care management 5. Continuous patient engagement, education, and monitoring 6. Referral coordination and escalation to local care teams The AI care manager delivers personalized outreach, behavior coaching, medication adherence support, and clinically relevant data capture, enabling proactive intervention and reducing disease progression. This model is highly scalable and can operate across dispersed communities without requiring significant new infrastructure.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Renewable Energy Alaska Project	Weatherization and Energy Efficiency for Child and Elder Care	AK	This project aims to address the issue of homes that provide childcare or are occupied by elders are energy inefficient and/or have deferred maintenance needed to maintain safety, efficiency, affordability and healthy indoor air quality. Inefficient and poorly maintained buildings pose several risks to occupants and the community. Children and elders are significantly more vulnerable to respiratory illness that can be caused or exacerbated by poor indoor air quality. There is a substantial body of evidence that providing weatherization upgrades guided by established building science practices and principles dramatically improves indoor air quality, occupant comfort, and affordability. For elders, uncomfortable, unhealthy and unaffordable conditions at home can also expedite the move to a costly long-term care facility. While the primary benefit is healthier indoor conditions for vulnerable populations, other benefits include job creation, lowering costs for essential local businesses with small margins, and improved cost of living for aging populations on fixed incomes.	This project proposes the establishment of a statewide weatherization program targeted towards in-home childcare facilities and homes occupied by elders. If funded, REAP would set up an accessible, low-barrier application process for individuals and care providers to receive up to \$75,000 of energy upgrades, 15-25% of which can be spent on life, health, or safety remediation. REAP will contract directly with certified energy auditors and trusted and experienced general contractors who will manage the construction projects. Engaging directly with a limited number of general contractors eases the burden on program participants and offers a larger potential contract with the general contractors to encourage longer term investments in training, certifications, and staffing. With the potential for multi-year funding, REAP could invest further in identifying training opportunities and recruitment of weatherization providers. Additionally, REAP would welcome the opportunity to partner with providers who work with these populations supporting the care or housing of children or elders. This program could benefit from being coupled with other programs offering home accessibility upgrades, long term housing, in home care, childcare, or other services.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Resilient Youth & Community, Inc.	Behavioral Health Workforce Recruitment & Retention Initiative	AK	Rural communities in Alaska face significant shortages of behavioral health professionals, particularly clinicians and behavioral health workers who support youth experiencing complex mental health and behavioral challenges. Geographic isolation, high relocation costs, and limited professional networks make recruitment and long-term retention of behavioral health staff especially difficult in frontier communities. For providers such as Resilient Youth & Community (RYC), these workforce shortages directly limit the availability of services for youth and families. When behavioral health positions remain vacant, organizations must reduce service capacity, extend wait times, or limit admissions to treatment programs. Staffing instability also disrupts continuity of care for youth who require consistent therapeutic relationships and coordinated treatment services. Demand for youth behavioral health services continues to increase across Alaska, yet the ability of rural providers to expand services is constrained by workforce shortages. This project addresses the opportunity to strengthen rural behavioral health capacity by recruiting and retaining key behavioral health leadership, clinicians, and behavioral health workers who support youth treatment services.	Resilient Youth & Community (RYC) will address rural behavioral health workforce shortages by implementing a targeted recruitment and retention strategy designed to attract and retain the clinical staff and behavioral health workers necessary to expand youth behavioral health services in Southeast Alaska. The project will focus on recruiting key behavioral health leadership, licensed behavioral health clinicians, and behavioral health workers who support youth treatment services. RYC will utilize professional recruitment firms with experience placing health care leadership and clinical professionals in rural and frontier communities. These firms will conduct targeted searches and national outreach to identify qualified candidates with experience in behavioral health care and youth treatment services. To overcome barriers to rural recruitment, the project will provide structured recruitment incentives and relocation support for new hires. These incentives will help offset the financial and logistical challenges associated with relocating to a remote community and allow RYC to compete more effectively with urban health systems and telehealth providers for a limited behavioral health workforce. The initiative will also implement retention incentives tied to multi-year service commitments to support workforce stability once positions are filled. These incentives are designed to encourage long-term employment and reduce turnover, which is a persistent challenge for rural behavioral health providers. By investing in targeted recruitment and retention supports, this project will stabilize RYC’s behavioral health workforce, expand clinical staffing capacity, and increase the number of youth and families who can receive behavioral health services. Strengthening staffing capacity will reduce service wait times, improve continuity of care, and support the long-term sustainability of youth behavioral health services in rural Alaska.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Advance to Implementation Application

Resilient Youth & Community, Inc.	RYC Regional Hybrid Psychiatry & Telehealth Expansion: Sustainable Access for Rural Youth	AK	Southern Southeast Alaska faces persistent gaps in youth behavioral health access due to geographic isolation, limited local specialty psychiatric capacity, and severe workforce shortages in remote communities such as Prince of Wales Island. Youth and families often experience long wait times, fragmented care, and inconsistent continuity across levels of service, particularly during transitions from crisis stabilization, residential treatment, or hospitalization. A central barrier is the inability of rural communities to reliably recruit and retain sufficient psychiatric providers and clinical/case management staff. When specialty coverage and care coordination are unstable, youth rely on repeated crisis response, delayed medication management, or out-of-region referrals, undermining sustainable access to care close to home and contributing to preventable escalation. This challenge presents an RHTP-aligned opportunity to redesign specialty delivery by stabilizing rural psychiatric and care coordination capacity through a hybrid model anchored in Ketchikan and supported by an Anchorage Access & Continuity Hub. By leveraging Anchorage’s larger clinical workforce and extending psychiatric oversight and clinical/case management support through telehealth-enabled workflows, RYC can expand appointment availability, strengthen post-discharge continuity, reduce vacancy impacts, and advance RHTP goals to expand rural specialty access and build sustainable workforce capacity.	RYC’s proposed approach is to implement a regional hybrid psychiatry and clinical support model that expands specialty psychiatric access and strengthens continuity of care for youth ages 10–21 and their families across Southern Southeast Alaska, including Prince of Wales Island and other remote communities. The model is anchored by a Ketchikan Psychiatric Hub and reinforced by an Anchorage Access & Continuity Hub that leverages Anchorage’s larger workforce pool to stabilize rural capacity. Rather than relying solely on recruitment in frontier communities, RYC will extend psychiatric oversight and clinical/case management support through technology-enabled workflows that increase appointment availability and reduce disruption caused by vacancies. Access Expansion: RYC will provide psychiatric evaluation, medication management, and structured telepsychiatry through coordinated referral pathways and centralized scheduling. Because RYC serves youth statewide in residential treatment, this model strengthens psychiatric continuity before, during, and after care while expanding access to follow-up and stabilization closer to home when clinically appropriate. Earlier specialty access reduces travel burden, limits out-of-region referrals, and decreases crisis-driven entry into care. Continuity and Quality: The Anchorage hub strengthens intake coordination, discharge transitions, and post-stabilization follow-up using standardized protocols, shared workflows, and measurable tracking across sites. The model is designed to improve 7- and 14-day follow-up as leading indicators and support higher 30-day follow-up after hospitalization, reduce crisis recurrence, and improve stabilization and suicide risk reduction. Sustainability: The model is integrated into existing service lines and reimbursement pathways. Telepsychiatry delivers specialty capacity without proportional rural hiring, improving efficiency and reducing volatility from workforce shortages. By stabilizing psychiatric oversight and care coordination, the initiative reduces reliance on high-cost crisis utilization and keeps youth connected to services close to home. By combining a rural psychiatric anchor hub with Anchorage-based workforce depth, this project advances RHTP priorities to strengthen workforce capacity, expand sustainable specialty access, modernize technology-enabled care delivery, and build an outcomes-driven behavioral health system for rural youth.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Advance to Implementation Application

Resilient Youth & Community, Inc.	Ketchikan TMS Pilot: Expanding Sustainable Access to Rural Specialty Depression Care	AK	Rural Southeast Alaska faces a severe behavioral health access gap driven by high rates of depression, suicide risk, geographic isolation, and limited specialty psychiatric capacity. Alaska consistently experiences some of the highest suicide rates in the nation, and rural communities face disproportionate barriers to timely, effective treatment. For many adolescents and adults with Major Depressive Disorder, symptoms persist despite medication and therapy, increasing crisis risk and disruption to school, work, and family stability. A key structural gap in Southeast Alaska, including Ketchikan and surrounding island communities, is the absence of advanced outpatient interventions for treatment-resistant depression. When individuals do not respond to standard care, there are few local options beyond repeated medication trials or out-of-region referral to Anchorage or beyond. This results in delayed stabilization, avoidable crisis escalation, and travel burdens that many rural families cannot sustain. This project addresses an RHTP-aligned opportunity to increase access to high-quality specialized behavioral health services close to home by establishing the first local Transcranial Magnetic Stimulation (TMS) service line in the region. By filling a missing tier in the rural behavioral health continuum, the project strengthens quality, reduces reliance on crisis systems, and advances Alaska’s rural health transformation goals.	RYC’s proposed approach is to establish the first local Transcranial Magnetic Stimulation (TMS) service line in Southeast Alaska as a specialty outpatient intervention for adolescents (15+) and adults with Major Depressive Disorder, anxious depression symptoms, and OCD. This pilot will increase access to high-quality specialized depression treatment close to home in a region that currently lacks advanced outpatient options for treatment-resistant depression. RYC is uniquely positioned to implement TMS because it maintains an onsite psychiatric provider with prescribing authority, an established clinical facility in Ketchikan, and an integrated outpatient and residential continuum. Many rural communities cannot offer TMS due to lack of psychiatric oversight or infrastructure; RYC has both in place, reducing implementation risk and accelerating access for Southeast patients. TMS will be integrated into existing workflows with structured referral pathways, standardized eligibility and safety protocols, and measurement-based care. The service will function as an intermediate tier between traditional outpatient treatment and higher levels of care, strengthening the continuum and supporting earlier stabilization before crisis escalation. Regional referral pathways will enable access for Ketchikan residents and patients from surrounding Southeast communities when travel is feasible, reducing out-of-region referrals. Outcomes will be tracked through defined access, clinical, and system measures, including time from referral to treatment initiation, completion rates, symptom improvement on standardized depression scales, functional stability indicators, reduced crisis escalation, and reduced need for out-of-region specialty referrals. The pilot is intentionally data-driven to generate Southeast-specific demand, staffing feasibility, and reimbursement information to inform long-term sustainability. Following start-up, the program is expected to transition to a reimbursement-supported model through established billing pathways, reducing reliance on grant subsidy and strengthening fiscal viability. By building a missing tier of evidence-based depression care in a rural hub community, this project expands specialty access, strengthens quality through standardized protocols and outcomes tracking, and establishes durable behavioral health capacity closer to home for Southeast Alaska communities.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

Resilient Youth & Community, Inc.	RYC Training Center Modernization: Strengthening Rural Workforce and Sustainable Access	AK	Rural, remote, and frontier communities across Alaska face persistent behavioral health workforce shortages, high turnover, and vacancy-driven service disruption. These challenges weaken care close to home and contribute to inconsistent practice, delayed onboarding, and gaps in continuity—especially in hub-and-spoke systems where staff support multiple communities and levels of care. A key structural barrier is limited access to standardized, evidence-informed training for rural providers and community partners. Travel costs, limited trainer availability, and insufficient distance-learning capacity prevent consistent onboarding, annual recertification, and continuing education. As a result, workforce readiness varies across organizations, collaboration is harder across systems, and retention risk increases. This creates an RHTP-aligned opportunity to strengthen workforce stability and consistent standards of care by expanding scalable training infrastructure. By modernizing a dedicated training center and enabling high-quality distance delivery, RYC can address a core system gap: the lack of reliable, affordable training capacity that supports recruitment, retention, and consistent practice for youth-serving behavioral health teams in rural and frontier communities.	Resilient Youth & Community (RYC) will modernize and expand its established training center to function as a regional workforce hub supporting youth-serving behavioral health providers across Southeast Alaska. For more than 30 years, RYC has delivered standardized on-boarding and required core trainings—including Peer Support, Teaching Family Model, MANDT, CPR, and Youth Mental Health First Aid—across residential and community-based programs. This project builds on that foundation by upgrading physical capacity and distance-delivery infrastructure to ensure scalable, consistent workforce development. Investments will include durable commercial furnishings to expand in-person training capacity, upgraded computer and recording equipment to support high-quality virtual delivery, standardized training module formatting for hybrid use, and trainer development for distance facilitation. These improvements will enable centralized, standardized training from Ketchikan while supporting staff delivering services in surrounding rural communities within a hub-and-spoke model. Enhanced distance capability reduces travel burden and service disruption, allowing rural providers to complete on-boarding, annual recertification, and continuing education without leaving their communities. Standardized modules and centralized delivery will improve time-to-competency, increase training completion rates, and reduce vacancy-driven disruption by accelerating workforce readiness. The upgraded center will also host structured in-person and virtual trainings for community partners, strengthening shared standards of practice and cross-sector coordination across Southeast Alaska. By formalizing and expanding scalable workforce training infrastructure, this project advances RHTP’s Strengthen Workforce initiative by stabilizing rural workforce capacity, improving on-boarding efficiency, and supporting consistent, high-quality care close to home for youth and families in rural and frontier communities.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Deferred or Not Advanced

Resilient Youth & Community, Inc.	SeaLevel Youth Center Renovation: Healthy Communities, Sustainable Access, and Workforce Innovation	AK	Youth in rural Southeast Alaska experience disproportionately high behavioral health risk driven by geographic isolation, workforce shortages, limited specialty capacity, and fragmented prevention and early intervention systems. Currently, many youth only enter care at the point of crisis, driving avoidable reliance on emergency departments, schools, law enforcement, and higher levels of care. Early needs frequently go unidentified, referrals go incomplete, and families face practical barriers such as technology gaps, difficulty navigating Medicaid and intake requirements, and stigma associated with formal treatment. A major structural gap is the lack of a consistent, youth-centered “front door” where prevention, early intervention, service navigation, and transition supports are integrated in one place. This is also a recognized community opportunity: SeaLevel has been identified and supported as a youth prevention transformation solution by the City of Ketchikan, Ketchikan Gateway Borough, and Peace Health, and is reflected as a desired youth support model in Alaska’s Behavioral Health Roadmap for Alaska Youth. This project addresses an RHTP-aligned opportunity to strengthen Healthy Communities, Health Care Access, Strengthen Workforce, and Spark Technology & Innovation by shifting the system upstream, expanding care close to home, and reducing downstream crisis-system strain.	SeaLevel is designed to advance Alaska’s Rural Health Transformation Plan (RHTP) by shifting the system upstream, strengthening sustainable access, and expanding care close to home for rural Southeast Alaska youth. It functions as a consistent, community-centered “front door” where prevention, early intervention, service navigation, workforce development, and continuum-of-care transitions are integrated within one coordinated, outcomes-driven model. To address gaps in prevention and early identification, SeaLevel expands RYC’s established after-school infrastructure into a structured prevention platform focused on mentorship, protective-factor development, substance use prevention, and health and nutrition education. This prevention-first approach strengthens whole-person well-being and reduces the likelihood that emerging behavioral health needs escalate into crisis, supporting RHTP’s goal of shifting spending from acute intervention toward preventive care. To reduce access barriers, SeaLevel will operate a modernized, technology-enabled learning and access hub that provides reliable connectivity, telehealth-capable private space, and staff-supported completion of referrals, documentation, and service navigation. Real-time warm hand-offs to clinical and case management services convert referrals into completed connections, improving care coordination and producing measurable improvements in access and engagement for rural youth. To strengthen long-term workforce stability, SeaLevel includes a teaching kitchen and supervised workforce café that delivers Food Workers Card readiness, job coaching, education support, and independent living skill development. This “grow our own” pipeline builds youth economic stability while contributing to rural workforce recruitment, retention, and community resilience. Integrated with RYC’s residential stabilization, psychiatric, and community-based services, SeaLevel reinforces continuity of care across the full continuum. By reducing crisis-driven entry into care and increasing successful linkage to preventive and early intervention supports, SeaLevel advances measurable improvements in access, quality, and fiscal sustainability consistent with RHTP goals.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Deferred or Not Advanced

Resilient Youth & Community, Inc.	Southern Southeast Alaska Rural Health Transformation Planning Initiative	AK	Southern Southeast Alaska lacks a coordinated, regionally aligned strategy to guide Rural Health Transformation across Ketchikan, Prince of Wales Island communities, Metlakatla, Wrangell, Petersburg, and surrounding frontier areas. While committed health system and Tribal partners are working to address community needs, the region faces persistent barriers consistent with those identified in Alaska’s Rural Health Transformation Program: geographic isolation, workforce shortages, limited specialty access, infrastructure and telehealth gaps, fragmented referral pathways, and financial strain on low-volume rural providers. These challenges contribute to delayed access to care, inconsistent coordination across Tribal and non-Tribal systems, duplication of limited services, and over reliance on crisis-driven models rather than prevention-focused, sustainable approaches. Smaller frontier communities face unique capacity constraints that make externally designed or one-size-fits-all solutions unrealistic. The opportunity is to bring regional partners together in a structured, community-grounded planning process to identify shared priorities, clarify service and workforce gaps, and define a sequenced vision for transformation aligned with RHTP goals. Without coordinated planning, future investments risk remaining fragmented, duplicative, and financially unsustainable.	To address the lack of a coordinated regional strategy for Rural Health Transformation in Southern Southeast Alaska, this project will implement a structured, community-grounded planning process that produces a practical, implementation-ready five-year transformation plan aligned with Alaska’s Rural Health Transformation Program priorities. Resilient Youth & Community, PeaceHealth, and Ketchikan Indian Community will convene health system partners, Tribal providers, community organizations, and regional stakeholders across Ketchikan, Prince of Wales Island communities, Metlakatla, Wrangell, and Petersburg to identify shared priorities and realistic solutions tailored to frontier conditions. The approach includes three phases. 1. Baseline Assessment and Gap Analysis The project team, working with Agnew:: Beck, will synthesize existing regional assessments, service data, and prior planning efforts to identify access gaps, workforce shortages, infrastructure and telehealth limitations, referral fragmentation, and areas of service duplication. Findings will be aligned with RHTP focus areas including Health Care Access, Healthy Communities, Strengthen Workforce, and Spark Technology and Innovation. 2. Regional Convenings and Rural Site Engagement Two regional convenings in Ketchikan will frame the effort. The first will establish shared priorities and focus areas. The second will review and validate the draft roadmap. Between convenings, task forces will conduct rural community visits and listening sessions in Prince of Wales Island communities, Metlakatla, Wrangell, and Petersburg to ensure strategies reflect real workforce capacity, transportation constraints, and small-community feasibility. 3. Five-Year Transformation Plan Development The final deliverable will outline phased strategies, partnership roles, measurable outcomes aligned with RHTP goals, and sustainability considerations. It will identify priority actions to improve access to primary, behavioral, maternal, and specialty care, strengthen workforce recruitment and retention, expand telehealth and hybrid delivery models, reduce duplication, and improve coordination across Tribal and non-Tribal systems. This structured approach reduces fragmentation, strengthens collaboration, focuses on whole person care and community health, and positions Southern Southeast Alaska for coordinated implementation that improves access, quality, and long-term sustainability in rural and frontier communities.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

Resonant Strategies	Voices of Strength Peer Workforce Initiative	OK	Alaska’s rural and frontier Tribal communities face severe behavioral health challenges driven by isolation, workforce shortages, and limited access to culturally grounded care. With no Tribal-specific peer support curriculum, Alaska Native communities lack a culturally relevant pathway to train residents as peer support specialists—despite urgent need where licensed providers are scarce. This project fills that gap by creating a culturally rooted Behavioral Health Peer Support curriculum and a tailored training-of-trainers (ToT) model. Preparing residents who share cultural identity and lived experience supports Alaska’s RHTP goal to build a resilient rural health workforce through recruitment, training, and retention, and advances the priority to expand behavioral health access. A culturally specific curriculum improves access and quality by ensuring services reflect Native values, languages, and healing traditions. Developed with Alaska-based partners, Native reviewers, and culturally grounded designers, the curriculum will be community-owned, culturally resonant, and clinically sound. The ToT model creates long-term sustainability by enabling Tribal communities to continually train new specialists without relying on outside trainers. In sum, this project fills a critical statewide gap, expands culturally relevant behavioral health care, and builds a durable, locally led workforce infrastructure that strengthens Alaska’s rural and frontier health systems for the long term.	The proposed approach directly addresses the behavioral health workforce crisis facing Alaska’s rural, remote, and frontier Tribal communities by creating a Tribal focused Substance Use and Mental Health Peer Support Specialist curriculum. Because no culturally grounded, Tribal specific curriculum currently exists, Alaska Native communities lack a standardized pathway to train local residents—despite the urgent need for community based behavioral health support in regions where licensed providers are scarce or unavailable. This project fills that gap by developing a culturally rooted curriculum and a training of trainers model tailored specifically for Alaska Native peoples. By preparing local residents who share cultural identity, lived experience, and community ties, the approach strengthens early intervention, recovery support, and ongoing behavioral health care. This directly advances Alaska’s RHTP initiative to “build a resilient rural health care workforce through pipeline, recruitment, training, and retention strategies,” offering a sustainable solution where traditional recruitment efforts have repeatedly fallen short. The approach also expands behavioral health access by ensuring that training reflects Alaska Native values, languages, and healing traditions. RHTP explicitly supports investments that increase access to substance use disorder and mental health services, and a culturally specific curriculum enhances both the quality and cultural safety of care delivered in Tribal communities. A key strength of the approach is its collaborative design process. Alaska based partners, Native curriculum reviewers, and culturally grounded graphic designers ensure the curriculum is clinically sound, culturally resonant, and community owned. This aligns with RHTP’s emphasis on strengthening local and regional partnerships to improve rural health system stability and access. Finally, the training of trainers model ensures long term sustainability by enabling Tribal communities to continually train new peer support specialists without relying on outside trainers or temporary grant funded staff. This supports RHTP’s mission to create “long term system level change” and strengthens Alaska’s behavioral health system well beyond the life of the grant. Overall, this approach improves access, enhances quality, and ensures sustainability by building a culturally grounded, self-renewing behavioral health workforce within Alaska’s Tribal communities.	\$50,000-\$250,000	Statewide	Southeast Fairbanks Census Area	Deferred or Not Advanced

Resource Center for Parents and Children RCPC	Pathways to Healing for Children, Parents, and Families	AK	This project addresses the need for accessible behavioral health services for families in Interior Alaska and the North Slope. We will provide specialized behavioral health support for postpartum mothers, new parents, families involved with the Office of Children’s Services (OCS), and children who have experienced trauma, along with their caregivers. Services will be delivered through in-person appointments, telehealth for remote access, and travel to rural villages to ensure families in remote communities can receive care. Focusing on these populations is critical because early childhood experiences and caregiver well-being are foundational to long-term health and family stability. Postpartum parents and families navigating child welfare involvement often experience high levels of stress, isolation, and untreated trauma, increasing the risk of poor mental health challenges and family disruption. Providing timely, trauma-informed behavioral health services during these pivotal moments strengthens parent-child relationships, supports healthy child development, and helps reduce the likelihood of future abuse, neglect, and deeper system involvement. Housed at the Resource Center for Parents and Children (RCPC), this program will integrate evidence-based trauma therapy and postpartum/new parent behavioral health care while collaborating with RCPC’s existing programs and regional partners across the Interior and North Slope to expand access to coordinated, family-centered care.	The proposed program will deliver trauma-informed, evidence-based behavioral health services. Services will be provided through a combination of in-person counseling in Fairbanks, secure telehealth services for families in remote communities, and scheduled travel to rural villages across the Interior and North Slope. This flexible model will reduce geographic barriers and ensure that families living in rural and remote areas have access to high-quality behavioral health care. Licensed behavioral health clinicians will provide evidence-based trauma therapies and parent-focused interventions tailored to postpartum mothers, new parents, children who have experienced trauma, and families involved with the Office of Children’s Services (OCS). Services may include individual therapy, family therapy, caregiver support, and parent-child sessions focused on strengthening attachment, improving emotional regulation, and supporting healthy child development. The program builds on RCPC’s existing behavioral health capacity, not duplicating efforts, and its long-standing role as a trusted provider of family support and child abuse prevention services across the Interior. For the past five years, RCPC has supported a grant-funded clinician dedicated solely to serving children who have experienced trauma. As part of this next phase of growth, RCPC will expand its capacity to include Medicaid billing, which has not previously been explored. The current Licensed Clinical Social Worker (LCSW) will provide clinical supervision and oversight for the program, ensuring quality care and adherence to evidence-based practices. Additional clinicians brought on through this project will focus on meeting Medicaid billing requirements while expanding access to services for families. This initiative will also serve as a workforce development opportunity. RCPC will provide licensure supervision at no cost to clinicians working toward independent licensure, along with training in trauma-informed and evidence-based therapy modalities. By strengthening the behavioral health workforce while building sustainable reimbursement through insurance billing, this program will expand access to care and support long-term, community-based behavioral health services for families across RCPC’s service area.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

ReviveHealth, Inc.	Technology, Innovation, and Services Partner for Alaskans' Access to Rural Healthcare	FL	Alaska's Rural Health Transformation Program accelerates progress toward reliable healthcare access across one of the nation's most geographically complex care environments. More than 80% of Alaska communities are off the road system, many residents must travel by air or seasonal routes to reach care, and internet connectivity can be costly, limited, or unreliable. At the same time, every community carries at least one Health Professional Shortage Area designation, and suicide rates remain more than double the national average. These conditions create significant barriers to timely access to primary and urgent care, behavioral health services, weight health, pharmacy, and specialty consultation for rural residents. The opportunity is to deploy scalable care models that can reach remote communities reliably, expand care capacity for local providers, and deliver services as close to home as possible despite geographic and infrastructure constraints.	Revive proposes deploying a virtual-first care model that supports frontier environments in expanding access to care for rural and remote Alaska communities. The approach combines universal access technology, integrated clinical services, and partnerships with local care teams to deliver care as close to home as possible. Universal Access Infrastructure: The platform uses Plain Old Telephone Service (POTS) to connect patients directly with board-certified physicians by telephone. Because the model does not require broadband, smartphones, or mobile apps, it can reliably reach residents in communities where internet connectivity is limited or unreliable, expanding access across the 82% of Alaska communities that lack road connections. Integrated Whole-Person Clinical Care: Through a single access point, residents can receive urgent and primary care, behavioral health support, weight health, pharmacy, and coordinated specialty referrals. Physicians and clinicians can diagnose conditions, prescribe medications, provide behavioral health triage, and coordinate follow-up care. Medications for many common acute and chronic conditions can be delivered directly to patients' homes, helping address adherence barriers in remote communities. Extending the Local Care Workforce: The platform complements Alaska's existing care ecosystem, including tribal health organizations, regional providers, and Community Health Aide/Practitioner (CHA/P) teams. By managing low- to medium-acuity episodes virtually, Revive's care extends the capacity of local physicians/clinicians so they can focus on complex in-person care while improving continuity of care close to home. Technology, Navigation, and Data Integration: The platform supports remote patient monitoring, wearable device integration, and community-based care navigation tools that connect residents with clinical and social services. AI-enabled tools assist clinicians with triage, documentation, and care coordination. Interoperable data systems enable integration with health information exchange (HIE) infrastructure and other vendor technologies, while advanced analytics support population health management, emergency department diversion, and claims redirection tracking. Together, this approach creates a scalable, technology-enabled access layer that strengthens Alaska's rural health system while supporting workforce capacity, improved care coordination, and sustainable health system transformation.	\$250K-\$1M	Clinic	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

RH Health Inc.	Home-Based Chronic Disease Screening and Care Navigation for Rural Alaska	CA	Over 21% of Alaska's population is Alaska Native or American Indian, and more than 30% of residents live in remote villages accessible only by plane or boat. These communities face chronic disease rates exceeding national averages, yet screening for diabetes, kidney disease, and colorectal cancer remains critically low The barriers are structural. When the nearest clinic requires a flight, provider shortages mean months-long waits, and weather can ground transportation for days, patients do not get screened. Conditions progress to late-stage disease requiring medevac transport and out-of-state specialty care. The cost is enormous. Uncontrolled diabetes leading to kidney failure costs over \$90,000 per patient annually. Colorectal cancer caught at Stage IV has survival below 15%, compared to over 90% when caught early through a home screening test. Alaska's RHTP has identified chronic disease prevention, consumer-facing technology, and innovative care as priorities. RH Health's NIH peer-reviewed platform addresses all three. We ship tests to patients' homes, use AI-powered engagement to drive completion, and coordinate follow-up via telehealth so abnormal results do not fall through the cracks. The opportunity is to prove a technology-enabled screening model can close chronic disease gaps in the most geographically challenging healthcare environment in the country.	RH Health will deploy a home-based chronic disease screening and care coordination platform in partnership with Alaska-based FQHCs or tribal health organizations. The model has three core components: home-based screening, AI-powered patient engagement, and telehealth care coordination. Patient Identification: Our platform, Sherwood, integrates with partner EHRs via HL7 FHIR to identify patients overdue for diabetes (HbA1c), kidney disease (ACR), and colorectal cancer (FIT) screening, focusing on uninsured, underinsured, or unscreened patients. Home-Based Screening: Patients receive FDA-approved diagnostic test kits shipped to their homes with simple instructions, collection materials, and a prepaid return mailer. They complete the test on their schedule and mail it back. Labcorp processes specimens and returns results electronically to our platform and the partner EHR. AI-Powered Patient Engagement: Our AI agent, Mariann, handles outreach via SMS: shipment notifications, reminders, check-ins for unreturned kits, and result communications. Patients can text back with questions and receive immediate responses. Complex issues escalate to clinical staff. Available in English and Spanish, with capacity to add Alaska Native languages through partner collaboration. Care Coordination: Every abnormal result triggers a structured workflow. The patient receives a call within 48 hours, a telehealth visit is scheduled with our physicians, and if specialist referral is needed, we coordinate and track it to resolution. This closes the loop that breaks down in most screening programs. EHR Integration: Results flow automatically into the partner EHR. Care teams receive alerts for abnormal findings. Quality metrics update automatically, extending the clinic's reach without adding burden to rural health staff. Implementation follows a phased approach: partnership and EHR integration in months 1-3, soft launch in month 4, active screening in months 5-12, and evaluation in months 13-15	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; Northwest Arctic Borough	Deferred or Not Advanced

Rhiza Psychiatry	HealthBridge: Alaska's First Cross-Sector Platform for Real-Time Behavioral Health Care Coordination	AK	Alaska's highest-need patients — domestic violence survivors, people experiencing homelessness, individuals with co-occurring mental health and substance use disorders — do not have one need. They have five or six at once. But Alaska's service system is built to handle one at a time. Behavioral health providers cannot see housing availability. Housing programs cannot see legal aid capacity. No shared platform exists to coordinate across all these sectors simultaneously. The cost of this fragmentation is enormous. Alaska spends approximately \$1,200 per day per person in emergency shelter — yet most of those individuals also need psychiatric care, legal support, and case management that nobody is coordinating. Unmanaged co-occurring disorders drive 30 to 40% of Alaska's non-emergent emergency department visits. Suicide rates run 2.5 times the national average. These outcomes are not inevitable — they are what happens when a system treats complex needs one piece at a time. No existing Alaska platform coordinates care across behavioral health, housing, legal aid, and social services simultaneously. HealthBridge fills that gap — and Rhiza Psychiatry is uniquely positioned to build it because we already coordinate all four every single day.	HealthBridge is a secure, HIPAA-compliant cross-sector coordination platform purpose-built for Alaska's highest-need populations. It solves a problem no existing platform addresses: the inability to coordinate care across behavioral health, housing, legal aid, medical services, and social supports simultaneously in real time. The platform has three core tools working together. First, a Needs Assessment Engine that screens a patient once and instantly identifies needs across all sectors — psychiatric, housing, legal, medical, and social — generating a unified care plan in a single session instead of five separate intake processes. Second, a Live Cross-Sector Dashboard that shows real-time availability across all partner organizations simultaneously — psychiatric appointments, transitional housing slots, legal aid clinics, and social service openings — so a case manager can coordinate everything in one place without making dozens of calls. Third, a Warm Handoff and Tracking System that documents every referral, confirms every appointment, and alerts the care team when a patient misses a connection or falls through a gap — something no current Alaska system does reliably. The platform is built specifically for Alaska. It runs on low-bandwidth connections for rural and frontier communities, includes a toll-free telephonic option for communities without smartphones, supports Alaska Native languages, and integrates with tribal health organization data systems that national platforms ignore entirely. Rhiza Psychiatry's Adaego Recovery Center ensures substance use disorder services are fully integrated alongside psychiatric care, housing, and legal supports — because for our population these needs are never separate. The 5-year rollout begins with a pilot serving Anchorage's highest-need populations in Year 1 and expands to rural and frontier communities across Alaska by Year 3, reaching full statewide coordination capacity by Year 5 with 150+ partner organizations actively sharing real-time availability data.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Rhiza Psychiatry	Northern Haven: Integrated Behavioral Health & Transitional Living for Rural Alaska Women & Children	AK	Alaska faces converging crises with no integrated solution: the nation's highest rates of intimate partner violence, record-level homelessness disproportionately affecting Alaska Native women and families, 27 federally designated Mental Health Professional Shortage Areas covering 400,000+ residents, and rural communities where some villages have no mental health provider within 200 miles. Existing services are siloed — emergency shelters offer 30 to 90 day stays that are insufficient for trauma recovery, while outpatient clinics lack housing supports and housing programs lack clinical depth. The cost of doing nothing is staggering. Alaska spends approximately \$1,200 per day per person in emergency shelter. Transitional housing with wraparound services costs roughly \$150 to \$200 per day. For an 80-resident program like Northern Haven, that gap represents nearly \$29 million in annual system savings against a \$6 million annual investment — a nearly 5 to 1 return before counting a single dollar in healthcare savings or reduced recidivism. Children bear a disproportionate burden too. DOJ research shows 27.7% of U.S. children are exposed to physical violence between parents by age 18, with lifelong consequences. Without an integrated care model, these children cycle through emergency systems repeatedly. Northern Haven breaks that cycle by combining safe housing, clinical care, and real pathways to permanent stability under one roof — something no current Alaska program provides.	Rhiza Psychiatry will operate Northern Haven as an integrated transitional living village combining comprehensive psychiatric services with 12-24 month transitional housing for approximately 80 women and children (20 adults, up to 60 children) fleeing domestic violence in Alaska. The model is structured around four sequential phases. Phase 1 (Intake & Safety, Weeks 1-4): Comprehensive bio-psycho-social assessment within 72 hours; individualized safety planning; urgent legal, medical, and benefits coordination; primary case manager assignment; children's developmental screening. Phase 2 (Stability, Months 2-6): Evidence-based individual trauma therapy using TF-CBT, EMDR, and Seeking Safety; psychiatric medication management; household routine coaching; targeted child interventions including play therapy; housing readiness activities; weekly peer groups. Phase 3 (Empowerment, Months 7-18): Employment and education milestone pursuit; advanced financial capability services; tenancy readiness simulations; child academic support and IEP coordination; parenting education using evidence-based curricula; family therapy. Phase 4 (Transition & Aftercare, Months 19-24+): Coordinated move-out; landlord engagement and mediation; structured follow-up contacts tapering from weekly to monthly; rapid response for tenancy crises; alumni peer mentorship; formal exit evaluation. Rhiza Psychiatry provides the clinical anchor: psychiatric assessment, medication management, telepsychiatry for rural outreach, crisis intervention, and clinical supervision. Northern Haven provides housing, 24/7 residential support, case management, childcare, workforce development, and housing navigation. Cultural responsiveness is operationalized through a Cultural Advisory Circle of Alaska Native elders and practitioners who co-design programming, ceremonies, and staff training. Telehealth infrastructure extends services to rural referral sources and supports care continuity after program exit, aligning directly with RHTP's Spark Technology & Innovation and Health Care Access initiative priorities. RingMD USA, INC.	Alaska IDD and All-Waiver Telehealth Expansion Platform	SC	Alaska has already established that people with intellectual and developmental disabilities need specialized telehealth support because rural access barriers, provider shortages, and poorly matched crisis response can drive avoidable emergency services and weaker continuity of care. RingMD’s active SDS contract is proof that this need is real, current, and statewide. Alaska’s broader RHTP framework separately identifies complex-care models for populations such as IDD, autism spectrum disorder, traumatic brain injury, severe and persistent mental illness, dementia, and serious medical conditions. The opportunity is to move beyond a narrow single-population service and convert an existing Alaska telehealth operation into a scalable all-waiver and complex-care access platform. By doing so, Alaska can expand timely specialist support, improve rural crisis and follow-up pathways, reduce duplication across populations, and create shared infrastructure that supports more than one program objective at a time.	RingMD proposes to launch the Alaska IDD and All-Waiver Telehealth Expansion Platform as an immediate expansion of an operating Alaska service rather than as a new pilot. As one interoperable care-delivery layer in RingMD’s broader Alaska rural health infrastructure portfolio, this platform connects naturally with the Digital Front Door, the Integrated Crisis Continuum, and the Behavioral Health AI workforce layer. The current SDS/RingMD program already provides 24/7 telehealth support, crisis triage, hospital and EMS coordination, follow-up behavioral health support, technical assistance, and rural access facilitation for IDD/ISW participants. The project uses that live operating base as the foundation for a platform serving additional Alaska-selected waiver and complex-care populations. In year one, the launch does three things. First, it strengthens the current IDD/ISW model with follow-up, caregiver and DSP workflows, referral completion tracking, dashboards, and quality reporting. Second, it adds configurable intake, triage, escalation, and follow-up pathways for one or more additional waiver or complex-care populations selected by Alaska leadership. Third, it creates a shared operating model—one telehealth platform, one help desk, one training model, one analytics structure, and common care-coordination workflows—that can be reused as more populations are added. The service is designed for frontier use from day one: mobile, tablet, computer, and phone access; accessibility supports; low-bandwidth performance; and technical support for participants, guardians, designees, caregivers, and DSPs. Because RingMD already runs the Alaska base service and has deep Anchorage-based support through Potawatomi Ventures and six years of Alaska Native service via IHS, no pre-award pilot recruitment is required to begin. The expansion can launch immediately through the existing operating base while SDS selects the first additional populations and workflows for rollout.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

RingMD USA, INC.	Alaska Integrated Crisis Continuum Platform	SC	Rural Alaskans in crisis often move across separate systems—988, IDD telehealth, behavioral health providers, EMS, emergency departments, Tribal health organizations, and waiver or care-coordination teams—without a shared workflow for triage, handoff, follow-up, or performance tracking. This fragmentation is especially harmful in frontier Alaska, where geography, weather, workforce shortages, and limited connectivity can delay the right response and increase avoidable transports, emergency department use, repeat crises, and caregiver burden. RingMD’s current SDS IDD telehealth work confirms the need is real and current: many crisis events involve overlapping medical, behavioral health, and disability-related needs that do not fit neatly into a single program silo. The opportunity is to join those priorities into one statewide rural crisis-continuum coordination platform that begins with a live Alaska operating base and then expands. Instead of funding another isolated pilot, Alaska can fund a launch-ready coordination layer that helps the right actor act faster, supports warm handoffs and follow-up, reduces repeated intake and duplication, and creates measurable visibility into crisis pathways across rural communities where fragmentation is hardest to overcome.	RingMD proposes to launch the Alaska Integrated Crisis Continuum Platform as a ready-to-deploy shared service that begins immediately through RingMD’s existing SDS Alaska operating base and then scales to broader crisis-continuum use cases. As one interoperable coordination layer in RingMD’s broader Alaska rural health infrastructure portfolio, the platform links naturally with the Digital Front Door, the IDD/All-Waiver Telehealth platform, and the Behavioral Health AI workflow service. The current SDS/RingMD service already provides 24/7 telehealth support for individuals with IDD, including immediate crisis evaluation, triage, coordination with hospitals and EMS, follow-up behavioral health support and rural access facilitation. The proposed project uses that live service as the foundation for a statewide crisis coordination layer rather than starting from zero. In year one, RingMD would launch workflows for crisis intake normalization, warm handoffs, follow-up scheduling, role-based work queues, referral completion tracking, and dashboards that can be used by the SDS-centered operating model, then by additional pathways as they onboard. This means the project can go live immediately even before full 988, hospital, Tribal, or EMS integration is complete. RingMD already controls the launch-critical components: platform, low-bandwidth access, phone fallback, messaging, dashboards, APIs, training materials, help desk, documentation workflows, operational staffing and RingMD’s federally hardened security posture. The first-wave scope emphasizes what Alaska can deploy now: coordinated crisis and urgent-concern workflows anchored in IDD and complex-care telehealth, structured handoff to local or regional next steps, follow-up tracking, and reporting on turnaround time, pathway utilization, and repeat crises. The platform would be configured so additional entities—including behavioral health crisis operators, hospitals, EMS agencies, Tribal health partners, or other state-selected participants—can be onboarded after launch without redesigning the core system. The result is a real, immediate rural crisis-continuum infrastructure project, not an aspirational interoperability diagram. The approach builds on RingMD’s prior statewide crisis infrastructure deployments, notably in the State of Ohio where a shared digital crisis coordination layer significantly improved response efficiency, reduced duplication across providers, and generated measurable cost savings.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

RingMD USA, INC.	Alaska Rural Behavioral Health Automation Workflow and Documentation Enablement Service	SC	Rural behavioral health providers in Alaska face a persistent mismatch between demand and operating capacity. Even when clinicians are available, too much staff time is absorbed by intake, repeated history collection, structured screening, note drafting, reminders, follow-up task management, QA requests, and reporting instead of direct patient care. In frontier communities, that burden translates into slower first response, delayed assessments, weaker continuity, longer waits, more incomplete intakes, and higher staff burnout. Alaska’s own RHTP materials explicitly signal support for AI-powered workflow tools, provider training for technology adoption, stronger data infrastructure, and practical technology investments that improve rural access and sustainability. This creates a timely opportunity for Alaska to launch a governed statewide service that helps rural behavioral health providers use human-in-the-loop AI workflow and documentation tools safely and consistently without requiring each site to buy, govern, train, secure, and maintain its own AI stack. The project opportunity is not generic AI innovation. It is a rural access and workforce-capacity project that uses workflow technology to help small teams move patients through intake and care more quickly, improve documentation quality, and sustain services in places where every hour of clinician time matters.	RingMD proposes an Alaska Rural Behavioral Health AI Workflow and Documentation Enablement Service: a ready-to-deploy statewide shared service that can be launched immediately upon award and made available to eligible rural behavioral health providers through a structured onboarding process. As one interoperable layer in RingMD’s broader Alaska rural health infrastructure portfolio, the service complements the Digital Front Door, Integrated Crisis Continuum, and IDD/All-Waiver Telehealth platforms by strengthening workforce capacity and documentation quality behind the scenes. Instead of funding a narrow software pilot at one site, RHTP funds would establish a practical statewide implementation service that gives participating rural providers access to governed human-in-the-loop workflow tools, training, help desk support, configuration, analytics, and implementation guidance. First-wave functions would include structured intake support, documentation drafting for clinician review, screening and outcome-measure capture, reminder and follow-up workflows, QA prioritization, operational dashboards, and role-based reporting. The project is intentionally not framed as autonomous AI replacing clinicians. Final clinical judgment remains with licensed professionals, and all outputs are reviewable, auditable, and controlled through acceptable-use policies, role-based access, audit logs, and training. The service can launch without named pilot providers because the first-year deliverables are vendor-controlled and implementation-ready: statewide workflow templates, governance rules, training modules, reporting dashboards, technical support, and an onboarding pathway for eligible providers selected post-award using readiness criteria approved by the lead Alaska entity. That means the project can begin immediately while still allowing Alaska to bring in providers in phases. The concept also directly supports Alaska’s published Spark Technology and Innovation milestone to launch technical assistance and training programs for providers using AI-powered workflow tools. RingMD can credibly deliver this because it already operates in Alaska through the SDS IDD/ISW telehealth program, has six years of Alaska Native service experience through IHS and maintains a federally hardened security posture with annual third-party audit and a multi-year ATO.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

RingMD USA, INC.	Alaska Rural Digital Front Door and Scheduling Platform	SC	Rural Alaskans often face fragmented entry points into care and limited visibility into what happens after a referral is made. A patient, parent, elder, or caregiver may know help is needed but not know whether the right next step is primary care, behavioral health, specialty telehealth, maternal support, community services, or another pathway. Providers face the same problem in reverse: referrals are often misdirected, incomplete, or never closed, and there is limited statewide visibility into where the access process breaks down by region, service line, or population. Alaska’s own RHTP materials explicitly point to community-based care navigation and scheduling assistance applications as a desired technology investment, making this one of the clearest opportunities in the program. A statewide rural digital front door creates one trusted access layer that reduces wrong-door referrals, shortens the path to the right next step, and gives Alaska a durable, measurable, consumer-facing infrastructure for rural access improvement.	RingMD proposes to launch the Digital Front Door and Scheduling Platform as a shared service that can begin operating immediately after award without requiring pre-award pilot recruitment. As one interoperable layer in RingMD’s broader Alaska rural health infrastructure portfolio, the platform functions as the consumer-facing access layer that complements the Integrated Crisis Continuum, the IDD/All-Waiver Telehealth platform, and the Behavioral Health AI workflow services. RingMD controls the core components already needed to go live: the platform, consumer-facing workflows, referral and request logic, API framework, messaging, dashboards, accessibility features, low-bandwidth design, help desk, training materials, and implementation staff. Rather than waiting for deep provider-specific integrations before launch, the project starts with an Alaska-wide minimum viable service supporting searchable pathway discovery, request-for-help intake, scheduling assistance, referral routing, reminder prompts, and closed-loop status tracking for prioritized pathways. The initial deployment will focus on a small number of high-value statewide pathways selected with Alaska program leadership, such as behavioral health access, primary care/FQHC access, specialty telehealth referral, maternal navigation, and other Alaska-prioritized service lines. Users will be able to enter through web, mobile, or phone-assisted workflows, answer a small set of routing questions, submit a request, receive next-step guidance, and remain connected until the referral, callback, or appointment process is complete. RingMD will operate centralized navigation and scheduling-assistance workflows where direct provider integration is not yet available, which makes the service launchable from day one while still leaving room for later regional or provider-specific integration. RingMD has implemented comparable digital access and care-routing infrastructure supporting statewide behavioral health and crisis access networks in Ohio. These deployments demonstrate how a shared digital front door can streamline navigation, connect individuals to the right provider faster, and improve scheduling and referral coordination across distributed care networks.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Rise Above Recovery LLC	Expanding Rural Alaska Behavioral Health Access Through Telehealth Innovation	AK	Rural and remote Alaska communities face significant barriers to behavioral health care, including provider shortages, long travel distances, limited infrastructure, and seasonal isolation. These challenges contribute to unmet mental health needs, delayed treatment, and increased risk of crisis. Telehealth has emerged as a critical tool for bridging these gaps, yet many communities still lack consistent access to behavioral health providers, culturally responsive care, and sustainable service models. This project addresses the opportunity to expand behavioral health access through a telehealth-enabled model that strengthens workforce capacity, improves service coordination, and delivers high-quality care to underserved regions.	The project will expand behavioral health access in rural Alaska through a phased telehealth and community-based service model. Phase 1 focuses on infrastructure development, including telehealth platform enhancements, workforce recruitment, training, and establishing referral pathways with local clinics, tribal health organizations, and community partners. The project will implement standardized workflows, culturally responsive practices, and quality assurance processes to ensure consistent, high-quality care. Phase 2 focuses on service delivery expansion, offering assessments, therapy, care coordination, and crisis support through secure telehealth. Providers will receive ongoing supervision and training to ensure competency in rural behavioral health needs. The project will also integrate community engagement strategies, including collaboration with schools, tribal councils, and local service providers and local church community's members that currently provide services in multiple rural villages. Evaluation and data collection will track access, timeliness, client outcomes, and workforce stability. Findings will inform continuous improvement and long-term sustainability planning.	\$50,000-\$250,000	Behavioral health/su bstance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Rising Roots Recovery LLC	Expanding Opioid Treatment Access in Alaska Through Technology-Enabled Care	AK	Alaska faces significant barriers to accessing treatment for opioid use disorder (OUD). Despite the state’s large geographic footprint, opioid treatment programs remain limited and are concentrated primarily in a few urban areas. Many individuals living in rural and frontier communities must travel long distances or temporarily relocate to access medication-assisted treatment such as methadone. These geographic barriers contribute to delayed treatment, reduced retention in care, and increased risk of overdose and other health complications. At the same time, clinical providers face growing administrative and regulatory burdens that can limit the capacity of existing programs to expand services. There is a clear opportunity to strengthen Alaska’s opioid treatment infrastructure by expanding treatment capacity and integrating technology-enabled care models that improve efficiency while supporting access for patients traveling from rural and underserved communities.	Rising Roots Recovery LLC proposes to establish a technology-enabled opioid treatment program in Anchorage designed to expand access to evidence-based treatment for opioid use disorder across Alaska. The clinic will serve as a central treatment hub capable of supporting approximately 200 patients while helping address the growing demand for medication-assisted treatment services. The project focuses on strengthening clinical infrastructure and implementing modern technology that improves both patient access and provider efficiency. Planned investments include telehealth capabilities, virtual care tools, remote diagnostic technology, and AI-assisted clinical documentation systems. These tools will help reduce administrative burden on clinicians, improve care coordination, and allow providers to spend more time delivering direct patient care. Because many individuals seeking treatment travel from outside Anchorage, expanding capacity at this location will improve access for patients from surrounding regions including the Mat-Su Valley, Kenai Peninsula, and rural communities that rely on Anchorage as a regional healthcare hub. The project will also prioritize collaboration with rural hospitals, tribal health systems, and community health providers to support referrals and coordinated care. By combining expanded treatment capacity with technology-enabled care delivery, Rising Roots Recovery aims to strengthen Alaska’s behavioral health infrastructure and create a more accessible and sustainable pathway to recovery for individuals experiencing opioid use disorder.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Kenai Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area	Deferred or Not Advanced

RMX Monitoring, LLC	Expanding Rural Cardiac Monitoring for Alaska Communities	NJ	Alaska’s rural and frontier communities experience some of the most significant barriers to cardiovascular care in the United States. Many residents live in isolated areas where no cardiology services are available locally, and harsh weather, long distances, and limited transportation make specialty care difficult or impossible to access. As a result, early signs of cardiovascular disease often go undetected until they manifest as medical emergencies, contributing to elevated rates of stroke, heart failure, and avoidable hospitalizations. This project addresses these gaps by deploying remote cardiac monitoring technology capable of screening at-risk patients directly in their home communities. The wearable, cellular-enabled device requires no external gateway or clinic visit, allowing patients to complete a full 14-day diagnostic study regardless of geography or infrastructure limitations. Providers receive rapid, clinically actionable reports that support early detection of arrhythmias and timely preventive treatment—an approach shown in other rural settings to improve outcomes and reduce downstream costs. [a-z-animals.com] By eliminating traditional access barriers and extending specialty-level diagnostic capability into underserved areas, this initiative strengthens Alaska’s capacity to manage cardiovascular disease proactively, improves equity in access to care, and creates a scalable model for frontier health delivery.	Our approach brings specialty-level cardiac diagnostics directly into Alaska’s rural and frontier communities through a fully remote, end-to-end screening and care-coordination model. Building on our proven remote monitoring workflow—where wearable devices collect continuous ECG data over a 14-day period and deliver full diagnostic reports to the ordering provider in just a few days—this project eliminates geographic, weather-based, and transportation barriers that currently prevent early detection of cardiovascular disease. We will partner with rural primary care clinics, tribal health organizations, FQHCs, and community health aides to identify adults with elevated cardiovascular risk. Local providers will receive training on referral pathways, device placement, and interpreting our clinical reports. Patients receive a lightweight, single-component monitor with built-in cellular transmission, removing the need for gateway devices or broadband access. This technology has been validated in other rural environments for its ease of use and high patient compliance. Every heartbeat is transmitted to our U.S.-based monitoring center—staffed by nationally certified cardiac technicians—who verify arrhythmia findings in near real time. Our proprietary clinical platform synthesizes the full 14-day dataset into a comprehensive provider-ready report. Providers receive actionable diagnostic reports within 2–3 days of study completion, enabling timely intervention for arrhythmias such as AFib before they escalate into severe events. When urgent findings occur, alerts are routed to the clinic immediately. Patients diagnosed with cardiovascular disease are connected to preventive care pathways. Additional screenings are conducted for newly identified high-risk individuals, enabling early intervention across the program’s duration. Our organization’s existing monitoring, reporting, and patient-support infrastructure, refined over many years of national cardiac monitoring operations—allows deployment on day one without reliance on local specialty resources. By integrating remote diagnostics, community partnerships, and rapid cardiology-level interpretation, this project provides Alaska with a scalable, frontier-adapted model capable of reducing preventable cardiac events and strengthening long-term rural health capacity.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Rosarium Health	Alaska Aging in Place Value-Based Care Initiative	CO	Alaska’s healthcare system faces rising financial and demographic pressure. The population of older adults is growing quickly while the cost of hospital care and long-term institutional services continues to increase. At the same time, many residents who could remain safely at home are unable to do so because their homes lack basic accessibility features. Without early intervention, everyday hazards can escalate into falls, hospital visits, and costly institutional care. Alaska currently lacks coordinated infrastructure that allows healthcare providers, community organizations, and service professionals to address home safety risks at scale. As a result, opportunities for prevention are often missed. This initiative by Rosarium Health offers a path forward. By establishing a statewide aging-in-place model built on prevention and value-based care, Alaska can improve health outcomes while reducing avoidable healthcare spending. Home safety improvements can prevent falls, reduce hospital utilization, and delay institutional placement. The initiative also strengthens Alaska’s workforce and economy by creating new opportunities for clinicians, therapists, contractors, and small businesses to deliver accessibility services that support safe, independent living.	Our approach is to build a coordinated aging-in-place infrastructure that connects healthcare providers, community organizations, and local service professionals to address home safety risks before they become medical crises. Working with the Juneau Economic Development Council and regional partners, Rosarium Health will launch the program in Juneau and Anchorage and expand over three years. Community organizations such as Southeast Alaska Independent Living, AARP Alaska, Catholic Community Service, and SEARHC will help identify residents who may benefit and coordinate referrals with care managers, clinicians, and social service providers. Once referred, licensed clinicians will conduct comprehensive home safety assessments to evaluate mobility barriers, fall risks, and accessibility challenges. These assessments may occur in person or through secure telehealth-enabled home evaluations, allowing residents in rural and frontier communities to receive expert guidance without long travel distances. Clinicians will recommend practical improvements that help residents safely navigate their homes and maintain independence. Rosarium will then coordinate local contractors and service providers to complete the recommended accessibility improvements. These may include entry ramps, railings, curbless showers, grab bars, widened doorways, improved lighting, stair supports, and other modifications that reduce fall risk and improve daily living. By coordinating these services through a single platform, the program ensures projects are completed efficiently and consistently across communities. Workforce development is a core component of the model. Rosarium will recruit occupational therapists, rehabilitation specialists, and school-based clinicians across Alaska and support them in expanding their practice into community-based home safety services. Local contractors and small businesses will also gain training and access to supply chains that support accessibility improvements. The program will operate within a value-based framework. Initial services will align with existing reimbursement pathways while building the data and outcomes needed to transition toward value-based payment models tied to fall prevention, reduced hospital utilization, and improved independence. Through this coordinated system, the initiative builds scalable infrastructure that improves safety at home, strengthens Alaska’s workforce, and allows more residents to remain in the place they call home.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Roshal Health	Rural/Frontier Health Ultrasound Collaboration	TX	Ultrasound is a foundational diagnostic tool used in maternal health, emergency care, chronic disease management, and trauma evaluation. However, rural communities frequently lack access to these services due to geographic isolation, equipment costs, and the nationwide shortage of certified sonographers. As a result, many Alaskans must travel long distances—often by air—to receive basic imaging services, delaying diagnosis and increasing healthcare costs. The Rural/Frontier Health Ultrasound Collaboration addresses these barriers through a scalable tele-ultrasound model that combines advanced ultrasound technology, real-time remote clinical guidance, and workforce training. The program equips rural facilities with modern ultrasound systems and telehealth-enabled imaging platforms that allow local clinicians—including nurses, medical assistants, and radiology technicians—to perform exams while being guided in real time by certified remote sonographers. This triad team model immediately expands diagnostic capacity while building sustainable clinical capability within local healthcare teams.	Program Scope & Target The Rural/Frontier Health Ultrasound Collaboration can serve all 13 Critical Access Hospitals and 29 FQHC’s across Alaska. The program utilizes a triad team model that combines local staff, remote experts, and real-time technology: • Local Operator: A healthcare professional (e.g., MA, nurse, X-ray tech, or provider) at the facility who positions the ultrasound probe and follows remote guidance. • Remote Guide: A certified sonographer connected via secure tele-ultrasound technology who provides step-by-step, real-time instruction and oversight. • Real-Time Communication: Integrated audio/video streaming allows the remote sonographer to guide image acquisition and ensure diagnostic-quality results suitable for interpretation. This model transforms existing rural staff into capable on-site operators supported by remote expertise—creating immediate, sustainable capacity for ultrasound services. Proposed Solution 1. Roshal Health – \$67,800 per Facility • Provide the tele-ultrasound platform and hardware (laptop, webcam, tripod, speaker, streaming kit). • Supply certified remote sonographers to guide on-site staff in real time 24/7. • Conduct three weeks of virtual training and one in-person site visit. • Provide 10 Remote scans and radiology interpretation services Monthly for 2-years. • Train billing and coding teams on ultrasound CPT reimbursement optimization. 2. GE Precision Healthcare, LLC – \$66,000 per Facility • Provide advanced ultrasound systems (general and echo capabilities). • Include AI-assisted imaging guidance to support probe placement and visualization. • Partner with academic institutions and nursing programs to support training and practice. Total Investment per Site: \$133,800 Total Program Cost (13-42 sites): \$1,739,400 - \$5,619,600	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Rural Alaska Emergency Services	Interior Alaska Mobile Integrated Healthcare Consortium	AK	The issue in our region is and always will be funding. The recoverable funds from billing will never sustain a 24/7 EMS service with a call volume of less than 600 (911) service calls per year, and most communities average between 100–400 calls, with only about 50% of those being actual transports that can be billed for. We live in an area that creates a perfect storm for EMS system failure: very high Medicaid and Medicare utilization, long transport times, no local emergency department, and all the other factors that make rural America one of the hardest places to run a proficient EMS service. The opportunity is to transform this failing model into a sustainable, locally controlled Mobile Integrated Healthcare system. By deploying triage-capable ALS ambulances with telehealth, point-of-care diagnostics, and treat-in-place protocols, and by building a local EMT workforce pipeline, this project will convert no-pay non-transports into billable encounters, reduce avoidable ER visits and air transports, and stabilize EMS as critical health infrastructure for Interior Alaska.	We will implement a tri-entity, corridor-wide Mobile Integrated Healthcare (MIH) system that combines (1) a regional nonprofit financial backbone, (2) a public-utility EMS operator, and (3) a dedicated workforce pipeline supported by the Interior Region EMS Council (IREMS) and Partners for Progress. First, Rural Alaska Emergency Services (RAES) will serve as the regional managing nonprofit and fiscal agent. RAES will receive RHT funds, build and manage a \$30 million endowment, coordinate mutual aid across Tok–Delta Junction–Fort Greely–Copper Center–Glennallen–Wasilla, negotiate treat-in-place/MIH contracts with Medicare, Medicaid, Tribal, commercial, and hospital/ACO partners, and provide centralized billing, compliance, and data reporting. This creates a stable regional backbone that de-risks participation for small communities. Second, the City of Delta Junction will operate as a public-utility EMS provider, owning and operating triage-equipped ALS ambulances that also serve Fort Greely and provide mutual aid along the corridor. These units will add telehealth, point-of-care lab, ultrasound, expanded monitoring, and an enhanced formulary to standard ALS capabilities, enabling safe treat-in-place and alternative destination transport. Additional triage units for Tok, Copper Center/Glennallen, and Mat-Su connector communities will be phased in over five years, following a clear capital and staffing timeline. Third, Partners for Progress will build a “grow your own” workforce pipeline via high-school EMT programs, a dedicated training ambulance, simulation lab, and region-wide continuing education. IREMS will provide regional training support, curricula alignment, instructor development, and QA/QI linkages so that local EMT education, protocols, and skills maintenance match state and national best practices. This combined Partners for Progress–IREMS approach creates a steady stream of locally rooted EMTs and paramedics, reduces recruitment costs, and improves retention. Together, these components convert non-billable non-transports into reimbursable encounters, reduce avoidable ER and air ambulance use, and transition EMS funding from fragile local subsidies to a mix of endowment income and enhanced billing, achieving long-term sustainability. Rural Alaskan Alliance for Transformative Healthcare, Inc.	VITAL Alaska (Vitality, Independence, Technology, Aging, and Longevity)	AK	Alaska’s rural and frontier older adults face significant barriers to accessing consistent, evidence-based preventive health services. Geographic isolation, limited transportation infrastructure, extreme weather, and provider shortages mean that many older Alaskans have no access to structured wellness programming that can reduce fall risk, prevent chronic disease progression, and support functional independence. Falls are the leading cause of injury-related death among older adults nationally, and Alaska’s rural communities face disproportionate risk due to isolation and limited access to rehabilitation services. Physical inactivity accelerates chronic disease, frailty, and loss of independence, driving costly emergency department visits, hospitalizations, and premature transitions to institutional care. Traditional in-person wellness programs cannot reach the vast majority of rural Alaska communities. There is an urgent need for scalable, technology-enabled solutions that deliver high-quality, supervised exercise programming directly to older adults in their homes or community settings, regardless of location.	We propose VITAL Alaska (Vitality, Independence, Technology, Aging, and Longevity), a personalized virtual strength program designed specifically for older adults in rural and frontier communities. The program aligns with Alaska's RHTP priorities - Healthy Communities, Health Care Access, and Spark Technology and Innovation - delivering evidence-based wellness programming that reduces fall risk, improves functional independence, and builds social connection among older adults in rural, remote, and off-road communities. We are ready for immediate statewide deployment and our project is designed to complement, not duplicate, existing state, Tribal, and community-based health services. Key program components include: • Live, instructor-led small-group classes delivered via Zoom with real-time feedback and individualized exercise modifications • Regular one-on-one functional assessments to quantitatively and qualitatively track participant engagement and strength improvement over time • A virtual, technology-enabled delivery model that eliminates transportation barriers while preserving accountability and social connection • A science-backed, evidence-informed focus on strength, balance, and mobility to reduce fall risk and support healthy aging • Large-group livestream classes as a lower-barrier entry point for new or hesitant participants Implementation will follow a phased approach, initially in RAATH's home, the Kenai Peninsula Borough; this includes community outreach and enrollment, participant onboarding with technology support, live virtual program delivery, and ongoing assessment and reporting. We will hire an Alaska-based project manager and certified personal trainers/physical and/or occupational therapists to ensure local presence and cultural alignment. The program will coordinate with Tribal organizations, Area Agencies on Aging, and community health partners. We can provide participant devices, where necessary. While internet connectivity is an unallowable use of RHTP funds, Starlink could be utilized for areas not accessible to Internet or 5G coverage.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

RurAL CAP	Community Action Health Framework	AK	RurAL CAP's more than 60 years of place-based work in Alaska has given us deep insight into persistent gaps and under-leveraged strengths within rural health and social service systems. Rural Alaskans face layered barriers to health, safety, and wellbeing, including geographic isolation, workforce instability, limited mental and behavioral health access, overcrowding, high rates of DV/SA, and fragile food and transportation systems. These challenges are compounded by fragmented systems that lack shared integration pathways, aligned planning, and accessible health literacy supports, creating unnecessary barriers to care. At the same time, many rural communities have vital programs and committed partners. What is often missing is the integration needed to connect available resources into a cohesive, community-led system. As a result, services and programs are accessed late, siloed, or underutilized, contributing to preventable crises and higher long-term costs. RHTP presents an opportunity to shift from fragmented service delivery toward integrated, locally grounded models that improve access, coordination, and sustainability. Drawing on decades of experience alongside rural communities, RurAL CAP will pilot practical, scalable, and replicable approaches that reduce navigation burdens and silos, and strengthen health literacy and continuity of care across the lifespan from cradle-to-grave.	Serving as the backbone, RurAL CAP will collaborate with communities, healthcare, and adjacent partners to design and implement community-specific models of integrated services grounded in existing local resources, strengths, and priorities, resulting in a shared navigation system that supports local impact but also informs the larger Framework. CAHF will begin in communities where RurAL CAP already has an established presence, and it will emphasize coordination through community workgroups and co-ownership. This includes piloting cross-sector projects to create new pathways and develop resources that support long-term, collaborative service delivery from cradle-to-grave. This light-touch administrative structure supports consistency, accountability, and replication-readiness without over-standardization. CAHF includes 5 Workstreams. In Year 1, each participating community will begin at least 1 Workstream, based on local readiness, priorities, and existing capacity. Workstreams and project examples include: •Healthy Lifespan: Improve preventative health access and literacy across service communities through provider partnerships. EX: Rural health fairs, trainings, transportation supports, and health promotion programs in interested Head Start and AmeriCorps Seniors communities. •Integrated Care: Partner to embed coordinated behavioral, mental, and preventative care within stable housing. EX: Permanent Supportive Housing hub demonstration in Anchorage to directly connect people with the highest needs to integrated care. •Caregiver Supports: Strengthen caregiver capacity using culturally relevant, evidence-based community models. EX: Community connection groups and home visiting in Mountain Village delivered with local clinics or tribal organizations. •Food Security: Advance food security as preventive care through training and service coordination. EX: Garden projects at Mutual Self-Help Housing developments in Seward, aligning nutrition, health literacy, and support across industries. •Workforce: Advance community health and housing stability by embedding workforce development into community infrastructure investments. EX: Workforce-embedded housing construction in Kodiak to expand housing supply and reduce overcrowding that contributes to poor health outcomes. Year 1 will prioritize readiness and early implementation by formalizing any pending partnerships, launching ready-to-go projects, planning identified pilots, and forming baseline measures.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Copper River Census Area; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Matanuska-Susitna Borough; Nome Census Area; Prince of Wales-Hyder Census Area	Advance to Implementation Application

RurAL CAP	Community Action Training and Technical Assistance	AK	Rural communities across Alaska face persistent barriers to accessing high-quality, sustainable health care, including geographic isolation, workforce shortages, limited organizational capacity, and high costs of care delivery. While the State of Alaska’s Rural Health Transformation Program (RHTP) provides a historic opportunity to address these challenges through system-level change, many community-based organizations, providers, and regional partnerships lack the technical capacity, administrative infrastructure, and implementation support needed to effectively design, launch, and sustain RHTP-aligned initiatives. This project addresses the opportunity to close that capacity gap by providing targeted, culturally appropriate Training and Technical Assistance (TTA) that enables rural organizations to translate RHTP goals into actionable, compliant, and sustainable projects. By strengthening local readiness and execution, the project supports Alaska’s broader RHTP objectives to expand access to care, strengthen the health workforce, improve care coordination, and build fiscally sustainable health systems tailored to Alaska.	RurAL CAP will partner with the State of Alaska to deliver flexible, needs-driven, and culturally appropriate TTA to state-identified projects, organizations, and regional collaborations advancing RHTP priorities. The approach builds on RurAL CAP’s role as Alaska's sole Community Action Agency and our demonstrated success delivering relationship-based, implementation-focused TTA across rural Alaska. Through our Community Action Resource Center (CARC), RurAL CAP has supported tribal governments, nonprofits, and rural community organizations with culturally responsive, hands-on assistance grounded in trust, continuity, and practical problem-solving. This support has helped partners navigate simple to complex funding and compliance environments, from initial SAM.gov registrations to American Rescue Plan Act’s (ARPA) Coronavirus State and Local Fiscal Recovery Funds (SLFRF) reporting requirements. Drawing on lessons learned through CARC and other capacity-building efforts, RurAL CAP’s TTA emphasizes meeting partners where they are and tailoring assistance to locally identified needs. RurAL CAP’s TTA will help move initiatives from planning into implementation, while remaining adaptable to the specific needs and structures of RHTP-funded efforts. Our approach is intentionally adaptive, allowing support to be deployed where it is determined to be the best fit. Core TTA activities may include RHTP project design and refinement; implementation planning; partnership and governance support; workforce development strategies; reporting readiness; sustainability and fiscal planning. RurAL CAP will leverage its statewide community network and experience working across housing, early childhood, food security, workforce, and community development to support integrated, whole-person approaches to health. Assistance will be culturally responsive, grounded in local context, and designed to help rural partners move from concept to execution while meeting state and federal requirements. This approach directly supports the State’s goal of using RHTP as a time-limited investment to build durable systems, operational models, and partnerships that can continue beyond the grant period.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Rural Healthcare Initiative	Rural Healthcare Access Blueprint: A Statewide Plan to Guide Priorities, Decisions and Investments	NC	Alaska's rural communities face healthcare access challenges of extraordinary complexity, challenges that demand a coordinated, strategic response rather than investments made in isolation. The core challenge is one of balance. When there are not enough services, healthcare is not effective. When there are too many services, healthcare is not sustainable. Further, effective rural healthcare planning must employ systems thinking that recognizes the interconnected nature of healthcare delivery across diverse rural regions. Rather than analyzing each community in isolation, successful planning examines three critical success factors: geographic access to care, appropriate level of service availability, and long-term financial sustainability. Given the scale of the need and opportunity, we believe there is significant benefit to first establishing a comprehensive, statewide plan to guide prioritization and decision making in future years. Such a plan would involve a data-driven planning process that thoughtfully considers and accounts for the unique situation of each community, incorporates the perspectives of residents, integrates input from key stakeholders, and includes recommendations based on long-term sustainability. The ultimate deliverable would be a detailed Blueprint containing region-specific and community-specific recommendations that account for each area's unique demographic profile, health needs, existing resources, geographic constraints, and economic realities.	Our proven approach has been demonstrated through a recently completed 18-month Rural Healthcare Sustainability Project spanning 78 rural counties in North Carolina, which inventoried more than 50 service and provider types, surveyed more than 1,600 adults statewide, and conducted 12 listening sessions and over 100 stakeholder interviews. Please visit https://ruralhealthcareproject.com/ Five distinctive approaches anchor that work and will anchor Alaska's Blueprint. Systems Thinking: Rather than examining individual facilities or communities in isolation, all touchpoints of healthcare delivery are treated as interconnected. Rural residents naturally cross county lines and switch between providers to find needed care, creating utilization patterns that transcend political boundaries. Patient Perspective and Optimization Balance: Planning is approached from the patient perspective, balancing three critical factors: proximity (services available at appropriate distances), complexity (the fullest sustainable range from routine to specialized), and stability (reducing duplicative services to enable financially stable providers to invest in needed services). Comprehensive Scope: Analysis goes far beyond the economic viability of hospitals to examine healthcare effectiveness at the individual level, inventorying the full spectrum of services and provider types to understand where care is truly available. Integrated Study Design: Deep quantitative analysis is paired with extensive qualitative research, including statewide surveys, listening sessions, and stakeholder interviews, reaching beyond traditional healthcare boundaries to include social service, education, and faith community perspectives. Flexible, Future Focus: The Blueprint provides decision-makers with data-informed pictures of healthcare supply and demand rather than prescribing outcomes for specific facilities, acknowledging that ultimate decisions rest with providers, communities, and policymakers. This methodology directly supports Alaska's Health Care Access priority to conduct a comprehensive provider gap analysis and the technical assistance and training use of funds, providing the analytical foundation that eligible entities need to develop strong applications and successfully implement Health Care Access projects.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Russell DeGroote MD PC	Improving Rural Health Access with Remote Haptic Physical Examination Technology	AK	Rural and frontier communities in Alaska face major barriers to timely specialty care due to geographic isolation, lack of road access, limited local clinical resources, and dependence on weather-sensitive air transport. Many clinical decisions require physical examination findings such as joint stability, abdominal tenderness, cervical changes, or tissue characteristics, which cannot be adequately assessed through traditional telehealth. As a result, patients often travel long distances or require costly medevac transport for evaluations that could potentially be managed locally with specialist input. This leads to delayed diagnosis, increased healthcare costs, and disruption for patients and families. The opportunity addressed by this project is to enable real-time remote physical examination through haptic technology, allowing specialists to directly assess tactile findings from a distance and bring advanced diagnostic capability to rural communities without requiring patient travel.	To address the limitations of traditional telehealth in rural and frontier Alaska, this project will develop and validate the Alaska Remote Haptic Examination System (ARHES), a novel telemedicine platform that enables real-time remote physical examination through tactile (haptic) technology. ARHES consists of two integrated components: a sensor-enabled examination glove worn by a Community Health Aide or rural provider during patient examination, and a corresponding haptic feedback glove worn by a remote specialist. The sensor glove captures pressure, motion, and tactile characteristics during the examination and transmits this data securely in real time via existing broadband or satellite connectivity. The specialist glove reproduces these tactile signals, allowing the specialist to directly perceive clinical findings such as joint stability, tissue resistance, tenderness, or anatomical changes while simultaneously observing the patient through standard telehealth video. The project will be implemented in three phases. First, a multidisciplinary engineering and clinical team will design and develop clinical-grade prototype gloves and a secure software platform that integrates real-time haptic transmission with video telehealth and the applicant’s electronic health record system. Second, the system will undergo controlled clinical validation under IRB-approved protocols to assess reliability, usability, and diagnostic concordance compared to in-person examination. Third, pilot deployment will occur in Southeast Alaska rural clinic settings, where Community Health Aides and specialists will use ARHES to conduct supervised remote examinations. Standardized examination protocols and training programs will be developed to ensure consistent and reproducible use. Outcome metrics will include time to specialist assessment, reduction in unnecessary patient transfers, diagnostic accuracy, provider confidence, and patient satisfaction. Cost-effectiveness and operational feasibility will also be evaluated to support long-term sustainability and broader rural deployment. By enabling specialists to directly assess physical findings from a distance, ARHES brings advanced diagnostic capability to remote communities, reduces travel burden, and improves the timeliness and quality of care for rural Alaskans.	\$1M-\$5M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Kenai Peninsula Borough; Kasilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Russell DeGroote MD PC	Reducing Medevac Transport Through AI-Enabled Portable MRI in Rural Alaska	AK	Rural and frontier communities across Alaska face significant barriers to accessing advanced diagnostic imaging, particularly MRI. Most rural clinics lack the infrastructure, space, and resources required to support conventional MRI systems. As a result, patients with neurologic symptoms, traumatic injuries, infections, or musculoskeletal conditions frequently must travel to regional hospitals in cities such as Anchorage or Juneau for diagnostic evaluation. Because many communities are not connected by road, this often requires air travel or medevac transport, which can cost tens of thousands of dollars per patient and delay diagnosis and treatment. This project addresses the opportunity to expand access to diagnostic imaging in rural Alaska by deploying portable low-field MRI systems supported by artificial intelligence (AI) and tele-radiology connectivity. These systems can operate in small clinical settings with minimal infrastructure, allowing advanced imaging to be performed locally in rural communities. By enabling earlier diagnosis and improving clinical decision-making at the point of care, the project aims to reduce unnecessary patient transfers, improve access to timely care, and strengthen the sustainability of rural healthcare delivery.	This project proposes the creation of a distributed rural diagnostic imaging network that deploys portable low-field MRI technology combined with artificial intelligence (AI) diagnostic support and tele-radiology connectivity to expand access to advanced imaging in frontier communities across Alaska. The goal is to bring diagnostic capability closer to patients, reducing the need for costly travel and improving timely clinical decision-making. The project will deploy portable low-field MRI systems in selected rural clinics that currently lack access to advanced imaging. Unlike traditional MRI scanners, these systems require minimal infrastructure, operate on standard electrical power, and can function in small clinical spaces. This allows rural facilities to perform MRI imaging locally for conditions such as neurologic symptoms, traumatic injuries, spine pathology, infections, and musculoskeletal injuries. Artificial intelligence tools will be integrated to support image reconstruction and assist clinicians in identifying urgent or clinically significant findings. AI can improve image quality from low-field scanners and provide decision support by highlighting abnormalities that may require urgent attention, such as intracranial hemorrhage, spinal cord compression, or septic joints. This support is particularly valuable in rural settings where radiology specialists may not be immediately available. All imaging studies obtained in rural clinics will be transmitted securely to regional radiology networks for specialist interpretation. Tele-radiology connectivity will allow radiologists and specialists at regional centers—including facilities in communities such as Ketchikan, Juneau, or Anchorage—to review images and provide timely consultation. This integrated network will ensure that rural providers receive expert guidance while maintaining diagnostic services locally whenever possible. Implementation will occur in phases. Initial pilot sites will be selected based on geographic isolation, current imaging limitations, and patient need. During the pilot phase, the program will track key outcomes including reduction in patient transfers, time to diagnosis, provider satisfaction, and cost savings. By decentralizing advanced diagnostic imaging and connecting rural clinics to regional specialists, this project will strengthen the rural healthcare system, improve clinical decision-making, and reduce the need for unnecessary travel. Rx for Health, LLC	Pharm Chat: Expanding Pharmacist Consultations Through Mobile App	AK	Medication errors are a major contributor to medical harm, accounting for approximately 37% of adverse events and costing the U.S. health care system nearly \$21 billion annually. These risks are amplified in rural and remote communities across Alaska, where geographic isolation, limited transportation, severe weather, and ongoing health care workforce shortages frequently prevent residents from obtaining timely pharmacist counseling or having urgent medication questions addressed. Many communities are not connected to the state’s road system and must rely on air or boat travel to reach health care facilities, making routine access to pharmacy services difficult. As a result, residents may have only intermittent access to pharmacist support or receive medications without direct counseling, which can lead to delays in addressing medication-related concerns, confusion about proper use, medication non-adherence, and poorly managed chronic conditions. Collectively, these challenges contribute to preventable medication errors, increased health care utilization, non-compliance, and persistent disparities in access to medication management for rural Alaskans.	To address these barriers, this project proposes a HIPAA secure, text-based mobile app that connects rural Alaskans directly with a licensed pharmacist in real time, available 24 hours a day, seven days a week. A pharmacist-by-text platform will provide patients with direct access to medication expertise through a secure messaging system, allowing them to ask questions about their medications, receive guidance on proper use, discuss potential side effects, and obtain support to improve medication adherence and chronic disease management. By providing timely pharmacist guidance, this platform can help reduce preventable medication errors, ensuring safer medication use and improving patient outcomes. By making pharmacist expertise available without requiring travel to a clinic or hospital, the platform helps overcome geographic and transportation barriers that often prevent rural residents from receiving timely medication counseling. This model extends the reach of pharmacy services beyond traditional settings, enabling pharmacists to support patients across multiple rural communities. It offers a scalable and sustainable approach to delivering pharmacy care in regions where on-site services are limited or intermittent. By improving access to medication guidance, supporting safe and effective medication use, reducing medication errors, and reinforcing chronic disease management, this initiative aims to strengthen health care delivery and improve health outcomes for rural and remote populations across Alaska.	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Rx for Health, LLC	Voices of Alaska: Living wisdom — A Preventative Health Library for Rural Families.	AK	Rural and frontier communities in Alaska face significant barriers to accessing preventive health education due to geographic isolation, limited healthcare infrastructure, and workforce shortages. Many communities rely on Community Health Aides as the primary point of care. While these providers deliver essential clinical services, they also use culturally grounded educational tools that connect modern preventive health strategies with traditional knowledge. At the same time, Alaska Elders hold invaluable knowledge related to nutrition, traditional food systems, family wellbeing, and resilience. Much of this knowledge has historically been shared through storytelling and lived experience but is at risk of being lost without intentional preservation and transmission to younger generations. Voices of Health: Living Wisdom—A Preventive Health Library for Rural Families presents an opportunity to bridge this gap. The project will collaborate with Elders, healthcare professionals, and a filmmaker to create a multimedia library of culturally grounded preventive health modules. These resources will support CHA/Ps and rural health programs in educating families about nutrition, healthy beginnings, and disease prevention. By combining Elder wisdom with evidence-based health education in a storytelling format, the project will expand access to culturally relevant preventive health resources while strengthening connections between traditional knowledge and modern healthcare practices.	The project will develop a culturally grounded preventive health education library through collaboration with Alaska Native Elders, healthcare professionals, Community Health Aides/Practitioners, and a filmmaker. The initiative will document Elder knowledge related to traditional foods, nutrition, family wellbeing, and healthy lifestyles while integrating evidence-based preventive health guidance. Filmed storytelling modules will be created to capture Elder perspectives alongside practical health education. These short modules will be designed for use by CHA/Ps and rural health programs during clinic visits, community education sessions, home visits, and outreach programs. Topics will include family nutrition, healthy pregnancy and early childhood development, traditional food systems, chronic disease prevention, and the role of subsistence activities in physical health and wellbeing. Modules will be organized into a digital library that is easily accessible to rural clinics, tribal health organizations, and community programs. Educational guides and discussion prompts will accompany each module to support health aides in facilitating conversations with families. Through this approach, the project strengthens the capacity of the rural healthcare workforce while providing families with culturally relevant health education that supports prevention and healthier lifestyles.	\$250K-\$1M	Home- and community-based services provider	Statewide	Anchorage (Municipality); Bristol Bay Borough; Dillingham Census Area; Juneau (City and Borough); Nome Census Area; Southeast Fairbanks Census Area	Deferred or Not Advanced

Rx for Health, LLC	Workforce Pipeline Augmentation: Expanding Care Capacity Across the Last Frontier	AK	Recruiting a sufficient number of highly qualified health care providers to meet Alaska’s needs remains a persistent challenge. We propose a paradigm shift in the approach to recruitment. Currently, most recruiting efforts are conducted by organizations based outside of Alaska. While these firms may have broad networks, they often lack a real understanding of Alaska’s culture, the specific needs of the rural health organizations they represent, the unique challenges associated with relocating, and the characteristics that contribute to a successful long-term transition for providers moving to Alaska. External recruiters frequently underestimate the geographic diversity of Alaska’s work environments while failing to effectively communicate the distinctive professional and personal opportunities available here. Alaska offers an exceptional work-life balance, unparalleled access to outdoor recreation and adventure, and the meaningful opportunity to make a profound difference in the lives of persons in rural and underserved communities. When these realities are not accurately represented, recruitment efforts falter. The result is a smaller and unoptimized candidate pool, longer recruitment timelines, and ultimately higher turnover rates. Addressing these gaps via a locally informed, Alaska-centered recruitment strategy will strengthen the health care workforce and improve long-term retention across the state.	As an Alaska-owned company that has successfully recruited pharmacists and technicians nationwide for over a decade, we understand the unique challenges and opportunities involved in attracting and retaining healthcare professionals in the Last Frontier. Our experience has provided valuable insight into the factors that support successful recruitment, relocation, and long-term retention in Alaska’s diverse communities. We have also piloted innovative staffing models that allow pharmacy professionals to work shorter, rotating assignments. This approach helps meet the staffing needs of rural Alaska while offering providers greater flexibility and exposure to varied practice environments. Building on these lessons, we propose establishing an Alaska-based central clearinghouse for healthcare recruitment. This hub would enable Alaska Native and rural health organizations to coordinate and strengthen their individual recruiting initiatives while benefiting from shared resources and a unified strategy. We will collaborate with Landsick Media, an Alaskan production company, to develop regionally tailored promotional video content for each rural health organization. Videos will highlight each organization’s facilities, workplace culture, community environment, and unparalleled recreational and lifestyle opportunities across Alaska. By authentically showcasing these elements, we can better inform and attract high-quality healthcare professionals who will embrace the unique experience of working in rural Alaska. An Alaska-based recruiting hub will also promote greater flexibility and collaboration across the state’s healthcare system. For example, a nurse or other provider completing a rotation at one location could easily transition to another site on a future assignment. This model encourages the cross-pollination of talent across organizations while offering providers enriching professional experiences and diverse personal opportunities throughout Alaska. This initiative will strengthen healthcare staffing across rural Alaska through captivating promotional media, coordinated recruitment efforts, and more efficient alignment of workforce needs. By clearly communicating both the professional rewards and lifestyle opportunities available, we can better align providers’ personal and professional goals with the needs of Alaska’s communities and improve retention. The project will enhance the quality and continuity of healthcare delivery across rural Alaska.	\$50,000-\$250,000	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Ryan Air	Using Advanced Air Mobility systems to delivery perishable pharmaceuticals to remote destinations	AK	Insulin, blood transfers, and hormonal and biological medications are highly perishable and need temperature-stable storage in-flight to ensure their effectiveness for the person(s) relying on them. Many health centers have reported shipping four vials of insulin, hoping that one arrives on time and in good condition to the customer. Many legacy aircraft in the state cannot make their cabins or cargo holds climate-controlled, increasing the risk of spoilage or packaging costs. Lastly, existing aircraft have higher operating costs, which limits air carriers' ability to move these medicines economically and drives up the cost for our regional health corporations and the end user.	Ryan Air has agreed to partner with Beta Technologies (an aircraft developer and leader in the Advanced Air mobility space) to bring electric vertical take-off and landing aircraft to Alaska. These aircraft have been designed from inception for medical transport, thanks to a partnership with United Therapeutics. They are designed to fly with temperature-controlled cargo areas that keep items at their intended temperature in both -20 and 90-degree environments. These new aircraft, since they can take off like a helicopter and fly as an airplane, can land on very short runways. When some villages experience runway issues due to snow, storms, or other environmental factors that limit the operations of legacy aircraft, these aircraft can still land and deliver critical supplies. Lastly, because operations are cheaper, these aircraft offer more economical delivery options, keeping the last-mile cost down. Additionally, as these systems move to fully autonomous in the coming years, they can operate 24/7, negating the need for crew duty days and rest requirements for human-piloted aircraft.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Dillingham Census Area; Nome Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Sacred Seeds Foundation	Living Waters Wellness Centers	AK	LWWC responds to a persistent gap in how rural Alaskans receive preventive and chronic disease care. Today, many rural residents must string together screenings, labs, imaging, and specialist visits across multiple trips and locations, often far from home. This leads to delayed detection of high-risk conditions, avoidable emergency visits and hospitalizations, and significant disruption for families, employers, and communities. The burden is especially heavy for people connected to Western Alaska regions and for residents of the rapidly growing Mat-Su Borough. Alaska’s RHTP goals call for measurable reductions in chronic disease risk, expanded access to care close to home, and a shift from reactive acute care to prevention and coordinated management. Existing efforts in Alaska and the broader U.S. address important pieces of this challenge but do not yet offer a comprehensive one- or two-day check-up hub specifically designed for Alaska’s rural and frontier realities, with built-in pathways back to local and tribal providers. The opportunity is to adapt high-efficiency comprehensive check-up models into an Alaska-specific, hub-and-spoke design that can sit inside regional RHTP delivery plans. Year 1 will determine how a Mat-Su hub can best serve rural communities across Western Alaska and other regions identified in the feasibility study, creating a practical blueprint for an integrated prevention and chronic disease model that prioritizes rural and underserved Alaskans.	LWWC is a three-phase initiative. Funding in this round will support Phase 1: Rural Co-Design and Feasibility, a disciplined research and design year that prepares for early implementation pilots in Phase 2. In Year 1 we will: Conduct structured rural co-design sessions with communities in the Mat-Su Borough and at least two Western Alaska regions connected with CC, BBNC, and BSNC, with additional locations identified through the feasibility study. Sessions will include tribal health perspectives, frontier and road-limited communities, and a focus on chronic disease and aging, while remaining open to similarly aligned partnerships statewide. Complete a feasibility and systems-integration study that maps how a Mat-Su hub-and-spoke check-up center can support rural residents across these regions. This includes defining referral pathways with tribal health organizations, primary care clinics, and hospitals, and ensuring the model can sit inside community-led regional RHTP delivery plans rather than creating a parallel system. Undertake a workforce reality assessment, including interviews with rural clinicians, community health aides, behavioral health providers, and system leaders. This will define practical staffing models, scope of practice, and telehealth support structures and produce a written workforce strategy aligned with Alaska’s Strengthen Workforce and Spark Technology initiatives. Design the clinical, financial, and technological model, including one day diagnostic experience, a multi-year business plan, and a draft technology architecture that supports telehealth, remote monitoring, and data sharing with partners. A targeted technical assistance visit to Memorial Hospital in Istanbul, Turkey, will ground our understanding of the model, how it operates and how we can tailor it to RHTP goals. Four core team members (clinical, operational, financial, and patient-experience leads) will undergo the full check-up experience and participate in structured meetings with Memorial leadership. This visit will generate concrete Year-1 deliverables: - Draft Standard Operating Procedures for the LWWC experience - Prioritized equipment and diagnostic lists - Workforce role maps - Technology design adapted to Alaska’s rural and cultural context. Phase 2 will use these Year-1 products to launch early implementation pilots in Mat-Su and selected rural regions, and Phase 3 will focus on refinement and regional scaling in alignment with RHTP priorities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area	Deferred or Not Advanced

Safety Net Connect	Alaska eConsult Initiative: Delivering Specialty Care Expertise Seamlessly to Every Community	CA	Rural and frontier communities in Alaska face persistent barriers to specialty care access, including severe provider shortages, long wait times, high travel costs, and geographic isolation. Many patients must travel hundreds of miles—often by air—for specialty visits, leading to delayed care, worsening conditions, and avoidable emergency department use. At the same time, primary care providers (PCPs) in rural settings operate with limited specialist support, contributing to professional isolation and referral bottlenecks. This project addresses the opportunity to redesign specialty access through a statewide, technology-enabled eConsult and care collaboration network. By connecting rural PCPs with specialists through secure, asynchronous consultation, patients can receive timely clinical guidance without unnecessary travel. The model strengthens local provider capacity, improves care coordination across medical and behavioral health services, and creates a more sustainable, workforce-efficient system of care tailored to Alaska’s rural landscape.	Safety Net Connect proposes to implement a statewide Rural Specialty Access Network using our enterprise eConsult and care collaboration platform to connect rural primary care providers (PCPs) with specialists across Alaska. The core of the approach is asynchronous eConsult. Rural PCPs will submit structured electronic consults to participating specialists, who will respond within defined service level timelines (e.g., 2–3 business days). Specialists will provide diagnostic guidance, treatment recommendations, and clear next steps. Many cases can be resolved without the need for an in-person visit; those requiring direct care will be prioritized appropriately, ensuring limited specialty capacity is used efficiently. This model reduces unnecessary travel, lowers system costs, and significantly shortens wait times. It also functions as a workforce multiplier by strengthening PCP capacity to manage complex conditions locally with specialist support. The platform will integrate with existing EHRs and support referral management, telehealth, and data reporting. For patients who require synchronous care, integrated telehealth workflows can facilitate virtual specialty visits when appropriate. Referral tracking ensures visibility into status and outcomes, improving care coordination and reducing delays. In addition, the system can support whole-person collaboration across medical, behavioral health, and social service providers when needed. Secure messaging, shared care plans, and real-time updates allow geographically dispersed providers to coordinate around high-risk patients. Implementation will follow a phased rollout: stakeholder engagement and governance design, specialty prioritization, onboarding of rural clinics and specialists, training, and go-live support. SNC provides project management, provider training, performance dashboards, and ongoing optimization. The approach is designed for long-term sustainability. The model can leverage existing Medicaid reimbursement pathways for interprofessional consultation, reducing reliance on ongoing grant funding. Built-in analytics will allow the State to track utilization, response times, resolution rates, avoided travel, and cost impact. By creating a connected virtual specialty network tailored to Alaska’s frontier environment, this project improves access, strengthens rural provider capacity, and builds a scalable, sustainable model of specialty care delivery.	\$250K-\$1M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Sage Consulting Incorporated	Alaska Medicaid Rural Clinics Service Expansion	AK	We would like to recommend revisions for rural health clinics covering Medicaid services. Rural Health Clinics eligible for reimbursement by Alaska Medicaid consist of federally qualified Rural Health Clinics and Centers (RHC/FQHC), Tribal health clinics, and private practitioner health clinics. All these providers have differing published guidelines for covered services and are reimbursable under different methodologies. None have published guidelines for Alaska Medicaid services that are current. They lack comprehensive explanation of services covered for their discipline, scope of practice guidance, and updated procedures for technological advances approved for coverage by CMS. We propose addressing each provider category by defining what they are allowed based on legal requisites to provide for covered services, what they have for covered services now, and the difference of what they lack compared to their current covered services appropriate for Medicaid reimbursement. There are many services that can be provided with the use of new technologies and paraprofessionals under the direction of qualified health providers. And CMS has published new codes for coverage for these types of services in 2025-2026 which are not covered services for Alaska Medicaid.	Based on new technologies, and community infrastructure, we would like to propose recommendations for widening available services while identifying any administrative hurdles to overcome in completing the workplan to accomplish any accepted recommendations for change. Here are some examples of changes that require no regulatory changes: 1. RHC/FQHC providers currently do not have HCPCS code G2025 (specific to RHC/FQHC telemedicine services, real-time and audio only for non-behavioral health services. 2. In 2025-2026 CPT/HCPCS new codes for technology include 11 codes for remote patient monitoring & digital health, 6 for virtual communication and telehealth (5 for non-physician services), and more that address primary care and behavioral health services not reimbursed by Medicaid. These services are generally not considered traditional "telehealth" and do not always require real-time audio-visual communication. We will also propose the introduction of paraprofessional providers with defined services and oversight requirements to bolster the use of existing community members to aid workforce development. And as we map existing covered and potentially available community services, and more defined parameters for covered services, we would intend on connecting all who are willing and able to connect to the Alaska Health Information Exchange (Health e-Connect). We feel that this approach to shoring up Medicaid coverage that has not been done yet is in the spirit of the Alaskan “North Star” objective for this great funding opportunity. The intent is to recommend modifications to existing programs that have existing infrastructure which will address preventative and essential services at a lower cost and improve access to patient care that serves both medical and health related social needs. There is a great need to accommodate new technologies and that will be an integral part of our review.	\$50,000-\$250,000	Statewide	Anchorage (Municipality); Copper River Census Area; Kenai Peninsula Borough; Matanuska-Susitna Borough; Sitka (City and Borough); Southeast Fairbanks Census Area	Deferred or Not Advanced

SAIC	Addressing Alaska’s Rural Healthcare Needs: the Alliance for Advancing Rural Healthcare	VA	The Alliance for Advancing Rural Healthcare (AARH) is a coalition that brings together eight leading players in the rural healthcare sector. The Alliance is led by SAIC, a leader in Mission Integration, with decades of experience serving state governments and federal health agencies (i.e., CMS, FDA, VA, NIH, CDC). SAIC is the submitting entity for this LOI as they lead the coalition, but the work in Alaska will be supported by all member organizations. Each of our coalition members provides a different area of expertise, including: - SAIC: Ecosystem Enablement, Cybersecurity, AI - TruBridge: Largest Nationwide Rural EHR, Ambient AI, RCM - Castlight: Care Navigation, Virtual Care, Remote Monitoring - Telemedicine.com: Telehealth, Remote Patient Monitoring - Arcadia: Interoperability, Analytics, Population Health - Covista: Workforce Training, Upskilling - Mission Mobile Medical: Satellite Mobile Clinic Network - Walgreens: Second Largest U.S. Pharmacy Chain, Primary Care Our project will address all of Alaska’s rural health transformation initiatives by providing a package of solutions spanning maternal and child health, expanding access, promoting healthy communities, improving pay for value, strengthening the health care workforce, and modernizing technology infrastructure.	Our Alliance is guided by three key mission-driven principles. - People First Focus: Bring care closer to rural residents, reducing barriers and expanding timely access where people live and work - Purpose-Built: Partner with states and providers to deliver solutions that reflect local community needs and priorities - Built to Last: Strengthen rural health systems so care is reliable, sustainable and available for the long term Our approach to addressing Alaska’s rural health needs will be driven by those principles, as our eight member companies work together to deliver measurable improvements in Alaska.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Saige, Inc.	AR / STAR Medevac Aircraft Satellite Connectivity Deployment - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes strengthening emergency response capacity, improving access to care in remote communities, and enhancing rural health system resilience. North Slope Borough’s Search and Rescue (SAR) and emergency medical aviation operations serve as critical lifelines across approximately 94,000 square miles of Arctic terrain. Medevac aircraft transport patients from remote villages to higher-acuity facilities under severe weather, long-distance, and time-sensitive conditions.	North Slope Borough will implement aircraft connectivity modernization across its SAR / STAR fleet through a structured deployment program. Implementation activities will include: 1. Equipment Procurement • Acquisition of aviation-certified satellite connectivity hardware • Procurement of required mounting, structural integration, and power systems • Redundancy and backup communication system alignment 2. FAA-Compliant Installation • Engagement of FAA-certified installation providers • Aircraft modification and integration during scheduled maintenance windows • System validation and flight testing 3. Clinical Integration • Activation of secure in-flight telemedicine capability • Integration with receiving facilities for real-time patient data transmission • Development of standardized in-flight consultation protocols • HIPAA-compliant data handling procedures 4. Crew Training & Operational Adoption • Training for flight crews on equipment use • Telemedicine escalation protocols • Communication coordination procedures • Ongoing operational support framework 5. Performance Monitoring & Reporting • Definition of connectivity uptime metrics • Monitoring of telemedicine utilization during transport • Measurement of response time improvements • Documentation of receiving facility readiness improvements	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Behavioral Health Access & Capacity Analytics Framework - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes improving access to care, strengthening rural system sustainability, and advancing long-term health outcomes in frontier communities. Behavioral health services in rural systems may face challenges related to provider availability, referral completion timelines, crisis recurrence patterns, and care coordination. Limited visibility into demand patterns and access bottlenecks can affect both clinical outcomes and fiscal sustainability. This grant provides an opportunity to: • Assess current behavioral health referral and access workflows • Analyze wait times, service capacity, and utilization variability • Identify gaps between behavioral health demand and available service resources • Evaluate recurrence patterns in crisis or emergency behavioral health events • Determine feasibility of a structured behavioral health access monitoring framework Saige proposes to conduct this structured planning effort in collaboration with North Slope Borough stakeholders and define an implementation-ready behavioral health analytics framework aligned with Health Care Access and Healthy Communities objectives. This initiative is structured as part of a broader rural modernization planning framework and may inform future implementation phases.	Saige will lead a structured planning project focused on behavioral health access analytics design, capacity modeling, and executive integration — not direct clinical service redesign. Planning activities will include: 1. Access & Referral Workflow Assessment • Documentation of behavioral health referral pathways • Analysis of referral completion timelines • Review of appointment availability and scheduling variability 2. Capacity & Utilization Analysis • Evaluation of provider capacity relative to demand • Analysis of service utilization trends and seasonal variability • Identification of service bottlenecks 3. Crisis & Recurrence Pattern Modeling • Multi-year review of crisis-related encounters • Identification of repeat behavioral health acute events • Risk stratification of high-recurrence cohorts 4. Fiscal & Sustainability Impact Modeling • Estimation of cost exposure associated with delayed or fragmented care • Scenario modeling of improved access coordination • Identification of KPIs tied to sustainability outcomes 5. Implementation Roadmap Development • Defined behavioral health access monitoring framework • Dashboard architecture blueprint • KPI framework for leadership oversight • Phased implementation roadmap with cost estimates	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Care Access Variability & Equity Analytics Framework – North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes improving access to care, strengthening rural system sustainability, and advancing long-term community health outcomes. Across North Slope Borough’s eight remote communities, access to care may vary due to weather conditions, travel logistics, workforce availability, and clinic capacity. These factors can influence appointment availability, referral completion, wait times, and continuity of care. Limited structured visibility into access variability across communities and service lines may reduce the ability to proactively allocate resources, prioritize service expansion, and strengthen long-term sustainability. This grant provides an opportunity to: • Analyze multi-year access patterns across communities and service lines • Identify variability in appointment availability, referral completion, and utilization • Evaluate geographic differences in care continuity and follow-up completion • Assess fiscal and operational impacts associated with access variability • Determine feasibility of a structured care access monitoring framework Saige proposes partnering with North Slope Borough Health Department leadership to conduct this structured planning effort and define an implementation-ready access analytics framework supporting improved access stability, resource planning, and equitable service delivery across rural communities.	Saige will lead a structured project focused on access analytics design, variability modeling, and executive integration — not service redistribution decisions. Planning activities will include: 1. Access & Utilization Pattern Analysis -Multi-year review of appointment availability and service utilization by community -Analysis of referral completion rates and wait-time variability -Identification of service categories with significant access differences 2. Continuity & Follow-Up Variability Assessment -Evaluation of follow-up adherence by service line -Analysis of repeat acute utilization relative to access variability -Identification of patterns indicating service gaps 3. Geographic & Service-Level Modeling -Stratification of utilization patterns by community -Assessment of travel-related service variability -Scenario modeling of alternative resource allocation approaches 4. Fiscal Impact & Sustainability Modeling -Estimation of cost exposure associated with access variability -Modeling of stabilization potential under improved monitoring -Definition of executive oversight thresholds 5. Implementation Roadmap Development -Defined access variability monitoring framework -Dashboard and reporting blueprint -KPI framework for leadership integration -Phased implementation roadmap with cost estimates	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	CHAP Digital Documentation & Field Enablement - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes workforce stabilization, rural access continuity, and operational sustainability across frontier communities. Within North Slope Borough Health Department (NSB DHR), CHAP provide essential frontline services across remote villages. CHAP providers are often the first — and sometimes only — point of contact for patients. Currently, CHAP clinical documentation relies heavily on handwritten notes and paper-based workflows. This creates: • Administrative inefficiencies • Delayed reporting and reconciliation • Limited real-time visibility into service delivery • Increased risk of documentation errors • Reduced integration with behavioral health and PHN services • Additional reporting burden when transferring data to State systems In a rural environment where workforce capacity is already constrained, paper-based workflows increase strain on frontline providers and limit system responsiveness. This Defined Approach project provides an opportunity to modernize CHAP documentation workflows through structured digital enablement while aligning with State and Tribal reporting requirements. This initiative is focused specifically on CHAP digital workflow stabilization and complements — but does not replace — broader DHR Clinical Documentation modernization efforts.	Saige will lead a structured Defined Approach phase focused on CHAP workflow digitization, field enablement design, interoperability planning, and implementation roadmap development — not full system replacement. Project activities will include: 1. CHAP Workflow & Documentation Assessment • Mapping of current handwritten documentation workflows • Identification of duplication points and reporting bottlenecks • Inventory of required clinical forms and reporting outputs • Assessment of device availability and connectivity constraints in each community 2. Digital Documentation Framework Design • Standardization of CHAP documentation templates into structured digital formats • Design of mobile-first clinical documentation workflows • Offline-capable documentation logic (critical for remote connectivity conditions) • Integration alignment with existing DHR systems 3. Field Technology Enablement Model • Definition of appropriate device strategy (tablets, secure laptops, hybrid models) • Security and access control design • Role-based permissions and privacy compliance • Workflow integration with clinic-based systems 4. Interoperability & Reporting Alignment • Design of structured export pathways to: AKAIMS (Behavioral Health, where relevant) State reporting requirements Future DHR data layer initiatives • Identification of structured data fields required for automated reporting • Elimination of manual re-entry wherever feasible 5. Workforce Stabilization & Efficiency Modeling • Quantification of administrative time currently spent on paper workflows • Modeling of documentation efficiency gains under digital workflows • Assessment of reduction in reconciliation burden • Evaluation of improved real-time visibility for leadership	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

6. Implementation Roadmap Development

- Defined CHAP Digital Enablement architecture blueprint
- Device and integration requirements
- Training and certification plan
- Phased rollout sequencing
- Cost ranges and resource estimates

Saige, Inc.	CHAP Workforce Mobility & Cost Optimization - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes workforce stabilization, cost sustainability, and improved access across rural and frontier communities. Within North Slope Borough Health Department (NSB DHR), Community Health Aides/Practitioners (CHAP) operate across geographically dispersed villages. Due to population distribution, workforce rotation schedules, seasonal conditions, and service demand variability, CHAP travel between communities is often required to maintain coverage and continuity. However, structured analysis of: • CHAP travel deployment frequency • Travel cost (airfare, lodging, per diem, lost productivity) • Service delivery efficiency during travel periods • Opportunity for telehealth substitution has not been systematically performed. In a region where transportation costs are high and workforce capacity is limited, mobility decisions materially impact: • Operational sustainability • Service continuity • Workforce strain • Fiscal stability This project provides an opportunity to analyze CHAP workforce mobility patterns and define an optimization framework that improves service alignment while reducing avoidable cost and strain	Saige will lead a structured study focused on CHAP travel analytics, cost modeling, substitution analysis, and optimization framework design — not workforce restructuring. Project activities will include: 1. CHAP Travel Deployment Analysis • Multi-year analysis of CHAP travel frequency by community • Identification of travel drivers (coverage gaps, demand spikes, rotation scheduling) • Seasonal variability analysis • Mapping of travel intensity by service type 2. Travel Cost Modeling • Comprehensive cost breakdown: Airfare Lodging Per diem Escort or support costs (if applicable) Opportunity cost of travel time • Cost-per-encounter analysis for travel-based service delivery • Variance analysis across communities 3. Service Delivery Efficiency Assessment • Comparison of service volume delivered during travel-based deployment vs in-community coverage • Assessment of appointment density and productivity during travel windows • Identification of potential inefficiencies caused by compressed visit schedules • Evaluation of care continuity impacts linked to mobility cycles 4. Telehealth Substitution Modeling • Identification of service categories suitable for telehealth substitution • Modeling of potential reduction in travel frequency under telehealth-supported scenarios • Connectivity and workflow feasibility assessment • Cost comparison of travel-based delivery vs telehealth-supported delivery 5. Workforce Stability & Risk Modeling	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

- Identification of mobility-related workforce strain indicators
- Risk modeling for burnout or turnover linked to travel intensity
- Scenario modeling of alternative coverage models (clustered scheduling, telehealth hybrid, adjusted rotation patterns)

6. Implementation Roadmap Development

- Defined CHAP Workforce Mobility Optimization framework
- Travel reduction threshold triggers
- Cost-stabilization targets
- Telehealth integration recommendations
- Phased operational adjustment roadmap

Saige, Inc.	Continuity of Care & Travel Risk Monitoring Framework	NY	In Arctic systems, care continuity is frequently disrupted by weather delays, travel dependency, specialist scheduling gaps, and workforce variability. The Continuity of Care & Travel Risk Monitoring Framework improves rural health access by identifying patients at risk of missed follow-up, delayed referrals, or fragmented care pathways. Access Impact • Flags care gaps before they escalate • Improves coordination between village clinics and regional facilities • Reduces preventable emergency transport Quality Impact • Improves follow-up completion tracking • Strengthens chronic condition management • Reduces repeat acute episodes Sustainability Impact • Lowers avoidable medevac and emergency costs • Improves reimbursement alignment tied to care continuity • Stabilizes utilization variability For North Slope Borough’s remote communities, strengthening continuity reduces the cascading consequences of missed or delayed care.	Project Concept Approach Saige will lead a structured planning project focused on continuity analytics design, risk modeling, and executive integration — not clinical workflow replacement. Planning activities will include: 1. Continuity & Follow-Up Analysis • Multi-year review of follow-up adherence rates • Identification of repeat acute utilization potentially linked to missed follow-up • Analysis of service-level continuity patterns 2. Access & Travel Impact Assessment • Evaluation of travel-related barriers affecting appointment completion • Assessment of seasonal or scheduling variability • Analysis of referral completion timelines 3. High-Risk Cohort Identification • Identification of patients at elevated risk for repeat utilization • Chronic condition and post-acute follow-up risk modeling • Stratification by service category 4. Fiscal & Operational Impact Modeling • Estimation of cost exposure associated with care disruption • Scenario modeling of improved follow-up monitoring • Identification of intervention trigger thresholds 5. Implementation Roadmap Development • Defined continuity monitoring framework • Dashboard architecture blueprint • KPI framework for leadership oversight • Phased implementation roadmap with cost estimates	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Digital Intake, Scheduling & Engagement Workflow - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes improved access to care, workforce stabilization, and operational sustainability across rural and frontier communities. In North Slope Borough (NSB), administrative burden related to intake processing, appointment coordination, manual reminders, and no-show follow-up contributes to workforce strain and delayed access to care. Missed appointments, fragmented intake documentation, and inconsistent routing workflows may reduce clinical efficiency and limit service continuity. This project provides an opportunity to: • Standardize digital intake and triage workflows across service lines • Automate appointment reminders and follow-up for missed visits • Improve referral routing and clinician notification processes • Reduce administrative overhead associated with manual scheduling coordination • Increase visit completion rates and strengthen reimbursement capture Saige proposes to partner with North Slope Borough to design and deploy a Digital Intake, Scheduling & Engagement Workflow that improves operational efficiency and care continuity while reducing administrative burden in a rural health environment.	Saige will lead a structured 6-month project focused on system configuration, workflow design, integration planning, and pilot readiness. Activities will include: 1. Workflow Standardization & System Design • Mapping current intake, scheduling, and reminder workflows • Defining standardized digital intake forms by service type • Designing automated triage and clinician routing rules • Establishing reminder cadence logic (SMS/email/voice where appropriate) 2. EHR & System Integration Planning • Integration design with existing scheduling and EHR systems • Privacy, consent, and role-based access configuration • Data capture and reporting alignment 3. No-Show & Re-engagement Automation Framework • Automated follow-up prompts for missed visits • Waitlist management logic • Visit adherence analytics dashboard 4. Workforce Impact & Efficiency Modeling • Administrative time savings estimation • Visit completion improvement modeling • Reimbursement capture impact modeling 5. Pilot Implementation Readiness • Defined deployment scope and technical configuration plan • Training framework for administrative and clinical staff • Implementation roadmap with cost and sequencing	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	EMR Documentation & Interoperability Modernization - North Slope Borough	NY	North Slope Borough’s Department of Health & Social Services (HSS) delivers behavioral health, public health nursing (PHN), and Community Health Aide (CHAP) services across remote and dispersed communities. Clinical documentation workflows currently operate across multiple systems: • Behavioral Health: AKAIMS • PHN: eClinicalWorks • CHAP: primarily paper-based documentation • Manual reconciliation and repetitive State reporting processes These fragmented documentation environments limit interoperability, create duplication, reduce clinical visibility across service lines, and increase administrative burden on frontline staff. HSS has identified the need for Electronic Medical Record documentation modernization and interoperability alignment that: • Digitizes CHAP documentation workflows • Reduces manual duplication across EMR systems • Improves internal cross-program visibility • Simplifies reporting to State systems • Strengthens continuity of care across behavioral and physical health	Saige will conduct a 6-month structured planning effort including: EMR Workflow Mapping • Detailed mapping of AKAIMS, eClinicalWorks, and CHAP documentation processes • Identification of duplication, manual reconciliation, and reporting inefficiencies CHAP EMR Digitization Design • Structured electronic documentation templates • Mobile-capable and offline-enabled workflows • Integration pathways into existing EMR systems Interoperability & Translation Layer Architecture • Design of structured data mappings between internal EMR systems • Automated reporting alignment to State requirements • Governance framework for cross-program visibility Implementation Blueprint • Vendor-neutral capability requirements • Phased deployment roadmap • Cost ranges and integration sequencing • Governance and adoption strategy	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Enterprise Data Governance Framework - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes sustainability, interoperability, fiscal accountability, and responsible modernization across rural communities. As reporting expectations evolve and technology modernization initiatives expand, structured data governance becomes essential to ensure that data is secure, appropriately stewarded, interoperable, and aligned with compliance requirements. While the current governance structures within North Slope Borough (NSB) require structured assessment, this Planning Grant provides an opportunity to: • Evaluate existing data ownership, stewardship, and access controls • Assess privacy, compliance, and reporting alignment frameworks • Identify governance gaps that may limit interoperability or reporting readiness • Define standardized data policies aligned with RHTP and Medicaid requirements • Develop a sustainable governance structure to support future modernization initiatives Saige proposes to partner with North Slope Borough to conduct this structured governance planning effort and develop an implementation-ready roadmap aligned with Spark Technology & Innovation objectives. This initiative is structured as a modular component within a broader Rural Health Modernization Planning Framework designed to support phased strategy-to-delivery transformation across rural Alaska communities.	Saige will lead a structured assessment and planning phase focused on governance design, policy development, compliance alignment, and sustainability modeling — not system deployment. Planning activities will include: 1. Governance Landscape Assessment • Review of existing data policies and procedures • Stakeholder interviews to understand stewardship practices • Evaluation of data access controls and approval workflows • Assessment of compliance alignment (HIPAA, Medicaid reporting, grant reporting) 2. Governance Framework Design • Definition of data ownership and stewardship roles • Development of governance charter • Standardized data classification framework • Access control and role-based permission model • Escalation and issue resolution protocols 3. Reporting & Compliance Alignment • Alignment of governance model with RHTP reporting expectations • Documentation standards for audit readiness • Data quality monitoring framework 4. Sustainability & Operating Model Integration • Governance oversight committee structure • Reporting cadence and accountability framework • Cost modeling for long-term governance operations 5. Implementation Roadmap Development • Defined phased governance rollout plan • Resource requirements • Training and change management outline • Draft Implementation Grant framework The outcome will be a documented, implementation-ready governance model tailored to NSB’s operational context.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Executive Health Command Center	NY	Alaska’s Rural Health Transformation Program emphasizes measurable outcomes, fiscal sustainability, workforce stability, and improved access across rural communities. Leadership teams in geographically dispersed environments must balance service utilization, workforce capacity, travel-dependent access, fiscal performance, and compliance obligations. Structured executive visibility across these domains can strengthen strategic decision-making and long-term sustainability. While the specific executive reporting environment within North Slope Borough (NSB) requires structured assessment, this Planning Grant provides an opportunity to: • Evaluate current leadership reporting processes and decision cycles • Assess availability and consistency of performance metrics across workforce, access, fiscal, and compliance domains • Identify gaps in executive visibility that may limit proactive planning • Define standardized performance indicators aligned with RHTP objectives • Determine feasibility of a unified Executive Health Command Center model This initiative is structured as a modular component within a broader Rural Health Modernization Planning Framework designed to support phased strategy-to-delivery transformation across rural Alaska communities.	Saige will lead a structured planning project focused on executive information needs assessment, performance framework design, governance integration, and sustainability modeling — not dashboard deployment. Planning activities will include: 1. Executive Information Needs Assessment • Identification of key leadership stakeholders • Documentation of current reporting workflows and decision cadence • Assessment of leadership performance visibility needs 2. Performance & Metric Framework Design • Definition of core performance domains (workforce, access, fiscal, compliance) • Standardization of key performance indicators • Alignment with RHTP reporting expectations • Data feasibility assessment 3. Command Center Architecture Blueprint • Design of executive dashboard structure • Definition of required data inputs • Role-based access and governance alignment • Integration feasibility mapping 4. Governance & Operating Model Integration • Reporting cadence design • Executive oversight framework • Accountability and escalation protocols 5. Implementation Roadmap Development • Phased deployment plan • Resource requirements and cost modeling • Training and change management outline • Draft Implementation Grant framework The outcome will be a documented, implementation-ready design for an Executive Health Command Center tailored to NSB’s operational context.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Rural Health Data Foundation	NY	Alaska’s Rural Health Transformation Program emphasizes long-term sustainability, interoperability, and modernization across rural, remote, and frontier communities. While the specific data infrastructure and reporting environment within North Slope Borough (NSB) requires structured assessment, increasing federal reporting expectations and value-aligned care initiatives highlight the importance of integrated, governed data architecture in rural systems. This Planning Grant provides an opportunity to: • Conduct a comprehensive inventory of clinical, EMS, workforce, and financial data systems • Evaluate current reporting workflows and compliance processes • Assess interoperability readiness and governance structures • Identify opportunities to strengthen fiscal transparency and reimbursement alignment • Determine whether an integrated Health Data Foundation would materially improve sustainability and reporting capacity Saige proposes to partner with North Slope Borough to conduct this structured planning effort and, based on findings, define an implementation-ready roadmap aligned with Spark Technology & Innovation objectives. This initiative is structured as a modular component within a broader Rural Health Modernization Planning Framework designed to support phased strategy-to-delivery transformation across rural Alaska communities.	Saige will lead a structured Planning Phase in collaboration with North Slope Borough stakeholders. This Planning Grant will focus on feasibility, architecture design, governance development, and sustainability modeling — not infrastructure deployment. Planning activities will include: 1. System Landscape & Reporting Assessment • Inventory of clinical, EMS, workforce, financial, and reporting systems • Documentation of data flows and reporting requirements • Evaluation of compliance workflows 2. Interoperability & Architecture Blueprint • Design of scalable data integration framework • Assessment of interoperability readiness • Development of phased implementation strategy • Identification of required technology components 3. Governance & Stewardship Framework • Definition of data ownership and stewardship roles • Access controls and privacy alignment • Governance charter supporting long-term sustainability 4. Fiscal & Sustainability Modeling • Evaluation of reporting efficiency opportunities • Identification of reimbursement alignment opportunities • Cost modeling and sustainability analysis • Risk assessment 5. Implementation Roadmap Development • Defined scope, timeline, and cost estimate • Phased deployment plan • Outcome measurement framework • Draft Implementation Grant framework The outcome of this Planning Phase will be a fully scoped, feasibility-tested blueprint ready for potential Implementation Grant submission.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Rural Health Technology Youth Workforce Pipeline - North Slope	NY	Alaska's Rural Health Transformation Program identifies workforce development and technology innovation as key pillars for sustainable rural health systems. On the North Slope, workforce shortages are compounded by geographic isolation, limited local training pathways, and heavy reliance on imported labor, creating instability in health service delivery. At the same time, North Slope Borough youth face limited structured engagement opportunities outside school hours, contributing to behavioral health challenges including substance use, social isolation, and disengagement. Research increasingly links digital skill-building and structured technology engagement to improved youth outcomes. This grant provides an opportunity to: • Assess feasibility of a guided AI-assisted technology learning platform tailored to rural Alaska youth • Evaluate how youth-built digital tools could address local health data and service delivery needs • Design a curriculum linking digital skills development to rural health system modernization • Model a pathway from youth digital engagement to health technology workforce placement • Determine alignment between youth behavioral health engagement and workforce pipeline goals Saige proposes partnering with North Slope Borough to design a Rural Health Technology Youth Workforce Pipeline that addresses youth engagement, workforce sustainability, and health technology capacity simultaneously.	Saige will partner with North Slope Borough leadership, school district representatives, youth program coordinators, behavioral health providers, and relevant Tribal entities to refine and structure a Rural Health Technology Youth Workforce Pipeline concept aligned to community priorities. This effort will focus on clarifying scope, defining roles, and determining whether a youth-centered technology workforce model can simultaneously strengthen youth engagement and local health system capacity. Activities will include: 1. Community & Youth Engagement Landscape Assessment • Map existing youth programming, participation gaps, and after-hours engagement challenges • Assess digital literacy levels, connectivity access, and device availability across communities • Document behavioral health indicators relevant to structured engagement programming • Identify culturally grounded priorities and guardrails for youth programming 2. Health System Needs & Alignment Review • Identify health system modernization needs suitable for youth-supported, non-clinical technology contributions (e.g., dashboards, reporting aids, workflow supports) • Clarify operational constraints and supervisory capacity within NSB health and IT functions • Determine realistic skill levels and contribution boundaries for youth participants 3. Program Model & Partnership Development • Define potential cohort structures, supervision models, and mentorship approaches • Identify required partner roles (education, health administration, Tribal partners) • Outline appropriate curriculum components aligned to community needs • Develop a governance framework for safe and structured participation 4. Administrative Readiness & Workplan Development • Define preliminary scope, staffing assumptions, and cost ranges • Identify sustainability pathways (education funding, workforce grants, program partnerships) • Produce a structured Defined Approach proposal framework for potential Year 2 submission	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Rural Scenario Stress Testing Simulator - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes long-term sustainability, improved access stability, and resilient rural health system operations. Rural and frontier health systems often face high-impact variability across workforce capacity, access disruption, emergency transport demand, reimbursement performance, and seasonal demand fluctuations. Without structured scenario modeling, leadership teams may be forced to respond reactively rather than plan proactively for predictable risk conditions. This grant provides an opportunity to: Assess current strategic planning and forecasting practices Identify the highest-impact operational and fiscal risk scenarios affecting sustainability Define a structured scenario stress-testing framework for leadership decision support Model how variations in workforce, demand, access disruption, and reimbursement affect service continuity and cost exposure Determine feasibility of an implementation-ready scenario simulation tool that supports proactive, data-informed planning Saige proposes to conduct this structured planning effort in collaboration with North Slope Borough stakeholders and define an implementation-ready scenario simulation framework aligned with Pay for Value and Health Care Access objectives. This initiative is structured as part of a broader rural modernization planning framework and may inform future implementation phases	Saige will lead a structured planning project focused on scenario definition, model architecture design, and executive integration — not operational policy replacement. Planning activities will include: 1. Scenario Identification & Prioritization Stakeholder workshops to identify highest-impact scenarios Selection of priority scenario categories (workforce loss, demand spikes, access disruption, emergency transport surges, reimbursement changes) Definition of scenario assumptions and severity tiers 2. Baseline System Modeling Establishment of baseline workforce, service utilization, and fiscal models Identification of key input variables and dependencies Mapping of data sources required for simulation 3. Stress Testing Framework Design Design of simulation logic and scenario levers Definition of outputs: cost exposure, service continuity indicators, staffing sufficiency, access delay impacts Development of threshold-based triggers for executive action 4. Fiscal & Sustainability Impact Modeling Estimation of fiscal volatility under each scenario Modeling of mitigation strategies (reserve approaches, capacity reallocation, targeted interventions) Alignment with governance and executive reporting cycles 5. Implementation Roadmap Development Defined simulator blueprint and functional requirements Dashboard / interface concept and user roles KPI and output framework for leadership use Phased implementation roadmap with cost estimates	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Service Delivery Utilization & Capacity Optimization - North Slope Borough	NY	Within North Slope Borough Health Department programs, service delivery is constrained by workforce travel schedules, limited on-site availability, and variable demand across villages. Behavioral health clinicians, CHAP providers, and PHN services operate across remote communities without consistent visibility into utilization patterns, demand spikes, travel load, or follow-up gaps. Without structured capacity alignment, the system may face: • Behavioral health and crisis bottlenecks • CHAP travel overextension • Inconsistent psychiatric/counseling visit cadence • Delayed referrals and follow-ups • Limited workforce forecasting ability This project will: • Assess service delivery patterns across behavioral health, CHAP, and PHN • Analyze utilization trends and demand variability • Identify workforce and travel optimization opportunities • Model demand-aligned visit cadence thresholds • Determine whether structured utilization optimization improves access stability and sustainability Saige will partner with North Slope Borough Health & Social Services to develop an implementation-ready Service Delivery Optimization Framework aligned with RHTP goals of workforce stabilization and continuity of care.	Saige will lead a structured planning project focused on internal service demand analysis, workforce alignment modeling, and operational optimization design — not program redesign. Project activities will include: 1. Service Delivery & Workflow Assessment • Inventory of behavioral health, CHAP, and PHN service delivery models • Mapping of visit cadence, travel scheduling, referral intake, and follow-up workflows • Identification of operational constraints (travel windows, clinician capacity, clinic availability) • Documentation of internal service coordination gaps 2. Demand & Utilization Pattern Analysis • Multi-year analysis of service volume by program and community • Assessment of psychiatrist utilization frequency and visit cadence • CHAP travel deployment frequency and load analysis • Identification of high-variance communities and episodic demand spikes • Analysis of no-show, follow-up completion, and service backlog trends 3. Capacity & Scheduling Optimization Modeling • Development of demand-aligned visit clustering logic • Threshold-based triggers for psychiatrist or behavioral health visit frequency • CHAP travel optimization modeling • Scenario modeling of alternative workforce deployment strategies • Service prioritization framework based on utilization intensity 4. Continuity & Workforce Impact Modeling • Identification of service continuity gaps caused by travel-based delivery • Modeling of potential reduction in service bottlenecks under optimized scheduling • Workforce strain indicators and capacity stabilization thresholds • Executive-level visibility dashboard blueprint 5. Implementation Roadmap Development • Defined Service Delivery Optimization Model framework • KPI framework for leadership oversight • Dashboard and reporting design blueprint • Phased implementation roadmap with cost estimates • Staffing and integration requirements	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Service Line Cost Transparency Model - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes fiscal sustainability, responsible stewardship of public funds, and improved alignment between service delivery and long-term system viability. In rural and frontier systems, small population volatility, travel dependency, and workforce constraints can significantly impact cost-to-serve by service type. Structured visibility into service-line cost performance is critical for sustainable decision-making, reimbursement alignment, and long-term planning. This grant provides an opportunity to: • Assess current cost allocation methodologies across clinical, EMS, and support services • Evaluate cost-to-serve by service category, including travel-related cost drivers • Identify service lines with high variance between cost and reimbursement • Develop scenario models to assess sustainability under different utilization patterns • Determine whether structured cost transparency tools would materially strengthen fiscal stability	Saige will lead a structured project focused on cost modeling, fiscal analysis, and sustainability design — not financial system replacement. Planning activities will include: 1. Cost Structure Assessment • Review of current cost allocation methodologies • Identification of direct, indirect, and travel-related cost drivers • Documentation of fixed vs. variable cost components 2. Service-Line Cost Analysis • Development of cost-to-serve models by service category • Margin variance assessment (cost vs. reimbursement) • Identification of high-cost volatility drivers 3. Travel & Rural Impact Modeling • Analysis of travel dependency impact on cost structures • Scenario modeling under seasonal or staffing shifts • Sensitivity testing for utilization fluctuations 4. Fiscal Sustainability Modeling • Identification of service-line sustainability thresholds • Scenario modeling of cost stabilization strategies • Risk modeling for small-population variance 5. Implementation Roadmap Development • Defined cost transparency framework • Dashboard and reporting requirements blueprint • Change management and executive adoption plan • Phased implementation roadmap with cost estimates	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Sexual Health Access & Confidential Supply Program - North Slope Borough	NY	Sexually transmitted infections remain a recognized public health concern in many rural regions, where access to preventive services may be constrained by geography, privacy concerns, and clinic availability. Current access to preventive supplies and sexual health information in North Slope Borough primarily occurs through clinic visits or public health outreach. In small communities, privacy concerns and logistical barriers may discourage individuals from requesting services or educational resources. There is an opportunity to explore a digitally enabled access model that strengthens prevention while integrating with existing public health services. Design elements include: • Confidential digital request channels for preventive supplies • Access to culturally appropriate sexual health educational resources • Optional home-based testing options where clinically appropriate • Flexible fulfillment models aligned with community preferences (clinic pickup, discreet shipping, or hub distribution) • Privacy-protecting monitoring tools to support public health planning while protecting individual confidentiality The initiative focuses on improving preventive access and reducing barriers to early engagement with sexual health services while supporting existing public health programs.	Saige will partner with North Slope Borough Public Health, Tribal health organizations, youth program leaders, and community stakeholders to design a confidential, technology-enabled access model that strengthens preventive sexual health services. The 6-month Planning Phase focuses on research, design, and implementation readiness rather than immediate deployment of new services. 1. Community Engagement & Access Barrier Assessment • Conduct stakeholder consultations with Tribal leaders, youth representatives, public health staff, and clinicians • Document current preventive supply distribution methods and outreach programs • Identify barriers related to confidentiality, stigma, clinic access, and supply logistics • Assess community preferences for confidential access channels and fulfillment models 2. Digital Access Model Design • Design secure digital channels that allow residents to request preventive supplies confidentially • Evaluate potential access interfaces such as secure web forms, SMS-based requests, or community-access kiosks • Define privacy-preserving workflows for request intake and fulfillment • Develop culturally appropriate educational materials integrated into digital access channels 3. Supply Chain & Distribution Coordination • Assess current procurement and distribution processes for preventive supplies • Design fulfillment models aligned with village preferences (clinic pickup, discreet shipping, or hub distribution) • Develop inventory monitoring and resupply planning approaches • Identify operational requirements for scaling supply distribution across communities 4. Privacy, Governance & Data Framework • Define confidentiality protections appropriate for small community settings • Establish minimal data collection and retention practices • Align program design with Tribal governance expectations and public health policy • Identify regulatory considerations related to supply distribution and optional testing services 5. Implementation Readiness & Sustainability Planning	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

- Develop operational cost estimates and staffing assumptions
- Identify public health funding pathways and prevention grants
- Define monitoring metrics for preventive engagement and program performance
- Produce an implementation-ready pilot roadmap for North Slope Borough communities

Saige, Inc.	Substance Use & Crisis Pattern Analytics Framework – North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes improving access to care, strengthening community health outcomes, and advancing long-term sustainability in rural health systems. Across North Slope Borough’s eight remote communities, behavioral health crises—including substance use–related incidents—can generate repeated emergency encounters, medevac transport, and service strain. Limited structured visibility into recurrence patterns, service coordination gaps, and follow-up completion may reduce the ability to intervene earlier and stabilize care. This grant provides an opportunity to: • Analyze multi-year crisis-related service utilization patterns across emergency response, behavioral health services, and follow-up care • Identify recurrence trends and clustering patterns in crisis encounters • Evaluate coordination gaps between crisis response systems and behavioral health services • Assess variability in crisis demand across communities and service lines • Determine feasibility of a structured crisis pattern analytics and monitoring framework Saige proposes partnering with North Slope Borough stakeholders to conduct this structured planning effort and define an implementation-ready crisis monitoring framework supporting earlier intervention, improved service coordination, and more stable behavioral health service delivery.	Saige will lead a structured planning project focused on system-level utilization analytics, recurrence modeling, and executive integration — not clinical program redesign. Planning activities will include: 1. Crisis Utilization Analysis Multi-year review of crisis-related encounters across service systems Identification of repeat encounter patterns Analysis of utilization variability across service lines 2. Recurrence & Cohort Modeling Identification of high-recurrence cohorts Analysis of time-to-recurrence intervals Risk stratification modeling to identify elevated-risk patterns 3. Service Coordination Review Evaluation of follow-up completion after crisis encounters Identification of handoff gaps between services Assessment of documentation and reporting variability 4. Fiscal & Operational Impact Modeling Estimation of cost exposure associated with repeat crisis events Scenario modeling of improved continuity and early intervention monitoring Identification of monitoring thresholds for executive oversight 5. Implementation Roadmap Development Defined crisis pattern analytics framework Dashboard and monitoring blueprint KPI framework for leadership integration Phased implementation roadmap with cost estimates	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Telehealth & Service Delivery Readiness Modernization - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes improving access to care, strengthening workforce stability, and modernizing rural service delivery infrastructure across frontier communities. Within North Slope Borough Health Department programs, telehealth infrastructure exists across communities, yet functionality, connectivity reliability, staff training, and workflow integration remain inconsistent. Behavioral health clinicians, CHAP providers, and traveling clinical staff rely on digital systems to maintain continuity of care across dispersed villages. Current challenges include: • Inconsistent telehealth equipment functionality across clinics • Variable bandwidth reliability and connectivity limitations • Limited digital literacy training for clinical staff • Service continuity gaps during clinician travel rotations • Underutilization of telehealth capacity due to workflow misalignment Rather than focusing on specialty expansion, this project centers on strengthening the telehealth foundation supporting service delivery, clinician mobility, and continuity of care. This initiative provides an opportunity to: • Conduct a telehealth readiness and connectivity assessment • Inventory clinical technology and identify functionality gaps • Assess digital literacy and training needs for staff • Evaluate telehealth’s role in reducing CHAP and clinician travel strain • Design a telehealth optimization framework aligned with workforce stabilization	Saige will lead a structured project focused on readiness assessment, operational optimization, and telehealth integration design — not network expansion or specialty program redesign. Project activities will include: 1. Telehealth Infrastructure & Connectivity Assessment • Connectivity audit across all North Slope communities (bandwidth, uptime, reliability) • Inventory of BTC units and telehealth-capable equipment • Functional assessment of hardware, software, and workflow usability • Identification of technical and infrastructure gaps 2. Clinical Workflow & Digital Literacy Assessment • Mapping of telehealth integration within behavioral health, CHAP, and PHN workflows • Digital literacy assessment of clinical and administrative staff • Evaluation of training gaps and support requirements • Identification of workflow barriers limiting telehealth adoption 3. CHAP & Workforce Travel Optimization Analysis • Analysis of CHAP travel patterns and frequency • Assessment of opportunities to substitute telehealth for selected travel-based services • Modeling of service continuity gaps during clinician rotation cycles • Evaluation of telehealth as a stabilizer during high-demand or travel-constrained periods 4. Telehealth Optimization Framework Design • Defined telehealth utilization model aligned with service demand patterns • Threshold-based guidance for when telehealth should be deployed • Integration blueprint with existing EHR systems • Operational governance model for telehealth oversight 5. Implementation Roadmap Development • Prioritized infrastructure upgrades (if required) • Staff training and certification framework • Phased telehealth adoption roadmap • Cost estimates and integration requirements • KPI framework for executive oversight	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Weather-Adjusted Service Demand Forecasting Framework - North Slope Borough	NY	Alaska’s Rural Health Transformation Program prioritizes strengthening rural health system resilience, improving access stability, and advancing long-term fiscal sustainability. Across North Slope Borough’s eight remote Iñupiat communities, health services operate within an Arctic environment where weather conditions, seasonal travel limitations, and flight availability can significantly affect clinical access, workforce mobility, and emergency transport. Storm conditions, limited flight windows, and seasonal workforce rotations can delay patient travel, restrict clinician movement between communities, and increase emergency service demand. These environmental factors create predictable patterns of operational strain, yet they are rarely integrated into structured service demand forecasting. This grant provides an opportunity to: • Analyze multi-year service utilization patterns relative to seasonal variability • Evaluate correlations between environmental conditions and service demand • Identify service lines sensitive to seasonal travel disruption or access constraints • Assess variability in scheduling, emergency transport demand, and travel-dependent care • Determine feasibility of a weather-adjusted service demand forecasting framework Saige proposes partnering with North Slope Borough Health Department leadership to design an implementation-ready forecasting framework supporting improved resource planning and access stability in rural communities.	Saige will lead a structured project focused on utilization analysis, environmental correlation modeling, and forecasting framework design — not operational system replacement. Planning activities will include: 1. Historical Utilization & Seasonality Analysis • Multi-year review of service utilization by category • Identification of seasonal demand patterns • Analysis of acute events relative to time-of-year variability 2. Environmental Correlation Modeling • Evaluation of service utilization variability relative to environmental indicators • Identification of service lines sensitive to travel disruption or seasonal access variability • Analysis of emergency transport patterns relative to environmental cycles 3. Workforce & Capacity Alignment Review • Assessment of staffing variability relative to seasonal demand • Identification of scheduling inefficiencies linked to predictable variability • Modeling of capacity-demand mismatch scenarios 4. Fiscal Exposure & Volatility Modeling • Estimation of cost exposure associated with demand spikes • Scenario modeling of proactive resource allocation • Identification of forecasting thresholds for executive oversight 5. Implementation Roadmap Development • Defined weather-adjusted forecasting framework • Dashboard architecture blueprint • KPI framework for leadership integration • Phased implementation roadmap with cost estimates	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Workforce Capacity & Risk Dashboard - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes strengthening and stabilizing the rural health care workforce. In frontier communities, workforce sustainability depends not only on recruitment but also on long-term development of local talent pipelines. Structured visibility into trainee progression, credential milestones, placement outcomes, and retention patterns can improve long-term workforce planning and reduce reliance on external contract staffing. This grant provides an opportunity to: • Assess existing workforce development and training pathways serving North Slope Borough (NSB) • Map progression from education and certification through placement and retention • Identify drop-off points or credential bottlenecks • Evaluate alignment between training investments and service demand • Determine feasibility of a structured workforce pipeline monitoring framework Saige proposes to conduct this structured planning effort in collaboration with North Slope Borough stakeholders and define an implementation-ready workforce pipeline framework aligned with Strengthen Workforce objectives. This initiative is structured as part of a broader rural modernization planning framework and may inform future implementation phases.	Saige will lead a structured planning project focused on pipeline mapping, progression analysis, and sustainability modeling — not direct training program deployment. Planning activities will include: 1. Workforce Pipeline Mapping • Identification of local education, certification, and training programs • Documentation of progression stages (education → credential → placement → retention) • Mapping of workforce categories (clinical, EMS, behavioral health, support roles) 2. Attrition & Bottleneck Analysis • Identification of credentialing or placement drop-off points • Evaluation of time-to-placement and time-to-certification patterns • Analysis of workforce shortages by role 3. Demand Alignment Modeling • Comparison of projected service demand to projected workforce pipeline output • Scenario modeling of workforce gaps over 3–5 years • Evaluation of targeted training investments 4. Incentive & Retention Modeling • Assessment of current incentive structures • Modeling of retention impact scenarios • Evaluation of rural-specific workforce stabilization strategies 5. Implementation Roadmap Development • Defined workforce pipeline monitoring framework • Dashboard and reporting blueprint • Governance integration plan • Phased implementation roadmap with cost estimates	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Workforce Credentialing & Compliance Readiness Tracker - North Slope Borough	NY	Alaska’s Rural Health Transformation Program emphasizes workforce stabilization and rural system sustainability. In geographically remote systems such as NSB, lapses in CPR certification, licensure renewals, and required clinical trainings may disrupt service continuity and increase reliance on costly contract staffing. Manual tracking processes increase administrative burden and reduce proactive workforce planning. This project provides an opportunity to: • Standardize credential tracking across roles • Automate renewal reminders and compliance alerts • Reduce last-minute staffing disruptions • Improve workforce planning visibility • Strengthen audit readiness and regulatory compliance Saige proposes to partner with North Slope Borough to design and implement a Workforce Credentialing & Compliance Readiness Tracker aligned with Strengthen Workforce and Spark Technology & Innovation objectives.	Saige will lead a structured 6-month project focused on system configuration, integration design, and operational readiness. Activities will include: 1. Credential & Compliance Inventory • Role-based mapping of required certifications and renewal cycles • Documentation of current tracking practices • Identification of high-risk compliance gaps 2. Automated Monitoring & Alert Framework • Renewal reminder logic by credential type • Compliance risk scoring model • Dashboard design for leadership visibility 3. HR & System Integration Planning • Integration blueprint with HR systems and training records • Role-based access controls • Reporting alignment with regulatory requirements 4. Workforce Stability Modeling • Estimation of service disruption risk reduction • Analysis of contract staffing avoidance • Administrative efficiency modeling 5. Implementation Roadmap • Defined scope and cost estimate • Phased deployment plan • Training and adoption framework	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Youth Behavioral Health Digital Intervention Platform - North Slope Borough	NY	Alaska’s RHT program prioritizes improving access to care, strengthening rural health system sustainability, and advancing long-term community health outcomes. Across North Slope Borough’s remote communities, youth behavioral health services face structural challenges including geographic isolation, limited provider availability, and gaps in after-hours support. These factors can delay early engagement with counseling services and increase reliance on crisis intervention. Statewide resources such as the Alaska Care Line provide important support but primarily rely on voice-based communication. Research across adolescent behavioral health programs shows that young people are more likely to seek help through text or chat-based channels, lowering barriers to early engagement. This Planning Grant provides an opportunity to: • Assess youth behavioral health access and engagement patterns across North Slope communities • Evaluate feasibility of a text- and chat-based engagement channel connecting youth to trained counselors • Identify integration pathways with school-based mental health programs and Tribal behavioral health providers • Develop privacy, safety, and crisis escalation protocols for minors in rural communities Saige proposes partnering with North Slope Borough stakeholders to evaluate this model and define an implementation-ready approach that strengthens early intervention and improves access to culturally competent behavioral health support.	Saige will partner with North Slope Borough behavioral health services, the school district, Tribal health entities, and youth program leaders to evaluate a digitally supported youth behavioral health access model that complements existing services rather than replacing them. This Concept Formation effort will clarify service scope, provider roles, privacy considerations, and sustainability pathways prior to detailed implementation planning. Activities will include: 1. Behavioral Health Access & Gap Assessment • Map existing services, referral pathways, and crisis response processes • Identify unmet youth engagement needs and communication barriers • Document provider capacity and licensing constraints 2. Service Model Clarification • Define potential service models (navigation support, triage, short-term counseling, hybrid) • Outline supervision and escalation protocols • Define integration with school-based and Tribal health programs 3. Privacy, Safety & Governance Framework • Define minor consent and confidentiality protocols • Clarify data handling, documentation, and compliance responsibilities • Align with Tribal governance expectations 4. Budget, Sustainability & Workplan Structuring • Develop cost ranges and staffing assumptions • Identify reimbursement and non-reimbursement sustainability pathways • Produce a Defined Approach submission framework	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Saige, Inc.	Youth Vulnerability Protection & Interagency Coordination Technology Feasibility Study	NY	North Slope Borough youth regularly transition between villages and urban service centers for healthcare, education, and social services. During these transitions, responsibility for youth safety may span multiple organizations including schools, behavioral health providers, child welfare agencies, and law enforcement. Coordination across these systems can be difficult due to geographic isolation, jurisdictional complexity, and limited shared visibility into early indicators of youth vulnerability. While North Slope Borough agencies actively work to protect youth, there is currently no structured framework to analyze vulnerability patterns, evaluate coordination gaps, or determine whether privacy-respecting technology tools could strengthen early protective response. This grant provides an opportunity to: Assess patterns of youth vulnerability across North Slope communities Evaluate existing protective services, reporting mechanisms, and coordination workflows Identify gaps in interagency communication between schools, behavioral health services, child welfare, and law enforcement Research models for early identification and protective coordination used in other rural or Indigenous communities Explore whether technology-enabled coordination tools could improve protective response while respecting privacy, Indigenous governance, and community trust This feasibility effort focuses on coordination and prevention, not surveillance or enforcement.	Saige will lead a structured Feasibility and Planning Phase in collaboration with North Slope Borough Health & Social Services, the school district, law enforcement, Tribal organizations, and behavioral health providers. Given the sensitivity of youth protection initiatives, the planning phase prioritizes research, stakeholder engagement, and ethical governance development. 1. Youth Vulnerability & Risk Landscape Assessment Review available data on youth vulnerability indicators, behavioral health risk factors, and protective service utilization Analyze patterns associated with youth travel, service transitions, and school or behavioral health referrals Conduct stakeholder interviews with child welfare professionals, school counselors, law enforcement, Tribal leaders, and behavioral health providers Review protective coordination programs deployed in comparable rural and Indigenous communities 2. Protective Services Coordination Audit Inventory current youth protection services and mandatory reporting workflows Identify coordination gaps between borough agencies, state services, Tribal authorities, and community organizations Review existing hotlines, reporting tools, and crisis response pathways Document jurisdictional responsibilities across agencies 3. Technology & Early Identification Model Research Evaluate technology-enabled models used to support youth protection and coordinated response Assess privacy-preserving approaches such as anonymized indicator monitoring rather than individual tracking Review programs from national child protection organizations and rural service networks Identify approaches that balance effectiveness with community trust and cultural appropriateness 4. Ethical & Cultural Governance Framework Facilitate community engagement on acceptable boundaries for youth protection tools	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

- Establish ethical guidelines balancing safety, privacy, and autonomy
- Integrate Indigenous governance principles into data and decision-making protocols
- Conduct legal analysis of jurisdictional requirements and data sharing constraints
- 5. Feasibility Determination & Implementation Roadmap
 - Evaluate whether technology solutions can meaningfully improve coordination and youth protection outcomes
 - Develop conceptual models and policy frameworks if feasibility is confirmed
 - Identify staffing, governance, and operational requirements
 - Recommend whether to pursue a future grant or alternative policy approaches

SALA LLC	Mobile Healthcare for Rural & Vulnerable Alaskans, Elders, Post Hospital & Preventive Care	AK	Rural, remote, and frontier communities in Alaska face significant healthcare access gaps, particularly among vulnerable populations, homebound elders, individuals experiencing homelessness, and patients recently discharged from hospitals. Many Alaskans outside of Anchorage or larger hub communities lack proximity to primary care providers, specialty services, and preventive health programs. Long travel distances, extreme weather, transportation barriers, and limited local healthcare infrastructure contribute to delayed care, unmanaged chronic conditions, and avoidable emergency department utilization. Homebound elders often struggle to attend clinic appointments due to mobility limitations, resulting in medication mismanagement, untreated conditions, and increased risk of hospitalization. Similarly, patients discharged from hospitals frequently lack structured follow-up care in rural areas, leading to gaps in continuity and higher readmission rates. Vulnerable populations, including those experiencing housing instability, face additional barriers to consistent preventive and chronic care. This will enable access to Mobile Integrated Healthcare (MIH) style programs, many rural regions do not have mobile primary and preventive care services. This project addresses these disparities by expanding mobile healthcare delivery into underserved communities, creating a reliable system of in-home and community-based care where traditional clinic access is limited or unavailable.	The proposed approach is to expand a proven Mobile Integrated Healthcare (MIH) model into rural and frontier communities through Mobile Healthcare Services. This model brings preventive, transitional, and primary care directly to individuals who face barriers accessing traditional clinic-based services. A mobile clinical team, may including a Physician Assistant, or Physician, Paramedic and Mental Health Clinician will provide care in homes, shelters, community settings, and other locations where patients reside. Services will focus on hospital discharge follow-up, chronic disease management, preventive screenings, wound care, infectious disease testing and treatment, medication management, and coordination with existing healthcare providers. Delivering care in community settings removes barriers related to transportation, education, prescription pickups, mobility limitations, distance to clinics, and weather conditions that frequently prevent rural residents from receiving timely care. This approach builds upon SALA’s Mobile Integrated Healthcare program, which has already demonstrated measurable success in improving patient outcomes. An independent analysis conducted by Evergreen Economics found that patients served through the SALA’s MIH program were 85 percent less likely to be readmitted to a hospital or emergency department compared with similar Medicaid, Medicare patients. In addition, patients receiving MIH services remained out of the hospital more than four months longer on average than the comparison group due to the holistic care provided. The mobile care team will collaborate with hospitals, primary care providers, and community partners to ensure continuity of care following hospital discharge and to support individuals who are at risk of falling through gaps in the healthcare system. Special focus will be given to vulnerable populations including homebound elders, individuals experiencing homelessness, and residents of rural communities with limited access to preventive and primary care services. By expanding this proven model into rural Alaska, Mobile Healthcare Services strengthens access to care, improves care coordination, and provides a scalable approach to delivering healthcare services in communities where traditional clinic access is limited or unavailable.	\$1M-\$5M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Advance to Implementation Application

Sanderling Renal Services, Inc.	Providing Nephrology and Dialysis Services to Rural Communities	TN	Approximately 1500 individual are receiving dialysis in Alaska. People living in rural areas have very limited access to dialysis. Without dialysis these patient with severe kidney failure (End Stage Kidney Disease) will die in weeks or months. In addition to the individuals on dialysis the epidemiologic data implies there are more than 5,000 patients with advanced kidney disease who would benefit from the expertise of a board certified nephrologist. Another 5,000 individuals probably suffer from advanced heart disease, and many of those patients also have renal disease which, if treated, can relieve some of the issues caused by the heart failure. It is this population of patients with serious chronic illness, that Sanderling aims to serve, both with dialysis, and the expertise of board certified nephrologists and specialized nephrology Registered Nurses.	Sanderling will identify existing healthcare providers in each target community. This would most likely be the local hospital or an outpatient clinic. Members of the community will be invited to receive training to become a Certified Clinical Hemodialysis Technician. This group of individuals will be trained by Sanderling through a combination of televised classroom training, and on-site practical training by a Sanderling staff member. The workforce created through this training will become the on-site personnel to set up dialysis machines in the hospital and/or patients' homes. Sanderling, through this grant, will procure, install, and commission telemedicine equipment and portable dialysis machines in hospitals, clinics, and patients' homes. Quality assurance will be provided through Sanderling's proprietary Electronic Medical Record, and will be overseen a medical director assigned to this program.	\$1M-\$5M	Home- and communit y-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Sauna Valdez LLC	Community Wellness Center in Valdez - Sauna & Contrast Therapy	AK	Valdez, Alaska is a small, isolated community of 4,000 residents facing significant public health challenges. Substance abuse and suicide have ranked as the community's top two health concerns for over ten years. Like many rural Alaskan towns, Valdez lacks welcoming, sober social infrastructure — the only communal gathering spaces are churches and bars. Seasonal Affective Disorder compounds these challenges, with long, dark winters deepening isolation, depression, and anxiety for residents of all ages. There is currently no public sauna or yoga studio in Valdez, which would be near ideal community gathering spaces. This gap represents both a pressing problem and a clear opportunity.	Sauna and contrast therapy are among the most accessible, evidence-backed forms of preventive care available — and a community sauna is uniquely positioned to address physical, mental, and social health simultaneously. Providing a healthy, sober third space where residents can gather, recover, and build welcoming community resilience. Sauna Valdez is expanding into a permanent community wellness facility through a phased approach. Phase 1 — a new sauna structure with a commercial cold plunge — is already under construction, completing June 1, 2026. The cold plunge is our critical remaining need, as contrast therapy amplifies sauna's well-documented benefits: improved cardiovascular health, reduced dementia risk, stronger immunity, better sleep, and elevated mood during Alaska's dark winters. Rooted in both Nordic tradition and Alaska Native sweat lodge culture, sauna has always been a community and family practice. We are building on that foundation with family-friendly programming, affordable membership pricing, and streamlined operations that keep access equitable. Phase 2 adds a bathhouse and yoga studio, targeting Fall 2027 — creating a comprehensive wellness resource Valdez has never had and urgently needs.	\$50,000-\$250,000	Single Community	Chugach Census Area	Deferred or Not Advanced

Scene Health	Expanding Video DOT to Improve Medication Adherence in Rural Alaska	MD	The cost of managing chronic conditions, infectious diseases, and substance use disorders continues to rise across the United States, placing increasing strain on health systems and public health resources. These challenges are amplified in Alaska, where patients in rural, remote, and frontier communities face significant barriers to consistent care, including geographic isolation, limited transportation infrastructure, workforce shortages, and intermittent connectivity. For patients who require ongoing medication adherence monitoring, traditional in-person approaches can be difficult to sustain and costly for both patients and providers. The Alaska Department of Health has already implemented video Directly Observed Therapy (vDOT) using the Scene Health platform to support tuberculosis treatment. This project represents an opportunity to expand that proven model to additional conditions that require reliable medication adherence and patient support, including other infectious diseases and opioid use disorder. By expanding access to vDOT, Alaska can improve continuity of care for patients in rural, remote, frontier, and native communities while reducing travel burdens and enabling care teams to support more patients efficiently. Building on an existing program allows the state to rapidly scale a digital care model that improves treatment support while helping control the long-term cost of care.	Scene Health proposes to expand healthcare access and improve treatment adherence for Alaskan populations living in rural, remote, frontier, and Alaska Native communities through its clinically validated, CDC-endorsed vDOT platform. Scene’s vDOT enables patients to record secure, asynchronous videos of themselves taking prescribed medications using a mobile device. These videos are reviewed by a care team that provides daily adherence monitoring, patient support, and timely intervention when doses are missed or potential issues arise. This model enables consistent medication monitoring without requiring frequent in-person visits. The approach directly addresses barriers common in rural Alaska, including limited provider availability, long travel distances, workforce shortages, and intermittent connectivity. Because the platform is designed to function in low-bandwidth environments and supports asynchronous video submission, patients can participate even in communities with limited internet access. The platform is patient-centered and designed to support diverse populations. It offers multilingual capabilities, user-friendly onboarding, and ongoing technical support to ensure equitable access for patients across different communities and levels of digital familiarity. Providers receive real-time adherence data and alerts, improving care coordination and enabling earlier intervention when adherence risks are identified. To further improve accessibility for Alaska Native and other underserved populations, the platform can incorporate additional language support and culturally appropriate patient engagement tools. Expanding language capabilities will help ensure patients can receive instructions, reminders, and support in languages that are most familiar to them, improving understanding, trust, and sustained engagement with treatment programs. Published research has demonstrated that Scene’s vDOT programs improve medication adherence, enhance clinical outcomes, and reduce healthcare costs across chronic and infectious conditions including diabetes, hypertension, substance use disorder, asthma, tuberculosis, and hepatitis C. Expanding vDOT in Alaska will extend care beyond traditional clinical settings, strengthen workforce capacity, and create a more sustainable model for delivering care to geographically dispersed populations. Scene’s clinical validation can be viewed here: https://www.scene.health/clinical-validation	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Scholars in Medicine, LLC	Scholars in Medicine's Health Initiative Strengthening Alaska's Rural Healthcare Workforce	HI	Scholars in Medicine will deliver accredited medical education tailored to Alaska’s rural healthcare workforce, including approximately 1,152 physicians and 1,125 nurse practitioners, physician assistants, and nurses. The program will produce 20 accredited, on-demand webinars for clinicians practicing in geographically isolated settings where access to specialty consultation and continuing education is limited. The curriculum will focus on diseases most commonly associated with hospitalization in rural Alaska to ensure training is practical and relevant to daily clinical practice. Topics will include maternal and newborn care, infectious diseases, cardiovascular disease, behavioral health and substance use disorders, respiratory disease, and digestive and metabolic conditions such as appendicitis, gastrointestinal disease, and diabetes complications. Additional content will address injury and trauma, delayed-treatment infections, and pediatric respiratory illness. Each webinar will feature experienced physicians with expertise in specialty disease states, emphasize case-based learning relevant to resource-limited settings. Programs will be available on demand, allowing clinicians to access education without leaving their communities while strengthening knowledge, clinical confidence, and the quality of care delivered in rural Alaska. Networking and clinical discussion opportunities will be available with live question and answer sessions following each webinar.	Scholars in Medicine’s (SiM) Rural Health Initiative Team will implement a targeted awareness and engagement campaign to ensure Alaska’s rural healthcare workforce becomes familiar with the SiM platform and can rapidly access its full educational benefits. Outreach will include print and digital communications, as well as direct phone contact, to introduce the platform, highlight its value, and assist clinicians in developing user profiles that tailor learning to the specific needs of the patient populations they serve. Through this effort, SiM will establish an online rural health community that connects frontline clinicians with specialty experts through best-practice–driven discussions, disease-state guideline–based case reviews, and access to specialist insight. By supporting an informed and connected workforce, the initiative will encourage adoption of advanced treatments and current clinical guidelines, strengthen clinical decision-making, and ultimately improve care delivery and patient outcomes in Alaska’s rural and remote communities. SiM will also conduct regular user surveys and ongoing platform optimization to ensure information is easy to locate, actionable, and quickly digestible, enabling clinicians to efficiently access relevant guidance during patient visits.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Sealaska Heritage Institute	From Village to Vital Care: Community-Centered Rural Health Pathways for Southeast Alaska	AK	Despite expanded medical infrastructure (Sitka, Juneau, Wrangell, Haines, etc.), and a forecasted 1,100 new healthcare jobs statewide in 2026 alone (Alaska Dept. of Labor Trends Jan. 2026), Southeast Alaska continues to rely heavily on a nonresident medical workforce. Southeast Alaska’s Health Care and Social Assistance workforce is 17.1% nonresident (Alaska Department of Labor, Nonresidents Working in Alaska 2026). While Southeast enjoys relatively modern medical infrastructure, urban hubs, and consistent broadband connectivity, local workforce development remains insufficient. Additionally, the region leads the state's “silver tsunami” – with more than 1 in 4 Southeast Alaska residents being 60+. In Juneau, residents age 65+ grew by 21% between 2020 and 2024 (Juneau Economic Development Council 2024). There is projected to be significant additional need for healthcare and medical access within the region due to its aging population. SHI brings 44+ years of experience operating educational programs and creating opportunity for Southeast Alaska youth, with its successful postsecondary planning programs currently serving all graduating seniors in 37 high schools located within 15 Southeast Alaska’s school districts. In addition to providing support for traditional postsecondary medical pathways, SHI proposes creating new medical pathways for the region’s high school and college aged youth through work study, internships, and mentor-apprenticeships.	In 2024, SHI served 60,777+ individuals in 121 communities, and SHI currently provides postsecondary planning to all graduating seniors in 37 high schools located within 15 of 16 Southeast school districts. Building upon SHI’s successful CTE consortium of 37 high schools and the Our Strength postsecondary planning/workforce development curriculum, SHI will include health exploration units, as well as annually evaluate educational needs with communities for healthcare educational and workforce opportunities. SHI will add additional capacity through traveling career counselors to support the region and provide youth with medical opportunities including mentorships, work study, internships, dual enrollment, and postsecondary pathways or apprenticeships to medical certification, and institute 10 HOSA – Future Health Professional clubs within Southeast schools. College age youth would have access to expanded internships within the medical field coupled with a cohort and dedicated guidance to ensure successful completion of their internship. Internships, work study, and apprenticeships will provide youth opportunities to advance into unsubsidized jobs within the healthcare workforce. Additionally, SHI is an official Registered Apprenticeship Program sponsor with the US Department of Labor and can add apprenticeships within the medical industry upon demand for additional pathways to medical certification outside of traditional postsecondary approaches. Participants may pursue and receive college credit towards medical certification. The proposed project expands upon existing work taking place within Southeast Alaska in partnership with 15 school districts, and community partners including SEARHC, Bartlett, PeaceHealth, Healing Hands Foundation, Goldbelt Heritage Foundation, and the University of Alaska. SHI’s experience in recruiting and supporting youth participants will be critical to Southeast Alaska’s success within the Rural Health Transformation Program. Utilizing SHI’s Council of Traditional Scholars and Southeast Education Committee, SHI will ensure that its RHTP project is community and community-engaged and successful for Southeast Alaska. The Council of Traditional Scholars is an advisory panel of Southeast Alaska clan leaders and elders knowledgeable in traditional customs and SHI’s Southeast Education Committee is composed of Southeast Alaska teachers who provide input and direction in SHI educational programs.	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Sealaska Heritage Institute	On the Land: Promoting Wild Food Harvest and Use in Southeast Alaska	AK	The Indigenous peoples of Southeast Alaska have long relied on wild foods as their primary source of nutrition. However, over the past century, the proportion of unhealthy processed foods has increased dramatically. Helen Drury noted this alarming trend in 1985, building off research dating back to 1933 that documented decreased dental health apparently resulting from increased consumption of non-Native foods (Price 1939). This ongoing trend is concerning because traditional diets are known to produce far lower rates of diseases associated with modern Western diets (Caprara 2018). The National Rifle Association has also documented declines in both hunting and public support of legal hunting, making the knowledge of how to hunt inaccessible to many. Medical anthropologists draw strong correlations between health and cultural consonance – an individual’s ability to live out a culturally meaningful life (Dressler 2012). Dr. Lisa Wexler has worked with Alaska communities on mental health promotion since 2000 and found suicide among Native people to be rare prior to the 1960s. But by the 1960s, Alaska’s Indigenous people had been forced into sedentary villages, altering lifeways and social structures; youth were “no longer an integral part of their family’s survival” (Woodward 2012). For Alaska Native people, Indigenous intellectual traditions, including cultural teachings and practices, are the heart of individual, family, and community wellness (Allen, Wexler, & Rasmus 2021).	Nutrient-dense wild foods and the physical exercise required to harvest in rugged environments nourish the minds and bodies of rural Alaskans. However, much subsistence knowledge is being lost today. To combat this trend and revitalize wild food use, SHI is actively piloting educational subsistence programs to restore traditional practices (e.g., mountain goat hunting, butchering, fish processing, and sharing wild foods). These programs are celebrated across Southeast Alaska for getting communities back out on the land; this project builds on those SHI programs and partnerships to ensure the momentum of wild food revitalization continues to grow. SHI’s On the Land app will gather real-time data on contemporary harvest activities, promote healthy lifestyles characterized by physical activity on the land, and encourage consumption of wild foods from the land; it will provide an accessible digital space for sharing harvest techniques and recipes, building community, and “virtually honoring” (e.g., badges, tiers, levels) the use of wild foods. SHI will also collect baseline and longitudinal harvest data through the app to assess and continue to develop the impact of the On the Land app. The Baby Raven Reads On the Land book series will encourage families to prioritize pediatric care, early literacy, and harvesting and consuming wild foods. Through vertically aligning its K-5 English language arts curricula and curricular resources (e.g., Raven Writes; Voices on the Land; TCLL) with On the Land goals, SHI will engage educators and provide school districts with culturally responsive English language arts curricula that will inspire young minds to seek nutritious foods and healthy futures. SHI and youth (grades 6-12) in its STEAM programs will probe factor in disease/preventative care and create a film to document the return and health impacts of wild food traditions in Southeast Alaska, focusing on mountain goat hunting and fueled by inquiry-driven topics developed by youth. The film will involve, educate, and inspire more young hunters and local mentors to get involved, and SHI will support them to hunt safely: hunter education classes, instruction on harvest regulations and identifying suitable harvest locations, wilderness first aid certification, and firearms safety training and equipment. Combined, SHI’s On the Land approach will provide residents of Southeast Alaska with the tools and inspiration they need to get healthy and back out on the land.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Seattle Children's Alaska Track Pediatric Residency	Pediatric Workforce Development in Alaska	WA	Our project aims to increase the pediatric physician workforce in Alaska. We continue to face challenges with recruitment and retention of pediatricians to Alaska. While our program has helped fill some gaps over the past 11 years, we continue to have workforce needs across the state, especially in our rural communities. Pediatricians can provide not only improved access to care for children, and especially children with complex medical needs, but also support family practice physicians and advanced practice providers (PA/NPs). In these ways, pediatricians in rural communities have have a large impact working in both direct primary care as well as as a specialist consultant for general practice physicians.	Through the support of RHTP funding, we aim to: 1. Expand services in the Mat-Su region through a new partnership with Ptarmigan Pediatrics, a well established private practice primary care pediatric clinic. We will place 6 Seattle Children's pediatric residents per year at Ptarmigan Pediatrics. Each pediatric residents will rotate 2 months per year providing direct patient care at nearly 1.0 FTE. 2. Provide faculty training and professional development at our new site. We have longstanding partnerships with the University of Washington and Seattle Children's Hospital. We will bring speakers and tenured faculty to help train and develop our new faculty members at a faculty development day. 3. Increase the number of pediatric subspecialty care by providing support for pediatric fellows to rotate in Alaska. This support includes salary and benefits, travel and housing and licensure fees during their 1 month rotation in Alaska. Fellows from needed specialties such as Pediatric Neurology, Rheumatology, Nephrology, Critical Care, Hospital Medicine, Development will spend time rotating in Alaska. This exposure will help with post-fellowship recruitment plans. 4. A recommended initial State PRA of \$163,000 per resident per year has been identified through statewide review and AK GME Council consensus. We have 4.0 resident FTE per year to support. What have the infrastructure and program staff including physician associate program directors and program coordinator based in Alaska. We just need funding.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Matanuska-Susitna Borough	Advance to Implementation Application

SeaView Community Services	Stabilizing Behavioral Health Access and Workforce Capacity in the Eastern Kenai Peninsula	AK	SeaView Community Services is the primary behavioral health provider serving Seward and surrounding communities in the Eastern Kenai Peninsula. The organization provides crisis services, outpatient treatment, residential care, and transitional housing for individuals experiencing mental health and substance use disorders. However, maintaining reliable access to these services is increasingly difficult due to workforce instability, housing shortages, and aging infrastructure common across rural Alaska. Recruiting providers to Seward is particularly challenging because limited rental housing forces many providers into temporary or high-cost rental arrangements. These conditions contribute directly to staff turnover and make long-term workforce retention difficult. Each vacancy disrupts service delivery, increases wait times, and places additional strain on remaining staff in a rural community with few alternative behavioral health providers. In addition to workforce challenges, several components of SeaView’s service infrastructure require modernization. Aging facility systems and outdated technology increase the risk of operational disruptions that could interrupt behavioral health services. These targeted investments will allow SeaView to reduce workforce vacancies, maintain consistent staffing, and ensure reliable behavioral health services for residents of the Eastern Kenai Peninsula.	SeaView will implement a coordinated set of workforce, housing, infrastructure, and technology investments designed to maintain reliable behavioral health services in the Eastern Kenai Peninsula. First, the project will strengthen workforce recruitment and retention. SeaView will implement retention incentives for staff who commit to remaining with the organization for 12–24 months and recruitment incentives for hard-to-fill behavioral health positions. A Workforce Retention and Development Manager will coordinate retention efforts, manage workforce housing placement, oversee professional development initiatives, and support staff training and career advancement. Second, the project will address one of the most significant barriers to rural workforce stability by acquiring dedicated workforce housing to recruit and retain behavioral health clinicians. Limited housing availability in Seward often forces clinicians into temporary or high-cost rental housing, contributing to turnover. Workforce housing will provide stable living arrangements for essential staff and reduce reliance on expensive leased housing currently used for recruitment. Third, SeaView will complete targeted facility improvements necessary to maintain access to care. The aging elevator serving the primary outpatient clinic will be replaced to ensure continued ADA-accessible access for elders, individuals with mobility limitations, and clients seeking behavioral health services. Fourth, SeaView will modernize technology systems to improve operational reliability and reduce administrative burden. This includes migrating aging server infrastructure to a secure cloud environment, implementing AI-supported documentation tools, and expanding telebehavioral health services to reach individuals who face transportation or geographic barriers. Finally, SeaView will expand professional development opportunities for staff, including continuing education, licensure support, and leadership development initiatives that strengthen long-term workforce capacity. These efforts will focus on building internal career pathways that support direct care staff in advancing into behavioral health clinician roles. The Workforce Retention and Development Manager will coordinate these initiatives, track participation and outcomes, and align training opportunities with workforce needs identified through recruitment and retention trends.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

See Stories	Culture & Care: Youth Filmmaking for Mental Health Awareness	AK	Culturally responsive healthcare and community wellbeing are pillars of health, especially in Rural Alaska, where factors like historical trauma inform staggering mental health statistics in local communities (Allen et al., 2025). Despite heartbreaking statistics depicting mental health metrics in rural Alaska, these communities tend to be left out of health data analysis and healthcare access due to small population sizes (Ndugga et al., 2025). Mental health care can be hard to access. There is a stigma against acknowledging and getting support for mental health related issues (Alaska Mental Health Trust Authority, 2023). In addition to mental health challenges in rural Alaska, there is an educational need for broader offerings that contribute to comprehensive health education in Alaskan school districts. Alaskan school districts are encouraged under Alaska Statute §14.30.360 to offer comprehensive health education that addresses topics such as substance abuse, personal safety, family health and disease prevention. Our proposed “Culture & Care” project will utilize See Stories’ strong relationships and culturally responsive approach in rural Southeast Alaska to tackle the above-mentioned problems: 1) the stigma around seeking support for mental health related problems, 2) the lack of education about how to seek support for mental health related problems 3) the lack of appropriate, standards aligned curriculum for health education throughout Alaska.	Our overall vision for this 5 year project is to engage local youth storytellers through digital media production to create culturally-grounded films about health and wellness, and to utilize these films for a region wide (and beyond) education and engagement campaign. To achieve this in year one, See Stories will use this planning grant to expand on our current relationships and build new partnerships with Community Health Aides throughout Southeast Alaska. We have a cadre of trained youth filmmakers as well as ongoing partnerships with the schools, Tribal Councils, Native Corporations, Alaska Youth Stewards, and other local partners in Angoon, Kake, Yakutat, Wrangell and Juneau. This upcoming year we would expand those relationships to include Community Health Aides. The Community Health Aide program is unique to Alaska, and is designed to help foster individual, community and family well-being. By building these new partnerships with Community Health Aides, See Stories will both plan and pilot our vision to engage youth filmmakers in sharing vital mental health films (or “PSAs”) for the communities where they live and beyond. In years 2 - 5 of this project we would scale up and roll out our work, disseminating mental health messaging through social media, radio, broadcast TV, at health clinics themselves, and community screenings and conversations, with the goal that at least half the people living in Southeast Alaska would engage with these mental health based films and messages so that community members 1) know how and where to receive mental health services, 2) destigmatize mental health related issues, and 3) support people to connect to culturally relevant activities that support positive mental health outcomes. In addition, we would integrate these student produced films into our “teacher tools” web-platform and virtual teacher professional development class for educators state-wide. To see a sample student produced film that documents and promotes positive mental health outcomes, watch Angel Jack’s "Healing Through Time" (https://seestories.org/videos/healing-through-time/). Angel explores the 1882 Angoon Bombardment and the U.S. Navy’s apology. Through community and virtual screenings, her film supports healing from historical trauma. It demonstrates how storytelling can address wellbeing and how broader social and cultural factors also contribute to community wellbeing.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Seldovia Village Tribe	Seldovia Village Tribe: Upgrades to Improve Health Access (UIHA)	AK	SVT seeks to enhance access to high-quality, coordinated healthcare in rural communities where workforce shortages, aging telecommunications infrastructure, and administrative burdens can impede timely service delivery. Communities in the Homer service region often face limited provider availability, long travel distances to specialty care, and operational challenges associated with small rural health systems. The UIHA initiative addresses these barriers by modernizing telehealth systems, improving clinical communications, introducing secure AI-assisted clinical documentation tools, strengthening workforce retention strategies, and streamlining patient intake workflows.	The UIHA initiative is designed as a multi-component rural health modernization strategy addressing both clinical infrastructure and workforce sustainability. Telehealth & Communication Infrastructure Modernization • Upgrade telecommunications infrastructure to a unified Mitel communication system • Transition from legacy PRI phone lines to scalable SIP trunking • Integrate Mitel systems with Zoom for high-definition telehealth visits • Improve provider communication reliability between Homer, Seldovia, and Anchor Point • Provide staff training to ensure adoption and effective utilization Tribal AI Sovereign Cloud Infrastructure • Deployment of a locally hosted Tribal LLM Sovereign Cloud supporting 100+ staff • High-concurrency AI assistance for clinical and administrative workflows • Clinical transcription and long-context summarization of telehealth encounters • Retrieval-Augmented Generation (RAG) knowledge base allowing staff to query HR policies and clinical protocols • HIPAA-compliant automation of prior authorizations and referral letters Digital Patient Intake Kiosks • Deployment of self-service patient check-in kiosks across Homer, Seldovia, and Anchor Point • Integration with eClinicalWorks for demographic updates, consent forms, and insurance verification • Point-of-service payment processing through secure payment integration • Reduced front desk workload and improved data accuracy Workforce Stabilization Strategy • Participation in salary benchmarking surveys to develop competitive compensation structures • Expanded employee wellness reimbursement to support retention • Professional certification and training opportunities for staff • Potential buyout of a locum provider to transition to permanent staffing	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Senior Citizens of Kodiak Inc	Improve home & community based care access with SCOK facility improvements and educational outreach	AK	Since a new census was taken in 2023, we have found a continued increase in the Kodiak Island senior population (60 and older). According to GetCare Data, an increase has also been found for those 80 and older, and those at poverty level. SCOK has consistently identified seniors within these categories who require home and community-based care by doing outreach in the community as well as collaborating with the agency's many partnering agencies, but collectively, we are still not reaching all those who require support to remain aging in place. We hope to improve access to home and community-based care by addressing the following opportunities: - Targeted facility improvements for SCOK's aging and outdated infrastructure - Improvements to SCOK's IT system and broadband connectivity issues - Development and Implementation of educational outreach programs for Kodiak Senior population By addressing these opportunities, we will be able to improve access to community-based services, promote aging in place and reduce institutionalization for our Kodiak senior population.	Our goal is to promote aging in place and reduce institutionalization by improving access to home and community-based care for seniors 60 and older in Kodiak, Alaska. To do so, we will use funding to address the following opportunities utilizing the approaches outlined below: • Targeted Facility improvement for SCOK's aging and outdated infrastructure: SCOK was established in 1973 and moved into our current building in 1985. Our Island Cove Adult Day Program, the only adult day program in the state of Alaska open 7 days a week, was started in 1991 in a community room across the street. In 1996, the Kodiak Senior Center was remodeled, and Island Cove was moved to the lower portion of the building, previously a workshop with power tools. It has been 20 years since a major renovation, and our facilities are aging and require modernization. Facility and furniture upgrades would improve access, safety, efficiency of our programs and increase the availability of safe, person-centered care close to home. • Improve IT system and broadband connectivity: SCOK experiences poor broadband connectivity, and limited data-sharing capacity, which hampers access and care coordination. Funding would be used to improve IT software, hardware and equipment upgrades at the Kodiak Senior Center, improving operability of our systems, and increasing efficiency of care coordination. • Develop and implement collaborative approach to educational and healthy living programs for Kodiak Senior population: SCOK has funding through the State of Alaska and a variety of other sources for our home and community-based services that promote aging in the place, thus reducing institutionalization. However, we do not have funding specifically to support educational programs and offerings at the Kodiak Senior Center, instead we rely heavily on volunteers as they are available. Funding would be used to develop programming that would support seniors in their effort to remain living healthy and independent in the home and community of their choice. A collaborative approach with our partners would assist us to offer programs would include but not be limited to education on fall prevention, specialized nutrition support, healthy living & wellness, as well as offer therapeutic and social engagement opportunities to improve well-being and delay intensive care needs.	\$50,000-\$250,000	Home- and community-based services provider	Single Community	Kodiak Island Borough	Advance to Implementation Application

SERRC - Alaska's Educational Resource Center	Building Southeast Alaska's Behavioral Health Workforce Pipeline	AK	Pursuing behavioral health credentials in Southeast Alaska often requires significant financial and logistical sacrifice. For residents of rural communities, tuition is only one barrier; the costs of travel, lodging, and lost wages during training can make participation impossible. As a result, many qualified local residents are unable to pursue behavioral health careers. Due to the lack of a strong local training pipeline, regional healthcare providers frequently recruit behavioral health staff from outside the region, contributing to workforce instability and turnover. According to the Alaska Department of Labor and Workforce Development Occupational Projections (2022–2032), Alaska has behavioral health vacancy rates of approximately 9–12% and expects industry growth of up to 12% by 2032. These vacancies, combined with growing demand, make it difficult for providers to maintain consistent services. This project addresses these challenges by creating a homegrown behavioral health workforce pathway for Southeast Alaska residents. The program will support training at two levels: entry-level Counselor Technicians (CT), enabling residents to quickly enter the behavioral health workforce, and Chemical Dependency Counselors I (CDC I), allowing current behavioral health staff to advance their credentials and expand substance use treatment services. By covering tuition, travel, lodging, and stipends, the project removes financial barriers and helps build a stable local workforce.	This project removes the financial and logistical barriers that prevent Southeast Alaska residents from pursuing behavioral health training. For many rural residents, the challenge is not only the cost of tuition but also the travel, lodging, and lost income required to attend training. This project addresses those barriers by providing comprehensive support so that qualified local residents can participate in credentialing programs. Funding will support the full cost of participation for trainees, including: Education Costs: Coverage of tuition, books, and certification fees for Counselor Technician (CT) and Chemical Dependency Counselor I (CDC I) training programs. Travel and Lodging: Transportation and lodging for participants traveling from rural communities to training locations in Juneau or Anchorage. Participant Stipends: Work stipends and childcare assistance to offset lost wages and allow participants to focus on completing their training. The program will support training at two levels to build a clear career pathway within the behavioral health workforce: -Entry-Level Training – Counselor Technician (CT): This track prepares new entrants to join the behavioral health workforce quickly in roles such as behavioral health assistants or support staff. The project will support approximately 10 trainees per cohort per year in the CT training track. -Credential Advancement – Chemical Dependency Counselor I (CDC I): This track supports current behavioral health workers who are seeking to expand their credentials and provide substance use treatment services. The project will support approximately 6 trainees per cohort per year pursuing CDC I certification. Training will be delivered through Waypoint Continuing Education, Inc., which offers state-recognized behavioral health certification programs. SERRC will coordinate recruitment, participant support, and partnerships with regional healthcare employers to connect trainees with job opportunities following certification.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

SERRC - Alaska's Educational Resource Center	Rural Health Career Pathways for Alaska Students	AK	Alaska faces persistent healthcare workforce shortages, particularly in rural communities where recruiting and retaining providers can be difficult. For example, Alaska is projected to have the highest vacancy rate in the country, with an estimated 22.7% of nursing positions unfilled. At the same time, many rural students have limited exposure to healthcare careers or opportunities to earn early certifications that could lead to employment in the medical field. Providing healthcare and behavioral health education in rural schools addresses both challenges. In the short term, students gain practical skills such as CPR, First Aid, and Mental Health First Aid that can help them respond to emergencies in their homes and communities. In the long term, early exposure to healthcare careers can encourage more students to pursue training and employment in the healthcare field, strengthening Alaska’s local workforce and reducing reliance on out-of-state providers. An additional opportunity relates to proposed legislation in the Alaska Legislature that would require schools to provide CPR instruction to students. This bill has passed the Senate. If enacted, rural districts will likely lack the certified instructors or resources to meet the requirement. SERRC could support schools by providing certified instructors and training programs to help districts implement CPR instruction.	This project will build on SERRC’s Southeast Alaska Area Health Education Center (AHEC) programming by establishing a Health Education Coordinator who will travel to rural communities across Southeast Alaska to deliver healthcare education and workforce training. SERRC already works closely with school districts throughout the region. Leveraging these relationships, the coordinator will schedule visits with rural schools to provide hands-on healthcare training, certification opportunities, and career exposure for students. Programming will be delivered on site in rural schools by SERRC staff who are certified instructors in CPR, First Aid, Basic Life Support, and Mental Health First Aid. Students will also receive information about healthcare career pathways including Certified Nursing Assistant (CNA), Emergency Medical Technician (EMT), and other health professions. Health career camps and additional career exploration opportunities may be coordinated with SERRC’s Alaska Transition Outcomes Project (ATOP). When traveling to communities, the coordinator will also offer continuing education opportunities for healthcare workers and community members. Trainings may include CPR recertification, Mental Health First Aid, trauma-informed care, behavioral health awareness, and cultural proficiency. Over the course of the project, the coordinator will travel to approximately six rural communities annually, reaching approximately 80 K-12 students and providing continuing education opportunities for approximately 20 adult professionals.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

SERRC - Alaska's Educational Resource Center	Youth Brain Injury Program Expansion	AK	The Epidemiology Bulletin Traumatic Brain Injury in Alaska (2023) highlights Alaska’s disproportionately high TBI rates, the urgent need for targeted prevention, and gaps in access to treatment and supportive services. A Centers for Disease Control and Prevention (CDC) report to Congress similarly identifies TBI in children and adolescents as a significant public health burden and emphasizes the need to close gaps in assessment, service access, and coordinated care. Despite this documented need, Alaska lacks the infrastructure that many states have established to support students with brain injury. There is no statewide framework for school-based concussion management, consistent communication gaps between schools and medical providers, limited awareness of brain injury impact, and access barriers to specialized support and training. Without timely identification and support, students are more likely to experience persistent symptoms such as cognitive difficulties and nervous system dysregulation. These challenges are associated with increased risk of academic failure, justice system involvement, mental health conditions, substance misuse, and suicide, all critical concerns across Alaska. This project addresses the well-documented statewide gap by establishing the Youth Brain Injury Program as Alaska’s centralized resource and expanding its successful model to ensure statewide access to prevention, early identification, and coordinated school-based support.	In 2023, the Alaska Department of Health approached SERRC, Alaska’s Educational Resource Center, with a request to develop a system of support for students affected by brain injury. The resulting Youth Brain Injury (YBI) Program has successfully established an innovative, scalable model tailored to Alaska’s unique geographic and service challenges. Initial limited Mental Health Trust funding and a small sole source contract with the Department of Health have built a strong foundation; however, new funding is needed to expand statewide consultation, screening, and school-based support for students with brain injury. In year one, the proposed expansion model closes rural service gaps by strengthening statewide coordination and building local capacity in three key domains: 1) Expansion of Division of Juvenile Justice Brain Injury Support: Scale staff training and universal brain injury screening to 100% of Alaska juvenile probation offices. Expansion will ensure access to educational accommodations and coordinated community support for justice-involved youth with brain injury. 2) School District Capacity Building: Pilot a school-based Brain Health Liaison (BHL) program in five rural or frontier communities, building local capacity with the support of certified brain injury specialists. Collaborate with five school or community partners to expand use of the “Defend Your Brain” curriculum and increase access across districts. Pilot software tools that support real-time educator training and return-to-school protocols for students with brain injury in three school districts. 3) Community Partnerships and Systems Development: Develop new partnerships to position the YBI Program as a centralized statewide resource coordinating brain injury prevention, identification, and recovery support across Alaska. Deliverables include establishing at least five new referral partnerships in medical, educational, or juvenile justice systems; developing and disseminating model concussion and TBI management policy guidance to five school districts or partner agencies; and deliver professional development sessions to 10 new audiences across education, health care, social services, public safety, and tribal partners.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Set Free Alaska Inc	Rural Health EHR & Systems Modernization TA Initiative	AK	SFA operates two primary EHR systems—AKAIMS and CareLogic—alongside eCW for medical billing and claims. These systems do not fully integrate with one another or with external platforms, resulting in duplicate data entry, reporting burdens, and limitations in delivering fully coordinated behavioral health and medical services. Internal operational workflows also remain inconsistent and lack standardized, organization-wide protocols. This fragmentation limits efficiency, reduces scalability, and constrains leadership’s ability to leverage data for strategic growth. By conducting a comprehensive evaluation of both technology platforms and internal operational systems, SFA can identify opportunities to modernize, streamline, and better align processes while enhancing interoperability and data-driven decision-making. Without intentional modernization, these system gaps will continue to increase administrative burden and restrict the organization’s capacity to expand sustainable rural healthcare services. This Readiness Grant will enable SFA to engage expert consultants to provide TA, identify the optimal modernization pathway, and deliver recommendations for EHR consolidation, replacement, or enhancement, alongside operational workflow redesign. By leveraging this external expertise, the organization will establish a sustainable and innovative infrastructure foundation that maximizes access, efficiency, accountability, and quality across rural healthcare settings.	This project will follow a phased and structured approach to evaluate technology and operational systems, leveraging a dual-consultant model to ensure specialized expertise and independent, actionable recommendations. Year One (April–September 2026) will focus on readiness, evaluation, and strategic planning, while Year Two (October 2026–September 2027) will concentrate on implementing selected modernization strategies. By intentionally separating evaluation from execution, the organization reduces risk, strengthens governance oversight, ensures data-informed decision-making, and enhances long-term sustainability. In April 2026, SFA’s executive leadership team, including the CEO, COO, CFO, Director of Compliance, and Director of Strategy and Innovation, will attend the National Council for Mental Wellbeing’s NatCon Conference to conduct a formal market scan, identify emerging vendor solutions, and inform consultant selection. Engagement at NatCon will provide exposure to national best practices in integrated behavioral health EHRs, interoperability standards, and technology-enabled operational improvement. Insights gathered during this conference will ensure that selected consultants possess relevant expertise, current market awareness, and the capacity to tailor recommendations to rural and frontier behavioral healthcare environments. Following the market scan, two consultants will be engaged to produce independent and complementary recommendations. The first consultant will focus exclusively on EHR systems evaluation, assessing AKAIMS, CareLogic, and eCW functionality, interoperability capacity, day-rate billing requirements, reporting capabilities, and total cost of ownership. The second consultant will evaluate agency-wide operational workflows—including intake, documentation, billing, reporting, and administrative processes—providing recommendations for standardization, automation, policy alignment, and efficiency gains. Year One will conclude with two independent consultant reports and Board-level review of proposed modernization pathways. Year Two will focus on executing selected strategies in alignment with Rural Health Transformation Program Goals and Initiatives.	\$50,000- \$250,000	Behavioral health/su- bstance use disorder treatment	Multi- Community or Participating in Regional Hub-and- Spoke	Kenai Peninsula Borough; Matanuska- Susitna Borough	Advance to Implementati on Application

Set Free Alaska Inc	Telehealth Enhancement & Rural Model Development	AK	Across rural Alaska, communities lack access to co-occurring, dual-diagnosis IOP behavioral health services due to persistent workforce shortages and low population density. Smaller communities cannot recruit or sustain the licensed clinicians necessary to operate the group frequency and billable hours required for a full IOP program. This gap results in delayed care, untreated behavioral health conditions, repeated crisis utilization, or the need to relocate for services. Over the past year, SFA has engaged with referring providers, community partners, and other local stakeholders across the Kenai Peninsula to understand service needs. These discussions revealed a lack of readily available OP services and long waitlists for comprehensive assessments and IOP treatment, underscoring the urgent need for expanded, accessible programming in the region. The opportunity is to redesign how intensive behavioral health services are delivered in rural Alaska. Rather than replicating full clinical infrastructures in every community, Alaska must evolve toward a scalable hub-and-spoke model that leverages telehealth, centralized clinical teams, and local peer and crisis support capacity. By shifting administrative and clinical group functions to a central hub while maintaining in-person peer support and crisis “light” services locally, rural communities can access co-occurring, dual diagnosis OP/IOP programs without needing to independently sustain a complete clinical workforce.	In Year 1, the model will be implemented across Homer, Kenai/Soldotna, and Wasilla to establish a fully operational regional network. In Homer, services will expand to include in-person peer support and crisis “light” engagement supported by upgraded telehealth capabilities that connect clients to centralized clinical services. In Soldotna, SFA will remodel its newly acquired outpatient facility, hire core staff including a program coordinator, peer support specialists, and administrative personnel, and launch OP/IOP services supported by enhanced telehealth infrastructure. This phase serves as a proof-of-concept period in which the model will be implemented, tested, and refined to ensure operational, clinical, and financial viability. Simultaneously, telehealth systems at the Wasilla Therapeutic Campus, including outpatient and residential programs, will be strengthened to support centralized clinical delivery across all sites. Clinical groups, assessments, and therapeutic services will be delivered through secure telehealth platforms linking rural hubs to Wasilla-based and remote licensed clinicians, including out-of-state providers. Embedded peer staff in each community will provide in-person group engagement, care coordination, and community-based crisis intervention designed to stabilize individuals and connect them to treatment before conditions escalate. In Year 2, the project will shift toward strengthening performance, optimizing workflows, and solidifying service integration in Homer and Kenai/Soldotna. Data-driven refinements will improve care coordination, staffing efficiency, and client engagement to ensure long-term operational stability. Year 2 also begins the exploration and planning for expansion into at least one additional rural hub, with Bethel, Kotzebue, and Utqiagvik identified as potential sites. SFA will assess feasibility, community readiness, and resource requirements before moving forward with development and implementation into at least one of these communities. This phased implementation creates a scalable rural behavioral health infrastructure that expands access, strengthens workforce capacity, and delivers high-quality care across geographically dispersed communities. By combining centralized clinical expertise with locally embedded peer support, SFA ensures services are both clinically rigorous and community-responsive. This approach enables sustainable growth and responsible expansion into additional rural regions.	\$250K-\$1M	Behavioral health/su bstance use disorder treatment	Multi- Community or Participating in Regional Hub-and- Spoke	Kenai Peninsula Borough; Matanuska- Susitna Borough	Advance to Implementati on Application

Seward Community Health Center	Seward Community Health Center Rural Clinic Infrastructure Planning & Design	AK	SCHC operates in clinic space that was never designed for a growing rural primary care practice. With only two rooms per provider and minimal space for behavioral health or specialty care, patients experience longer waits, fewer appointment options, and limited onsite services. Rural residents routinely travel long distances for specialty care because SCHC does not have space to host visiting clinicians consistently. SCHC owns a one-acre parcel immediately north of the Critical Access Hospital and has long envisioned it as the future site of a new clinic. At the same time, the City of Seward – owner of the hospital building – has expressed willingness to accept federal interest and is open to exploring a jointly beneficial expansion. A modern clinic designed around patient flow, integrated care, and flexible community-use space is essential for sustaining health access for Seward and Moose Pass.	This project focuses solely on planning and design. SCHC will work with Alaska-experienced architects and engineers to complete full schematic design, design development, and construction-ready drawings. Work will include patient-flow modeling, room standardization, infection-control planning, and integrated behavioral health design. Design will also include a multipurpose community room with a teaching kitchen to support hands-on health education, healthy cooking classes, family nutrition programs, and community wellness events. SCHC will evaluate both potential building paths: constructing a standalone clinic on SCHC-owned land or expanding the hospital building in partnership with the City of Seward. The feasibility review will compare capital costs, operating costs, patient access, workflow, and design flexibility. Co-location could offer substantial advantages for rural patients – lab work and imaging across the hall, reduced overhead, and shared utilities – while a standalone clinic may offer greater design freedom and long-term expansion potential. The project also includes telehealth- and HIE-ready specifications, community engagement, and development of a construction financing strategy using technical assistance (fund development planning only, no fundraising activities).	\$1M-\$5M	Federally qualified health center	Single Community	Kenai Peninsula Borough	Advance to Implementation Application

Seward Community Health Center	Clinical Equipment Modernization & Diagnostic Capacity Upgrade for Rural Primary Care	AK	Core clinical equipment at SCHC is 20–30 years old, most of it inherited when SCHC took over clinic operations in 2014. Much of it appears original to the 1996 facility, far beyond typical medical equipment lifecycles. These aging assets impair safe procedures, reliable sterilization, cardiopulmonary triage, and infection-control. Only two rooms have adequate air filtration; exam tables create accessibility and safety concerns; and the legacy EKG system is incompatible with our EHR (Epic), causing delays and higher documentation risk. SCHC budgets modestly for small annual equipment replacements but lacks an established reserve fund capable of modernizing an entire diagnostic and exam infrastructure. Without RHTP support, outdated equipment will continue to impede safe, equitable care for rural residents who deserve the same standard as urban Alaskans.	Through this project SCHC will procure and install: (1) five ADA-accessible exam tables and one procedure table; (2) a reliable, clinic-scale autoclave; (3) four portable HEPA filtration units to achieve safe respiratory evaluation capacity in all six exam rooms; (4) two oxygen concentrators for in-clinic stabilization; (5) three Abbott ID NOW units for rapid molecular testing; and (6) a GE MAC 7 EKG system integrated with Epic EHR. Additional small equipment will be purchased if funding allows. SCHC has vendor quotes or estimated pricing for more than half of these items and is purchase-ready. Vendor-supported staff training will be provided for the EKG system, the Abbott ID NOW platform, and the autoclave to ensure competency, safety, and longevity of use. Implementation plan (12 months): Months 0–2: ordering, site prep, IT integration planning, SOP drafts. Months 3–5: delivery, installation, validation, training, and go-lives for HEPA, autoclave, exam tables, oxygen, and ID NOW. Months 6–9: EKG/Epic integration, competency sign-offs, early PDSA cycles. Months 10–12: outcome review, workflow refinement, and sustainability transition.	\$50,000- \$250,000	Federally qualified health center	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Seward Community Health Center	Rural Care Coordination & "No Wrong Door" Referral Network	AK	The 2024 PSMC CHNA identifies fragmented navigation, delayed follow-up, and transportation barriers as major contributors to poorer outcomes in Seward. Many residents struggle to complete referrals or access specialty services outside Seward, and pregnant patients often relocate late in pregnancy to Anchorage or Kenai because local labor-and-delivery and NICU services are unavailable. Preventive care and follow up measures show room for improvement across all age groups, with gaps in screening completion, depression follow-up, and care plan adherence. These challenges point to the need for a coordinated approach that reduces navigation burden, supports timely care-gap closure, and strengthens continuity across medical, behavioral, and social services. A shared “No Wrong Door” model - supported by Epic Compass Rose, Azara DRVS, and structured RN led care management - would help ensure residents receive timely referrals, warm handoffs, consistent follow up, and improved navigation support.	Years 1–2: Build (Incubator Phase): • Hire an RN Case Manager and Program/Grant Manager. • Configure Epic Compass Rose for referral tracking and integrated navigation. • Begin workflow design and baseline data governance. • Train up to two internal Epic Super Users to support long term EHR optimization, workflow alignment, and navigation enhancements. • Launch core “No Wrong Door” (NWD) referral partnerships to support warm handoffs and shared coordination pathways using Compass Rose and Azara DRVS. Years 3–4: Formalize & Scale: • Formalize partner roles and strengthen workflow reliability. • Expand the NWD referral network to include more medical, behavioral health, and community organizations. • Continue internal EHR optimization and best practice development supported by trained Super Users. • Begin payer-readiness activities for Medicaid and Medicare value based payment (VBP) pathways. Year 5: Optimize & Innovate: • Enhance SDOH linkages and targeted outreach workflows. • Advance technical improvements and refine care management infrastructure. • Prepare for emerging VBP models through exploratory planning and pilot testing. Monitoring & Continuous Improvement: • Monthly Compass Rose review • Monthly Azara DRVS review • Quarterly PDSA cycles • Iterative refinement based on outcomes and partner feedback	\$250K-\$1M	Federally qualified health center	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Seward Physical Therapy LLC	Seward Physical Therapy: provide direct access to PT services and cultivate a healthier community.	AK	I want to help decrease the barrier of receiving physical therapy services due to needing a referral prior to starting physical therapy as well as provide the community with a consistent provider that is involved in the community and knows the unique needs and struggles of our rural town. I want to provide physical therapy services to people quickly so that acute injuries can heal properly and decrease long term impairments. By giving the community another option for direct access physical therapy, patients will also initiate therapy when they are most motivated to improve, therefore increasing the chances of early healing and improving overall health. Currently there is no formal injury prevention program for athletics in the schools or in collaboration with school sports. I want to create a relationship with the high school and middle school athletics to aid in acute injuries and overuse injuries. I want to create an injury-prevention program for athletes to complete prior and during their sport season that is sport specific to decrease common injuries. I want to help implement fall prevention strategies to community members with collaboration of the senior community to decrease falls and decrease the severity of falls. Lack of healthy lifestyle education is prevalent amongst community members. I want to help educate the community on importance of physical activity and how it can improve and prevent chronic health conditions.	I am starting a physical therapy clinic, Seward Physical Therapy LLC, that will address the previously listed issues. By having my own practice, I can focus on addressing community needs without other organizational limitations. I plan to highlight the ability to access physical therapy without need of a referral and promote that knowledge to community members via community outreach. The outpatient clinic will function and run like any other outpatient clinic, with scheduled non-patient times to focus on implementing programs to address the listed issues. During the program building time I will create: 1. Injury prevention home exercise program (HEP) for middle school and high school sports. Each HEP will be specific to the sport. 2. Create a workshop to educate community members on importance and benefits of consistent exercise and how to implement daily changes to create an exercise habit. 3. Collaborate with the senior center and Alaska Falls Prevention CoP to implement fall prevention material, and safe home suggestions and modifications.	Under \$50,000	Specialist	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Seward Prevention Coalition	Early Head Start Expansion to Strengthen Rural Maternal Health and Workforce Stability in Seward	AK	Rural Alaska faces persistent barriers to health care access driven by geography, workforce shortages, and limited service infrastructure. These challenges are particularly significant for pregnant and postpartum women and families with young children who often experience difficulty accessing coordinated prenatal care, behavioral health services, and early developmental supports. The Alaska Rural Health Transformation Program identifies poor maternal and infant health outcomes and behavioral health needs as statewide priorities requiring upstream, community based solutions. In Seward, these challenges are compounded by a severe gap in Early Learning and Care capacity for children from birth to age three. Local estimates indicate Seward has approximately 60 to 80 infants and toddlers under three each year, while existing licensed programs can serve only 10 children under 30 months, leaving families without access to early learning and care. This project addresses the opportunity to expand Early Learning and Care through a partnership between the City of Seward, owner of the Providence Seward Mountain Haven facility, and Chugachmiut Early Head Start. By creating additional Early Head Start capacity at Seward Mountain Haven, the project strengthens early developmental environments and improves families’ ability to access preventive health services, developmental screenings, and coordinated supports that contribute to healthier maternal and child outcomes in rural communities.	This project expands Early Learning and Care capacity for children birth to three through a partnership between Seward Prevention Coalition, Chugachmiut Early Head Start, the City of Seward, and Providence Seward Medical Center. The City of Seward owns the Mountain Haven facility, creating an opportunity to adapt existing infrastructure to support Early Head Start programming serving Seward and surrounding rural communities. The proposed approach focuses on establishing an Early Head Start classroom within Seward Mountain Haven that provides Early Learning and Care services aligned with the federal Early Head Start model. The program will support infants, toddlers, and their families through developmental screenings, family partnership planning, early relational health supports, and coordinated referrals to health and behavioral health providers. Embedding Early Learning and Care within a facility connected to health services improves coordination between early childhood systems and rural health infrastructure. Minor facility modifications will prepare existing conference space at Mountain Haven to support infant and toddler learning environments. Improvements will include sleep spaces, changing areas, sanitation infrastructure, and developmentally appropriate classroom materials. These upgrades allow the community to leverage an existing building rather than constructing new infrastructure. The project also supports recruitment and preparation of early childhood staff and the coordination needed to launch Early Head Start services. Seward Prevention Coalition, through the HYPER program, will coordinate implementation including partnership alignment, facility preparation, program startup, and community outreach. The Early Head Start classroom will be staffed by four Early Head Start teachers consistent with federal infant and toddler ratios, with Seward Prevention Coalition providing a project coordinator responsible for implementation oversight, partner coordination, and startup support. This partnership benefits Chugachmiut and its tribal beneficiaries by supporting expansion of Early Head Start services within the region and increasing access to comprehensive early childhood services for families. By expanding Early Head Start capacity in Seward, the project strengthens early childhood development, improves family stability, and increases access to coordinated health and behavioral health supports aligned with RHTP priorities.	\$250K-\$1M	Single Community	Kenai Peninsula Borough	Advance to Implementation Application

Seward Prevention Coalition	Alaska Prevention Model Pilot: Seward Youth Wellness & Resilience System	AK	Seward is facing a youth mental health crisis with limited rural capacity and fragmented pathways to early support. Provider shortages and long wait times mean many youth and families do not receive help until concerns escalate into high-acuity, high-cost crises. Local data show urgent gaps: 70% of female teens report poor mental health and 50% report high stress across indicators. We also see steep progression risk from first-time to regular cannabis use (40% to 32%), increasing long-term health costs. These pressures raise risk for substance misuse, and chronic stress-related health conditions. In rural systems with provider shortages and long wait times, families often do not receive support until challenges escalate into high-acuity, high-cost crises. This creates a costly cycle: stress and mental health concerns go unaddressed, substance use risk increases, and families rely more heavily on emergency response or intensive services that are harder to access in rural Alaska and far more expensive than early support. The opportunity is that Seward has a well-established coalition and cross-sector partners ready to implement a coordinated, data-driven prevention and navigation system. By piloting an Alaska Prevention Model adapted from IPM we can strengthen protective factors, create clearer early help-seeking pathways for caregivers and youth, and reduce long-term costs by preventing escalation before it reaches the most expensive parts of the health system.	We will pilot a replicable Alaska Prevention Model adapted from the Icelandic Prevention Model (IPM) and powered by Planet Youth data to address urgent local priorities: youth mental health, stress, substance use, ACE reduction, and stronger “skill discovery” and belonging. This approach aligns with Alaska RHTP initiatives for Health Care Access, Healthy Communities, Healthy Beginnings, and Strengthen Workforce and is implementation-ready through four coordinated roles and a shared workplan. Work-stream 1: Prevention Operating System (IPM + Planet Youth). An IPM Coordinator will restructure coalition governance and partner commitments under IPM and lead the full prevention cycle: data review, dissemination, priority setting, and a measurable action plan. The Planet Youth partnership will support ongoing data infrastructure and training so partners use shared indicators and strategies. Work-stream 2: Youth & Family Front Door (prevention + navigation). A School Prevention Specialist & Resource Connector will provide prevention-focused supports (stress regulation, coping skills, belonging/skill discovery, protective factors) and create efficient pathways to appropriate services through warm handoffs and access to free transportation. This directly responds to local data showing high levels of distress and stress among teens. Work-stream 3: Parenting Seward (0–18 caregiver capacity). With CHSC, we will build Parenting Seward, a locally tailored 0–18 caregiver hub modeled after ParentingMontana.org. It will centralize trusted guidance, supports, and referrals, strengthening Early Childhood Development through adolescence by improving caregiver knowledge, help-seeking, and connection to resources. Work-stream 4: Workforce and thriving adulthood pathways. A Career Pathways Coordinator will build career-connected learning and “grow our own” pathways with AVTEC, employers, and health partners to strengthen long-term rural stability, including healthcare-adjacent options and local training pathways. Accountability: A Project Coordinator will oversee compliance, spend-out, and reporting, and support partner implementation tracking. Year-1 measurable targets (modest, realistic): serve 300+ students through Prevention Specialist; complete 30 warm handoffs/referrals with follow-up; launch Parenting Seward within year one and reach 500+ caregiver users/visits; train 30–60 coalition partners/community leaders, support 25–40 youth placements/pathway engagements.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Shiftfocus LLC	Keeping Alaska's Investment: A Rural Health Career Development Ecosystem	AK	The RHTP will bring new talent into rural health careers through grow-your-own programs, expanded residencies, and service commitments. To protect that investment long-term, Alaska needs a shared infrastructure that gives health professionals a visible, compelling career arc that keeps them in state. The highest-risk window is years three to five, when professionals have proven their capabilities and become attractive to out-of-state recruiters. Service commitments buy time, but when they end, professionals need to see where they go next within Alaska. The goes beyond retention at any single organization. Transformation happens when we shift from organizational retention to system-level retention. A worker who develops at a village clinic and moves to a regional hospital carries rural knowledge into a larger system. A behavioral health provider who grows at a regional facility and steps into a hub leadership role brings that continuity with them. Over time, this intentional circulation builds leaders at every level with experience across Alaska's full care continuum. This requires a shared career development ecosystem where every organization knows how to recruit and onboard for the roles it provides, develop people while they are there, and prepare them for what comes next. When organizations are connected this way, talent moving between them strengthens the whole system. This is how Alaska turns a workforce investment into a leadership pipeline.	This project proposes a Portable Career Development Ecosystem for Alaska's rural health workforce, creating shared infrastructure that connects organizations across communities so professionals can see, plan, and pursue a career within Alaska's health system. This is a concept formation project. The intended outcome is a validated, pilot-ready framework with stakeholder support, positioned for expanded implementation in subsequent RHTP funding cycles. The project has three components: First, career pathway mapping. Working with a workforce partner, we will document how key rural health roles are distributed across facility types, from village to regional to hub facilities. For each role, we will define what it means to learn the role, perform well in the role, and be ready for the next opportunity. This creates a shared vocabulary that works across organizations. When a professional moves from one facility to another, both organizations will have a common understanding of that person's readiness and development needs. Second, manager development. Managers are a critical part of any retention strategy. We will develop and test training that equips rural health managers to assess where people are in their career, have effective development conversations, onboard new staff using shared standards, and prepare high performers for their next step. This will be tested with a small rural cohort to validate the approach before broader deployment. Third, stakeholder validation and evaluation design. We will engage at least two rural health facility types to test career maps, gather input on real-world career progression patterns, and assess organizational appetite for a shared development framework. Working with these stakeholders, we will co-develop measures for tracking the framework's impact on retention and talent development, producing the evidence base needed to support expanded piloting in Year 2. This project is personal. As a born and raised Alaskan, I have watched skilled professionals get recruited out of state for decades. As the leader of a technical consulting firm in Alaska, I lived this problem. I built the culture, the systems, and the frameworks that kept our people here and developed them into leaders. I learned that managers are the key to retention, and giving them practical tools and shared frameworks is what empowers them to succeed. That experience is the foundation of this proposal.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Copper River Census Area; Fairbanks North Star Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Shiftfocus LLC	Protecting Alaska's Investment: Leadership Support for RHTP Projects	AK	Alaska's RHTP will fund dozens of complex transformation projects across all six initiatives. These projects will be led by healthcare professionals who may be navigating new territory: managing large-scale change, coordinating across organizations, and leading teams through uncertainty. The RHTP has planned operational TA for the mechanics: applications, financial management, reporting, and data collection. But the difference between a project that meets its reporting requirements and one that actually transforms health care delivery is the people leading it. Research shows that fewer than half of organizational change initiatives meet their objectives, and that leadership support is the single largest predictor of success. RHTP projects will face these same dynamics in Alaska's unique environment. When a multi-million dollar project stalls because a team can't align, the cost isn't just the lost dollars. It's the lost trust and the lives impacted because they have to keep waiting for healthcare transformation. The RHTP includes TA as an allowable use of funds. This project is for a specific type of TA: supporting the people delivering transformation through a program that turns insights across projects into value for the whole program. This project protects Alaska's RHTP investment by supporting the people who will determine whether these projects succeed.	This project creates a coaching TA program for RHTP grantees with three components: a vetted coaching pool, a structured engagement process, and an Alaska-based coordinating entity. The coaching pool is anchored by Terawatt, a coach-matching platform with 80+ coaches whose credentials have been validated through an established vetting process. The pool will grow, adding Alaska-based coaches and specialists using the same vetting standards. This provides a deep, diverse, and expanding pool available to support projects. To access coaching, grantees will work with the DOH program office and ACF to determine their needs. They will select a coach based on project needs, budget, and the coach's area of expertise. Coaches will complete an orientation on Alaska Native peoples' cultural context, rural and frontier health delivery realities, and the specifics of the grantee's project at the start of an engagement. A post-mortem is conducted at the close to capture outcomes and identify cross-project themes. The coordinating entity, Shiftfocus, administers the program in Alaska. Shiftfocus founder Brian Walch is a lifelong Alaskan who built the systems that grew a technical consulting firm from 20 to over 200 employees. He knows what it takes to keep skilled professionals in Alaska. Shiftfocus ensures that every coaching engagement is set up to succeed and that the program as a whole delivers value beyond any single engagement. It prepares coaches, provides project-specific support, and conducts structured close-outs that capture what's being learned. Across engagements, Shiftfocus identifies patterns and surfaces them to DOH, such as common barriers grantees are facing or emerging needs the program could address. That cross-project visibility is what turns individual coaching into a program-level asset, creating opportunities to convene grantees around shared challenges or to develop resources that benefit the broader RHTP community. Year 1 stands up this infrastructure and puts it to work, actively placing coaching into approximately 10 grantee projects. Those first engagements will test the model, generate early cross-project insights, and provide the evidence DOH needs to continue investing in the people leading rural health transformation.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Shiloh Community Housing Inc.	Community Resource Center (CRC) Health, Wellness & Workforce Hub	AK	Alaska’s vulnerable residents face a fragmented and difficult-to-navigate system of care. This challenge is especially acute for rural Alaskans who must travel to Anchorage, the state’s primary hub for specialized social services. Older Alaskans, families with children, and individuals are impacted by a system where essential services are scattered across multiple agencies and locations. Behavioral health services, housing support, benefits enrollment, and workforce programs are typically located in separate facilities with different scheduling systems, eligibility requirements, and intake processes. Individuals are forced to independently coordinate multiple services during a limited window of time in the city. Systemic barriers such as appointments delayed, canceled, or missed, the entire chain of care can collapse. Individuals frequently return to their communities without completing treatment plans, securing benefits, or stabilizing their housing situation, resulting in reliance on high-cost emergency and crisis services. A one-stop-shop for health and wellness services, workforce development programs, housing navigation, benefits assistance, and partner-led support, allows individuals and families to address multiple needs during a single visit. Shifting the system toward integrated, preventative, and community-based care, the CRC will improve outcomes for vulnerable populations while generating long-term efficiencies across Alaska’s healthcare and social services.	SCHI established the CRC as a comprehensive, trauma-informed hub that co-locates traditional and non-traditional service providers on a single campus. Renovations will upgrade and update and of the 2nd floor and enhance other areas of the center: • Health & Wellness Center: Space for physical health supports, behavioral health services, wellness education, and care coordination and navigation, with telehealth infrastructure for rural patients traveling through Anchorage. Providers will schedule same-day appointments, coordinate follow-up care before patients depart, and connect individuals to telehealth services once they return home. This directly advances RHTP’s Health Care Access and Healthy Community and long-term services and support. • Workforce Development & Job Center operated by the DOL integrates SCHI’s established workforce programming to provide work readiness training, digital skills, and employment credential pathways strengthening Alaska’s workforce initiatives. • Financial literacy operated by local banks and economic development consultants will deliver money management education. Income instability is among the most consistent upstream predictors of poor health outcomes; this programming addresses it at the root. • Childcare accessibility and affordability are significant barriers for many individuals and families seeking essential services. Parents and caregivers who are responsible for young children often face difficult choices when attempting to attend appointments. Without safe and reliable childcare, many are forced to postpone or completely forego these critical services. This barrier disproportionately impacts single parents, caregivers of multiple children, and rural visitors who travel long distances to access services within urban centers. On-site childcare within a service delivery setting significantly reduces barriers by allowing parents and caregivers to fully engage in the services designed to support their stability and well-being. • Commercial Partner Office Suites: Nine or more spaces for partner agencies (health providers, social service organizations, state and local programs), enabling warm handoffs, co-located case management, and integrated service delivery under one roof. Operationally, the CRC will function as a coordinated entry point and referral workflows. Community outreach will move clients, especially rural Alaskans, from immediate needs to stabilization to long-term health and economic wellbeing.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Shiloh Community Housing Inc.	Cultivating a Rural Health Workforce Pipeline: LIFE@Work for Adults	AK	Alaska's health care system faces compounding workforce pressures. A 2023 State report found that more than 500 primary care and behavioral health positions remained unfilled statewide, with rural and remote communities disproportionately impacted. Turnover in frontline health care support roles runs 30 to 40% annually at some facilities, driving up costs and eroding care continuity. Meanwhile, thousands of Anchorage adults are underemployed and lack access to short, structured training pathways that lead to family-sustaining wages. SCHI's LIFE@Work program is an operational, evidence-informed work-readiness model serving youth ages 16 to 25. This proposal expands the proven platform to serve adults ages 25 to 55 by introducing a new health care support track focused on care navigation competencies. The new track will complement existing curriculum offerings and further strengthen the program's workforce development pathway. Alaska RHTP Initiative #5 identifies workforce development and care navigation as priorities for system transformation. No existing Anchorage-based workforce program combines adult reskilling, care navigation training, and integrated wrap-around supports in one program. This planning grant will support the design work needed to close that gap.	LIFE@Work will use 12 months of RHTP planning funds exclusively to design and validate an adult health care support track. This planning phase will produce an implementation-ready program for the next RHTP cycle. Building on LIFE@Work's fully remote operations during COVID, SCHI has the capacity to deliver curriculum and training virtually to improve access for participants who face transportation, caregiving, or geographic barriers. The planning phase is structured across four evidence-based design activities. During months 1 through 4, SCHI will adapt the LIFE@Work curriculum for adult learners using adult learning principles, trauma-informed instruction, and health literacy frameworks, and best practices while defining core care navigation competencies such as patient communication, HIPAA and confidentiality, motivational interviewing, system and benefits navigation, referral coordination, documentation, and related workplace readiness skills; SCHI will also map potential credential and certification options (including Community Health Worker pathways) alongside minimum employer hiring requirements. During months 3 through 6, SCHI will design a structured internship and externship model with employer partners, including supervision standards, learning objectives, feedback loops, and progression criteria, and will engage at least three employer sites spanning clinic, hospital, and community-based settings to ensure alignment with real hiring needs. During months 4 through 8, SCHI will formalize partnerships by executing MOUs with participating health care employers; health care professionals will assist in defining clear roles and responsibilities, referral protocols, and accountability structures for each partner according to best practices for remote learners. During months 8 through 12, SCHI will complete implementation readiness work by finalizing a recruitment and retention plan, outcomes and data collection framework, participant support budget, staffing model, and launch a budget for the first implementation cohort, culminating in a comprehensive, implementation-ready plan for RHTP review. CRC co-location with DOL eliminates a common barrier in workforce programs: Participants benefit from coordinated services such as unemployment assistance, workforce training programs, labor market data, and career pathway planning. This integrated model supports participants from training through job placement.	\$250K-\$1M	Statewide	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Matanuska-Susitna Borough	Deferred or Not Advanced

Shiloh Community Housing Inc.	SCHI Capacity Forward: Technical Assistance for RHTP Program Development and Administration	AK	SCHI has the vision, the community relationships, and the organizational foundation to be a meaningful RHTP participant. What it needs is the capacity to do so at full strength. As RHTP funding comes online, the demands on small organizations are substantial. Competitive applications require fluency in CMS requirements and RHTP criteria; assistance with detailed implementation plans, evidence-informed curricula, HIPAA-compliant workflows is needed. Expanded federal funding carries administrative obligations, including reporting, fiscal controls, and monitoring systems. Existing staff cannot absorb these requirements. SCHI has developed program concepts addressing multiple RHTP initiatives, including health care access, workforce development, and community-based health support. Each requires substantial design work before it can be implemented with the fidelity that measurable outcomes demand. Technical assistance is sought. This proposal requests a targeted, time-limited investment in technical assistance that directly unlocks larger, longer-term rural health investments. A skilled contractor performs the specialized work that allows SCHI’s programs to launch with fidelity, operate with CMS compliance, and produce the measurable outcomes RHTP targets. This is not overhead. It is the enabling investment that assist in quality assurance of program offerings.	SCHI will engage a qualified technical assistance contractor using a qualifications-based selection process, requiring demonstrated experience with federal health program grant writing, rural health systems, CMS compliance standards, and Alaska-specific community contexts. Contractor support will be organized across four domains: Grant Writing and Application Development: The contractor will lead or substantially co-develop RHTP full proposals and future-cycle funding applications, including needs assessments, program narratives, logic models, outcome frameworks, and budget justifications aligned with RHTP evaluation criteria. Each application will be grounded in RHTP’s evidence standards, demonstrate clear rural impact, and satisfy CMS permissibility requirements, enabling SCHI to pursue RHTP cycles with competitive, well-substantiated proposals rather than reactively assembled ones. Program Design and Planning: The contractor will develop implementation-ready program designs across SCHI’s priority service areas, including health navigation, care coordination, workforce development pathways, and community-based health support. Each design will include a detailed workplan, milestone framework, risk management strategy, and adaptive management protocol aligned with RHTP’s workplan and monitoring criteria. Curriculum and Standards Development: The contractor will develop workforce training curricula for health care support and care navigation roles, including competency frameworks, adult learning adaptations, trauma-informed instruction approaches, and health literacy integration. The contractor will also draft standard operating procedures for service intake, referral coordination, HIPAA-compliant data handling, and care transitions between Anchorage-based and rural providers. Administrative and Compliance Infrastructure: The contractor will develop fiscal management procedures, reporting templates, data collection frameworks, and performance monitoring systems. This infrastructure supports CMS compliance and RHTP accountability requirements, ensuring that all funded programs are administratively sound from launch.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

Silver Tern LLC	Educating and enabling Alaskans in the healthcare management and prevention	AK	Silver Tern proposes a hybrid model of rotational village-based care and telemedicine services to address the unique healthcare challenges of Alaska’s rural, remote, and frontier communities. This approach improves access to high-acuity specialty care, strengthens local healthcare capacity, and reduces unnecessary medical evacuations (medevacs), all while maintaining cultural competency and continuity of care.	ilver Tern is headquartered in Alaska and operates with a focus on rural, remote, and frontier communities across the state. While Silver Tern does not maintain permanent brick-and-mortar offices in each community it serves, our staff—including clinicians, traveling RNs, and Community Health Aide Practitioner (CHAP) partners—are actively based in Alaska and operate throughout the region. Clinical operations are coordinated through regional hubs in Bethel, Nome, Kotzebue, and Dillingham, which serve as logistical centers for rotational village visits and telemedicine support. These hubs allow for efficient coordination of care, equipment distribution, and provider travel while supporting local partnerships with tribal and regional health organizations, including the Alaska Native Tribal Health Consortium, Southcentral Foundation, Yukon-Kuskokwim Health Corporation, and Norton Sound Health Corporation. Silver Tern’s team provides care through a hybrid model that combines in-person village rotations and telehealth services. This approach ensures that all participating communities have access to high-acuity specialty-informed care, consistent follow-up, and proactive chronic disease management, even in villages without permanent office space. By integrating our clinicians into local healthcare networks, we maintain a strong Alaska presence and ensure continuity of care while building sustainable partnerships with local healthcare providers.	\$250K-\$1M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

SimX, Inc.	Alaska Rural Maternal Health Workforce Readiness Initiative	CA	Alaska faces urgent maternal health challenges, especially in rural and Tribal communities. Between 2012 and 2021, rural maternal mortality rose by 184%, with Alaska Native women experiencing disproportionately high rates. In many rural areas, clinicians, nurses, EMS providers, and Community Health Aide/Practitioners must manage obstetric complications, such as postpartum hemorrhage and neonatal emergencies, without consistent training or specialist support. Persistent workforce shortages, skill decay from low patient volumes, and lack of simulation-based training compromise clinicians’ ability to manage maternal emergencies and deliver timely, high-quality prenatal, delivery, and postpartum care close to home. The SimX Alaska maternal health workforce readiness solution will strengthen rural maternal and early childhood health capacity through immersive simulation training for nurses, EMS, midwives, hospital clinicians, and Community Health Aide/Practitioners. Focus areas include obstetric emergency stabilization, neonatal care, and postpartum maternal health. Launching with Alaska Prehospital Education Consortium (APEC), Guardian Flight Alaska, and Alaska Native Tribal Health Consortium (ANTHC), this 1-year initiative will serve as a demonstration model to improve clinical competencies, reduce preventable complications, and sustain access to maternal services in underserved regions. It is implementation-ready and aligned with Alaska RHTP’s Healthy Beginnings initiative.	The proposed solution will deliver immersive simulation-based maternal and neonatal emergency training to rural clinicians. Alaska Prehospital Education Consortium (APEC) will serve as the clinical training hub, coordinating remote immersive VR training sessions for rural hospitals and clinics, while SimX will provide platform deployment, technical support, and simulation facilitation. Training will include instructor-led sessions and self-guided modules, allowing clinicians to maintain readiness despite geographic isolation and workforce constraints. Published studies of the SimX platform demonstrate that VR is an effective, learner-endorsed method for strengthening clinical preparedness, able to provide a 12% improvement in skills acquisition and up to 75% reduction in training costs compared to traditional manikin-based simulation. The initiative will initially deploy to 8 participating sites within the network and partner clinics serving rural and semi-rural populations in communities including Kodiak, Seward, Valdez, Eagle River, and the Mat-Su region. These sites include rural hospitals and affiliated clinics as well as partner community health centers and Tribal clinics that support maternal and infant health services. ANTHC is expected to collaborate in engaging Tribal clinics and Community Health Aide/Practitioner providers. Guardian Flight Alaska will participate in selected simulation exercises to strengthen coordination between rural providers and medevac teams. Training will focus on high-risk obstetric and neonatal emergencies that require rapid stabilization before medevac transfer. Core simulation scenarios will include postpartum hemorrhage, preeclampsia, shoulder dystocia, maternal sepsis, cord prolapse, neonatal resuscitation, and premature infant stabilization. Simulation sessions will occur biannually, supplemented by continuous on-demand training access so providers can refresh skills when caring for pregnant patients or preparing for potential delivery complications. Project evaluation will measure clinician competency improvement within simulation scenarios, number of providers trained, and participant satisfaction. Findings will inform refinement and potential expansion of the model. During the 1-year period, the initiative will establish an operational maternal emergency training network that can be expanded to additional rural hospitals, Tribal clinics, and EMS agencies in future RHTP phases.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Copper River Census Area; Denali Borough; Dillingham Census Area; Kenai Peninsula Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

SimX, Inc.	Alaska Rural Simulation & Clinical Competency Network (ARSCN)	CA	Alaska’s rural health system faces a structural workforce readiness challenge driven by extreme geography, low patient volumes, high turnover, and limited access to specialty backup. More than 80% of communities are off the road system and nearly all regions face Health Professional Shortage Area designations. Rural hospitals and EMS agencies have to manage high-acuity emergencies (e.g., maternal complications, trauma, behavioral health crises, chronic disease exacerbations) with limited opportunities for ongoing skills reinforcement. Low-frequency, high-risk medical events require rapid, confident clinical decision-making; however, workforce turnover and limited training access contribute to preventable patient transfers, costly medical evacuations, and reductions in local services that threaten access to care close to home. This project addresses a critical opportunity: to transform how Alaska develops, reinforces, and retains its rural clinical workforce. The Alaska Rural Simulation and Clinical Competency Network (ARSCN) will establish a statewide, technology-enabled training infrastructure that provides continuous, high-fidelity remote simulation training to rural hospitals, Tribal health organizations, EMS agencies, and training programs. By shifting from episodic training to ongoing, data-driven competency reinforcement, ARSCN will strengthen medical readiness, improve workforce retention, and stabilize essential services across rural and Alaska Native communities.	The Alaska Rural Simulation and Clinical Competency Network (ARSCN) will establish a statewide, implementation-ready workforce training and competency reinforcement infrastructure, directly advancing RHTP Initiatives #5 (Strengthen Workforce) and #6 (Spark Technology and Innovation). The ARSCN will deploy immersive, evidence-based virtual reality (VR) simulation to rural hospitals, Tribal health organizations, EMS agencies, and training programs. SimX’s immersive, multiplayer platform, which provides both cloud-based and offline operation to ensure full functionality in low-bandwidth regions and allows geographically dispersed teams to train together in real time, will enable clinicians across isolated communities to practice high-risk, low-frequency scenarios in realistic, interactive simulation environments. Multiple partners will be engaged during initial rollout. The approach includes four integrated components: - Statewide Simulation Deployment: Participating sites will be equipped with VR hardware, scenario libraries, and instructor tools to support maternal emergencies, trauma, behavioral health crises, chronic disease management, and/or team-based acute care. Mobile deployment kits delivered by mail will extend access to frontier facilities. - Workforce Pipeline Integration: VR simulation training will be embedded into CHA/P, nursing, EMS, and allied health training programs to expand clinical capacity and reinforce competencies prior to and during rural service. - Remote Simulation Coordination Hub: The ARSCN will establish regional hubs capable of facilitating remote, instructor-led simulation training to multiple rural sites simultaneously. - Performance Analytics: Competency tracking dashboards and LMS integration will be implemented to measure skill progression and workforce readiness over time. Timeline: Y1: Launch initial network deployment and establish the first regional simulation hub. Y2-3: Expand statewide deployment. Y4-5: Establish a fully operational statewide network with integrated analytics and continuous workforce training programs. By creating a technology-enabled competency infrastructure, ARSCN will shift rural workforce development from episodic continuing education to continuous readiness reinforcement, strengthening maternal and emergency care reliability and improving workforce retention across rural Alaska.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Sitka Counseling and Prevention Services Inc.	Sitka Counseling Therapeutic Services Expansion & Renovation Project	AK	This grant seeks to address the lack of adequate, safe, and accessible infrastructure to support early childhood mental health services and workforce development. Our Preschool and Family Center programs currently operate in two adjacent buildings originally built as family housing for the former Sheldon Jackson College and acquired by the agency in 2011. These buildings were not designed for clinical mental health services. The current facilities create significant operational inefficiencies and limit service capacity. The physical separation of two departments reduces clinical capacity and limits coordinated service delivery, supervision, and team-based learning. Staff transport materials between buildings, diverting time away from client care. Offices, therapy rooms, and waiting areas are multipurpose and insufficient, restricting program coordination and the efficient sharing of staff, supervisors, and clinical resources. The absence of designated group therapy rooms prevents or disrupts concurrent therapeutic sessions, and the shortage of clinical offices constrains the agency’s ability to hire additional clinicians despite documented community need. The facilities, physical buildings where we direct services to adults and adolescents, pose urgent and persistent safety, privacy, and accessibility risks. Transition areas between buildings are exposed to harsh weather, increasing the risk of slips and falls.	This planning grant will support preliminary work essential to renovating Sitka Counseling’s Preschool and Family Center facilities, primarily, as well as smaller improvement projects in for the Residential SUD, Adult Outpatient/Reception, and Adult/Teen rehab buildings. Funding will cover architectural and design services to create detailed renovation plans that address therapeutic needs, operational efficiency, safety, and accessibility. It will also support site preparation, including grading, leveling, and other groundwork necessary to ensure the property is construction-ready. Additionally, the grant will allow the agency to research and select appropriate therapeutic materials, furniture, fixtures, and signage to support clinical functionality, safety, and accessibility. Planning will include design considerations for interior space reallocation, upgrading building exteriors to address water damage and improve energy efficiency, replacing windows, repairing gutters, and enhancing insulation. The renovation plans will also make the facilities ADA-compliant by widening doorways, expanding bathrooms, adding a lift, and ensuring sufficient turn radius for wheelchairs. Safety and code compliance upgrades, such as a fire sprinkler system, will be incorporated, along with technological improvements, including strategically placed Ethernet connections, computers, and secure Wi-Fi, to support telehealth, training, and administrative operations. Investing in this planning phase will reduce risk and increase cost-effectiveness for the full renovation by identifying potential challenges early, ensuring compliance with safety and accessibility standards, and allowing informed decisions about design, materials, and operational workflows. These infrastructure limitations directly hinder the agency’s ability to expand and improve service capacity, develop its workforce, ensure safety and accessibility, and implement a sustainable hub-and-spoke model to extend specialized early childhood mental health expertise across rural Alaska. Upgrading the facilities is essential to meeting the growing mental health needs of individuals and families in Sitka, with an intent to extend reach to support outlying areas.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Single Community	Sitka (City and Borough)	Advance to Implementation Application

Sitka Counseling and Prevention Services Inc.	Early Childhood Mental Health Rural Collaborative (ECMHRC) Pilot Program	AK	The central problem this grant seeks to address is the lack of an integrated network for early childhood mental health services in rural Alaska. Early childhood care in rural Alaska faces two critical challenges: a shortage of clinicians trained in developmentally appropriate, evidence-based services for young children, and limited collaboration between community mental health agencies, schools, and tribal government social services. This gap hinders care that is both age-appropriate and culturally grounded. By establishing the Early Childhood Mental Health Rural Collaborative, this project presents an opportunity to connect providers, build regional networks, and offer culturally grounded, evidence-based training across rural Alaska’s early childhood social institutions. The collaborative will foster sustainable partnerships, streamline communication across systems, and enhance access to high-quality, culturally responsive services for young children and their families. In smaller communities, psychoeducation opportunities and evidence-based parenting psychotherapy groups remain extremely limited but are frequently requested by referring organizations, such as local school districts and the Office of Children’s Services. Evidence-based dyadic family therapy for young children and caregivers is also greatly inaccessible.	To address the lack of an integrated early childhood mental health (ECMH) network in coastal rural Alaska, this project proposes the Early Childhood Mental Health Rural Collaborative, with Sitka serving as the coordinating hub, piloting participation from Sitka, Yakutat, Cordova, and Valdez. Sitka Counseling will hire a program administrator to coordinate training, partnerships, and administrative functions, ensuring consistent communication and task management while minimizing administrative burden on local agencies, schools, and tribal governments. The collaborative will expand access to specialized training, including those such as DC:0–5 diagnostic training, Filial Therapy, Child-Parent Psychotherapy, and supporting credentials such as Registered Play Therapist (RPT) and Early Childhood Mental Health (ECMH) Endorsement. The collaborative will establish a network for regional reflective supervision to share clinical cases influenced by regional issues. In so doing it would promote problem-solving at both the individual psychotherapy and broader social service levels. It would also redistribute resources, such as tuition waivers, for qualified social service workers pursuing child-focused training. The initial communities included in this pilot program proposal were invited due to their limited access to clinicians trained in early childhood mental health, lack of integration within larger hospital systems, and reliable transportation connections through commercial air service and the Alaska Marine Highway ferry system. Sharing similar economic and cultural contexts, these towns provide an ideal foundation for a replicable, regionally informed collaborative model. The agency currently maintains contact with at least one organization in each community which has expressed initial interest in continuing discussions toward participation in the collaborative.	\$50,000- \$250,000	Behavioral health/su bstance use disorder treatment	Multi- Community or Participating in Regional Hub-and- Spoke	Chugach Census Area; Sitka (City and Borough); Yakutat (City and Borough)

Sitka Homeless Coalition	Comprehensive Care	AK	In rural Sitka, geographic isolation, limited provider capacity, transportation barriers, and weather-dependent travel make consistent access to health care difficult. For individuals experiencing homelessness or housing instability, these barriers are compounded by unstable living conditions, lack of reliable communication, and limited support navigating health systems. As a result, many delay preventive care, struggle to manage chronic conditions, and rely on crisis services when health needs escalate. Sitka Homeless Coalition recently opened Hítx’i Sáani, a 12-unit Permanent Supportive Housing community serving individuals with significant medical, behavioral health, and housing stability needs. The opportunity now is to strengthen that housing community and expand access to care through the development of SHC’s Services Building. The Services Building will serve as the operational hub for SHC staff, including case management, while also providing coordinated wraparound services and seasonal emergency winter shelter. By bringing care navigation, health system support, and partnerships with local providers into a single trusted location, the project will help residents and other high-need community members connect with primary care, behavioral health services, and preventive supports. This approach reduces barriers to care while supporting long-term health stability in a rural community.	Sitka Homeless Coalition will address barriers to health access by operating a centralized Services Building that integrates housing support, care coordination, and low-barrier access to health services. Located within the Hítx’i Sáani Permanent Supportive Housing community, the building will serve as the operational hub for SHC staff and the primary site for coordinated wraparound services. Case managers and support staff will work directly from the Services Building to assist residents of Hítx’i Sáani and other community members experiencing homelessness or housing instability. Staff will provide individualized care navigation, helping participants connect with primary care providers, behavioral health services, substance use treatment, and other community health resources. This hands-on support helps individuals overcome practical barriers such as transportation challenges, complex enrollment processes, and difficulty coordinating appointments. The project will also expand access to care by creating space where services can be delivered directly. The Services Building will support telehealth access for specialty care that is not locally available, assistance with Medicaid enrollment and insurance navigation, and coordination of transportation to medical appointments. SHC will partner with local providers and organizations to host visiting service days, outreach clinics, and health education activities within the building. During winter months, the building will also serve as the location for SHC’s seasonal Emergency Winter Shelter, ensuring that individuals experiencing unsheltered homelessness have safe overnight shelter and immediate connection to services and care navigation. This proximity allows staff to engage individuals early and connect them to health care, housing pathways, and stabilization services. By combining housing, shelter, and coordinated support in one accessible location, the project reduces barriers to care and increases consistent engagement with health services. The Services Building strengthens the supportive community created at Hítx’i Sáani while expanding access for other vulnerable residents in Sitka. This approach improves continuity of care, supports management of chronic health conditions, and promotes long-term stability for high-need individuals in a rural frontier setting.	\$50,000-\$250,000	Single Community	Sitka (City and Borough)	Deferred or Not Advanced

Skagway Development Corporation	Skagway Community Wellness Trail and Outdoor Recreation Initiative	AK	Skagway is a rural Southeast Alaska community with limited healthcare access and seasonal conditions that can reduce opportunities for regular physical activity and community connection. While the community has strong outdoor recreation traditions, infrastructure supporting safe and accessible daily recreation close to town is limited. This project explores the development of a Skagway Community Wellness Trail and Outdoor Recreation Initiative designed to strengthen year-round access to safe outdoor spaces that promote physical activity, mental wellbeing, and social connection. By improving trail access, accessibility, and recreation infrastructure, the project aims to support preventative health behaviors and improve quality of life for residents and workers in the community.	The proposed initiative focuses on improving community access to outdoor recreation infrastructure that supports preventative health and wellness. The project would include improvements to existing trail access points, development of accessible walking routes and recreation loops near town, and installation of small-scale infrastructure that supports safe and inclusive use of outdoor spaces. Potential project elements may include improved wayfinding signage, benches and resting areas, trailhead improvements, and accessibility enhancements that allow seniors, families, and individuals with mobility limitations to safely access community recreation areas. The initiative may also include community-based outdoor wellness programming and recreation events that encourage residents to engage in physical activity and build social connections. These activities could include walking groups, outdoor wellness programming, and community recreation events that promote healthy lifestyles. By combining infrastructure improvements with community programming, the project seeks to create sustainable opportunities for physical activity and wellness in a rural community.	\$50,000-\$250,000	Single Community	Skagway (Municipality)	Deferred or Not Advanced

Skeetawk	Skeetawk Management Technology	AK	Passes/Products: Skeetawk currently has a real-time pass verification process, with physical passes checked visually by an employee before a user loads the lift. This process only supports 2 types of pass products: 1) day passes (riding the lift on that specific day) or 2) season passes (riding the lift any day of the season). As Skeetawk is entering the second year of the Mat-Su Borough School District (MSBSD) partnership, the program to provide outdoor recreation and education for school credit continues to expand to every school in the district through hybrid learning courses. At this volume, the MSBSD requires a season-long controlled product for their students that is less expensive than a season pass. Skeetawk stands ready to offer this service to the students of the MSBSD, but requires technology-based verification and recording infrastructure to facilitate these products. Remote transaction software: With Skeetawk's current system, users of Skeetawk must be physically present at Skeetawk to purchase passes or rent equipment (if under 18 - guardian must be present). With this new technology parents in more remote locations, sending their children to Skeetawk through school or public transportation, will be able to remotely purchase and reserve the child's passes, rental equipment, and anything they need to have a profitable day of outdoor recreation.	By installing Radio Frequency Identifier (RFID) technology and management software at the ski area, Skeetawk will be able to provide more structured access, ensuring fair and controlled use of the ski area at a lower cost than a full season passt to the MSBSD users and all users of Skeetawk. For example, the MSBSD has requested a 2-visit-per-week pass option for students enrolled in their courses. They would like the youth to be able to visit the ski area 2 times per week at any point during the week, up to a certain number of hours for course credit during the season. Currently, Skeetawk cannot control participants of that request with visual pass verification. With RFID, Skeetawk can issue any pass type imaginable to users. Using the example above, Skeetawk will issue a 2-visit-per-week pass to each student enrolled in the Winter Recreation course across the MSBSD. Those students will visit the ski area, and utilize their passes as required for their course. The RFID gates will automatically control the parameters for which their pass type is set, and will also track the usage of that pass at Skeetawk. That tracking and reporting feature is invaluable to the MSBSD as they will utilize the reports to ensure student participation in the program and issue school credit for that participation. For the community, this technology will also allow users to remotely purchase and reserve Skeetawk products, including e-waivers. This is extremely valuable for families who live far from the ski area, but have the opportunity to send their children to recreate through school programs, Mat-Su Borough public transportation options, or other community groups. Currently, parents/guardians must be physically present at the ski area to reserve equipment for their youth. Additionally, this technology will allow parents/guardians to load money directly onto the child's pass for ski area purchases like food and beverage or equipment (gloves, hats, helmets, etc). This option will allow parents greater fiscal monitoring and responsibility as they send their youth to the ski area for recreation. This technology will also better support year-over-year ski area users, as customers will build a profile in the system. As they return to recreate each year, their information and demographics are pre-saved, ensuring a more efficient year-over-year pass renewal and equipment rental process.	\$250K-\$1M	Statewide	Anchorage (Municipality); Chugach Census Area; Denali Borough; Fairbanks North Star Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

SKINLIFE LLC	SkinLife Early Detection, Skin Health, and Wellness Initiative	AK	Alaskans face delayed access to timely skin assessment, early detection, preventive education, and coordinated follow-up. Specialist access is limited, travel is burdensome, or referral pathways are fragmented. As a result, patients may wait too long to have suspicious or medically significant skin concerns evaluated, increasing the likelihood of poor long term outcomes associated with late detection and delayed treatment. SkinLife’s initiative is designed to address this gap by expanding access to early screening, telehealth-supported triage, prevention education, workforce capacity, and coordinated care pathways that improve how patients are identified, supported, and connected to appropriate care. Further, Alaska is lacking in access to the most cutting edge laser technologies surrounding skin health and wellness. The SkinLife providers will build on their 55+ years of laser & light experience with newly advanced laser technology.	SkinLife’s project will create a coordinated early-detection, skin health, and wellness model that expands timely access to screening, triage, prevention education, and follow-up care across Alaska. The project combines in-person services with asynchronous telehealth to improve earlier identification of suspicious and medically significant skin conditions and provide ongoing treatment and support. The approach includes recruitment and training of physician assistants, nurse practitioners, registered nurses, and support staff to provide prescreening, patient education, navigation, follow-up, and referral support. SkinLife will strengthen care quality through advanced training in dermatologic conditions, laser and light theory, laser safety, treatment planning across diverse skin tones, psychodermatology-informed care, and anatomy-based diagnostic education. The project also includes a prevention and wellness component focused on youth, families, and communities. This includes education on sun safety, sunscreen use, protective clothing, early recognition of concerning skin changes, and lifestyle factors that influence skin and overall wellness, including stress, sleep, hydration, nutrition, and hormone-related skin concerns. SkinLife will expand its existing seasonal Sunscreen Station currently staffed during the summer fishing months on the Kenai river and community outreach efforts into a broader prevention platform that connects education with screening, referral, and follow-up. To support long-term impact, the project will invest in telehealth infrastructure, portable diagnostic equipment, and standardized clinical workflows that improve access, care coordination, and sustainability beyond the grant period.	Over \$5M	Clinic	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Sitka (City and Borough)	Deferred or Not Advanced

Skypoint	Alaska Frontier Communities' AI-Enabled Rural Health Data Unification & Care Coordination Platform	OR	Rural, remote, and frontier communities in Alaska face significant barriers to timely, coordinated health care due to geographic isolation, workforce shortages, and fragmented health data systems. Providers often rely on multiple disconnected systems for clinical, claims, and community information, limiting their ability to identify high-risk patients, coordinate care across organizations, and proactively manage chronic disease, behavioral health, and maternal health risks. At the same time, rural providers care for complex populations with limited staff and resources. Without unified data and actionable insights, care teams struggle to prioritize outreach, monitor patients remotely, and coordinate care across Tribal Health Orgs, rural clinics, and regional health systems. This project addresses the opportunity to create a unified data foundation that connects health information across providers, telehealth systems, remote monitoring technologies, and Alaska’s statewide health information exchange (HIE). Through integrated analytics, real-time dashboards, and AI-ready infrastructure, providers can identify care gaps earlier, coordinate care more effectively, and deliver services closer to home. Strengthening data sharing and enabling AI-ready population health management across Alaska’s Tribal and rural health systems will improve access to care, support overburdened providers, and create a sustainable model for delivering high-quality care in remote communities.	Our approach is to implement a unified, secure data platform that connects health information across rural providers, Tribal Health Organizations, telehealth systems, remote monitoring technologies, and Alaska’s statewide health information exchange (HIE). This platform will integrate clinical, claims, and community data to create a comprehensive, real-time view of patient needs and population health trends across participating organizations. By unifying fragmented data sources, the platform will enable advanced analytics, predictive modeling, and real-time dashboards that help providers identify high-risk patients, monitor care gaps, and prioritize outreach. These capabilities will support proactive management of chronic disease, behavioral health conditions, maternal health risks, and other complex needs that disproportionately affect rural populations. The platform will be designed to integrate with existing electronic health records and care management tools used by rural clinics, Tribal Health Organizations, and regional health systems. This ensures providers can access actionable insights within their existing workflows while improving coordination across organizations and care teams. To improve access to care, the platform will also support telehealth and remote patient monitoring programs, allowing providers to track patient status between visits and intervene earlier when risks are identified. This approach helps reduce avoidable hospitalizations and emergency department visits while allowing patients to receive more care within their home communities. Finally, the platform establishes a scalable, AI-ready data infrastructure that prepares Alaska’s health systems for current and future AI-enabled tools. These capabilities can support clinical decision support, population health management, and intelligent agents that assist providers and care coordinators with patient outreach, documentation, and care navigation. Together, this approach strengthens care coordination, expands access to care, and equips rural providers with the data and tools needed to deliver sustainable, high-quality care across Alaska’s geographically dispersed communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Skyscape Medpresso	Scaling Rural Care: A Technology & Workforce Partnership	MA	Due to the vast geography, extreme climate, and sparsely populated rural/remote communities in Alaska, many residents live far away from critical care resources, and rural healthcare providers often work in isolation with limited access to real time care coordination, ongoing medical education, specialty support, and evidence-based clinical resources. Equipping rural healthcare teams with integrated digital and "responsible AI" driven trusted mobile clinical education and decision-support platform (Skyscape's Medical Library) and it's HIPAA-secure real-time communication and collaboration application (Skyscape's Buzz) can address these gaps by empowering healthcare clinicians individually or working as a team in a healthcare enterprise. This project specifically addresses the opportunity to: Amplify Provider Reach: Connect isolated Community Health Aides with specialists in real-time using Buzz™ our HIPAA-secure communication and collaboration platform, empowering every Alaskan clinician Accelerate Workforce Readiness: Nursing SkillsHub™, a mobile training platform accelerates clinical readiness and nurses and students master nursing skills whether in the Classroom, Lab, Clinic or Home. Also AI driven trusted clinical library in the pocket (mobile app) - Clinical and Nursing Constellation - for point of care peer reviewed guidance (no internet needed) This project represents an opportunity to invest in Alaska's digital health future!	Skyscape proposes deployment of an integrated responsible and trusted AI driven digital health enablement platform that combines secure clinical communication, mobile clinical decision support, and workforce training tools. This approach equips frontline healthcare providers—including Community Health Aides, nurses, and rural clinicians—with the resources needed to deliver timely, evidence-based care even in isolated environments with limited connectivity. The initiative will deploy the Buzz Secure Medical Messenger to enable HIPAA-compliant real-time communication and care coordination between rural providers and regional specialists, care teams, and referral centers. Buzz will allow clinicians to securely consult with specialists, share patient information, coordinate referrals, and collaborate on clinical decisions, reducing professional isolation and accelerating access to expert guidance. By transforming individual providers into connected members of a broader care network, this platform strengthens care coordination and expands the effective reach of Alaska’s healthcare system. Integrated AI tools will also allow clinicians to prepare care plans or other documentation easily from within the platform. In parallel, the project will equip participating clinicians and trainees with Skyscape’s mobile clinical knowledge platform, including the Skyscape Medical Library and Nursing SkillsHub. These tools provide trusted, peer-reviewed clinical references and structured skills training directly on mobile devices, enabling clinicians to access critical medical guidance and training materials at the point of care—even in low-bandwidth or offline environments. SkillsHub will support workforce readiness by enabling nursing students and practicing nurses to master core clinical competencies through structured learning modules, quizzes, and guided skill validation across classroom, lab, and clinical settings. Also an AI component within the medical knowledge provides a conversational paradigm to trusted information. Implementation will occur through a phased deployment model that includes stakeholder engagement with rural health organizations, onboarding and training of healthcare teams, and ongoing technical and clinical support. The project will prioritize usability in remote environments by leveraging mobile-first design, offline access to clinical content, and secure messaging optimized for limited bandwidth conditions.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Slana Community Corporation	Expanded Slana EMS Training (05)	AK	Slana EMS operates in a remote, frontier region where emergency responders face long distances, harsh conditions, and limited backup. Current training opportunities are constrained by geography and staff availability, creating gaps in advanced skills, certifications, and readiness. Expanding EMS training presents an opportunity to strengthen local expertise, improve emergency response capabilities, and better prepare personnel for the unique challenges of serving rural Alaskans.	The project will provide EMS personnel with expanded training in advanced emergency care, including updated certifications, hands-on skill development, and scenario-based exercises tailored to rural and frontier conditions. Training will be delivered through a combination of in-person sessions, regional instructors, and remote learning where appropriate. Scheduling will accommodate staff availability and seasonal accessibility, ensuring all responders can participate. This approach strengthens local capacity, equips personnel with up-to-date skills, and enhances the community’s overall emergency response readiness.	Under \$50,000	Single Community	Copper River Census Area	Advance to Implementation Application
Slana Community Corporation	Slana Area Rural Health Care Based on a Rural Alaska Native Health Care Type Model (06)	AK	The project aims to establish a functioning community clinic space in the SCC building and provide basic in-person services with telehealth access to regional providers. Residents will experience improved access to routine and preventative care without needing to travel long distances. Early operations will also provide insight into service demand and operational needs to guide future development of the clinic model.	The project will establish an as-needed community clinic space within the SCC building to provide basic health services and support telehealth access.	\$250K-\$1M	Other	Copper River Census Area; Southeast Fairbanks Census Area	Advance to Implementation Application
Slana Community Corporation	Slana Community Corporation Equipment Building & EMS Vehicle Storage Building Upgrades (02)	AK	Current facility is old & deficient in order to support emergency response, training, safety, and readiness.	Upgrade facility to modernize and make facility more accessible to responders and the public.	\$50,000-\$250,000	Other	Copper River Census Area; Southeast Fairbanks Census Area	Deferred or Not Advanced
Slana Community Corporation	Slana Community Corporation/Slana EMS Positive Revenue Stream Implementation (07)	AK	Rural emergency responders across Alaska often rely on fragmented information sources for weather, transportation conditions, hazard alerts, and operational coordination. This creates delays in situational awareness and response planning. Slana EMS leadership has identified an opportunity to develop a scalable digital platform that consolidates critical regional response information into a single tool for responders.	The project will support early development of a regional emergency response application designed to integrate weather data, road and aviation information, hazard alerts, standing orders, hazmat, technical orders, geospatial information, and emergency resource coordination tools. Initial work will focus on defining system requirements, establishing administrative capacity within Slana EMS, and coordinating with potential responder partners. The platform will be designed for scalability to support broader use by responders across Alaska. We currently have a prototype that is close to readiness for beta testing.	\$50,000-\$250,000	Other	Copper River Census Area; Southeast Fairbanks Census Area	Deferred or Not Advanced
Slana Community Corporation	Slana EMS Ambulance & Ambulance Equipment Upgrade (04)	AK	Current ambulance/equipment is outdated and unreliable.	New ambulance outfitted with current up to date equipment.	\$250K-\$1M	Other	Copper River Census Area; Southeast Fairbanks Census Area	Deferred or Not Advanced

Slana Community Corporation	Slana EMS Emergency Radio Communications Upgrade (03)	AK	Effective as of January 2021, all new radios added to ALMR must be TDMA capable/enabled. Slana EMS relies on outdated radios that are not TDMA-compliant. Limited coverage, aging equipment, and incompatible technology hinder timely communication, slow emergency response, and reduce coordination with regional responders. In a remote frontier community, these gaps create safety risks for both patients and EMS personnel.	Upgrading to TDMA-capable radios will provide reliable, interoperable communication across the community and with neighboring responders, firefighters, medical personnel, law enforcement, and incident command.	\$50,000-\$250,000	Other	Copper River Census Area; Southeast Fairbanks Census Area	Deferred or Not Advanced
Slana Community Corporation	Slana EMS Personnel Access (01)	AK	Timely emergency responses due to remoteness, lack of equipment, extreme weather and destructive geological activity and unforeseen events, which require reliable equipment. The lack of reliable equipment has already this year prevented residents from being able to access roads in order to attend important medical care and appointments.	Minimize disruptions to preventative medical care, routine medical care, and non-emergency medical care. Ascertain Emergency Medical Services access to critical patients in a timely fashion in order to improve patient outcomes. To achieve aforementioned would require new snow removal equipment, listed in order of priority: motor grader, backhoe, plow truck, snowblower, and a loader.	\$250K-\$1M	Other	Copper River Census Area; Southeast Fairbanks Census Area	Deferred or Not Advanced
Smart Health Network PBC	Cut Paperwork Not Care - Smart Health Infrastructure for Rural Alaska	NY	Alaska's healthcare system spends an estimated \$1.8–3.6 billion annually on administrative waste — and rural providers bear the heaviest burden. A physician in Nome or Bethel navigates Medicare, Medicaid, IHS, and multiple insurers through separate portals, paper forms, and faxes. Prior authorizations take 5–7 days. Coverage errors drive 15–20% of first-pass claim denials. Critical Access Hospitals spend 15+ hours per week on tasks unrelated to care. Nationally, 58% of rural hospitals reported negative operating margins in 2023. Administrative fragmentation is a primary driver. Alaska has a functioning clinical HIE — healtheConnect Alaska connects 170+ provider organizations for clinical data exchange. What has never been built is the administrative layer: real-time eligibility, electronic prior authorization, and claims automation across all payers simultaneously. The CMS Prior Authorization Final Rule takes effect January 2027, requiring electronic infrastructure most rural Alaska providers don't have. The window to build correctly — once, to federal standards, with neutral governance — is now. This is not a workflow problem. It is an infrastructure gap. Until the administrative layer exists, investments in telehealth, AI, and value-	Smart Health Network is healthcare's VISA: a neutral, three-way hub connecting providers, payers, and patients through a single standardized connection. Before VISA, every bank negotiated bilateral agreements with every merchant. Healthcare has the same problem — a Critical Access Hospital in Bethel manages separate portals, credentials, and workflows for every payer. SHN solves this the same way VISA did: connect once, transact with everyone. SHN deploys by layering onto healtheConnect Alaska's existing provider network — avoiding redundant connections and accelerating adoption by building on established trust relationships. The platform is proven at scale: 68M+ lives connected through CVS Aetna, Elevance Health, HCSC, Cleveland Clinic, and Sentara. Capabilities deploy in sequence, with providers seeing value within months: **Coverage verification (live by September 30, 2026):** Real-time eligibility in under 3 seconds, replacing 15–20 minute manual workflows. Eliminates 60–80% of coverage-related first-pass denials immediately. **Prior authorization (Year 2, ahead of the January 2027 CMS mandate):** FHIR-based electronic PA using Da Vinci standards. Coverage requirements surfaced at point of order — eliminating unnecessary submissions before they start. Real-time determination for routine requests. **Claims automation (Year 2):** Clean claims submission, denial management, pre-adjudication edits — reducing the 45–60 day A/R cycle and the 15–20% first-submission denial rate.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census	Deferred or Not Advanced

based care cannot reach their potential. SHN closes that gap.

Patient visibility is built in from day one. For the first time, Alaska patients — including Alaska Native community members served by ANTHC, SEARHC, YKHC, and Southcentral Foundation — have a unified view of their coverage, authorizations, and claims in real time.

Governance is constitutional. SHN's Public Benefit Corporation charter permanently separates Rules, Rights, and Rails — no single participant can capture or redirect the network. An Alaska stakeholder council including tribal health representatives ensures the infrastructure serves Alaska's needs.

After RHTP funding, SHN operates as a permanent self-sustaining utility at 0.05% of transaction revenue, with revenue-sharing with healtheConnect Alaska — no ongoing state appropriations required.

Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area

Smith Hall , Inc	Connection to Smith Hall -Fiber Burial	AK	Smith Hall currently relies on a 15+ year-old outdoor Ethernet cable to connect with the Shelter. This cable is not rated for outdoor use, is exposed to the elements, and is increasingly unstable, causing frequent network errors and disconnections. These disruptions affect critical services such as Rightworks, telehealth, care coordination, and staff communication, creating operational challenges and potential safety risks for residents. The opportunity is to replace this aging infrastructure with a buried fiber optic line, providing a reliable, long-term network connection. This upgrade will ensure uninterrupted access to essential services, improve the quality and efficiency of care, and strengthen the sustainability of Smith Hall’s operations for the rural and frontier community it serves.	To address the unreliable network connection between Smith Hall and the Shelter, we propose installing a buried fiber optic line from the Shelter’s main network to the 2nd-floor network rack at Smith Hall. This approach eliminates exposure to weather, physical interference, and latency issues inherent in the existing aerial cable and alternative line-of-sight solutions. The project will involve: Electrical work to connect the fiber to existing network equipment. Trenching and burial of the fiber line to ensure durability and long-term reliability. Installation and testing of the fiber connection to verify stable, high-speed network performance. This solution provides a robust, long-term infrastructure upgrade, ensuring uninterrupted access to digital services, telehealth, and care coordination systems, while supporting the sustainability of Smith Hall’s operations in a rural and frontier community.	Under \$50,000	Single Community	Juneau (City and Borough)	Deferred or Not Advanced
Smith Pierre LLC	The H. Sally Smith Healthcare Housing Center	AK	There is an urgent need for housing for healthcare workers in our region.	Our location is centrally located in the first and original hotel in the region centrally located in downtown Dillingham. We propose the total rehab of the historic area using a strategic approach preserving the historic heritage and design elements. We will modernize with contemporary materials and finishes all while retaining some original design appeal. H. Sally Smith was a prominent Alaskan healthcare leader, and redevelopment of this historic site honors her work and love for the people of the region. Snow Creek Consulting	Pathways to Rural Alaska Healthcare Workforce Development	AK	Alaska faces a persistent and growing healthcare access crisis that could be addressed by improving the workforce development system and training opportunities. Geographic isolation, combined with intersectional challenges such as poverty, limited educational opportunities, and systemic inequities, creates compounding barriers for residents seeking care, with rural and Indigenous communities bearing a disproportionate share of that burden. The demand for healthcare services is clear and well-documented. What is less developed are the integrated, non-siloed training pathways to meet it. Training opportunities for healthcare providers within the state remain limited, leaving a significant gap between need and capacity. This gap carries real costs. Alaska currently relies heavily on locum tenens providers, an expensive and temporary solution that cycles both dollars and skilled professionals out of the state. The result is a workforce that cannot sustain itself and an economy that exports the very resources it needs most. Addressing this is not just a health imperative, it is an economic one. Investing in research on the development of clear healthcare workforce pathways has the potential to change this. By identifying local training opportunities and building effective partnerships across education and healthcare systems, Alaska can cultivate providers who are rooted in the communities they serve.	The project approach is structured around all Alaska's geographic regions and delineated tribal health care service areas to ensure that data collection, analysis, and recommendations reflect the significant and region specific distinct workforce realities, cultural contexts, and community priorities of each area rather than defaulting to a statewide average that obscures local conditions. To obtain feedback from all 12 recognized regions of Alaska in the first year of the RHTFs, some of the regions are paired. The work unfolds across four phases. The first phase launches regional engagement alongside baseline data collection. Rather than starting at the state level and filtering down, the project initiates contact with tribal health organizations, regional health corporations, educational institutions, and community stakeholders in all 12 regions (some paired) from the outset. This ensures that the workforce needs assessment, shortage mapping, and retention barrier documentation are shaped by what communities themselves identify as most pressing. The second phase deepens regional presence through structured listening and inventory work. Each region participates in stakeholder interviews, focus groups, and local partner consultations to document existing training infrastructure and career pathway barriers. Engagement methods will be designed to reach remote and frontier communities within the real constraints of distance, limited broadband, and seasonal access. The third phase brings regional findings into dialogue. Cross-regional analysis identifies shared patterns and coordination opportunities while preserving place-specific recommendations. Regional partners will review draft findings before finalization, a built-in accountability step that keeps the study credible and community-facing. The fourth phase produces differentiated deliverables for each region alongside the statewide strategic roadmap, including workforce profiles and tailored recommendations that speak directly to each area's infrastructure and capacity. Throughout all phases, engagement is treated as continuous rather than transactional. Regional relationships built during the study are themselves an asset for implementation.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Social Intelligence Laboratory, Inc.	Pathfinder: Empowering People to Ask for Help	AK	People facing behavioral health crises and substance abuse struggle to ask for help. They typically cannot determine the specific nature of their concern (particularly at early stages when proactive response and reduction of long-term impact is most possible), do not know the right questions to ask, struggle to navigate resources, and fear negative stigmas and repercussions. Depression and anxiety (WHO: cost 12bn working days & \$1tn annually), substance abuse (SAMHSA: 18% of Americans directly impacted, 62% second-order impact), and sexual abuse/violence (NSVRC: 81% of women and 43% of men impacted) have a significant impact on community resilience and wellness. Navigating social services is incredibly challenging even where they are most available, let alone in rural and remote communities. Resources exist both in-state and nationally (i.e., clinics, behavioral health units within medical centers or ANTHC, hotlines, crisis services nonprofits, etc). However, individuals are rarely able to define their need until crises magnify, and caregivers and community leaders struggle to find the right questions. Even seasoned professionals often struggle to effectively and proactively connect individuals to supporting resources without cases falling through the cracks.	Pathfinder links the framework of the John Praed Foundation’s Crisis Assessment Tools (a gold standard in behavioral health/crisis assessment and response) with the available intake processes and resources of eligible supporting resources, in order to identify the key clarifying questions necessary to support individuals in need. These prompting questions will initially support community caregivers and leaders in rapidly responding to a broad array of needs, guiding, informing, and strengthening their efforts. The system can both support both periodic check-ins as well as direct conversations. Based on the data collected in response to these questions over just a few minutes of system interaction, Pathfinder then is capable of providing warm introductions to the right resource. Complex cases often co-occur, requiring follow-up referral to additional support structures, and the system is capable of virtually walking alongside the individual to retain the high-level of effective referral and prevent cases from falling through cracks. Trend-spotting drives higher resolution and lower incident rates, while informing communities, systems, and organizations of potentially unmet needs. Our preliminary efforts and approach is supported by collaborative research from the University of Alaska-Anchorage (Public Policy), University of Washington (Social Work), Denver University (Social Work), Stanford University (Behavioral Sciences), Stephen F. Austin State University (Psychology) University of Texas-Austin (Data Science), United States Air Force Academy (Crisis Management), University of Illinois-Urbana Champaign (Social Computing), and Syracuse University (Informatics).	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Matanuska-Susitna Borough; Nome Census Area	Deferred or Not Advanced

Sound Mental Health	The Fisherman's Knot	AK	The Fisherman’s Knot project addresses two interconnected challenges facing rural and remote communities in Alaska: limited access to quality mental health services and a shortage of well-trained, clinically supervised behavioral health providers. Geographic isolation, workforce shortages, and high provider turnover make it difficult for communities to recruit and retain qualified clinicians, leaving many residents without timely or consistent mental health care. At the same time, Alaska’s behavioral health workforce pipeline remains fragile, with many emerging clinicians lacking consistent access to high-quality supervision, mentorship, and structured professional development necessary to achieve licensure and long-term practice in the state. The Fisherman’s Knot initiative seeks to strengthen both service delivery and the behavioral health workforce pipeline. By expanding access to structured clinical supervision, mentorship, and hands-on training opportunities, the program supports emerging clinicians as they move toward licensure and independent practice. This investment in supervision and professional development helps cultivate a stronger pipeline of qualified practitioners who are prepared to serve in rural communities and remain practicing in Alaska. By addressing workforce development alongside community service needs, the Sound Mental Health team aims to improve both the availability and long-term sustainability of high-quality mental health care across the region.	Communities across Prince William Sound and the Copper River Basin face barriers to timely, culturally responsive behavioral health care. Geographic isolation, workforce shortages, provider turnover, and limited training pipelines create service gaps that disproportionately affect families and Alaska Native communities in Valdez, Cordova, Tatitlek, and Glennallen. These challenges, combined with limited professional opportunities in rural areas, contribute to workforce instability and unmet behavioral health needs. Alaska also faces a critical gap in the behavioral health workforce pipeline between graduation from a master’s-level clinical program and licensure. Post-graduate clinicians must complete 2,000 hours of supervised practice, yet supervision opportunities are limited and costly. Many graduates leave Alaska, avoid rural practice, or exit the profession before licensure—losses Alaska can no longer afford. Through the Rural Health Transformation Program, Sound Mental Health, with its nonprofit arm Safe Harbor Alaska, seeks funding to strengthen a regional behavioral health network that expands access while building a sustainable rural workforce. At the center is The Fisherman’s Knot, a workforce development and service model addressing care access and Alaska’s licensure pipeline gap. The program provides structured supervision, mentorship, and professional development for emerging clinicians, creating supported pathways from graduate education to rural practice. The Fisherman’s Knot connects clinicians and communities through coordinated supervision and service delivery anchored in a central hub. Clinicians remain linked to a supervisory and professional support structure that ensures clinical quality and workforce retention. The program will recruit bachelor’s- and master’s-level social workers, mental health clinicians, and case workers from the University of Alaska Anchorage and University of Alaska Fairbanks through rural-focused training pathways. Participants relocate to Valdez for structured supervision, licensure exam preparation, and training in rural, frontier, and Alaska Native-serving care systems. From Valdez, clinicians operate as a mobile, hub-based workforce, traveling to Cordova, Tatitlek, and Glennallen for clinical services and case management. After each deployment, providers return to Valdez for supervision, peer consultation, and professional development, reinforcing care quality and long-term workforce retention.	\$1M-\$5M	Private practitioner	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Copper River Census Area	Deferred or Not Advanced

Sound to Sea LLC	Diagnostic and therapeutic musculoskeletal ultrasound access for Southeast Alaska	AK	Musculoskeletal injuries are among the most common reasons patients seek care, particularly in communities where fishing, outdoor labor, and outdoor recreation place high demands on the body. Despite this need, many musculoskeletal conditions affecting tendons, muscles, ligaments, nerves, and joints require ultrasound access and sports medicine training not readily available in Southeast Alaska. Musculoskeletal ultrasound is one of the most effective tools for evaluating these injuries. Tendon injuries, nerve, muscle and some joint injuries are often best visualized with ultrasound because it provides high-resolution, real-time imaging of soft tissue structures that are difficult to assess with standard imaging or physical examination alone. In addition to diagnosis, ultrasound guidance improves the accuracy and safety of therapeutic procedures such as injections, aspirations, and hydrodissections. In some cases, these procedures can only be safely performed under ultrasound guidance. Effective musculoskeletal imaging requires high-quality equipment capable of distinguishing subtle differences between small and complex soft tissue structures and someone that can interpret these findings and make clinical decisions. I am the only primary care physician in Southeast Alaska who has completed additional fellowship training in sports medicine musculoskeletal medicine, of which a significant portion of my training involved diagnostic and therapeutic ultrasound use.	My proposed approach is to acquire a high-quality musculoskeletal ultrasound system that will allow me to fully utilize the diagnostic and procedural skills I developed during my sports medicine fellowship and bring this level of care to patients in Juneau and throughout Southeast Alaska. Musculoskeletal ultrasound is highly operator-dependent and requires specialized training and familiarity with the ultrasound platform being used. While many ultrasound systems exist, there is considerable variability in image quality, probe capability, interface design, and workflow. Learning to optimize image acquisition, recognize subtle abnormalities in tissues, and integrate ultrasound into procedures requires significant time and repetition. During my fellowship training, I used the Sonosite LX ultrasound system extensively in a high-volume musculoskeletal practice. This machine was in use for over a decade, delivering reliable and high-resolution imaging. Because I am already experienced with this system, acquiring the Sonosite LX will allow me to immediately implement musculoskeletal ultrasound into practice without the delay associated with learning a new system. With this equipment, I will provide both diagnostic and therapeutic services locally. An additional advantage of the Sonosite LX is its portability. The system is designed for point-of-care use and can be transported easily between clinical settings. This mobility would allow me to bring musculoskeletal ultrasound services to other communities in Southeast Alaska where access to specialty musculoskeletal care is even more limited. By acquiring a reliable ultrasound platform that I am trained to use, I can expand access to advanced musculoskeletal diagnosis and treatment, reduce the need for costly travel and specialty referrals, and deliver timely, high-quality care to patients throughout Southeast Alaska.	\$50,000-\$250,000	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

South Adult Day Services, LLC	South Adult Services Adult Day Program Infrastructure and Capacity Expansion Project	AK	South Adult Services seeks to address the growing need for adult day services in Anchorage and the surrounding region, where seniors and adults with disabilities face limited access to structured, community-based care. As Alaska's population ages and the number of individuals living with chronic conditions, cognitive impairment, and functional limitations increases, there is a critical need for services that support aging in place and reduce reliance on institutional care settings. Anchorage serves as Alaska's primary healthcare hub for both urban and rural populations. Many individuals from rural and remote communities relocate to Anchorage to access medical care, but often lack access to adult day services that provide supervision, cognitive engagement, and support necessary for safe community living. Without these services, individuals are at increased risk of hospitalization, emergency department utilization, and premature placement in long-term institutional care. This project presents an opportunity to expand healthcare system capacity by establishing adult day services infrastucture that improves access to care, enhances care coordination, and supports Medicaid beneficiaries and vulnerable populations. By providing structured supervision, safety monitoring, and participant-centered programming, South Adult Services will strengthen community-based care delivery, reduce healthcare system strain, and improve quality of life for participants and their families.	South Adult Services will address the identified gap in adult day services capacity by establishing a fully operational, community-based adult day care program in Anchorage serving up to (40) participants daily. The project approach includes infrastructure deployment, workforce implementation, and phased operational launch aligned with Medicaid Home and Community-Based Services (HCBS) standards. The First phase focuses on facility readiness, including installation of safety systems, furnishings, equipment, and commercial kitchen infrastructure necessary to support structured daily programming and participant supervision. Concurrently, the organization will recruit and onboard qualified staff, including program leadership and activity personnel, to insure appropriate staffing ratios and participant-centered service delivery. Following SDS site approval and Medicaid provider enrollment activation, services will begin with a phased participant enrollment strategy to safely ramp to full capacity. The program will provide structured cognitive engagement, social programming, safety monitoring, and coordinated support designed to prevent unnecessary hospitalization and premature institutionalization. The approach incorporates evidenced-based gerontology practices, structured daily programming, and modern safety infrastructure to improve participant outcomes and support caregivers. Referral pathways will be developed with local healthcare providers, social workers, and discharge planners to ensure continuity of care for Medicaid beneficiaries and rural Alaskan's residing in Anchorage for medical services. By combining infrastructure investment, workforce expansion, and sustainable reimbursement mechanisms, this project establishes a durable adult day services model that strengthens healthcare access, improves care coordination, and supports aging in place within Alaska's healthcare system.	\$250K-\$1M	Home-and communit y-based services provider	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

South Adult Day Services, LLC	South Adult Services Rural Medical Access Lodging Project	AK	Residents of rural Alaska frequently travel to Anchorage to access specialized medical services that are not available in their home communities. While Anchorage functions as the primary healthcare hub for the state, many rural patients and their caregivers face challenges securing short-term lodging while attending medical appointments, receiving treatment, or waiting for return travel to their home communities. Seasonal demand, high lodging costs, and limited availability can create barriers that complicate access to timely care. The South Adult Services Rural Medical Access Lodging Project addresses this need by developing fourteen temporary lodging units within an existing mixed-use facility in Anchorage. By expanding lodging capacity specifically for rural patients and caregivers traveling for healthcare services, the project will reduce barriers associated with medical travel and improve the ability of rural residents to access care in Anchorage. This project also presents an opportunity to efficiently utilize an existing facility that already supports community-based health services. The lodging units will operate with administrative coordination and facility support from South Adult Services staff located on-site, allowing the program to launch quickly and operate efficiently. During the initial two-year implementation period, the lodging units will be made available at no lodging cost to eligible rural residents traveling to Anchorage for healthcare.	The South Adult Services Rural Medical Access Lodging Project will address the need for temporary lodging for rural residents traveling to Anchorage for healthcare by developing fourteen lodging units within an existing mixed-use facility located at 7830 Old Seward Highway in Anchorage. The space has already been framed for lodging use and is fully sprinklered, allowing the units to be completed through the targeted renovation and installation of necessary plumbing, electrical, fixtures, and furnishings. Once completed, the lodging units will be available for rural Alaska residents who must travel to Anchorage for medical care, as well as caregivers accompanying patients. The facility will operate as temporary medical access lodging rather than commercial hotel accommodations, providing safe and reliable short-term lodging for individuals traveling for treatment, follow-up appointments, or coordination of care. Program administration and guest intake will be coordinated through the existing South Adult Services front desk located within the same facility. Administrative staff will oversee check-in and check-out procedures, maintain occupancy records, and coordinate scheduling. Housekeeping and facility support staff already operating within the building will provide room readiness and sanitation services. During the initial two-year implementation period, the lodging units will be made available at no lodging cost to eligible rural residents traveling to Anchorage for healthcare services. By utilizing an existing facility and operational infrastructure, the project can be implemented efficiently while providing immediate benefit to rural patients and caregivers who require temporary lodging while accessing medical care in Anchorage.	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Copper River Census Area; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

South Peninsula Behavioral Health Services	Homer Youth Programming Everyday (HYPE)	AK	According to the Alaska After 3pm research from Oct. '25, the parents of over 82,000 children sought after-school programming, yet, only 17,516 were enrolled in 2025. 4 out of 5 kids did not partake. South Peninsula Behavioral Health Services (SPBHS) is coordinating a community initiative to support youth and families during out of school time (OST). SPBHS will be building on a model which includes partnership with Center for Alaska Coastal Studies, Kenai Peninsula Borough School District, Paul Banks Elementary, The City of Homer, Paul Banks PTA, Homer Community Recreation, The Homer Foundation, and The Southern Kenai Peninsula Resilience Coalition to provide stimulating and engaging out of school activities to the community. The program will offer low/no cost services to all children of the Southern Kenai Peninsula which will include academic support, recreational support, health support, mental health support, social activities, and nutritional support. The program will operate from 3pm to 6pm Monday through Thursday during the school year.	Children will be dropped off at our HYPE location and checked in by SPBHS Staff. A Program Director will oversee daily operations and Activity Staff will oversee specific activities/events on a daily basis. HYPE will partner with local specialists/professionals/volunteers to offer numerous programs and activities. A sample of a Thursday schedule is as follows: <table><tr><td>Day</td><td>3-3:15pm</td><td>3:15-4pm</td><td>4-4:45pm</td><td>4:45- 5pm</td><td>5-6pm</td></tr><tr><td>Thurs</td><td>Arrival</td><td>Coastal Std</td><td>Coastal Std</td><td>Clean-up</td><td></td></tr><tr><td>Open Gym</td><td></td><td>Nutrition</td><td>Academics</td><td>Taggames</td><td></td></tr><tr><td></td><td></td><td></td><td>Nature Hike</td><td>Art Class</td><td></td></tr></table> On this particular Thursday, the kids would arrive and get a healthy afternoon snack (nutrition). Then, at 3:15, they would attend either a Science Class with our partner the Center for Alaskan Coastal Studies, homework/academic enrichment time, or go on a nature hike. The sections offered by our partner organizations, in this case the science class from Coastal Studies, would be pre-determined at registration by the parent/caregiver. Or, if the parent prefers the child participate in homework/academic enrichment time, that would be determined at registration as well. Children not enrolled in either of those options would participate in the Nature Hike that day. At 4:00, the Coastal Studies class would continue for those kids enrolled. The other children would have the option of participating in some active Tag games or joining in the Art Activity. At 4:45, everyone comes together and helps clean up the spaces. And finally, at 5:00, parents may start picking up their children. The gymnasium will be open for supervised free play while the children await pick-up. Our plan is to be able to offer the specialized sections offered by our partner organizations at no cost to the families. However, due to the nature of some of these programs an additional cost at registration may be necessary. We will be exploring grant and funding options to help keep these specialized activities available to all. The Staff at SPBHS are also trained mental health clinicians and para-professionals. They will be leading and supporting the activities as well as identifying individuals in the community who may need additional supports to be successful and providing that support preventatively rather than reactively. South Peninsula Hospital	Expand Healthcare Quality and Access Through Implementation of Robotic Surgery	AK	Residents of rural communities are often not able to receive gold standard surgical care close to home because most rural facilities do not have access to modern surgical technologies. When patients in the South Peninsula Hospital service area can't find the care they need locally, they must travel 150 miles roundtrip on a highway that is dark and icy half the year to the next closest hospital or seek care in Anchorage or beyond. This represents an extraordinary cost and inconvenience for many. For others, lack of local access means they delay or simply forego the care entirely. We have heard directly through Press Ganey surveys that patients in our region are seeking robotic surgeries elsewhere. This presents a risk to the future of healthcare as loss of revenues threatens already tight margins. The Kenai Peninsula is rapidly aging, and many urologic conditions increase with age (e.g., benign prostatic hyperplasia, incontinence, and kidney stones.) SPH is already seeing a huge increase in demand for urology services—up 123% since 2021. Urology is one of the fields in which robotic-assisted surgeries can be most effective. Our communities want and expect robotic-assisted surgery capabilities in their care. And SPH leadership and medical staff are enthusiastically onboard with integrating this new technology into their care.	To transform SPH's ability to address rising healthcare needs, SPH will purchase an intra-abdominal surgical robot and train its medical workforce to use it. These systems are commonly used for urological, gynecological, and general surgeries. Robot-assisted surgery has been broadly adopted by teaching hospitals and increasingly by hospitals around the country. Robotic surgeries offer finer dissection leading to a higher level of precision, less tissue manipulation and damage, lower pain levels, and easier healing. Today, robotic surgeries are standard of care for many types of common surgeries in this country (e.g., appendectomy, cholecystectomy, hernia repair), and patients as well as providers seek out these technologies when considering where to receive and provide care. The Kenai Peninsula's population is older than the state overall and the nation, and a continued rise in this population sector is projected—peaking in 2030 – 2035 at nearly ¼ of the population. This means that healthcare needs in our region are growing, and growing in complexity—the need for urology services (which typically address issues that increase with age), for example, has more than doubled since 2021. And as people age, the incidence of numerous disorders requiring abdominal surgery increase, such as gallstone disease, diverticular disease, and colorectal cancer. Our communities want robot-assisted surgeries. In 2024, SPH launched robotic orthopedic surgeries, and in the following year, saw a 45% increase in demand for total knee arthroplasties (knee replacements) relative to the average of the two years prior. Surgical robots will help stabilize SPH's surgical workforce and expand its capacity. Estimates indicate that this technology will increase urological volumes enough to hire a full-time urologist who can provide consistent care. Inevitably, locums surgeons take their patients to other facilities that have surgical robots, undermining overall healthcare sustainability. Robotic orthopedic surgery enabled SPH to triple its orthopedic staffing and expand the types of surgeries offered locally. Driven by strategies to address key findings of SPH's recent Community Health Needs Assessment, this project addresses Initiative #2, Health Care Access and is an allowable use of RHTP funds. This technology will position SPH to better provide a continuum of care for residents in the region, including dual eligible seniors and those with or at risk of chronic disease.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

South Peninsula Hospital	Expansion and Improvement of Rehabilitation Services to Support Continuum of Care Close to Home	AK	SPH currently lacks cardiopulmonary rehabilitation services. Patients recovering from myocardial infarction, coronary artery bypass grafting, heart failure, COPD, or other chronic cardiopulmonary conditions must travel 150 miles or more roundtrip for therapy. For many people—especially seniors and those with limited transportation or fixed incomes—travel barriers result in low participation or no rehabilitation at all. Alaska’s RHTP identifies chronic disease burden, limited specialty access, and insufficient long-term care capacity as major rural challenges. The Kenai Peninsula’s aging demographic intensifies this need. Without local rehabilitation services, patients face higher risk of deconditioning, preventable readmissions, functional decline, and institutionalization. At the same time, demand for inpatient PT and OT as well as speech therapy for pediatrics and adults remains strong. The SPH Long Term Care and Acute Care Departments rely on inpatient PT and OT to ensure the health of patients and residents, and speech therapy services are offered as both in- and outpatient care. Temporarily rehoused to make room for SPH’s new integrated women’s health clinic, these services are currently located in a temporary space within the hospital, awaiting final location in a purpose-designed location within hospital walls.	The Kenai Peninsula has a disproportionately high senior population (22%) compared to both Alaska (16%) and the nation (18%). Older adults experience significantly higher rates of cardiovascular and pulmonary disease and need cardiopulmonary rehabilitation to promote health. To truly transform health in Alaska’s rural communities, we must make healthcare accessible, high quality, and sustainable over the long-term. On the southern Kenai Peninsula, our communities prioritize local access to care. In many cases, if individuals can’t find the care they need at SPH, they must travel 150 miles on a highway that is dark and icy for half the year, or even farther to Anchorage. For many people, this isn’t just impractical, it is impossible. And for some types of care—especially rehabilitation and therapy, which typically require frequent visits over an extended period of time (twice weekly for 18 weeks)—local availability of care is the difference between patients receiving the services they need or not receiving them at all. Based on strategies developed to address key findings of recent SPH Community Health Needs Assessments, this project represents a proactive investment in to position SPH to provide essential services to the region’s aging population and existing inpatient and outpatient populations long into the future. This project will renovate 1,900 square feet of existing hospital space to support cardiopulmonary rehabilitation as well as physical, occupational, and speech therapy. This project will establish a cardiopulmonary rehabilitation program designed to meet evidence-based CMS standards. Design of the new space will be concluded this spring. Equipment purchases for cardiopulmonary rehab include a treadmill, recumbent ellipticals, stationary bikes, weights, and monitoring devices. SPH will: 1. Renovate 1,900 square feet of space recently vacated by behavioral health services for therapy and rehab. Equip space for a new cardiopulmonary rehab service line as well as continued PT/OT/speech therapy. 2. Recruit one new RN or therapist and cross-train existing therapists and nurses for cardiopulmonary rehab. 3. Technology Integration: Integrate wireless remote monitoring capabilities and data tracking tools within Epic. 4. Care Coordination: Develop referral pathways for cardiopulmonary rehab with SPH primary care, hospitalists, cardiology consultants, and Anchorage specialty providers to ensure seamless post-acute transition.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

South Peninsula Hospital	Leveraging Technology to Increase Workforce Sustainability and Improve Patient Care	AK	SPH, like other rural hospitals in Alaska, is in a Health Professional Shortage Area. Recruiting providers to our end-of-the-road community can be difficult and expensive, especially with local housing shortages, high cost of living, and limited workforce pipelines. Increasing administrative documentation demands pile onto these challenges, and serve as a barrier to long-term retention of existing healthcare workers. Providers at SPH’s Homer Medical Center routinely spend two to four hours beyond the work day on charting and inbox management. Many have to attend to these duties during evening and weekend hours. This situation is not sustainable. Note-taking burden is contributing to workforce burnout, recruitment challenges, and reduced appointment availability. To address these challenges, we will leverage an AI scribe system to capture and record provider-patient conversations and create detailed and accurate clinical notes in SPH’s Epic EHR system. Providers will be able to focus on patient interaction and care, rather than on note-taking. After appointments, they will merely need to review and edit AI scribe-created notes for corrections rather than creating them whole cloth. SPH’s pilot test of an AI scribe system found that it could cut note-taking time in half or more, a true game changer for our workforce.	This project represents a technology-enabled solution to deftly address two top findings of SPH's most recent Community Health Needs Assessment, conducted in collaboration with MAPP, the region’s health improvement coalition: shortages in healthcare workers and barriers to receiving primary care. SPH will implement an AI scribe system integrated into Epic across selected primary care and specialty providers in a phased rollout. The benefits of reduced administrative burden on providers will cascade to patients. Providers will interface directly with patients more and won’t be staring at a screen during appointments. And appointments will feel less rushed as providers will have more time to work directly with patients, without the burden of clinical notetaking impinging on visits. Implementation steps will include: 1. Release RFP for an AI scribe system 2. Develop and launch a patient survey and education plan to gauge patients’ perspectives and educate them on the benefits and limitations of the new system. 3. Purchase and install the system in a phased approach at SPH primary care and specialty clinics. 4. Carry out provider training on the new system. 5. Launch services with the new system in a phased approach. 6. Monitor performance of the new system by tracking data such as accuracy, note-taking time, provider time for corrections, provider and patient satisfaction, etc. 7. Carry out quality assurance by establishing review protocols to ensure documentation accuracy and compliance.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

South Peninsula Hospital	Modernize and Automate Medication Dispensing for Safety and Efficiency	AK	SPH’s medication distribution workflows rely heavily on manual processes and dated systems, which are labor-intensive and inefficient. Manual workflows increase risk of medication errors, consume valuable pharmacist and nursing time, and limit scalability as SPH seeks to expand infusion services and other areas of patient care to meet the rising needs. According to the American Society of Health-System Pharmacists, 97% of hospitals in the U.S. use AMDS. But many rural hospitals are left out of this technological advancement. Alaska’s RHTP identifies aging infrastructure, workforce shortages, and need for technology modernization as major rural health system challenges. This program presents a generational opportunity to modernize rural facilities to meet growing and changing healthcare demands, leverage opportunities provided by new technological developments, and implement facility and process improvements that support a strong, engaged, and sustainable workforce. On the Kenai Peninsula, an aging population and high chronic disease burden are increasing demand for specialty medications and infusion therapies. Now is the time for SPH to proactively invest in its pharmacy infrastructure as its population ages and as it seeks to expand infusion services, which have seen a sharp increase in demand in the last five years. Implementation of the AMDS will help SPH meet rising infusion demand safely and efficiently.	As healthcare demands in our region rise, SPH is limited in meeting these needs by infrastructure, process, and workforce constraints. The goal of this project is to modernize infrastructure, streamline processes, and use staff time more efficiently to enable a scaling up of Pharmacy capacity in order to meet the healthcare challenges in our region. These challenges include the expanding needs of an aging population that requires higher level care close to home, the large growth in demand for infusion, and the need to manage higher patient acuity while also expanding services lines to include, for example, cardiopulmonary rehabilitation and expanded urology procedures. An AMDS will position SPH to meet these challenges. Automated dispensing technology improves medication safety through barcode verification, real-time inventory management, controlled substance tracking, and standardized workflows. These capabilities are particularly critical in rural settings like ours where workforce shortages, supply chain disruptions, and limited redundancy increase operational risk. Without improvements to medication distribution workflows, expanding infusion services could strain staffing capacity and increase operational risk. Or SPH might be forced to increase staffing to address growing medication management needs, which would increase healthcare costs. This project addresses the opportunity to modernize medication management infrastructure to improve safety, efficiency, and readiness for expanded specialty services. SPH will purchase and implement this AMDS and integrate it into its Epic EHR. Key implementation components include: Equipment Acquisition & Installation 1. Release an RFP to support the purchase and installation of AMDS 2. Configure controlled substance management features 3. Integrate barcode verification and inventory tracking systems Pharmacy & Infusion Integration 1. Establish standardized medication preparation and dispensing protocols 2. Train staff and align workflows 3. Develop updated medication administration policies Data & Inventory Optimization 1. Implement real-time inventory monitoring 2. Improve formulary management This project is integral to strategies that address key findings of SPH’s recent Community Health Needs Assessments, which are developed with MAPP, the regional health improvement coalition, including the need to reduce barriers to specialty care and to develop services targeted to promote senior health.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

South Peninsula Hospital	South Peninsula Hospital Medical Service Expansion and Infrastructure Upgrade	AK	The Kenai Peninsula population is rapidly aging. This region now has a higher percentage of seniors than Alaska overall and the nation, and projections call for continued growth of this population sector, peaking at 24% in 2030. Our aging population means that healthcare needs in our region are changing, growing, and becoming more complex. As people age, rates of cancer, cardiovascular disease, diabetes, chronic lung disease, cognitive impairment, and other illnesses. Older adults are more likely to need infusion services as well as advanced imaging and other services. At the same time, according to the latest South Peninsula Hospital Community Health Needs Assessment, cancer was the leading cause of death in the region for the period 2007- 2020, with incidence rates higher than state averages, additionally driving the increased need for cancer care and a larger suite of imaging capabilities in the region. These challenges require proactive investment. And SPH has the organizational capacity and regional support to successfully carry out this project. Annual strategic planning shaped by results of regular, collaborate Community Health Needs Assessments drive this project, which has already been issued a State of Alaska Certificate of Need. The challenge for small hospitals like ours is securing capital to make such an investment. Once the new and expanded services are in place, we estimate an increase in revenues to offset the cost of expanded care.	This is a two-phased project. Phase 1 will focus on the Infusion and Oncology Department and the Hospital Pharmacy. Phase 2, scheduled for Year 2 of the RHTP, will focus on Nuclear Medicine. In Year 1, this project will relocate and expand SPH’s Infusion and Oncology Department, currently in a 960 square foot offsite building to 4,401 square feet of unprogrammed space within hospital walls. This project will double the number of infusion chairs, including doubling the number of chairs in a private room for added privacy and increased infection controls. The facility will have exam rooms, restrooms, a nurse’s station, registration desk, a med room, a staff rest area, and ancillary support spaces. Relocation of this facility within the hospital walls will enhance patient safety and comfort, as emergency services, the hospital cafeteria, and other support facilities are located in the main building. In addition, the SPH Pharmacy will be relocated to 1,437 square feet of unprogrammed space adjacent to the new Infusion and Oncology Department, more than doubling its size. The renovated Pharmacy will include two compounding rooms with dedicated compounding hoods that meet USP requirements. A biological safety cabinet will allow for the safe storage and handling of hazardous drugs, and a separate Pharmacy-dedicated air handling system will enable the facility to meet certification requirements. Staff workflow and security (including for pharmaceutical deliveries), will be improved in the new location. Co-location with the Infusion and Oncology Department will streamline delivery of medications and avoid outdoor transport of sensitive pharmaceuticals. The design process for this project is complete. SPH and the Kenai Peninsula Borough, which owns the hospital facility, are ready to move into the bidding phase. Construction is estimated to be completed in 12 months. This project addresses RHTP Initiative #2, Health Care Access, with the aim of expanding and sustaining essential health services in rural Alaska. While this project represents an extraordinary advance in the healthcare capacity for the region, the SPH footprint will not change. All of the structural and framing elements in the building are already in place to make this project a success. This project will carry out strategic reprogramming of existing space to meet project goals.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

South Peninsula Hospital	Digital Displays at South Peninsula Hospital	AK	Since Covid, communication channels are unpredictable and chaotic. Once-reliable local media cannot now be trusted for content, reliability or even availability. Staffing shortages cause local radio to replay news programs that are weeks old; and the local newspaper is so short staffed it closed its Homer office and the remaining reporter works from home. Additionally, the clinical experience changed. Waiting rooms removed paper and magazines, patients get roomed faster to avoid crowded waiting rooms, shifting long waits to sitting alone in an exam room. Patients are sent to the “patient portal” to do business, which eliminates conversation. SPH runs an active social media page, and publishes a monthly e-newsletter, but engagement with these tools is spotty. Printed materials are expensive and quickly outdate. The hospital’s growth has expanded our services into 13 buildings spread across the entire town. A patient might “interact” with SPH only at the functional medicine clinic, a small converted home approximately four blocks from the hospital, or at the outpatient rehab center, two miles from the hospital. The digital displays are critical in keeping patients and staff connected with the entire healthcare system, no matter what door they walk through or what waiting room they’re in. Whether waiting for a loved one, to be called in, or for results – the wait time is when we can both help a patient pass the time, and inform them about information related to their care.	Hospitals have always known the power of the screen – thus every hospital inpatient room has a television in it. The screen is just as powerful beyond the inpatient room. South Peninsula Hospital will purchase digital displays and mount on walls in waiting rooms and even in exam rooms that tend to have longer sit and wait times. We will use these monitors to display information about local providers and services, health tips, pertinent helpful information related to one’s care, engagement with the hospital “owner” (non profit entity), encourage patient satisfaction surveys to be completed and more. SPH supports a very robust health education program for the community which could easily be replicate on the screen. The majority of our outpatient clinic waiting rooms have recently been remodeled; so all waiting rooms have electrical power, wireless connection and a fresh coat of paint. The IT Department has already verified that our wireless network is robust enough to support this program. Monitors of varying sizes would have to be purchased and installed. Larger for bigger waiting rooms, smaller for key exam rooms. The hospital’s IT and maintenance departments are prepared to support the decision making, purchasing and installation. Numerous subscription software programs are available for this type of digital healthcare communication that come with canned programming, however none of them are Alaska lifestyle-friendly. SPH would purchase a bare bones version and handle content development on our own from the marketing department and health & wellness department. From board meeting announcements and even job recruitment, to welcoming a new specialist or explaining how to use the new patient portal, these digital screens will carry the power to connect, educate and inform.	Under \$50,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

South Peninsula Hospital	Friends and Food as Medicine in Rural Communities	AK	As we know in Alaska perhaps more than anywhere in the country, a meal is not just nutrients. It is culture, tradition, social connection, and health. But one in seven adult Alaskans—and one in six Alaska kids—are food insecure according to Feeding America. Healthy food can be hard to come by, especially in Alaska’s rural communities where grocery prices are often exorbitant and not everyone can harvest wild foods, and in many cases, the availability of wild foods is changing. The SPH 2023 Community Health Needs Assessment identifies food insecurity as a factor affecting health in the region. Our elders often face extra challenges accessing healthy food, including the challenges of affordability when on a fixed income, traveling to shop for groceries in harsh winter conditions, and just the difficulties of cooking and dining for those who live alone. At the same time, our communities are witnessing an epidemic of loneliness and its outcomes. According to a 2023 Health and Human Services report, about half of American adults experience loneliness. Loneliness is linked to chronic illness—increasing rates of cardiovascular disease, dementia, stroke, depression, anxiety, and premature death. Being socially isolated is as risky for your health as smoking up to 15 cigarettes a day, while social connection can help reduce the risk of chronic disease and serious illness. SPH is poised to help address these challenges by supporting healthy, shared meals in our community.	According to the National Council on Aging, seniors who share meals with others experience improved physical and mental health and a better quality of life. SPH supports meal-sharing among seniors and others through its programs and cafeteria lunchtimes. For example, SPH provides a free weekly from-scratch soup and bread dinner during its public Wellness Wednesday health education and outreach programs. We know from feedback that for some people in the region, especially the elderly, this is their once-weekly opportunity to eat in community. In addition, SPH provides free healthy meals at its annual Senior Wellness Day, and at its annual Community Resources Connect event, which provides support and services to people experiencing homelessness or economic instability (this event served 115 people this year). Additionally, SPH provides healthy snacks at regular events, such as a weekly indoor walking program that regularly hosts 60 or more individuals each week, spring-time community walking celebrations, and Brest Cancer Awareness month events. The SPH kitchen is the invisible workhorse behind these programs. Meals are, of course, also provided at the hospital cafeteria, which is open to the public 11 am - 1 pm daily. Over the last two years or so, the SPH cafeteria has become a popular gathering space for seniors looking for a place to share affordable, healthy meals with friends. Lunches served to the public have tripled since 2024. As demand for SPH meals for hospital patients and residents has increased with higher patient and resident censuses, and participation rates in our education and outreach programs have grown, the capacity of our food service infrastructure is maxed out. Alaska’s RHTP presents a generational opportunity for rural hospitals like ours to leverage the synergistic connection between high quality food and social connection to improve health in our region. SPH will purchase and install the following equipment: 1. Walk-in Cooler: SPH has run out of cooler space, and needs more capacity to support patient care as well as public meals and programs. 2. Double Oven: To double the capacity of SPH’s oven space to meet growing needs. Current oven space is maxed out, running nonstop morning through evening to prepare food in time for patient meals and public programs. 3. 10-Burner Range: This will nearly double SPH’s stove top capacity to meet current needs. 4. Steam Table: This piece of equipment helps keep hot meals hot.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

South Peninsula Hospital	Infrastructure Improvement to Support Patient Safety and Workforce Sustainability	AK	As in the state overall, the Kenai Peninsula population is rapidly aging. Between 2010 and 2020, the region’s overall population grew by 6%, but the number of residents 65 years and older surged by a staggering 80%. The Kenai Peninsula now has a higher percentage of seniors than Alaska overall and the nation, and projections call for a continued growth in this population sector. By 2050, projections estimate that the state’s population of 85-year-olds and older will increase 270%, and one-third of these individuals will suffer from Alzheimer’s or related dementia. Our aging population means that healthcare needs in our region are changing, growing, and becoming more complex. Long-term, skilled nursing care is essential to ensuring our elders can age safely close to home with dignity. SPH’s Long Term Care Department is well-positioned to meet the expanding needs for skilled nursing care long into the future. A national-award-winning facility, LTC employs about 80 dedicated employees with a robust staffing mix of RNs, LPNs, and CNAs on every shift. LTC has worked hard to build a strong, sustainable workforce through in-house training, tuition assistance, cross-training and other opportunities, which keep LTC’s nursing turnover rates consistently below state peers’. In addition, LTC’s clinical outcomes (including for depression, falls, and skin disorders) are consistently higher than state and national averages. A strong leadership team is ready to make this project a success.	Our current lift system has reached the end of its life and has started to fail. On top of that, it does not adequately accommodate bariatric patients. Our goal is to position South Peninsula Hospital’s Long Term Care facility to be able to serve our growing senior population long into the future. This goal demands proactive investment in infrastructure. Many residents who enter LTC have limited or no mobility. LTC must be adaptable to increasing resident acuity and an aging population. And the facility must be able to serve bariatric patients who, without this lift system, would need to be referred out to other facilities far from home. This lift system will ensure that resident rooms remain functional over time and help LTC avoid costly retrofits long into the future. And it will reduce the risk of injury to staff. SPH LTC is the only nursing home in the region. The 18,000 square foot facility has a day room, kitchen, library, therapy areas, and a private tub room. This facility ensures that elders can age close to home and supports residents in maintaining family and community ties. Family members are warmly welcomed into the facility—many stay for meals and come for frequent visits. In addition, the LTC van delivers residents to local events such as movies and parades. In addition, family, friends, and community groups are welcomed in for special events (e.g., Thanksgiving, Christmas, and Valentine’s Day dinners), live music performances, Halloween trick-or-treating, and other formal and informal gatherings that help residents maintain important family and social ties. This project is a strategy to directly address a key finding of SPH’s most recent Community Health Needs Assessment, a collaboration with MAPP, the regional health improvement coalition: to enhance services and support for seniors. SPH LTC will decommission the existing lift system and purchase and install a new, higher capacity patient lift system in every bedroom in the facility. The equipment will include ceiling tracks, lift motors, slings and transfer accessories. Installation will carry out structural reinforcements as needed, staff training, and development of standardized safe-handling protocols. SPH will launch an RFP process, procure the lift system, and work with the vendor to install it. SPH will ensure that there is no disruption to patient care.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

South Peninsula Hospital	Modernizing and Upgrading Facilities to Support Rural Healthcare	AK	SPH’s primary air handling system is a dinosaur. This energy hog is 41 years old, beyond its useful life, and just about impossible to find parts for. A failure of one of the system’s old three-phase motors leveled the system for nearly three weeks a few years ago because it took so long to find parts. This AHU serves more than one-third of the hospital building—including surgery, obstetrics, and neurology (about 35,000 square feet). When the system goes down, we lose adequate heating and cooling ability, the air stagnates—which can increase the threat of infection, and there's a risk of the fire alarm going off because of humidity issues. Typically, these systems last 15 - 25 years. An ancient, unreliable air handling system puts SPH at risk of state citation, if our temperature and humidity controls are out of compliance with CMS requirements. In addition to being crucial for patient and provider health and safety as well as staff comfort, this system handles the air in our server room, the IT and security hub for the hospital, which has very stringent environmental requirements. On top of this, the current air handler was installed decades before today’s seismic safety standards were established, and it remains vulnerable to failure in the event of an earthquake or other natural disaster. A major seismic event could cause the system to collapse or shut down—compromising patient health and safety and forcing closure at a time of greatest community need.	The RHTP presents small rural hospitals like SPH with an opportunity to invest in infrastructure that sustains healthcare for our communities long into the future. This project will replace our ancient AHU with a modern, code-compliant, energy-efficient system designed for healthcare environments and regional hazards. The new AHU will meet current standards for airflow, filtration, energy efficiency and natural disaster resilience. Enhanced system reliability will reduce unplanned shutdowns, improve environmental control in clinical areas, and support uninterrupted outpatient and inpatient care, which will reduce operational risk. SPH will replace the existing AHU that serves the bulk of the SPH main hospital building. The project will include engineering design, seismic and structural evaluation, equipment procurement, installation, commissioning, and integration with existing building management systems. The new system will: 1. Meet current healthcare ventilation and filtration standards 2. Improve energy efficiency and reduce operating costs 3. Include modern controls for monitoring performance and indoor air quality 4. Be designed with seismic bracing and other resilience features 5. Incorporate enhanced filtration capacity to address volcanic and other airborne hazards common to the southern Kenai Peninsula. We are ready to immediately launch this project. Project planning will include coordination with clinical leadership to ensure uninterrupted patient care. The timeline is as follows: 1. Facility & Engineering Assessment (6 wks): Evaluate existing system condition, load requirements, structural capacity, electrical capacity, infection control risks, and seismic considerations. 2. Design & Construction Documents (8 wks): Mechanical engineer develops stamped drawings and specifications to meet healthcare standards, energy code, and seismic requirements. 3. Permitting & Approvals (6 wks, overlaps with design): State plan review and local building permits. 4. Procurement of Equipment (12 wks): Order AHU 5. Pre-Construction Planning (2 wks, overlaps with procurement): Develop phasing plan to maintain hospital operations, infection control plan, and temporary ventilation strategy. 6. Installation & Construction (20 wks): Remove old system, set new units, ductwork, controls integration, and seismic bracing. 7. Commissioning & Testing (4 wks): Air balancing, controls programming, performance verification, and staff training.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

South Peninsula Hospital	Support Workforce Sustainability Through Streamlined Housing Support	AK	SPH’s two most recent, collaborative Community Health Needs Assessments identify housing as a top community priority alongside staff workforce shortages—underscoring that housing constraints are directly linked to healthcare capacity on the southern Kenai Peninsula. The Assessment also recognizes that stable housing can have significant impacts on health outcomes. SPH is one of the largest (if not the largest) institutional renters of housing units on the southern Kenai Peninsula, substantially adding pressure to an already-tight market. Over the last two and half years, as SPH has added new service lines and expanded existing departments and ancillary services, the organization’s workforce has increased 17%, from about 600 to 700. We’re likely to see continued workforce growth as SPH works to meet the growing healthcare needs of an aging population. Delivering these services—especially through expansion—requires an ample and flexible housing stock as SPH has relied on visiting and traveling clinicians as well as newly recruited providers relocating to the area. SPH currently rents 26 housing units in Homer to support traveling clinicians and new hires. Short-term clinicians require 2 - 10 days of housing, and SPH offers 3 - 12 months of housing for new employees relocating to the area. The ability to offer temporary housing is a meaningful recruitment lever in a highly competitive market. As with other rural Alaska facilities, SPH is in a Health Professional Shortage Area.	SPH has already taken meaningful steps to strengthen workforce recruitment and retention—and reduce its contribution to the local housing crunch—by partnering with a private contractor to construct 25 new SPH-dedicated housing units, which will be available in early summer but will not totally alleviate the hospital’s need to rent additional properties around the region. A dedicated housing coordination function is a direct mitigation strategy to reduce reliance on expensive stopgap staffing as well as a proactive strategy to support workforce and service expansion. Delays in securing housing can postpone start dates, increase vacancy periods, elevate contract staffing costs, and reduce service availability. This project addresses the opportunity to create a structured housing coordination model that removes a primary non-clinical barrier to workforce stability and rural access to care. SPH will hire a dedicated, 12-month Housing Coordinator responsible for securing, managing, and optimizing workforce housing inventory across Homer for temporary and relocating staff. Currently, these duties are split somewhat haphazardly between a fulltime Senior Recruiter in the Human Resources Department and a fulltime Executive Assistant in the Administration Department. As the need for housing coordination and management have grown, the demands of this work have exceeded the ability of these two positions to address them above and beyond their other duties. Hiring a dedicated Housing Coordinator will streamline these functions and position SPH for continued successful recruitment and retention of a strong workforce now and into the future. SPH will recruit a candidate with strong interpersonal skills, attention to detail, and commitment to serving the SPH mission. Core responsibilities of the new position will include: Housing Acquisition & Partnerships 1. Develop and maintain relationships with local property owners 2. Negotiate rental agreements 3. Build an inventory of flexible housing options Property Management Functions for SPH-dedicated housing and general housing units 1. Manage check-in/out processes, cleaning, and turnover 2. Address maintenance issues 3. Serve as primary liaison between SPH and property owners 4. Manage key hand-offs and documentation Establish Systems to Streamline Housing Coordination 1. Establish property management and coordination systems to support efficient housing coordination into the future as SPH scales up its workforce.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

South Peninsula Hospital	Telesitting: Leveraging Technology to Enhance Patient Safety and Optimize Workforce Efficiency	AK	According to the NIH, more than one in five U.S. adults—and more than one-third of young adults—live with mental illness. Alaskans face higher rates of mental illness than residents of other states, with suicide rates here triple the national average. Rural Alaska often faces starker mental health challenges than urban parts of the state while having fewer behavioral health resources. SPH frequently admits patients with behavioral health disorders who require 1:1 supervision for their safety. On top of this, our aging population means that a greater portion of our patients are a fall risk. During FY 2025, 4,650 hours of 1:1 observation care were required in SPH’s Acute Care Department. These needs are highly variable and impossible to predict. Staffing 1:1 supervision often requires overtime or reassignment of clinical staff, increasing costs and contributing to workforce fatigue. But recruitment of additional staff solely for intermittent observation isn’t practical. Like other rural regions in Alaska, the Kenai Peninsula is a Health Professional Shortage Area. Recruitment here can be especially expensive—involving costs for travel, temporary housing, and other factors not seen elsewhere. These conditions make technology-enabled solutions to expand staffing capacity even more valuable. Without a scalable solution, SPH faces increased staffing costs, staff burnout, and potential constraints on its ability to safely care for behavioral health patients locally.	This project directly addresses two key findings of the collaborative work of SPH and MAPP, the regional healthcare coalition, which identified behavioral health needs and healthcare workforce shortages as two of the top priorities in the most recent Community Health Needs Assessment. Telesitting allows trained observers to remotely monitor multiple patients simultaneously using secure audiovisual systems, intervening when necessary and alerting bedside staff in real time. This model improves patient safety while reducing reliance on costly, difficult-to-staff in-person 1:1 observation. This project addresses the opportunity to deploy technology-enabled patient observation to improve safety while strengthening workforce stability and fiscal sustainability. Key components of this project include: Technology Acquisition and Installation • Installation of in-room audiovisual monitoring units • Secure centralized monitoring station • Integration with existing hospital IT and privacy protocols • Compliance with HIPAA and hospital safety standards Clinical Workflow Development • Establish clear criteria for telesitting eligibility • Develop escalation protocols for bedside intervention • Integrate telesitting into behavioral health stabilization pathways Staffing Model Optimization • Train designated observation staff • Reduce reliance on overtime for 1:1 in-person supervision • Allow bedside nurses and CNAs to focus on clinical care Performance Monitoring • Track observation hours, overtime reduction, and safety events • Monitor patient outcomes and staff satisfaction This project aligns with RHTP Initiative #6 by deploying innovative technology to address rural workforce constraints, Initiative #5 by reducing burnout and improving retention, and Initiative #2 by ensuring safe local access to behavioral health stabilization services. By modernizing observation capacity, SPH strengthens its ability to safely care for vulnerable patients without unnecessary transfer, preserving access to care for the southern Kenai Peninsula.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

South Tongass Volunteer Fire Department	Building health habits and communities through restoration of the STVFD playground	AK	In 2023, the Ketchikan Gateway Borough released the Parks & Playground Master Plan. This plan identified hazards within the current playground and immediately had the playground shuttered. The Master Plan also identified the need for recreation along South Tongass. However, within the Master Plan, the STVFD Playground was not identified as a project to be funded in the next 10 years, leaving the south end, and a large, family-oriented neighborhood, without adequate recreational opportunities for the foreseeable future. Notably, the Borough does not claim this playground as one of its recreation properties, which is why it was a low priority for restoration. This project presents an opportunity to invest in infrastructure renovations and equipment in an existing community hub. By rehabilitating this space, we address the lack of dedicated space and resources to facilitate physical activity, ensuring the south end is no longer left without adequate recreational opportunities.	This application seeks to modify the space to allow efficient, dual-purpose use for extracurricular recreation and wellness activities. Our approach includes the removal of dangerous and defunct structures, site preparation, and the installation of a modern play structure. The project will leverage volunteer labor and in-kind donations to establish a wellness center atmosphere that promotes community health. By timing the playground's reopening with the reconstruction of the South Tongass Fire Station (expected late summer 2026), we create a unified, dual-purpose community asset. Once installed, minimal maintenance is required and would be managed through our volunteer membership and community collaboration.	\$50,000-\$250,000	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

Southcentral Foundation	Chitina Community Health Clinic Expansion	AK	The clinic at Chitina is open again. Southcentral Foundation has an opportunity to impress the community and increase outreach. The challenge that the clinic in Chitina faces is not primarily some outdated emergency equipment (although those items we mention could certainly benefit from a refresh or update). The most significant challenge is a lack of encounters, which in turn leads to a lack of billable services, which places a burden on the program making it more difficult for the facility to remain current and usable. The community has self-reported some poor health, which indicates a pressing need for local services. Although individuals in the community may be traveling the 50 miles (>1 hr.) to the Robert Marshall health center in Glennallen, they may also be suffering without sufficient care. Since we know that another challenge in Chitina is transportation, it is likely that some health issues are simply not being addressed at all, and an outreach campaign, perhaps some transportation assistance, coupled with a more robust inventory of emergency equipment, could change that. As part of this project, SCF needs to secure better provider housing. Some in-clinic housing options, though rudimentary, will be available within the coming weeks. However, it would be a better idea for providers and the community if SCF could secure housing in the village, initially within the scope and allowable costs in this opportunity, and then expanded as encounters and income increase.	SCF has already updated most standard equipment in the Chitina clinic. The project manager would use program funds to update, replace, and supplement emergency response items (Stryker bed, cameras, etc.), transporting and installing them over the course of 12-15 months. For an outreach campaign, the clinic manager would partner with the Corporate Communications department to identify several ways to reach individuals in the community, explaining the available hours and services offered. These could include radio ad time, an updated Facebook (or other social media) page, or a word-of-mouth campaign. As previously stated, SCF is installing temporary sleeping quarters in the clinic itself within the upcoming weeks. However, it is not conducive to the care needed to ensure providers’ best service. SCF will be looking into the community for warmer, more comfortable and better-maintained quarters. The transportation issue is more complex and would need to be addressed in a secondary phase of the Chitina Clinic project.	\$250K-\$1M	Other	Single Community	Copper River Census Area	Advance to Implementation Application

Southcentral Foundation	Expanding Access to Pharmacy Services in the Mat-Su Valley	AK	Southcentral Foundation’s pharmacy services at the Benteh Nuutah Valley Native Primary Care Center (BNPCC) face growing pressure due to three key challenges: 1) the rapidly increasing demand for local healthcare services across the wide geographic area of the Matanuska-Susitna Valley; 2) the need for more convenient and accessible pharmacy options—especially outside normal business hours or for individuals with limited mobility; and 3) rising operational costs associated with meeting these expanding service needs. As the population grows and more families rely on BNPCC for their care, the current pharmacy model cannot fully support the demand for timely, consistent access to medications. Customer-owners increasingly need flexible, closer-to-home options for routine prescription pick-ups that do not require entering the pharmacy or waiting for staff availability. This project offers an opportunity to modernize pharmacy operations by investing in advanced technology and equipment that expand access and improve efficiency. Automated medication systems and secure pickup solutions reduce reliance on additional staffing, streamline refill workflows, and make medication access available beyond standard pharmacy hours. These improvements will lower operating costs, improve convenience, and enhance overall customer-owner experience while ensuring that high-quality services remain sustainable as community needs continue to grow.	The Pharmacy Technology project will fund essential equipment for the expanded Benteh Nuutah Valley Native Primary Care Center (BNPCC), ensuring the facility can fully support high-quality, safe, and accessible healthcare services. The project centers on improving access by using pharmacy medication lockers and automating processes. Pharmacist involvement in the medication use process significantly enhances safety and quality of care. Pharmacists provide direct oversight of medication selection, dosing, monitoring, and patient counseling—key functions that reduce medication errors and prevent adverse drug events. Integrating this expertise into BNPCC’s expanded operations ensures that growing patient volume can be supported without compromising safety or quality. The project incorporates advanced pharmacy medication locker technology to expand access to prescriptions. These secure, automated lockers allow SCF to dispense routine and refill medications at a convenient location, improving medication adherence. Lockers include live video support to maintain personal connections and ensure that customer owners can receive assistance from pharmacy staff, when needed. By shifting routine pickup encounters to this technology, pharmacy staff can focus more time on clinical care and complex medication needs, increasing overall efficiency. Together, pharmacist-driven oversight and medication locker technology create a streamlined, accessible, and patient-centered medication distribution system. This approach ensures BNPCC can meet the growing population demand for local pharmacy services, enhances convenience for customer owners, and supports better long term health outcomes through improved medication access and adherence.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Southcentral Foundation	Expansion of Statewide Child and Family Developmental Services	AK	Alaska's access to pediatric developmental specialists and therapies is extremely limited. Reliance on out-of-state providers that travel to Alaska intermittently creates minimal capacity and disjointed continuity of care. Travel out of Alaska to access services is limited to those with sufficient resources and those providers are restricted by licensing issues and generally cannot provide follow-up and in-person care. SCF's Child and Family Developmental Services (CFDS) clinic seeks to address the state limited capacity and access to timely and appropriate levels of care through a 5-year clinic expansion plan. The dearth of developmental services available in Alaska and the needs amongst its service population, have bolstered SCF's commitment to bridging the gap in access to care with a five-pronged approach. SCF will 1) recruit additional developmental service providers and shore up the therapies and support infrastructure; 2) increase opportunities to provide appointments through telehealth, which further expands rural reach; 3) expand clinic space to house the additional staff, which would require remodeling of clinic space currently housing other services; 4) create a pipeline for Child Life Specialists through a tuition reimbursement program, since recruiting for this position has yielded no qualified candidates; 5) develop a youth transition program to facilitate the timely shift to adult-based services.	Southcentral Foundation's (SCF) 5-year expansion plan is backed by a proforma that projects what is needed to right-size the Child and Family Developmental Services (CFDS) clinic. The proforma is ambitious and gradually adds FTEs to the clinic starting with an additional 31 employees in FY27; 45 in FY28; 56 in FY29; 60 in FY30 and 62 in FY31. The reality is that recruiting for the additional FTEs and establishing new service lines will take longer than the proforma depicts. The State's Rural Health Transformation Program (RTHP) funding would help to accelerate this timeline by supporting the new FTEs until they are covered fully by reimbursement to allow the next round of recruitment to begin earlier; a clinic space remodel; creation of a workforce pipeline for Child Life Specialists; modernization and expansion of clinic therapy supplies and minor equipment; acquisition of additional telehealth services equipment for the clinic; and implementation of a comprehensive, systematic transition plan for youth heading towards adulthood. The initial staff expansion for the 1st budget year of the Alaska RHTP funding would focus on the addition at least one Occupational Therapist, Physical Therapist, Speech Language Pathologist, Testing Psychologist, Registered Behavioral Technician, Nurse Case Manager, Case Management Support, Community Case Manager, Therapy Technician and Program Coordinator. Additionally, recruitment will start for a Geneticist; Pediatric Neurologist; Physical Medicine and Rehabilitation Physician; Developmental Behavioral Pediatrician; and Music Therapist, as these positions are harder to recruit and will require active recruitment until all of the positions are filled. Work on the telehealth service expansion; modernization of clinic supplies and equipment; the Child Life Specialist workforce pipeline; and the youth transition program would all begin in the 1st budget period. The clinic renovations are needed almost immediately, but will likely occur in year 2, as the space is currently occupied and a new location for that program needs to be identified. The right-sizing of the CFDS clinic would truly transform rural health care in Alaska, bringing in specialties and services not currently available or that have insufficient capacity. Components of this project are likely to impact non-tribally sponsored services and may develop replicable approaches that could be adopted and adapted throughout the state.	Over \$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Southcentral Foundation	Leveling the Playing Field: Expansion of Specialty Pediatric Services	AK	SCF’s Specialty Pediatric Clinic has identified significant gaps in care for Alaska Native and American Indian children, birth to age 18, with complex medical and developmental needs. Rural and remote communities face persistent shortages of pediatric specialists and high turnover of care coordinators, resulting in delayed diagnoses, fragmented care, and limited access to subspecialty services. To address these statewide gaps, the Clinic expanded its pediatric subspecialty team across 13 disciplines, including endocrinology, neurology, pulmonology, genetics, and gastroenterology, among others, that are rarely available outside Anchorage. While this expansion has improved statewide capacity, the rapid growth in referrals and the complexity of cases has created a parallel need to increase support staff. Currently, specialty providers are spending substantial time on case management, care coordination, travel logistics, discharge planning, and family education—tasks that limit the time they can devote to direct care and reduce overall clinic efficiency. Additional support staff is essential to ensure that providers can focus on delivering high-quality specialty services while families receive comprehensive, wrap-around support. This project presents an opportunity to strengthen access to specialty pediatric care statewide by expanding the support infrastructure needed to sustain the Clinic’s multidisciplinary model and meet rising demand from rural and frontier communities.	The proposed approach focuses on expanding the statewide Specialty Pediatric Clinic’s support team to enhance access, care coordination, and overall quality of services for Alaska Native and American Indian children—particularly those traveling from rural, remote, and frontier communities. Additional support staff is essential to improve case management, streamline clinic operations, and ensure families receive whole-person, culturally grounded care. Children who travel from regional hubs face different and more complex care coordination challenges than local families. While Integrated Pediatrics (PCC) coordinates care for Anchorage-based customer-owners, rural families must often navigate long-distance travel, multiple appointments, and transitions in and out of their home communities. Many of these children have medically fragile or highly complex conditions, creating additional needs around travel logistics, discharge planning, referrals, and follow-up support once they return home. Without dedicated support staff, specialty providers must fill these coordination gaps, reducing the time available for direct patient care. SCF will enhance the Specialty Pediatric Clinic by adding Clinical Medical Assistants (CMAs), Case Management Support (CMS), Nurse Case Managers, and Community Resource Specialists. These positions will provide comprehensive navigation, including care coordination, resource linkage, travel and lodging assistance, pre-visit planning, and school or community support. This multidisciplinary support structure will create a seamless, guided experience for families, reduce care fragmentation, and improve timely access to specialty services. The expanded staffing model offers a fully integrated approach that addresses physical, behavioral, developmental, and social needs within a single coordinated system. By allowing specialty providers to focus on complex medical care while dedicated staff manage care logistics, SCF will increase appointment access, improve continuity across regional and specialty services, and strengthen proactive management of chronic and high-risk pediatric conditions. This approach ensures that children across Alaska—regardless of location—can receive high-quality, coordinated specialty care.	\$1M-\$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Southcentral Foundation	Quyana Qenq'a Project	AK	The following opportunities currently exist in the provision of SPMI services to the population of Anchorage, including those who have relocated from Alaska's rural and remote regions to access those services. The most significant problems concern the fragmented care, access delays, and gaps in providing SPMI treatment services. Current SPMI care is fragmented due to the separate SCF programs of Quyana Clubhouse, Integrated Case Management (ICM), and Fireweed Behavioral Health Clinic, and the resulting difficulties coordinating services across these locations and service lines. There are also delays in care at API, prisons, etc., with access delays due to transitions from one program to the next and creating delays at every step. These delays can result in someone with SPMI completely dropping off the radar without care, as there are not enough Case Management personnel to coordinate and provide care at this level of service intensity. The SPMI population needs multiple interventions to receive appropriate treatment. Intensive workforce training is required, as Case Management personnel need comprehensive training in conflict management skills and training to work with the SPMI population in group settings or community settings - as opposed to just one-on-one treatment. Gaps in service include needed therapies for dual diagnosis; vocational rehabilitation; peer support services; and psychiatric rehabilitation services. There is no access to these services now.	SCF recognizes the growing need for expanded behavioral health services in Alaska. The Quyana Qenq'a project represents a critical step toward strengthening our system's ability to serve individuals experiencing the most acute behavioral health challenges. The new Quyana Qenq'a facility—meaning “Thank You House” in Dena'ina Athabascan—will offer a transformative space for healing when it opens in May of 2028. The building will bring together two essential programs under one roof: 1) Day Treatment Program: A therapeutic setting that blends integrated behavioral health and primary care with Alaska Native tradition, providing structured support within a nurturing milieu. 2) Intensive Case Management (ICM) Program: A community-based service that focuses on outreach, engagement, intensive community case management, individual therapy, medication management, and connection to other vital supports. By expanding treatment capacity, this project will help reduce strain on emergency departments and law enforcement while promoting coordinated, effective, and culturally centered pathways to wellness. The new facility is intentionally designed to meet individuals where they are in their health journey by providing immediate access to care, strong community connections, and support for basic needs, such as food and clothing. Its size and layout will allow both programs to operate effectively, creating an environment that is healing-centered and supportive of long-term recovery for individuals living with severe and persistent mental illness. SCF will be exploring the Flexible Assertive Community Treatment (FACT) approach for potential use in the Quyana Qenq'a facility. Within this approach, multi-disciplinary teams provide comprehensive, community-based care for individuals with SPMI, combining intensive, shared-caseload management (similar to standard ACT) for crisis periods with personalized, individual case management for stable periods. Within the FACT model each discipline brings their expertise and training to bear on treatment of individuals. Team structure consists of Psychiatry, Nursing, Therapists, Vocational Rehabilitation Specialists, Psychosocial Rehabilitation Specialists, Case Managers, Substance Use Specialists, and Peer Specialists. This model allows for fluctuating support levels within the same team, reducing the need to transition customers to a different team/program while also reducing hospitalization/emergency service utilization.	\$250K-\$1M	Family or primary care	Single Community	Anchorage (Municipality)	Advance to Implementation Application

Southcentral Foundation	Rural Elders Program	AK	Rural Alaska’s growing Elder population faces limited access to coordinated, preventive, and home-based healthcare. Geographic isolation, workforce shortages, transportation barriers, fragmented services, and aging housing stock contribute to preventable decline and unnecessary relocation from home communities. Elders often struggle to navigate benefits, arrange travel, coordinate dental and specialty care, complete advance care plans, or protect themselves from financial exploitation. Social isolation is common, and services are not consistently aligned to population-level need. Without structured local coordination—such as a dedicated Elder Resource Specialist—clinical recommendations may not translate into completed services. A coordinated, community-based aging-in-place model is needed to stabilize access, improve outcomes, and strengthen sustainability.	The Rural Elders Program implements a five-year phased redesign of elder care delivery, community-based Elder Resource Specialists (ERS) all to assist with aging in place in the local community. Each participating community will establish a part-time ERS who serves as the local anchor for coordination. A project lead for the ERS’s will be located in Anchorage. The ERS will: • Connect Elders to primary care, dental, PT, and specialty services • Arrange transportation • Assist with needs to keep elder in their home • Reinforce advance care planning • Coordinate housing modification referrals • Facilitate social gatherings and healthy wellness activities Care Teams will conduct structured in-home visits, completing standardized screening bundles (ADLs, fall risk, dental coordination, advance care planning). The ERS ensures follow-through after the visit. Complete an assessment of how physical therapy services will travel to rural locations on a scheduled basis with telehealth follow-up. Dental coordination will ensure annual exams and denture education. Transportation plans will be documented for every Elder. Housing safety assessments and age-friendly modifications will be coordinated in partnership with Tribes and housing entities. Social isolation will be addressed through strengthened gathering spaces, with ERS support for participation outreach. Data dashboards will track performance metrics.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Kenai Peninsula Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; Yukon-Koyukuk Census Area	Advance to Implementation Application

Southcentral Foundation	Rural Pharmacy Upgrade	AK	The challenges faced by Southcentral Foundation’s rural pharmacy services are 1) the medicine dispensing machines (PickPoint brand) are aging, and 2) temperatures in pharmacies in SCF’s rural communities are much too high for the providers and some medications. USP-NF (<659>) defines Controlled Room Temperature (CRT) for pharmacy storage as 20°C to 25°C (68°F to 77°F), with permitted brief excursions between 15°C and 30°C (59°F to 86°F). Some of the SCF CHC pharmacies require facility modifications to maintain appropriate medication storage area room temperature ranges. The Pick Point Remote Dispensing Unit Cabinet Design has been updated since the initial telepharmacy installations. All 14 locations have the older cabinet model; Nilavena has a combination of one old and one new RDS. A total of 15 RDS with corresponding modifications in clinic pharmacy networking technology are requested.	The involvement of a pharmacist in the medication safety process significantly enhances both medication safety and access to care in the rural clinic setting. Pharmacists provide critical oversight in medication selection, dosing, monitoring, and patient education, reducing the risk of medication errors and adverse events. The use of barcode technology, remote dispensing systems, and climate-monitored, pharmaceutical-grade refrigerators and freezers creates additional safety nets that support accurate dispensing and proper medication storage. These systems help ensure medication integrity, maintain cold chain compliance, and reduce the potential for human error. Maintaining a standardized clinic medication formulary tailored to the specific needs of the local community further strengthens access to essential medications. This proactive approach allows rural clinics to anticipate and stock critical medications needed for their patient population. It also improves resilience during periods of poor weather affecting transportation, mail delays due to weather or staffing shortages, and natural disasters such as earthquakes or volcanic eruptions. Together, pharmacist involvement, technology integration, and strategic formulary management create a comprehensive framework that supports safe medication practices and reliable access to care in rural communities.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Chugach Census Area; Copper River Census Area; Kenai Peninsula Borough; Lake and Peninsula Borough; Yukon-Koyukuk Census Area	Advance to Implementation Application

Southcentral Foundation	SCF Traditional Healing Project	AK	This project addresses a growing need for culturally grounded inpatient and community-based support for Alaska Native customer-owners traveling from rural communities, and a growing need for ceremonies, spiritual support, and cultural coordination within and beyond the Traditional Healing Clinic. Currently, staffing limitations restrict the department’s ability to meet these needs consistently, sustainably, or even at all. Additionally, in recent years there has been an increase in requests for staff to support pandemic responses, disaster relief, and other emergency situations. The opportunity is to formalize and expand Traditional Healing and its service delivery model through strategic items include: Staffing: a. Tribal Doctor Apprentices (10) b. Clinical Supervisor (1) c. Traditional Healing Cultural Advisor (1) d. Clinical Learning & Development Training Specialist (1) e. Case Management Support (1) f. Administrative Support (1) Training: a. Clinical Training (CME/CEUs) b. Non-Clinical Training c. Covering Staff Support Salaries d. Create a certified Tribal Doctor Certificate for SR roles to better educate and offer services within ANMC on understanding how we can better connect the Traditional Healing services This investment strengthens workforce capacity, improves cultural integration in care delivery, and builds long-term sustainability of Tribal Doctor services.	The proposed approach is a phased workforce expansion and infrastructure build-out during FY26–27 (through 9/30/2027). Staffing Plan: a. Hire 1 Clinical Supervisor to provide oversight, mentorship, and quality assurance. b. Hire 1 Traditional Healing Cultural Advisor to provide ceremonial and spiritual services support c. Hire 1 Clinical Learning and Development Training Specialist to provide Tribal Doctor Training services d. Hire 10 Tribal Doctor Apprentices to expand inpatient and village-based service delivery. e. Hire 1 Case Management Support staff member to coordinate care transitions and referrals. f. Hire 1 Administrative Support staff member to manage scheduling, reporting, and operational needs. Service delivery will expand in the following areas: a. Increased inpatient Tribal Doctor presence for customer-owners traveling from rural communities. b. Scheduled village visits to improve continuity, prevention, and relationship-building. c. Increased presence for ceremonies within and outside SCF for Traditional Healing practices Travel and training: Travel and training will include attending conferences and training for skill building. Data tracking will include service utilization, inpatient referrals, customer-owner satisfaction, and continuity of care indicators. This structured expansion ensures quality, workforce development, and system integration rather than ad hoc growth.	\$250K-\$1M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Southcentral Foundation	The Tinitun Qenq'a Pathway Home Project	AK	Residential behavioral health programs must continuously evolve to meet the needs of adolescents with complex behavioral health and co-occurring conditions. Addressing the increasingly acute needs of adolescents in today's society, is a primary need for SCF in successfully providing the appropriate treatments and environment for these youth to be successful in life. The Pathway Home seeks to advance its clinical model, implement evidence-informed therapeutic modalities with fidelity, strengthen workforce competencies, expand clinical supervision, and improve program operations and environment. An external consultant will provide comprehensive evaluation and recommendations for clinical model enhancement, supervision structures, fidelity monitoring, workforce development, and targeted environmental improvements. This project addresses the opportunity to provide more consistent, evidence-informed care, strengthen team-based care, and enhance outcomes for adolescents from across Alaska, including rural communities.	The project will advance The Tinitun Qenq'a Pathway Home adolescent residential program through an integrated approach of clinical, operational, workforce, and environmental improvements. Activities include: - o Engaging a consultant for program evaluation and recommendations on clinical model, therapeutic modalities, supervision, and operations - o Implementing or refining evidence-informed therapeutic modalities with fidelity - o Expanding clinical supervision and oversight for clinicians and paraprofessionals - o Developing structured competency pathways, trainings, and fidelity monitoring systems - o Enhancing integrated behavioral health team functioning and interdisciplinary care coordination - o Supporting staff participation in professional conferences and learning collaboratives - o Targeted environmental improvements, including furniture upgrades and sensory-supportive spaces, to align the physical setting with the clinical model This approach ensures the program is aligned with trauma-informed care principles, strengthens workforce competencies, improves consistency and quality of treatment, and enhances the therapeutic environment for adolescents, reinforcing the statewide behavioral health continuum.	\$1M-\$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Southcentral Foundation	Yeshjesh T'uh Crisis Project	AK	Demand for high-intensity crisis services has grown, and rural customer-owners often lack timely access to crisis stabilization and crisis residential care. Yeshjesh T'uh Crisis Project provides an opportunity to open fully prepared programs with trained personnel, integrated behavioral health teams, and structured supervision. Start-up funding for personnel, including co-located kitchen and pharmacy services, ensures operational readiness. Integrated pharmacists will enhance medication management, support staff in complex care decisions, and improve outcomes. Workforce development and supervision lay the foundation for high-quality crisis services that strengthen the statewide behavioral health continuum. Yeshjesh T'uh will address serious gaps in the continuum of mental health care in the State of Alaska's current system, which leaves Alaska Native and American Indian people with few options when experiencing a mental health crisis. If they do not require or need hospitalization, they are discharged from the Emergency Room back into the community without receiving the appropriate level of care, support, or coordination they need. Yeshjesh T'uh would remedy this inequity by providing individuals and their families with mental health crisis care with an open gateway to the appropriate level of behavioral health services and ensure less time is spent in first responder custody or jail.	The project will establish high-intensity crisis programs by addressing personnel readiness, workforce competencies, and integrated care. Key activities include: • Funding start-up personnel costs for clinicians, paraprofessionals, kitchen, and pharmacy staff prior to program opening • Incorporating integrated pharmacists into behavioral health care teams to provide direct consultation, medication management, and support for complex co-occurring conditions • Workforce training, structured supervision, and competency development for all clinical staff • Developing fidelity monitoring and quality assurance for evidence-informed crisis interventions This approach ensures staff readiness at opening, strengthens high-intensity crisis stabilization and crisis residential care, enhances rural customer-owner access, and supports seamless integration within the behavioral health continuum. Yeshjesh T'uh will provide a variety of operational and administrative efficiencies for multiple organizations involved in the process. Those efficiencies include the reduction in mental health crisis Emergency Room visits – reducing the strain on demand for Emergency Room services; reduction first responder or police involvement in mental health crisis events – freeing up first responder capacity and lessening the amount of time an individual spends in custody; reduction in overall costs with earlier intervention at a more appropriate level of care for the individual; and the delivery of appropriate tribal and community-based services for additional support, treatment, and referrals that lead to more efficient and appropriate treatment and better health outcomes	Over \$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Southcentral Foundation	Access and Entry Control System Modernization for Tribal Health Care Facilities	AK	SCF’s current building access control system is severely antiquated and poses significant security vulnerabilities that must be addressed to ensure the safety of employees, customer-owners and organizational assets. The current system relies on RFID badge technology that can be easily compromised using inexpensive, commercially available tools.	To bring SCF’s access control system up to current security standards, it will be necessary to update door entry systems, integrate organization-wide security system systems and functions, procure unique coded badges that cannot be cloned, replace all badge readers across the organization with compatible models, implement updated management software for secure credential issuance, monitoring and deactivation.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced
Southcentral Foundation	Building upon Maternal Child Home Visiting Services to Meet the Needs of Rural Communities	AK	Maternal child home visiting programs have a long history of improving birth, infant and early childhood health outcomes. The State of Alaska has identified home visiting as a protective factor for Sudden Unintentional Infant Death (SUID), which is disproportionately high amongst Alaska Native and American Indian families in Alaska's rural and remote communities. SCF's Nutaqsiivik program has launched a Safe Sleep initiative as the SUID deaths are on the rise in Alaska, most of which are preventable deaths. The Nutaqsiivik program has also demonstrated high rates of developmental screenings, immunization , timely well child visits, and postpartum care. The current program limitations for expansion to rural communities include it being a prenatal program, ending at the child's second birthday, requiring nursing staff, and expecting at least one visit a month while enrolled in services. Services are designed to be provided in-person, though telehealth was utilized with mixed results during the COVID-19 pandemic. SCF supplements the NFP model with in-home behavioral health support for families. The program currently serves around 260 families annually with 11 home visiting nurses and two nurse supervisors. Rural communities need similar home visiting services that are responsive to the needs of families and the environments in which they reside.	Southcentral Foundation (SCF) treats maternal child home visiting services as an extension of primary care. As such, SCF has sought to provide home visiting services through its network of FQHCs. Attempts have been made to develop a plan to move forward with alternative home visiting modalities with mixed success. The greatest limitation is the lack of staff dedicated to analyzing what SCF has already learned through its Indigenous Project Launch grant; 16 years of its Tribal Maternal Infant Early Childhood Home Visiting (MIECHV) grant; and four decades of service provision to families within the Nuka System of Care and its FQHCs. In-depth analysis and planning support is needed to map a way forward to deliver impactful home visiting services in rural communities . Additionally, SCF has worked on the development of Infant and Early Childhood Mental Health (IECMH) curriculum for providers system wide and built capacity to deliver Strengthening Families trainings for SCF staff, but full rollout and scalability of these trainings for SCF employees, including healthcare providers, is hindered by insufficient staffing to lead these trainings. Ensuring that providers serving families in any capacity take an IECMH informed, strength-based approach is paramount to developing a partnership with parents as they navigate pregnancy and parenting through the 1st five years of their children's lives. Home visiting can be a catalyst and protective factor for improving the health outcomes for Alaska Native and American Indian families and the development of a home visiting modality that provides a consistent, relational and impactful home visiting services in rural Alaska communities is long overdue. SCF is requesting funding for a planning grant that would support a Clinical Informatics Specialist, a Learning and Development Clinical Training Specialist, and a project lead for the Year 1 budget period, which would would allow for the rollout of IECMH and Strengthening Families trainings to health care providers and the development of a home visiting modality that incorporates evidenced-based programming and the tribal context of the rural and remote communities served by Southcentral Foundation.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality); Copper River Census Area; Kenai Peninsula Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Southcentral Foundation	Digital Security and Monitoring Modernization for Tribal Healthcare	AK	Rural Tribal healthcare delivery depends on efficient administrative operations and secure digital systems. Workforce shortages, geographic isolation, and increasing documentation requirements place significant strain on care teams. Emerging AI tools offer meaningful opportunities to reduce administrative burden and improve operational efficiency; however, safe implementation requires modernized security, monitoring, and data governance capabilities. Currently, legacy security platforms and fragmented monitoring tools limit SCF’s ability to responsibly deploy AI technologies while maintaining regulatory compliance and protecting customer-owner information. The opportunity is to modernize and consolidate digital security systems in order to safely enable AI-driven operational improvements that strengthen rural healthcare sustainability.	SCF proposes a phased modernization of its digital security and monitoring environment to enable safe adoption of AI-powered administrative tools that improve operational efficiency across rural healthcare services. The project will consolidate legacy cybersecurity systems into a unified, integrated platform that strengthens monitoring, improves incident response, and enhances protection of patient information. This modernization will establish the safeguards required to responsibly deploy AI tools that assist with documentation support, internal knowledge access, workflow coordination, and administrative task reduction. Key components of the approach include: - Implementing advanced monitoring and detection capabilities to reduce the risk of system disruption. - Strengthening data governance controls to protect protected health information (PHI) while enabling appropriate internal access. - Enhancing audit and oversight functions to maintain compliance and accountability. - Standardizing digital security architecture to reduce operational complexity and improve sustainability. - Deploying AI tools in controlled phases, beginning with administrative and operational workflows. This structured approach ensures that AI adoption enhances workforce capacity without increasing compliance risk or compromising customer-owner privacy. By aligning modernization with operational outcomes, SCF will improve system reliability, reduce administrative strain, and strengthen the long-term viability of rural healthcare services.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Southcentral Foundation	Electronic Health Record System Updates for Tribal Health	AK	SCF’s current health information infrastructure faces performance, interoperability, and workflow efficiency limitations that hinder the ability of care teams to fully utilize modern tools and technologies. These challenges are increasingly significant as the healthcare environment shifts toward telehealth, distributed care teams, integration of behavioral health, and more comprehensive data use. Rural and remote staff—particularly CHA/Ps, village based behavioral health providers, and mobile clinicians—often experience inconsistent system performance, delayed access to information, and limited ability to use emerging care delivery modalities. At the same time, SCF’s workforce needs more intuitive, efficient, and reliable systems to support growing demand and increasingly complex care needs. This project addresses the opportunity to modernize and optimize SCF’s core health information systems to better support rural care delivery, reduce workflow burden, and create a more scalable, sustainable foundation.	The project will take a phased, systems engineering approach to improving infrastructure, usability, and reliability across SCF’s clinical information ecosystem. Key elements include: • Infrastructure Modernization: Upgrading servers, storage, and network elements that support Cerner Millennium and ancillary systems, improving speed, stability, and uptime for both urban and rural users. • Workflow Optimization & System Redesign: Partnering with clinical and operational teams to streamline documentation, reduce redundancies, and standardize workflows—especially in telehealth, behavioral health, care coordination, and village-based services. • Enhanced Interoperability: Expanding interfaces, data-sharing capabilities, and clinical data reconciliation workflows to support more consistent, real-time information exchange with regional partners, tribal facilities, and remote clinic systems. • Telehealth & Remote-Care Enablement: Adapting the EHR to better support virtual visits, remote assessments, mobile charting, and technology that rural teams use in the field. • Testing & Training: Implementing structured training, communication, and adoption strategies to ensure staff can quickly incorporate improvements into daily workflows. This approach ensures immediate improvements while laying a scalable foundation for future enhancements.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Southcentral Foundation	Hub, Spokes and Wheels: Expanding Access to Care with Mobile Clinics	AK	Reliable and accessible transportation and child care coverage repeatedly rise as two of the most frequently cited reason for not utilizing primary care services and even health care in general. In Anchorage, the public transportation system continues to retrench bus routes, greatly increasing the wait times and walking distance between the stops and desired locations, increasing risks to customer-owners due to poorly maintained sidewalks and harsh weather, as well as the number of missed appointments. It also results in delayed care and an increase in ER visits. Medicaid vouchers for transportation are often not accepted by local cab companies or individual drivers. Ongoing efforts to increase accessibility in Anchorage has resulted in small clinics being set up at Covenant House, Brother Francis Shelter, Centennial Village, Quyanna Club House and SCF's Elder Program. However, space limitations and clinic locations have not sufficiently addressed the access issues. SCF does provide home health visits, but what they can do without clinic space is very limited. Outside of Anchorage, public transportation is virtually non-existent. SCF works to provide additional services to the rural clinics by sending providers out to the communities, but once again, space becomes an issue in the rural clinics. Mobile clinics will address clinic space, transportation, quality of care and child care coverage barriers, while also increasing the range of screening and prevention services.	Southcentral Foundation (SCF) is interesting in exploring the use of mobile clinics. Developing mobile clinics as a service delivery modality has been under consideration for some time, especially as the service population continues to outpace Indian Health Service and third-party payor resources. The migration of Alaskans from rural communities to regional hubs, the Matanuska-Susitna Borough and the Municipality of Anchorage over the past two decades requires further innovations in service delivery to address the ever growing needs of customer-owners (individuals that receive services from SCF). This will be a phased project. Phase 1 (Budget Year 1): -Determine the specifications for two mobile primary care clinics (Month 1) -Submit bid request for competitive equipment bid and RFP development (Month 2) -RFP Release (Month 3) -Bid process completion and contract awarded (Month 4-5) -Mobile clinic process and procedures developed (Months 6-12) -Mobile clinic received and initial service delivery trials initiated (Months 9-12) -Determine the number and types of mobile clinics to bring on line in the next phase (Months 3-6) Phase 2 (Budget Years 2-5): -Determine the specifications for second round of mobile clinics (Month 1) - Submit bid request for competitive equipment bid and RFP development (Month 2) -RFP Release (Month 3) -Bid process completion and contract awarded (Month 4-5) -Analyze outcomes from the additional mobile clinics to inform future mobile clinic requests (Months 6-9) -Mobile clinic process and procedures developed for additional mobile clinics (Months 6-12) -Mobile clinic received and initial service delivery trials initiated for new clinics (Months 9-12) Phase 3 (Year 5): -Evaluate the overall project implementation and mobile clinic service modality funded under the Alaska RHTP project (Months 1-9)	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Copper River Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

Southcentral Foundation	Increasing Access to Statewide Specialty Pediatrics and Anchorage Native Primary Care Clinic	AK	SCF’s Primary Care 2-South and Specialty Pediatric clinics opened in 2001 and have not been remodeled since. The current space no longer meets the needs of customer-owners and integrated care teams delivering relationship-based care. Exam rooms are too small to accommodate families—many traveling together from rural areas—resulting in crowded, stressful visits. Individuals using wheelchairs must navigate tight corners and narrow doorways, slowing movement and creating safety concerns. Staff must continually reposition furniture to make space, disrupting workflow, delaying access, and detracting from the quality and purpose of each visit. While minor cosmetic updates have occurred, the environment is outdated and inconsistent with SCF’s commitment to welcoming, culturally grounded healing spaces. Customer owners report dissatisfaction with cramped, uncomfortable rooms, especially compared to the facility’s updated areas. Furnishings and equipment are also aging and increasingly unreliable. Exam tables malfunction, cabinet locks fail, and frequent repairs lead to temporary room closures, reducing capacity and slowing operations. This significantly affects the statewide Specialty Pediatric Clinic, as families cannot reschedule due to limited travel windows. Upgrading technology—including medication dispensing machines, integrated diagnostic systems, power exam tables, and telehealth-ready exam rooms—is needed to support efficient, safe, high-quality care and improve access.	The redesigned Anchorage Primary Care 2-South and Specialty Pediatric clinics will modernize exam rooms and clinical spaces to meet SCF clinical standards, support fully integrated care delivery, and create an environment that honors Alaska Native people, culture, and wellness. SCF is beginning planning and design, using a progressive design-build approach to support collaboration, innovation, and value. The design work is scheduled for completion in early 2027. Construction is anticipated to begin in Summer 2027 and conclude in Summer 2028. The project will fully renovate 13,700 square feet in the outdated clinic areas. Improvements include acoustic upgrades, family-friendly layouts, and expanded 120-square-foot consultation areas designed to better serve families, rural residents, elders, and individuals with disabilities. The layout will enhance coordinated, integrated services provided by family medicine, behavioral health, pharmacy, nutrition, physical therapy, psychiatry, midwifery, and pediatrics. The statewide Specialty Pediatric Clinic has expanded its provider team to include 13 subspecialties, including pediatric pain management, pediatric endocrinology, genetic services, and other specialties. The remodel will improve access and efficiency during time-limited visits for families traveling from rural communities. The design also advances SCF’s transition from patient-centered to family-centered care. Technological capabilities will be significantly upgraded. Telehealth-ready infrastructure—including large displays, enhanced connectivity, and dedicated virtual care hubs—will expand access for rural and remote communities and enable physicians to seamlessly transition between in-person and virtual services. Additional automated systems, such as updated diagnostic equipment and medication dispensing technology, will enhance clinical efficiency, safety, and workflow. Throughout construction, SCF’s project manager will collaborate with clinic leadership and contractors to select equipment and design features to optimize room functionality and support culturally grounded, relationship-based care. Upon completion, customer-owners will have access to a modern, integrated clinic where physical, mental, and emotional needs can be met in a healing environment that supports improved access to high-quality, coordinated care focused on specialized medical services, prevention, and proactive chronic disease management.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Southcentral Foundation	Mobile Dental Clinic Launch Project	AK	SCF sends dental professionals into Head Start and other programs, but most dental work requires specialized equipment: a lot of it. A dentist and/or hygienist can perform basic screenings and offer education and outreach, but cannot more without the appropriate clinical environment. The need for more specialized dental services and equipment increases with the age of the teeth (and customer-owner), and yet adults and elders without sufficient dental care exist in our communities. Oral and dental health is often taken for granted until a negative event: a toothache or a tooth breaks. Without strong teeth, overall health suffers. Children can struggle academically. An NIH study in 2012 found that "Students with toothaches were almost 4 times more likely to have a low grade point average." Another NIH study in 2018 reports that among unhoused individuals, 30% could not eat because of dental pain, and 20% could not sleep. Individuals may also experience "Dental Shame" (NIH 2025), making social interactions more difficult in addition to any pain. Many individuals cannot make or keep dental appointments frequently due to time constraints or lack of transportation. They struggle to travel during clinic hours, especially if the clinic is rural or has otherwise limited hours for dental appointments. SCF aims to fill the gap by bringing a mobile dental clinic to them, promoting oral health and greater access.	SCF has been evolving the idea of mobile clinics already. SCF Dental Department proposes a mobile clinic, similar to mobile medical and mammogram mobile units. In addition to the planning and assessment for which this application supports, the full project would roll out in three different phases: The initial phase of acquiring and equipping a vehicle will take 1-2 years. This phase would involve selecting a vehicle (optimistically, one large enough for at least 2 operatories, built on a motor home chassis), publishing an RFP, purchasing the vehicle, establishing storage and maintenance options, and equipping the vehicle. A dental clinic will always need to include some radiology, which will require extra planning. Additionally, sterilization equipment poses its own set of questions as part of the exploration of this project. After the vehicle is purchased and outfitted, the second phase can begin. In this first year of service, SCF would evaluate and refine how it meets needs, and where gaps in service remain. This type of evaluation is not only part of SCF’s approach, but improves access as we further identify needs. The third and final phase of the project would allow SCF to expand services to new sites. Leadership in the Dental Department is considering including traveling to schools, congregate living spaces for elders, and expanding services for FQHCs and shelter clinics.	\$1M-\$5M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

Southcentral Foundation	Rehabilitation Services Expansion & Transformation Project	AK	The demand for rehabilitative therapy at SCF continues to rise, leading to long wait times, capacity challenges, and a growing need for specialized services in chronic pain management and traumatic and acquired brain injury (TABI). Currently, customer-owners may wait more than 35 days for routine referrals and up to 28 days for urgent needs, delaying preventive treatment and prolonging recovery. SCF plans to hire additional therapists to address immediate needs. However, a long-term, right-sized, scalable therapy service is required to ensure timely and equitable access to care. Rehabilitative therapy is highly preventive and can reduce the need for surgery, hospitalization, and other intensive interventions when accessed early. Long waits can limit treatment effectiveness and slow recovery. Complementary services, such as exercise physiologists, further support chronic disease management and prevention but remain limited by current capacity. Most therapy is delivered onsite, requiring frequent travel that can be difficult due to weather, transportation barriers, or mobility limitations. Alternative delivery methods are needed to increase flexibility and reduce the burden on customer-owners, especially for episodic visits. This project presents an opportunity to expand capacity, modernize delivery models, and remove structural barriers to care—reducing wait times, supporting earlier intervention, and strengthening long-term wellness outcomes and system sustainability.	The Rehabilitative Therapy Expansion has three components designed to expand service and increase access to care: 1. Staffing & Service Expansion: SCF will hire additional therapy providers to reduce wait times and increase initial capacity. Additional therapies, such as chronic pain management support and pelvic physical therapy, which is available statewide, will be expanded to meet the demand for services. Expanding access to Cognitive Rehabilitation Therapy—currently limited to insured customer-owners—creates a more equitable service model and meets a growing need for TABI support. To ensure long-term capacity, SCF will also increase the number of support staff responsible for scheduling, referral management, and care coordination. These staff will work closely with integrated care teams to support continuity of care, assist customer-owners in navigating transportation or home visiting needs, and help remove barriers to timely access. 2. Delivery Methods & Scale: SCF is responsible for providing pelvic physical therapy statewide and supporting the rural CHCs it serves. To increase reach and access, SCF will explore alternative therapy delivery, such as expanding home visiting and hybrid telehealth in rural areas, and mobile therapy units that bring equipment and services directly to customer-owners. Group therapy delivered through learning circles will allow SCF to scale services efficiently while supporting cultural values, peer learning, and community-based healing. These approaches reduce travel burden, create more frequent touchpoints, and increase the number of customer-owners who can receive timely care. 3. Infrastructure & Equipment: To support the expanded workforce and service delivery model, SCF will remodel existing space to accommodate additional therapy providers and create a larger gym-like area for group services and learning circles. Telehealth-enabled spaces and mobile service hubs equipped with large screens will enable providers to seamlessly transition between in-person and hybrid visits or consultations. Additional therapy equipment is needed to support increased service volume and ensure providers can deliver high-quality, function-based assessments and interventions. Together, these strategies create a sustainable, flexible, and accessible model to increase capacity, reduce delays in care, and ensure customer-owners—especially those in rural and remote regions—receive timely, culturally grounded services.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Southcentral Foundation	Rural Dental Equipment Innovation	AK	While Southcentral Foundation strives to provide excellent service to everyone it serves, time passes and needs arise. Since taking on our rural sites and since its previous equipping, SCF’s dental equipment has been aging and is uncomfortable for providers and patients and is progressively more difficult to use. Equipment that is uncomfortable to customer-owners causes individuals to avoid encounters. They simply won’t make appointments or will wait until they travel into Anchorage. Equipment uncomfortable to providers creates exhaustion and burnout. The providers have to restrict the length of their travel visits and number of encounters per visit. Additionally, because of changes in the technology, SCF can no longer afford to maintain current equipment units that travel with providers, and changing the brand or type of equipment that SCF uses to provide dental services requires expansion funding.	The solution is that SCF needs to phase out some of the expensive, aging equipment that travels with dental providers and find a new vendor with a more sustainable cost point. Simultaneously, SCF will purchase and install updates of the more permanent and modernized dental equipment units in the clinics. Ideally, providers would also be able to store larger items on site. This refresh approach costs more initially but can increase billable encounters. New equipment will be sourced based on durability and repairability and will help the providers be able and willing to work for longer periods of time or more frequently out in SCF’s rural sites.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Chugach Census Area; Copper River Census Area; Kenai Peninsula Borough; Lake and Peninsula Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced
Southcentral Foundation	Sights and Sounds: Increasing Access to Optometry and Audiology Equipment, Services and Hardware	AK	The first aim is to protect and improve health outcomes for individuals needing access to clinically appropriate dry eye treatment, glasses, contacts in the communities served by SCF's Optometry clinics. Less than 1% of individuals diagnosed with dry eye disease have received treatment due to the prohibitively high out-of-pocket cost that ranges from \$500 to \$1,200 annually, as the treatment is not covered by most 3rd party payors. Untreated dry eye disease could cause corneal abrasion, infection, ulceration, scarring, and significant or permanent vision loss. Using glasses or contacts that do not meet the current eye conditions can lead to severe eye strain, debilitating headaches, dizziness, and nausea. For children, good vision is critical to learning and needs updating more frequently. Due to financial restrictions, glasses are kept at school hindering learning at home. The second aim is to secure hearing aids and Cochlear implants and processors for individuals served by SCF's Audiology clinics. At least 300 individuals are identified annually who need hearing aids, but can not afford the out-of-pocket costs. Hearing well is needed for children to learn and interact safely in the world around them. Adults with no or clinically inappropriate hearing aids risk accelerated cognitive decline, isolation and depression, safety risks, and employment challenges. The implications are more severe for	SCF's Audiology and Optometry clinics will be working with individuals receiving services to identify and address financial barriers to care. Funding will be provided to cover the out-of-pocket expenses for dry eye treatments, glasses, contacts, hearing aids and cochlear implants and processors for those without the ability to pay. The RHTP funds would be payor of last resort for these services. During village visits, Audiologists and Optometrists will identify individuals facing financial barriers to receive support under this project. The same is true for individuals seen in the Anchorage and Wasilla clinics. Additionally, support for new equipment to support dry eye treatment is being requested in year 1 to increase availability and treatment modalities needed to address the underlying cause of dry eye disease. Audiology supplies and equipment are also being requested to support service expansion. The estimated funding request for year 1 is approximately \$4 million, which would cover the equipment (not attached to a facility), minor equipment and supply costs to support this endeavor, along with approximately 300 sets of hearing aids; 20 Cochlear implants and processors; dry eye treatments for 1,170 individuals, 1,300 pairs of glasses and contacts for 440 people.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough; Kodiak Island Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

individuals needing cochlear implants and processor updates.

Southcentral Foundation	Support for Health Appointment Travel	AK	The biggest roadblock, if you'll pardon the expression, preventing access to health care in the Anchorage Service Unit (ASU) is simply the challenge of getting from there to here when they're so far away. Southcentral Foundation's customer-owners in Anchorage, the Valley, and other communities on the road system (and off) consistently lack reliable transportation to and from appointments. This challenge is especially complex when you consider that many of the elders and those most in need of regular medical encounters live too far from busy roads to be expected to walk, bike, or ski to the nearest bus stop – especially if they are suffering from leg injuries, for instance.	The collaborative solution to this challenge is to explore funding sources and transportation assistance methods between VNPCC and ANPCC, and from an individual's home into town and back. By preference, SCF would contract out to a medical transportation service. Discussion is already underway to pilot such a program in the next two or three months. If the pilot is successful, SCF will need funds to expand the program. Another possibility, though not a popular one for facilities on the road system, might be to begin a bespoke shuttle service. This type of project would involve expanding SCF's services outside of its familiar scope from health care into public transit. SCF would need to purchase and insure handicapped-accessible vehicles, hire and insure reliable drivers, and manage routes. A third option might be to contract with Tribal Councils. In the past, the Knik Tribe has provided a car and driver for health appointments. They and other councils could provide the transportation and contract for full or partial reimbursement, or even pay for the transport themselves while SCF could create a position to coordinate or communicate with drivers or shuttles.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Kenai Peninsula Borough; Matanuska-Susitna Borough; Yukon-Koyukuk Census Area

Deferred or Not Advanced

Southcentral Foundation	Updating Call Systems to Enhance Tribal Healthcare Infrastructure	AK	For many customer owners, access to care starts with whether they can reach SCF by phone and connect quickly to the right team. In rural Alaska, where distance, weather, and geography create access barriers, dependable phone reachability is essential to being seen by a clinician or care team member. This project modernizes SCF from legacy fixed-location telephony to cloud calling, soft phones, and a modern contact center. Staff will stay reachable and coordinated even when away from desks or working remotely, improving routing speed, reducing avoidable wait times, and strengthening continuity during disruptions. It improves current access and creates the foundation for future multi-channel options such as chat, video, and callback. Updated phone systems are needed to respond to the changing needs of the workforce, including an increase in remote work. SCF has maintained and upgraded its current on-premises telephony/contact center environment, but the architecture is primarily designed around physical desk phones and is not optimized for location-independent communication at current scale. SCF’s workforce is increasingly mobile. Staff need to place and receive calls from the device that fits their role and location, including mobile phones, laptops, and physical desk phones where appropriate.	This project would allow SCF to continue to use desktop phones until they reach their end-of-life service duration, while also transitioning the workforce to a cloud solution for calls, video, file sharing, and integrating communications systems. SCF will use a staged migration over an estimated 18 months to move from on-prem Cisco telephony/contact center to cloud calling, soft phones, and SaaS contact center capabilities, avoiding a big-bang cutover. The work starts with planning/readiness and SOW-supported implementation services, followed by a pilot cohort of approximately 100 users to validate call flows, integrations, E911, recording, and support workflows. Based on pilot lessons, migration will continue in controlled waves to broader user groups and service queues until steady-state operations are established. The approach uses existing license value with step-up/trade-in mechanics and scales over time toward roughly 3,000 users/phone numbers.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Kenai Peninsula Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Southcentral Foundation	Yeshjesh T'uh: Medical Detox Expansion	AK	Southcentral Foundation (SCF) Detox program aims to maximize the beds available to Alaskans 18 and over for residential withdrawal management. Detox is a Medically Monitored inpatient program supported by 24/7 with nursing and medical staff to ensure continual observation of the customer as they progress through withdrawal symptoms. Staff members use tools to assess withdrawal such as Clinical Opiate Withdrawal Scale (COWS) and Clinical Institute Withdrawal Assessment for Alcohol (CIWA) and have clear protocols for supporting each customer. The program is already working to provide services to those who frequently overuse critical medical services such as the Emergency Room. The program supports customers seeking medical withdrawal and the staff work to stabilize them medically, but also psychiatrically if needed. The program supports priority admissions set by the State of Alaska, but also works with individuals in the community who have confirmed placements in residential treatment to support improving bed utilization by ensuring customers are able to go bed-to-bed and have the clearance needed to enter a stepdown program. SCF Detox integrates Medication Assisted Treatments (MAT) into the program and works to ensure that customers who are requesting services such as Naltrexone, Vivitrol or Suboxone have access to and an appointment for ongoing services when they discharge.	The Yeshjesh T'uh is a 105,000 square foot facility and the Detox program will be the building's first occupants in Fall 2026. Yeshjesh T'uh is a critical project designed to enhance the behavioral health and substance use disorder services available in Anchorage and throughout the state. The SCF Detox program expansion works to address the ongoing and increasing need for state-wide medical detox services. The funding requested under Alaska's RHTP grant is to support the additional personnel and non-personnel expenses associated with the increase in beds from 16 to 30. The program will grow from 55 FTEs at present to 71 FTEs in July 2026. Because the existing program has sufficient oversight positions, economy of scale is achieved with only 16 FTEs being added rather than 30 or more that would be needed to expand the state's detoxification beds by another organization. The expansion will require the following additional staff: -Registered Nurses (RNs): 5 FTEs to complete admissions, screenings, medication administration based on protocols and withdrawal scales; -Nurse Practitioners or Physician Assistants (NP/PA): 4 FTEs to perform complete full examinations, review customers' psychiatric needs and address issues throughout treatment. A provider is on-call after hours to discuss any changes in a customer's conditions. They provide medical care beyond withdrawal, support customers getting back onto needed medication and work to ensure hand-off to specific primary care physicians when customers discharge from services. -Case Management Support: 2 FTEs to support the work of the clinical providers by assisting with care coordination; verbal and written communication; and information research and transfer. -Community Resource Specialists (CRS): 1 FTE to support case management, comprehensive discharge planning, biopsychosocial assessments, educational group services, needs assessments, access to Medication Assisted Treatment services, and establishing connections to healthcare services for follow-up care post discharge. -Behavioral Health Consultant (BHC): 1 FTE to provide assessment and brief intervention and support customers with co-occurring disorders. -Intake Program Coordinators: 2 FTEs to support customers and clinical staff through the intake process. -Integrated Pharmacist: 1 FTE to oversee medication needs and potential medication interactions. Funding for new Medical Monitoring equipment totaling \$200,000 will be needed in year 1.	\$1M-\$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Southeast Alaska Independent Living (SAIL)	SE Alaska Participant Directed Rural Health Access Project	AK	Southeast Alaska Independent Living (SAIL) is the designated Center for Independent Living, Aging and Disability Resource Center, Developmental Disability Resource Connection, and Traumatic and Acquired Brain Injury grantee for Southeast Alaska. SAIL has staffed offices in six communities, but over twenty rural, remote, and frontier communities across the region have little or no access to participant-directed care, independent living services, home assessments, assistive technology, or brain injury supports. Veterans, elders, and people with disabilities in places like Yakutat, Hoonah, Wrangell, and Kake often do not know these services exist. Alaska has the highest concentration of veterans in the nation, with eight to ten percent of the population having served. Many meet nursing home level of care criteria the state must provide. A full year in nursing home care in Alaska costs \$334,000 to \$436,000 per person. SAIL's VOICE program keeps veterans home through participant-directed care, averaging less than \$40,000 per year, saving hundreds of thousands of dollars per person annually. SDS is also preparing to launch Participant Directed Medicaid Waiver services, allowing nursing home-eligible Alaskans to remain home with caregivers of their choosing. This project will plan the expansion of these critical services to rural Southeast Alaska communities that currently lack access.	Participant Directed Rural Health Access is a one-year planning initiative that will lay the groundwork for SAIL to expand its full range of services across all of Southeast Alaska, including the six communities where SAIL already has staff and more than twenty additional rural, remote, and frontier communities from Metlakatla to Yakutat. SAIL will dedicate one existing staff member and hire 1.5 FTE new positions to carry out planning activities, with service delivery primarily through in-person travel, augmented by technology where connectivity allows. During the planning year, SAIL will conduct community needs assessments throughout the region, including communities such as Yakutat, Hoonah, Gustavus, Wrangell, Kake, Metlakatla, and villages across Prince of Wales Island, among others. These assessments will identify veterans eligible for the VOICE program, individuals who may qualify for the upcoming Participant Directed Medicaid Waivers, and residents who need independent living services, home assessments, assistive technology, brain injury supports, and aging and disability resource information. SAIL will identify local points of contact in each community, build referral relationships with tribal health organizations, local hospitals, long-term care providers, and community organizations, and develop outreach and education materials to prepare communities for the Participant Directed Waiver so that SAIL is ready to facilitate enrollment as soon as the Participant Directed waiver service launches. This planning phase will produce a detailed implementation plan for Years 2 through 4, including community-specific service delivery schedules, travel logistics across Southeast Alaska's ferry and air networks, staffing models, partnership agreements, and measurable goals. By investing in thorough planning, SAIL will be positioned to deliver sustained, high-quality participant-directed care and independent living services region-wide through a hub-and-spoke model that builds on its existing infrastructure.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

Southeast Alaska Independent Living (SAIL)	Future Ready: Workforce Readiness for Middle School Youth with Disabilities	AK	Youth in rural Southeast Alaska face increasing challenges related to mental health, social isolation, and limited access to prevention-focused programming that builds resilience and life skills. Communities like Juneau, Ketchikan, and Sitka are geographically isolated and have limited behavioral health resources. This makes early prevention and skill-building critical to supporting long-term health outcomes. The transition to middle school is a particularly vulnerable time for youth, as they navigate new social environments, increased academic expectations, and growing pressures that can affect their mental and emotional well-being. At the same time, youth with disabilities often experience additional barriers to participation in recreation, peer activities, and leadership opportunities. In rural communities, accessible and inclusive programming that allows these youth to build social skills, confidence, and independence can be limited. Future Ready addresses these challenges by creating structured, experiential opportunities for youth to develop communication, teamwork, emotional regulation, and problem-solving skills through outdoor recreation and challenge course programming. By focusing on prevention and resilience during early adolescence, and by ensuring youth with disabilities have inclusive opportunities to participate, this initiative aims to strengthen protective factors that support mental health, social connection, and long-term well-being in rural communities.	To address the need for youth resilience, social connection, and inclusive recreation opportunities in rural Southeast Alaska, Southeast Alaska Independent Living will implement a two-part youth development initiative that uses outdoor recreation and experiential learning to build critical life skills. First, all sixth-grade students in Juneau will participate in facilitated challenge course programming. During these sessions, trained staff guide students through structured activities designed to build communication, teamwork, leadership, problem-solving, and emotional regulation. The challenge course environment provides a safe and supportive setting where youth practice collaboration, trust-building, and healthy risk-taking while strengthening relationships with peers. This programming supports youth during the critical transition to middle school and helps build protective factors that contribute to long-term mental health and well-being. Second, Future Ready will provide ongoing high-adventure recreation programming for middle school youth with disabilities. Activities will include adaptive kayaking, biking, hiking, and overnight camping experiences. These programs are designed to build confidence, independence, and social skills while providing youth with disabilities opportunities to participate in outdoor recreation that may otherwise be inaccessible in rural communities. Through school-based experiences and skilled facilitation, participants will practice communication, leadership, and teamwork while forming supportive peer relationships. Together, these efforts create inclusive, community-based opportunities for youth to develop skills that support healthy development and resilience. By combining universal programming for all sixth-grade students with targeted opportunities for youth with disabilities, Future Ready expands access to health-promoting experiences while addressing barriers to participation. This approach strengthens protective factors such as social connection, self-confidence, and problem-solving ability, which are associated with improved behavioral health outcomes and stronger community well-being.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Southeast Alaska Independent Living (SAIL)	HomeMAP: Home Modifications for Aging in Place	AK	Southeast Alaska Independent Living (SAIL) developed and owns HomeMAP (Home Modifications for Aging in Place), a structured home safety assessment tool used statewide to help seniors and people with disabilities identify modifications needed to remain safely in their homes. The State of Alaska has funded three grantees — RurAL CAP, Anchorage NeighborWorks, and Alaska Community Development Corporation — who purchased HomeMAP assessments from SAIL and use them to guide home modifications for their clients. The HomeMAP assessment content remains accurate and effective, but the delivery platform has not been updated in over a decade. The tool currently requires an in-person visit to conduct each assessment, which severely limits reach in a state where most communities are off the road system and travel is expensive, weather-dependent, and time-consuming. As a result, a program that has completed hundreds of assessments over its lifetime has dwindled to approximately 10 this last year statewide. Alaska has the one fastest growing senior population in the country. The need for home safety assessments has not decreased — the platform simply cannot reach the people who need it. Seniors and Alaskans with disabilities who want to age in place, particularly those in rural, remote, and frontier communities, have no accessible way to evaluate their own home safety or understand what modifications would help them stay home.	SAIL proposes a one-year planning initiative to research, design, and scope a modernized digital version of the HomeMAP assessment tool. The core question this project will answer is whether current technology can enable HomeMAP assessments to be conducted remotely — without requiring an assessor to physically travel to the home — and if so, what the right platform and format would be. This could take the form of a consumer-facing app, a web-based guided self-assessment, a video-assisted remote walkthrough, or another approach identified during the research phase. The planning work will be carried out by a mix of SAIL staff and contracted technology and design consultants. Activities will include a comprehensive review of available technologies for remote home assessment, including photo-based and video-based tools, guided digital checklists, and emerging approaches. SAIL will gather input from the three current HomeMAP grantees — RurAL CAP, Anchorage NeighborWorks, and Alaska Community Development Corporation — who bring direct experience using the tool with clients across different regions of Alaska. Their feedback will inform what works in the current assessment, what barriers they encounter, and what a modernized tool would need to do. SAIL will also conduct user research with seniors and people with disabilities to understand technology access, comfort, and usability considerations, particularly for older Alaskans in rural communities. The planning phase will produce a feasibility assessment, a recommended platform and design direction, a scope of work for development, and a cost estimate for building the modernized tool. This deliverable will position SAIL to make an informed decision about whether to proceed with full development and to seek implementation funding.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

SouthEast Alaska Regional Health Consortium	Mammo On the Go Southeast	AK	One in eight U.S. women will be diagnosed with invasive breast cancer, and Alaska Native women have slightly higher rates than non-Native women in the state. Early detection through regular screenings is crucial for improving treatment outcomes however rural Alaskan women face significant challenges accessing regular mammograms due to geography, transportation limitations, weather, and socioeconomic factors. There are no mobile mammography coaches in Southeast region currently. Limited options for mobile mammography contractors, routine cancellations due to weather or transportation issues have hindered access to screenings. SEARHC previously contracted Fairbanks based providers, but services were limited to one month out of the year. Tight schedules, travel delays, and reduced appointment availability meant many women missed screenings. In 2024, only 207 of 370 needed appointments were available. Many went unfilled due to a short duration of access, and missed appointments weren't rescheduled so women delayed or missed annual screenings altogether. In 2025 the vendor increased contract costs 36% and reduced available appointments. SEARHC ended the contract opting to organize group travel for screenings, which involved complex logistics for flights, food, and transport in Juneau. Despite limited successes, overall screening numbers did not reach our target. Rural tribal women expressed a clear preference for local mobile mammography over traveling for care.	SEARHC proposes purchasing the first regional mobile mammography coach equipped with an Automated Breast Ultrasound System (ABUS.) Services will offer year-round breast cancer screening and diagnostic mammograms in remote Southeast communities, expanding continuous access to dedicated mammography services. The mobile coach will be 22 ft. for better maneuverability on ferries and remote road systems and feature a Hologic Mobile 3D Screening and diagnostic Mammogram unit as well as a GE Healthcare Invenia ABUS 2.0-Breast Imaging Ultrasound system. Since it is not possible to provide on-site diagnostic mammography, ultrasonography, or have a radiologist present, this technology eliminates the need for an on-site radiologist and enables enhanced screening capabilities for patients with previous screening or diagnostic results indicating dense breast tissue. The ABUS offers additional screening to detect potential malignancies and could decrease the number of women who must travel from remote or rural locations to urban centers like Juneau or Sitka for follow-up diagnostics. It also supports extra CPT billing codes. The coach will include mammogram and ultrasound imaging equipment, a reception area, and a private exam room. Staff will consist of two mammography technologists and a patient navigator. Additional support staff already working in the region will include Radiology and Imaging Services, Community Wellness Nurse Evaluation Specialist, RN Case Managers, and a Data and Evaluation Specialist. Radiologists will review transmitted images, while Primary Care Providers will offer further healthcare services and specialized referrals, supported by local healthcare staff. The Women's Health team, together with imaging staff, aims to deliver breast cancer screening, prevention education, and health counseling through regularly scheduled visits to remote communities along the Alaska Marine Ferry System and rugged roads of rural Southeast Alaska. The coach will be based in Juneau to allow flexible rescheduling during weather or ferry delays. Ultimately, the project seeks to reduce late-stage cancer diagnoses and mortality by increasing early detection and personalized care.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area; Juneau (City and Borough); Prince of Wales-Hyder Census Area	Advance to Implementation Application

SouthEast Alaska Regional Health Consortium	SEARHC Health Information Exchange Standardization	AK	HIE systems are essential to securely sharing patient health information between providers and different entities, enhancing care coordination, and improving overall clinical efficiency. Alaska’s current HIE landscape, however, faces challenges related to interoperability, data quality, regulatory complexity, sustainability, and patient participation. Data from non-standardized systems often lacks semantic interoperability, meaning receiving systems cannot interpret the data accurately. Without standardized identifier systems, matching patients across different organizations is difficult often resulting in incomplete, inaccurate, or redundant information that is not useful for clinical decision-making. Different electronic health record (EHR) systems often use proprietary formats that do not communicate, making data exchange labor-intensive, costly and prone to data breach. By initiating a standardization SEARHC will create a framework that can be scaled for adoption statewide.	SEARHC will establish a contract with dedicated IT professionals to provide technical assistance and guidance in establishing the HIE framework between SEARHC and ANTHC as key partners serving overlapping patient populations. HealthEconnect Alaska and ANHB would be engaged during the process to ensure a framework that could be scaled statewide. Through implementation of initiative #2: Health Care Access and #6 Spark Technology and Innovation, this project will focus on: • Standardizing HIE between SEARHC and ANTHC • Ensuring adaptability across care settings • Strengthening sustainable, equitable information access • Supporting statewide adoption of interoperable exchange	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

SouthEast Alaska Regional Health Consortium	AI-Integrated Primary Care in Southeast Alaska: Coordinating Virtual, Remote & Community Services	AK	As SEARHC advances its initiatives to improve healthcare access in rural Southeast Alaska, the organization continues to address challenges related to standardizing care, sustaining workforce stability, and minimizing administrative burdens so providers can focus more efforts on direct patient care. SEARHC proposes to deploying Tom™, an AI-enabled primary care infrastructure platform, within our regional network. Rather than replacing current technology, Tom integrates with our electronic medical records (EMRs) and health information exchange (HIE) to strengthen coordination across primary, behavioral, maternal, and community-based services throughout Southeast Alaska. The platform functions as a digital force multiplier for our care teams. Through continuous analytics and AI-driven Best Next Actions, it identifies care gaps, rising-risk patients, and preventive needs, and can autonomously initiate outreach and care coordination within defined clinical protocols, enabling proactive chronic disease management, maternal follow-up, behavioral health coordination, and post-discharge outreach. This expands effective panel capacity, improves chronic disease interventions and health outcomes, and minimizes unnecessary travel for rural patients. Because it is integrated within existing platforms it is inherently HIPAA compliant.	Implementation will focus on aligning the platform within existing clinical workflows and priority service areas with measurable improvements in preventive outreach, chronic care coordination, and care team efficiency. It will streamline coordination activities, prioritizing actionable insights and reducing administrative strain. It assists care teams by simplifying coordination tasks, highlighting meaningful health indicators, and enabling healthcare providers to focus on practicing at the top of their license, especially in areas with limited workforce resources. Digital engagement complements, rather than replaces, in-person care and remains anchored within SEARHC’s regional delivery model and Tribal coordination framework. By modernizing interoperable infrastructure and embedding coordinated workflows across clinics, critical access hospitals, and community care providers, this approach reduces fragmentation, strengthens continuity of care, and builds durable infrastructure. Embedding Tom into the existing infrastructure also positions SEARHC with scalable AI capable of evolving over time, ensuring long-term adaptability and innovation without requiring system replacement. It advances RHT initiatives focused on Alaska’s Health Care Access, Healthy Communities, Strengthen Workforce, and Spark Technology & Innovation initiatives by expanding sustainable primary care capacity without requiring new physical infrastructure. What Lumeris does: Primary Care as a Service (PCaaS): Offers a technology-led model supporting primary care teams with AI tools, operational help, and compliance. AI-Powered Technology (Tom™): Tom™, their proprietary AI, integrates with EHRs to automate routine tasks and suggest next actions, aiding—rather than replacing—physicians. Value-Based Care Enablement: Supports health systems in managing risk, optimizing contracts, and improving performance through PHSO services. Data Aggregation: Integrates multiple EHR and payer data sources for real-time care decisions. Risk Management: Focuses on supporting organizations in managing high-risk and chronically ill populations.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

SouthEast Alaska Regional Health Consortium	Empowering Access: Self-Registration Kiosks for Southeast Alaska Healthcare	AK	Rural and remote healthcare clinics encounter several distinctive obstacles during the patient registration process, particularly when verifying personal information. One significant issue is the high rate of staff turnover, which frequently disrupts clinic operations and causes interruptions in the initial phase of service delivery. Staffing shortages further compound these challenges. With fewer staff available, clinics are more likely to experience longer wait times for patients and an increased likelihood of incomplete or illegible paper forms. These constraints often result in a rushed registration process, undermining the accuracy and completeness of collected patient information. In small communities where patients lack anonymity, individuals may feel hesitant to disclose personal details, particularly those related to social determinants of health. This reluctance can hinder the collection of critical information necessary for establishing accurate and comprehensive patient care during the onboarding process in a clinical setting. This hesitancy and the resulting incomplete or missing data can significantly impact a clinic’s ability to deliver holistic and effective care, emphasizing the importance of addressing these challenges in rural and remote healthcare environments.	SEARHC will address workforce shortages and enhancing efficiency by installing 35 self-serve registration kiosks in clinics across key communities. These kiosks automate check-in tasks, reduce front desk workload, lower patient wait times, and let staff focus more on direct patient care. They also provide patients with a safer, more private way to share confidential information that reveal social determinants of health which can be securely documented for clinical use. Key features include contactless check-in, digital signatures, instant badge printing, and multi-lingual options. After conducting an internal review, SEARHC provided sole source justification for selecting Luma Health as our chosen vendor. Luma Health was found to be the most qualified based on its product features, warranty options, and capacity to install kiosks at all sites. The company offers comprehensive proprietary integration with our Meditech electronic health record and full-service installation and warranty support, to ensure a smooth and timely startup. Key Benefits: • Self-service check-in updates the EHR and patient status in real time. • Digital intake, consent forms, insurance updates, and ID upload eliminate paper forms. • On-site scheduling allows patients to manage appointments. • SMS feedback collection links responses to EHR records; automated recalls support follow-up care. • Payment collection at the kiosk streamlines copay and balance payments. • EHR integration ensures accurate data and reduces manual entry, cutting administrative workload.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Prince of Wales-Hyder Census Area; Sitka (City and Borough); Wrangell (City and Borough)	Deferred or Not Advanced

SouthEast Alaska Regional Health Consortium	Southeast Regional Health Career Pathways & Training Center	AK	Southeast Alaska is home to approximately 71,000 people, with nearly half residing in the capital city. The region heavily depends on its year-round residents to sustain essential services, however increasing outmigration of younger generations due to limited opportunities contributes to aging communities and chronic workforce shortages. This demographic shift presents a critical opportunity to invest in healthcare training opportunities that grow our own workforce and provide meaningful careers close to home. Healthcare represents about 8% of the regional workforce, generating \$312 million annually, however roughly 18% of Southeast Alaska healthcare workers are nonresidents. Local opportunities for education are limited or non-existent. For example, demand for nurses statewide is 1,400 only 346 nurses graduate annually. Increasing reliance on locum tenens, or "traveler" services is cost prohibitive and increasingly unsustainable with healthcare wages in the region rising 79% just in the past decade. Establishing a training center open to all Alaskans will strengthen the economy, create living wage career opportunities, fill gaps in care for our aging population, and ensure that all rural Alaskan communities have reliable access to high-quality health services in their home communities.	In response to Goal 3: Drive Workforce and Technology Innovation in the State of Alaska RHTP plan, SEARHC proposes to establish a regional training center integrating accredited didactic instruction with clinical training and simulation. In the first year, SEARHC would propose a planning grant to further scope and refine this business model as SEARHC prepares the physical location for in-person, hands on training in a simulated lab environment. Funding for necessary medical equipment would be included in the year 1 funding request. This early procurement will allow site prep to happen in tandem with curriculum and accreditation development. The purchase of this equipment would be funded through the first-year RHTP funding allocation while SEARHC provides the facility and necessary renovations. This coordinated approach will allow for timely setup of training environments aligned with phased implementation planning and timely launch of training programs. Pima Medical Institute has proven success rates in delivery of hands-on, accelerated training for healthcare careers and multiple state and program specific accreditations. Securing their technical assistance will ensure timely accreditation and licensing. Pursuing accreditation will not exclude partnerships with other educational organizations but will allow for adapting to meet needs and availability of partnerships and training programs moving forward. Initial areas of focus will be: • Dental Assisting • Sterile Processing • Ophthalmic Aide/OMT • Certified Nursing Assistant/Medical Assisting • Limited Scope Radiology Technology • Customer Service/Cultural Orientation This initiative would be conducted in collaboration with tribal partners, community organizations, educational organizations, and healthcare providers ensuring that necessary resources and supports are in place to maximize benefits for students. The process will be phased, beginning in the first year with curriculum and accreditation development, procurement of essential equipment for all programs, renovation and site prep/installation and launching of initial, non-accredited training programs beginning with Certified Nursing Assisting and - upon accreditation - adding Dental Assisting, Sterile Processing, and Ophthalmic Aide. SEARHC maintains an outstanding record of success in strategic facility expansion, workforce housing provisions, and training program development and is proposing a timeline that confidently reflects this experience.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Southeast Childhood Collective	Develop Near Site Child Care for Bartlett Regional Hospital	AK	Reliable child care is a critical factor in recruiting and retaining health care professionals at Bartlett Regional Hospital (BRH). Like many hospitals across Alaska, BRH faces ongoing workforce challenges, and access to dependable child care is a significant barrier for many current and prospective employees. In Juneau, licensed child care is available for only a fraction of the children who need it, resulting in long waitlists and limited options that often do not align with the schedules of health care workers. Hospitals depend on a stable workforce to maintain services for their communities. Yet, child care shortages can make it difficult for employees to accept positions, remain in the workforce, or work the full schedules required in health care settings. These challenges are particularly acute for shift-based positions that require early morning, evening, or variable hours. This project creates an opportunity to strengthen the health care workforce by expanding child care options specifically accessible to BRH employees through a near-site child care program. By increasing access to reliable care for hospital staff, the project will support workforce recruitment and retention, reduce absenteeism related to child care disruptions, and help ensure that BRH can maintain consistent health services for the communities it serves across Southeast Alaska.	Southeast Childhood Collective (SCC) will collaborate with Bartlett Regional Hospital (BRH) and a licensed child care provider located within a few miles of the hospital to expand near-site child care capacity, prioritizing enrollment for BRH employees. SCC has already identified a recently opened licensed center whose owner is interested in designating a portion of its child care slots specifically for hospital workers. The project will provide targeted support to expand the provider’s capacity through modest facility improvements, equipment purchases, and operational support, enabling the program to add additional licensed child care slots. SCC will also work with the provider and BRH to identify priority age groups and scheduling needs, including care for school-age children, so the program aligns with the realities of hospital work schedules. SCC will coordinate implementation by working closely with the provider to ensure the program can scale quickly while maintaining licensing compliance and high-quality early learning environments. This will include technical assistance related to licensing requirements, staffing plans, and classroom setup as new spaces are added. BRH will support the effort by promoting the program to employees and prioritizing enrollment access for hospital staff. With these coordinated steps, the near-site child care program could begin serving BRH employees within months of receiving funding, providing a practical and near-term solution to a key workforce barrier for the hospital.	\$50,000-\$250,000	Single Community	Juneau (City and Borough)	Advance to Implementation Application

Southeast Childhood Collective	Expand the Child Care Apprenticeship Program	AK	Child care programs across Southeast Alaska face ongoing challenges in developing and retaining a qualified workforce. Even when individuals are interested in working in early childhood education, many lack access to structured training pathways that allow them to gain credentials while continuing to work. For small programs in rural communities, the time and cost required to support staff through traditional education programs can make workforce development difficult. The child care apprenticeship program offers a practical opportunity to strengthen the early childhood workforce by providing a structured, earn-while-you-learn pathway into the profession. Apprentices are employed in licensed programs while completing college coursework and supervised on-the-job learning that builds the competencies required for high-quality early learning environments. Expanding the apprenticeship program will allow additional child care programs and educators across Southeast Alaska to participate in this model. The program provides a scalable approach to workforce development that supports providers in building stable staffing pipelines while increasing the number of trained professionals working in early childhood education across the region.	Southeast Childhood Collective will expand participation in its federally registered Child Care Apprenticeship Program to recruit and train additional early childhood educators across Southeast Alaska. The program combines paid employment in licensed child care programs with structured on-the-job learning and college coursework, creating an earn-while-you-learn pathway into the profession. Apprentices complete the Occupational Endorsement Certificate in Early Childhood Development through the University of Alaska Anchorage while accumulating supervised on-the-job learning hours in licensed programs. Each apprentice is supported by a trained mentor who provides guidance, evaluates skill development, and helps connect classroom learning with daily practice in early learning environments. SCC coordinates the program by supporting apprentices, mentors, and participating employers to ensure progress toward completion. As the program expands, SCC will prioritize enrollment for educators working in child care programs that serve health care employees or are located near hospitals and medical facilities. Strengthening the workforce in these programs helps ensure reliable child care is available for health care workers whose schedules and workforce demands require stable care options. Through this approach, the project will expand the number of trained educators entering the field while building workforce capacity in programs that play a critical role in supporting the health care workforce across Southeast Alaska.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Sitka (City and Borough); Skagway (Municipality)	Advance to Implementation Application

Southeast Childhood Collective	Parents as Teachers 4th Trimester Initiative	AK	The Parents as Teachers 4th Trimester Initiative expands postpartum support to families across Southeast Alaska from birth through the first 16 weeks after delivery. The project addresses a critical gap in rural maternal and infant health services. Families in Southeast Alaska face significant barriers to postpartum care, including geographic isolation, transportation challenges, limited perinatal mental health services, and workforce shortages. Many parents return home from birth without access to consistent support during the most vulnerable months following childbirth. Alaska’s rates of perinatal mood disorders exceed national averages, increasing the risk of adverse childhood experiences (ACEs), disrupted parent-child attachment, developmental delays, and increased behavioral health service use later in life. The first three months postpartum are a critical window for maternal mental health, infant brain development, and family stability. Without early screening and support, postpartum depression and parental stress can escalate into crises requiring costly interventions across health, behavioral health, and child welfare systems. This initiative establishes a coordinated, prevention-focused maternal-child health model that connects families to Parents as Teachers home visiting immediately following birth, improving outcomes for rural families.	The Southeast Alaska 4th Trimester Initiative will expand evidence-based home visiting services region-wide using a hybrid delivery model that ensures equitable access across remote and frontier communities. Key components include: • Weekly home visits beginning at birth and continuing through 12 weeks postpartum • Standardized maternal mental health screening and early referral coordination • Infant developmental guidance and parent-child attachment support • Care navigation assistance (WIC enrollment, Medicaid enrollment, birth certificate processing, lactation access, behavioral health referrals) • Optional peer support groups (virtual and in-person) to reduce isolation • Telehealth integration to ensure continuity of service in geographically isolated communities The initiative will coordinate closely with regional hospitals, Tribal health partners, public health agencies, and community-based providers to create seamless referral pathways and avoid duplication of reimbursable services.	\$50,000- \$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough)	Advance to Implementati on Application

Southeast Childhood Collective	Art for Family Wellbeing	AK	The early years of parenting can be emotionally demanding, and many families experience stress, fatigue, and isolation during the transition to caring for a young child. In rural communities like those in Southeast Alaska, long winters, geographic isolation, and limited opportunities for family-centered activities can make it difficult for parents to find supportive spaces to connect with their children and other families. Early childhood represents an important opportunity to strengthen parent-child relationships and support healthy social and emotional development. Creative activities such as art provide a natural way for young children and caregivers to interact, communicate, and express emotions together. When parents engage in creative play with their children, it can strengthen attachment, support early development, and reduce caregiver stress. This project addresses that opportunity by creating a welcoming environment where parents and young children can participate in guided art activities together. By integrating creative expression with parent-child interaction, the classes will help families build stronger relationships, support early emotional development, and create opportunities for connection among families navigating the early stages of parenting.	Southeast Childhood Collective will offer a series of small-group parent-child art classes designed to support connection, creativity, and emotional well-being for families with young children. Classes will be held twice per month and will take place in a rented space at the local Makerspace, which provides a welcoming environment for hands-on creative activities. Each session will be led by a certified art teacher or art therapist who will guide families through simple, developmentally appropriate art experiences that parents and children can complete together. Activities will focus on creative exploration, sensory engagement, and opportunities for positive interaction between caregivers and their children. The small-group format will allow instructors to provide individualized guidance while fostering a relaxed, supportive environment for families. All art materials will be provided so families can fully participate without bringing supplies. Sessions will be accessible to parents with young children and will emphasize process-based art activities that encourage expression, curiosity, and shared creativity rather than artistic skill. By offering consistent opportunities for families to engage in creative activities together, the project will provide a supportive space for parent-child interaction while helping caregivers build confidence using art and creative play as tools for connection and emotional expression at home.	\$50,000-\$250,000	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Southeast Childhood Collective	Child Care Policy and Development Specialist Position at SCC	AK	Communities across Southeast Alaska are actively seeking solutions to persistent child care shortages that limit workforce participation and economic stability. The lack of reliable child care has become a major barrier to recruiting and retaining workers in essential sectors, including health care. Several Southeast communities have expressed interest in developing local child care grant programs or other sustainable funding mechanisms to support providers and increase the supply of licensed care. However, many communities lack the policy expertise, program design capacity, and administrative infrastructure needed to develop and implement these systems. The Southeast Childhood Collective (SCC) has successfully implemented and administered child care grant programs in partnership with local governments and has received requests from multiple Southeast communities for technical assistance in developing similar models. At present, SCC does not have dedicated staff capacity to support this regional policy development work. This project represents an opportunity to establish a Child Care Policy and Development Specialist position to work with communities across Southeast Alaska to design sustainable funding models, develop implementation plans, and build the infrastructure needed to support long-term child care capacity. Strengthening these systems will support workforce stability in sectors critical to rural access to health care.	This project will establish a two-year Child Care Policy and Development Specialist position at SCC to support Southeast communities in developing sustainable child care funding models and implementation strategies. The specialist will work directly with local governments, tribal organizations, providers, and community stakeholders to assess child care supply and demand, identify feasible policy options, and design locally appropriate funding mechanisms. This work may include exploring options such as municipal grant programs, employer-supported child care models, dedicated local revenue sources, or other community-based funding strategies. The position will also support the development of administrative structures needed to implement and manage local child care grant programs. This includes designing application processes, eligibility criteria, monitoring systems, and evaluation frameworks that ensure funds translate into increased child care capacity. The specialist will collaborate with communities already engaged in this work, including those participating in projects currently under consideration through the Rural Health Transformation Program. By providing coordinated technical assistance across multiple communities, the position will accelerate the development of child care systems that support workforce participation and strengthen access to rural health care.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Sitka (City and Borough); Skagway (Municipality)	Deferred or Not Advanced

Southeast Childhood Collective	Cooking Classes for New Parents	AK	Many new parents want to provide healthy, nutritious food for themselves and their babies, but often lack practical guidance on how to do so during the demanding early months after birth. The postpartum period can be physically and emotionally challenging, and families may rely on convenience foods or less nutritious options when time, energy, and resources are limited. In Southeast Alaska, high food costs and limited access to fresh ingredients in some communities can make healthy eating even more difficult. At the same time, the transition to parenthood creates an opportunity to build lifelong healthy habits that benefit both parents and children. Learning how to prepare simple, affordable meals that support postpartum recovery and infant nutrition can improve maternal well-being, strengthen family routines, and support healthy child development. This project addresses that opportunity by offering a year-long series of cooking classes designed specifically for new parents. The classes will focus on preparing healthy, whole-food meals, making homemade baby food, and creating bulk freezer meals that help families maintain nutritious eating habits during the early stages of parenting. By building practical food preparation skills and confidence in the kitchen, the project supports healthier outcomes for families with young children.	Southeast Childhood Collective will offer a year-long series of hands-on cooking classes designed specifically for new and expecting parents. Classes will be held three times per month at the local high school culinary classroom, which is equipped with six cooking stations that allow participants to cook alongside instructors in a practical learning environment. Each class will accommodate six parents who will prepare recipes together with guidance from experienced instructors. The curriculum will focus on affordable, whole-food meals that support postpartum recovery and early childhood nutrition. Topics will include preparing homemade baby food, cooking nutrient-dense meals for postpartum health, and preparing bulk freezer meals that families can store and use during busy periods after a child’s birth. All ingredients will be provided so participants can focus on learning skills rather than purchasing supplies. Participants will also receive practical tools, such as freezer containers and reusable baby food pouches, to continue preparing healthy meals at home. By combining instruction with hands-on cooking and take-home supplies, the classes will build practical skills and confidence that help families maintain healthy eating habits during the early years of parenting.	\$50,000- \$250,000	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Southeast Childhood Collective	Expand CBJ Child Care Grant Program to other Southeast Communities	AK	Across Southeast Alaska, communities increasingly recognize child care as essential infrastructure that supports workforce participation, economic development, and community health. When families have access to reliable, high-quality child care, parents, including health care workers, can remain in the workforce and contribute to their local economies. The City and Borough of Juneau (CBJ) has developed a successful child care operating stipend program that provides predictable financial support to licensed providers. This model helps close the gap between the true cost of delivering quality care and what families can pay, allowing programs to operate more sustainably while maintaining stable staffing and services. This project will adapt and extend the CBJ operating stipend model to Sitka, Ketchikan, Skagway, and Haines. With initial support from RHTP, Southeast Childhood Collective will work with each community to establish similar locally supported stipend programs designed to strengthen the financial viability of child care businesses. By adapting the proven Juneau framework to meet each community's needs, these programs will help stabilize existing providers and create conditions that make opening and sustaining a quality child care program a viable business opportunity. Strengthening the financial foundation of child care programs will expand access to care for working families and support critical workforce sectors.	Southeast Childhood Collective (SCC) will work with municipal leaders and child care providers in Sitka, Ketchikan, Skagway, and Haines to establish locally supported child care operating stipend programs modeled after the successful program implemented by the City and Borough of Juneau. SCC is already engaged with each of these communities on child care planning and system development, and local leaders have expressed strong interest in establishing operating stipends that strengthen the financial sustainability of child care programs. Through this project, SCC will help each community adapt the Juneau stipend model to its local context. This will include working with municipal leaders and providers to define eligibility criteria, determine stipend amounts, establish payment schedules, and clarify administrative roles. The goal is to ensure that stipends provide meaningful operating support that helps child care programs remain financially viable while keeping the program structure simple and practical to administer. SCC will then develop the tools and systems needed to implement the stipend programs, including provider application materials, verification procedures, payment tracking systems, and communication materials for participating programs. Once these systems are in place, SCC will support program launch by enrolling eligible providers and administering stipend payments. Initial grant funding from RHTP will provide the resources needed to launch the stipend programs while municipalities identify and secure long-term revenue sources to sustain the investment. Throughout implementation, SCC will track participation and gather provider feedback to help communities refine the program design and transition the stipend programs to sustainable municipal funding over time.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Sitka (City and Borough); Skagway (Municipality)	Deferred or Not Advanced

Southeast Childhood Collective	Expanding Circle of Security Classroom Program	AK	Child care teachers play a critical role in shaping young children’s social-emotional development, yet many early childhood educators have limited access to high-quality, relationship-based professional development. The Circle of Security Classroom (COSC) program, offered by Circle of Security International, provides evidence-informed training that helps educators understand attachment, strengthen teacher-child relationships, and respond effectively to challenging behaviors. However, the cost of COSC training presents a barrier for many child care programs, particularly those serving low-income families. Without financial support, teachers may be unable to access this training, limiting opportunities to improve classroom climate, reduce behavioral challenges, and promote secure attachments in early learning settings. This project seeks grant funding to cover the cost of COSC training for child care teachers in Southeast Alaska, increasing access to high-quality professional development and strengthening the social-emotional foundation for the children they serve.	With grant support, we will cover the registration costs for COS Classroom for participating providers who otherwise could not afford this investment in their professional growth. We will also provide a stipend for providers who complete the training. Allowing providers to access COS Classroom will: • Build understanding of attachment needs and emotion regulation strategies in early childhood settings. • Strengthen teacher confidence and competence in responding to challenging classroom dynamics. • Improve classroom climate and teacher-child relationship quality, which supports children’s school readiness and ongoing development. By removing financial barriers, this approach ensures that more early care professionals can implement evidence-informed practices that enhance both educator well-being and children’s social-emotional outcomes.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Sitka (City and Borough); Skagway (Municipality)	Deferred or Not Advanced

Southeast Childhood Collective	Expanding School Age Child Care in Juneau	AK	The Juneau School District historically operated the RALLY school-age child care program across multiple elementary schools, providing after-school and summer care for working families. In 2025, the district discontinued direct program operations, resulting in a significant loss of capacity. A private provider stepped in to launch programs at three school sites. However, current enrollment is only a fraction of previous capacity, and the programs are still navigating the licensing and startup phase. The loss of school-age child care has immediate consequences for the workforce. Parents without reliable after-school or summer care are forced to reduce hours, decline shifts, or leave the workforce entirely. This is particularly disruptive for health care providers who work fixed schedules, extended shifts, or critical coverage roles. This project addresses an urgent opportunity to stabilize and rebuild the school-age child care system within existing school district facilities. With targeted startup and stabilization support, current programs can reach sustainable enrollment levels and additional sites can reopen, restoring the child care capacity that working families, including health care workers, depend on.	This project will stabilize and rebuild school-age child care capacity within Juneau School District elementary school facilities by supporting the transition from district-operated programs to a sustainable community provider model. Funding will support the stabilization of three existing school-age programs currently operating in district buildings and the development of up to two additional sites. Investments will focus on startup and ramp-up costs that occur before programs reach stable enrollment, including staffing during program development, materials and equipment required for licensing and quality programming, and short-term operational support while enrollment builds. A key priority will be supporting the provider through the licensing process so the programs can accept families using the state Child Care Assistance program and become eligible for the state child care grant program. Access to these existing public funding streams is critical to long-term sustainability. The Southeast Childhood Collective will provide implementation coordination, including technical assistance with licensing navigation, enrollment systems, Child Care Assistance onboarding, and coordination with the school district and City and Borough of Juneau. This centralized support will reduce startup delays and help programs reach sustainable enrollment more quickly. By leveraging existing school district facilities and focusing on targeted startup barriers, the project will rapidly restore critical child care capacity for working families.	\$250K-\$1M	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Southeast Childhood Collective	Grandparent Connections: A Peer Network & Intergenerational Play Initiative	AK	Across Juneau, a growing number of grandparents are serving as primary or significant caregivers for young children. Some step into this role unexpectedly due to a family crisis, substance use, housing instability, deployment, or economic hardship. Others provide daily childcare so parents can remain in the workforce, helping stabilize families and sustain the local economy. Despite their essential role, grandparents often navigate caregiving in isolation. They are parenting in a different social, educational, and technological landscape than when they raised their own children. Many report challenges related to understanding current childhood development practices, navigating childcare and health systems, managing financial strain on fixed incomes, coping with stress and grief, and addressing trauma or behavioral concerns in children. Juneau’s childcare shortage—where licensed care is available for only one in three children—intensifies these pressures. Caregiver isolation and chronic stress are well-documented risk factors for poor mental health. Because caregiver mental well-being directly shapes child development and long-term community outcomes, strengthening grandparent caregivers is a preventive public health strategy. This project addresses the opportunity to support grandparents, strengthen their mental wellbeing, increase access to community resources, and build peer connection—recognizing them as a critical part of Juneau’s early childhood and health ecosystem.	We propose Grandparent Connections: A Peer Network & Intergenerational Play Initiative, a prevention-focused model designed to strengthen caregiver mental health as a pathway to improved child and community wellbeing. Healthy caregiver mental health supports consistent, responsive caregiving — a foundational protective factor against adverse childhood experiences and later behavioral health system involvement. This project intentionally strengthens that protective layer. 1. Monthly Peer Gatherings Informal, relationship-centered gatherings that build connection among grandparent caregivers. Sessions emphasize: • Shared lived experience and normalization of stress • Practical caregiving strategies • Stress reduction and resilience tools • Updates on local health and behavioral health services Peer connection itself is a proven protective factor for mental well-being, reducing isolation and buffering stress. 2. Monthly Intergenerational Play Groups Grandparents and children participate together in themed sessions focused on a variety of topics, like: • Literacy & Early Language • Movement & Brain-Body Health • Food & Nutrition Security • Arts & Emotional Expression These sessions model positive caregiver-child interaction, strengthen attachment, and promote early brain development. Strengthening relational health at this stage reduces long-term risk of behavioral health crises. 3. Quarterly Contracted Facilitation A licensed behavioral health or family wellness contractor will provide quarterly structured sessions addressing: • Trauma-informed caregiving • Caregiver stress and secondary trauma • Behavioral health system navigation • Burnout prevention 4. Community Resource Integration Each gathering includes a brief resource spotlight connecting caregivers to Medicaid navigation, early intervention, food supports, and behavioral health services, with warm referrals as needed. By strengthening caregiver mental health and relational capacity, this project addresses root contributors to poor child health outcomes and reduces long-term demand on rural behavioral health systems.	Under \$50,000	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Southeast Childhood Collective	Match to CBJ Child Care Grants	AK	While supply has been steadily increasing in recent years, Juneau continues to face a significant shortage of licensed child care, limiting families' ability to participate fully in the workforce. This shortage is especially acute for workers in essential sectors such as health care, where staffing stability is critical to maintaining access to services across Southeast Alaska. The City and Borough of Juneau currently supports child care capacity through an annual operating grant program administered by the Southeast Childhood Collective (SCC). These grants provide monthly per-child operating support to licensed providers and have proven to be one of the most effective tools available for stabilizing existing programs and encouraging expansion of new slots. However, the current funding for this program is a line item in the city's general budget and cannot be increased due to municipal budget constraints. At the same time, demand for child care in Juneau is increasing. The upcoming homeporting of the U.S. Coast Guard icebreaker Storis will bring additional families to the community, further intensifying pressure on an already constrained child care system. This project represents an opportunity to temporarily match the city's existing child care operating grants, accelerating the creation of new licensed child care slots, while the community works toward a long-term dedicated funding solution through a future local ballot initiative.	This project will provide matching funds to expand the existing City and Borough of Juneau Child Care Operating Grant Program administered by SCC. The program provides monthly operating support to licensed child care providers based on the number of children enrolled, helping programs offset the gap between the true cost of providing care and what families can afford to pay. By matching the city's existing investment, this project will immediately increase the resources available to support both new and expanding providers. Operating grants allow providers to hire additional staff, open new classrooms, extend hours of care, and maintain sustainable enrollment levels. Because the program is already operational, additional funds can be deployed quickly through the existing grant structure. This approach builds on prior experience with matched funding. When the CBJ program was previously supplemented with Innovation Grant funds, the additional investment resulted in a measurable increase in the supply of licensed child care slots. The same model can again be used to accelerate capacity growth. In parallel with this short-term expansion effort, community leaders are exploring the development of a dedicated local funding source for child care through a future ballot initiative, potentially funded through a modest excise tax or similar mechanism. Because the development and passage of such an initiative will take time, the proposed project fills a critical interim funding gap while the long-term funding strategy is established.	\$1M-\$5M	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Southeast Childhood Collective	On-Site Professional Development for Child Care Providers	AK	Child care providers often have limited access to meaningful professional development that directly improves their daily practice. Traditional training models typically require educators to attend workshops outside of work hours, which can be difficult for providers who already work full days caring for young children. As a result, many educators have few opportunities to receive individualized support to strengthen classroom management, support children’s development, and build confidence in their work. Relationship-based coaching offers an opportunity to provide professional learning that is practical, supportive, and immediately applicable. By observing classrooms, modeling strategies, and engaging educators in reflective conversations about their work, coaches can help providers strengthen their skills in real time as they work with children. This project will address the gap between traditional training and everyday practice by bringing professional development directly into child care classrooms. Through on-site coaching, educators will receive individualized guidance to support higher-quality early learning environments while strengthening workforce confidence and retention in the field.	Southeast Childhood Collective will provide relationship-based coaching to four teachers working in licensed child care centers in Juneau during the first year of the project. Coaching will be delivered by a local educator with extensive classroom experience and a master’s degree in early childhood education. This educator will work directly with participating teachers to provide practical, individualized support that strengthens classroom practice. Each participating program will receive weekly coaching sessions conducted during the teachers’ regular workday. Coaching will include classroom observations, modeling of developmentally appropriate strategies, and side-by-side support while teachers work with children. This approach allows educators to immediately apply new techniques and see how specific strategies affect children’s engagement and behavior. In addition to in-classroom coaching, the coach will facilitate reflective conversations with teachers outside of the classroom but still within their workday. These discussions will allow educators to process challenges, reflect on their practice, and identify goals for continued improvement. By combining observation, modeling, and reflective dialogue, the project will provide sustained, relationship-based professional development that strengthens teaching practice and supports high-quality early learning environments.	\$50,000-\$250,000	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Southeast Childhood Collective	Pre-Development Support For Fireweed Family Center	AK	The Fireweed Family Center will expand childcare capacity, strengthen the early childhood workforce, and create a hub where families with young children can access services and connect with one another. Juneau and other Southeast Alaska communities are experiencing growing demand for childcare and family support services. Demand is expected to increase as Juneau prepares for the arrival of additional U.S. Coast Guard families associated with the homeporting of the USCGC Storis icebreaker. The Fireweed Family Center presents an opportunity to strengthen the early childhood infrastructure that supports families and the regional economy. In addition to expanding childcare capacity, the center will provide a welcoming space for caregiver connection, addressing increasing concerns about family isolation. Southeast Alaska’s geography, long winters, and limited gathering spaces can intensify isolation for families with young children. The project builds on decades of collaboration among agencies that support families through Partnerships for Families & Children, a coalition supported by Southeast Childhood Collective. The Fireweed Family Center will bring childcare, family services, and community connection together in one place, strengthening coordination and access. SCC has purchased the construction site, completed early planning, including a construction estimate and a financial pro forma, and secured \$5 million in federal CDS funding, championed by Senator Lisa Murkowski.	Southeast Childhood Collective will advance development of the Fireweed Family Center through planning, design, and coordination activities that prepare the project for construction and long-term operation. This project does not fund the construction of the facility itself. Instead, RHTP support will ensure the project is fully prepared for construction by completing the remaining pre-development work needed to move the center from concept to a build-ready project. RHTP funding will support several key components of this preparation. SCC will complete architectural drawings and facility planning needed to finalize the building design and ensure the space supports childcare, workforce training, and coordinated family services. Funding will also support capital campaign management to coordinate fundraising efforts and secure the resources needed for construction. Additional planning work will include design of the indoor playground and family gathering spaces to ensure they are safe, developmentally appropriate, and usable year-round in Southeast Alaska’s climate. A dedicated project manager will coordinate architects, funders, nonprofit partners, and other stakeholders to maintain project momentum and move the development process forward. Limited travel and communications costs will support coordination with regional partners and preparation of materials for the capital campaign and community engagement. Significant progress has already been made toward developing the Fireweed Family Center. SCC has purchased the construction site, completed a formal construction cost estimate, developed a financial pro forma for the facility, and prepared a comprehensive case for support. SCC has also engaged a professional capital campaign manager to lead fundraising efforts. These steps position the Fireweed Family Center to move efficiently into construction once the remaining development work is complete and capital funding is secured. RHTP funding will ensure the project maintains momentum and advances toward construction of a facility that will expand childcare capacity, support workforce development, and strengthen services for families across Southeast Alaska.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Sitka (City and Borough); Skagway (Municipality)	Deferred or Not Advanced

Southeast Childhood Collective	Professional Development for Caregivers and Practitioners	AK	Professionals who support families with young children in Southeast Alaska often work in small teams across large geographic areas with limited access to ongoing professional development. Health care providers, social workers, and early childhood educators frequently encounter families experiencing stress, trauma, or behavioral health challenges, yet many have few opportunities to strengthen relationship-based skills or receive reflective support for this work. Workforce burnout and turnover are persistent challenges across these sectors, particularly in rural and frontier communities. Strong evidence shows that the quality of relationships between professionals and families is a key driver of improved maternal mental health, child development, and family stability. When professionals are equipped with tools that strengthen attuned communication, reflective practice, and leadership, they are better able to support families and coordinate care across systems. This project addresses that opportunity by providing a coordinated series of evidence-based trainings for professionals serving families across Southeast Alaska through the Partnerships for Families & Children coalition. Trainings will include Facilitating Attuned Interactions (FAN), Circles of Security for Providers, Dare to Lead, and reflective supervision, strengthening relationship-based practice, leadership capacity, and workforce resilience.	Please describe your proposed approach to the above problem or opportunity. Southeast Childhood Collective will coordinate a regional professional development initiative that brings evidence-based training opportunities to professionals serving families across Southeast Alaska. The project will begin by identifying and contracting qualified trainers certified to deliver models such as Facilitating Attuned Interactions (FAN), Circles of Security for Providers, Dare to Lead, and reflective supervision. SCC will work with training organizations and certified facilitators to schedule a series of learning opportunities over the project period. To ensure accessibility for rural participants, training will be offered in both in-person and virtual formats. In-person sessions will be scheduled strategically to coincide with existing regional gatherings or hosted in hub communities. At the same time, virtual offerings will allow participation from remote communities that cannot easily travel. This blended approach will expand access while maintaining opportunities for relationship-building and reflective practice. SCC will promote the training through the established Partnerships for Families & Children coalition network, which includes health care providers, behavioral health professionals, social service agencies, and early childhood programs throughout the region. Outreach will include direct invitations to partner organizations, coalition communications, and targeted outreach to agencies serving rural communities. To reduce barriers to participation, the project will also establish a stipend program that compensates participants for the time required to attend and complete the training. This approach recognizes the staffing constraints faced by rural service providers and ensures that professionals can participate without creating financial strain for their organizations. Through coordinated scheduling, broad outreach, and participant stipends, the project will expand access to high-quality professional development for the workforce serving families across Southeast Alaska.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Sitka (City and Borough); Skagway (Municipality)	Deferred or Not Advanced

Southeast Childhood Collective	Strengthening Family Wellbeing Through Coordinated Community Engagement	AK	Families in Juneau rely on a range of services that support children, caregivers, and family well-being, including early childhood education, home visiting, public health, family support, and behavioral health. While these services are strong individually, families often experience them as separate systems rather than a coordinated network of support. This is especially challenging in rural communities, where geographic isolation, transportation barriers, and limited behavioral health capacity make coordination essential. Juneau faces shortages of behavioral health providers, making prevention and early support critical to reducing demand on strained crisis response systems. Alaska experiences high rates of Adverse Childhood Experiences (ACEs), which are strongly associated with long-term behavioral health challenges including depression, substance use disorders, and chronic disease. Strengthening family protective factors like caregiver resilience, social connection, and access to supportive resources can greatly reduce ACE risk and improve lifelong health outcomes. For twenty-eight years, the Juneau Partnership for Families & Children (PFC) coalition has brought together sixteen nonprofit and state agencies serving families with young children. Strengthening the coordination infrastructure of this coalition will improve cross-sector collaboration, increase system efficiency through coordinated service delivery, and expand access to preventive behavioral health supports.	This project will strengthen the collective impact infrastructure of the Juneau Partnership for Families & Children (PFC) coalition to improve cross-sector collaboration, expand community engagement, and strengthen preventive behavioral health supports for families. The Southeast Childhood Collective will provide backbone coordination for the coalition, enabling partner agencies to align outreach efforts, strengthen referral pathways, and implement collaborative strategies that increase the reach and effectiveness of family support services. A core component of this work will be coalition coordination and shared planning. Project staff will facilitate regular communication, collaborative planning, and shared decision-making among partner agencies. This backbone support allows organizations working across early childhood, public health, family services, and behavioral health to align their efforts and function as a more integrated support network for families. The project will also strengthen cross-sector service integration. By improving collaboration among agencies serving families, the coalition can enhance referral pathways, reduce duplication of services, and improve system efficiency through coordinated service delivery. Families will experience services as a connected network of support rather than isolated programs. Coordinated community engagement activities and family-centered events will serve as a visible entry point for families to connect with the network of services available to them. These events will provide welcoming opportunities for caregivers and children to participate in play-based activities, creative programming, and community gatherings while learning about resources offered by partner organizations. The coalition will also implement shared outreach and resource navigation strategies, ensuring families receive clear and consistent information about available services. Through coordinated messaging and outreach, agencies can extend the reach of their work while reducing barriers to access. Together, these strategies strengthen the coalition’s ability to operate as a coordinated support system that improves access to preventive services, strengthens family protective factors, and reduces downstream demand on crisis-driven behavioral health services in a region facing significant provider shortages.	Under \$50,000	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Southeast Conference	Ensuring Access to Health Care for Rural Remote Alaskans	AK	The project protects access to health care for rural and remote Alaskans who rely on the marine highway system to travel to appointments, for providers to travel to communities, and access to supplies. Over the last decade, marine transportation services for residents across the state have significantly declined. Currently, our Marine Highway Systems in Alaska suffer from a lack of qualified-trained workforce and access to training options. This lack of workforce prevents operators from fully crewing all available vessels in the fleet and thus reduces service. For example, AMHS has two vessels it is unable to operate due to a lack of available crew, meaning Yakutat will have another year without service. This condition limits the ability of residents to travel to and from health care services, the ability to move medical equipment, supplies and prescriptions to and from communities and the ability to move health care providers to and from communities. Flying not only has a limiting capacity; it is also often cost prohibitive for many Alaskans and is subject to more weather cancelations or safety concerns. Marine transportation is critical for ensuring affordable and reliable access to primary, specialized, behavioral and oral care for rural Alaska’s who do not live on the traditional road system. Without a strong marine transportation system, that state faces significant transportation barriers to health care access, this project aims to address this need.	Ensuring Access to Health Care for Rural Remote Alaskans Project supports continued affordable health care access for Alaskans helping marine transportation operators build and serve their workforce internally. This project provides key funding to support the marine highway workforce through funding for required training, scholarships to support crew to advance their licenses helping fill critical roles and enabling high level trainings within the state to help keep costs down and improve access to workforce development opportunities. The project includes funds for on-the-job training, security training, vessel and crew licenses and renewals, terminal staff training, and administrative training for Inter Island Ferry staff. Additionally, the project will provide funding for AMHS annual training budget, wheelhouse assessment plans, fleet wide culinary training, scholarships for 3rd assistant mate, AB to 3rd assistant mate, oiler to 3rd assistant engineer training programs to help crew move up. Funding is also utilized to build a 1600 GT license class for the University of Alaska Southeast’s Maritime Training Center and design and replacement of the center’s davit utilized for required safety training and lifeboat deployment. Finally, funds will be used to provide scholarships for Alaskan’s to achieve necessary training to enter job positions with Alaska’s Maritime transportation providers as well as conduct outreach to schools. Providing workforce development funding to ferry operators and the training organizations that support them helps ensure continued operation of critical access to health care in coastal Alaska. In 2019 on the IFA route alone 1,150 patients took 4,900 ferry rides for medical purposes.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Chugach Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Lake and Peninsula Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Southeast Conference	Southeast AK Regional Outdoor Recreation Planning for a Healthy Lifestyle and Residential Benefits	AK	Southeast communities are generally small places that provide almost immediate access to the outdoors. With almost 97% of the land in Southeast publicly owned, accessing public spaces doesn’t take much. These small communities also often lack indoor gyms or fitness classes that help maintain health. Furthermore, these small communities often offer a practical opportunity for residents to get around by non-motorized means. Conditions that mean the outdoors offer an effective opportunity to help residents maintain healthy lifestyles, prevent disease and attract and retain a strong health care workforce. Yet, despite these conditions, many outdoor recreation assets across the region have not been maintained, and useability is limited for many. Furthermore, Alaska has a high burden of chronic diseases and a mental health crisis, with a suicide rate twice the national average. Southeast’s population is comprised of many high-needs populations with 19% 65 or older and 17% under 15. The region’s median household income is 16% below the State’s median household income. All communities in Alaska have one or more Health Professional Shortage Area designations for primary, dental, or behavioral health care, and most rural areas experience high staff turnover and rely on temporary workers. Providing an opportunity to build healthy communities and increase community livability by holistically addressing outdoor recreation goals, active transportation networks and equitable assets.	Realizing a need and opportunity to address how Southeast Alaska and the Tribal, rural and remote communities of the region can build healthy communities, reduce chronic diseases and increase our residents’ quality of life. The Southeast AK Regional Outdoor Recreation Planning for a Healthy Lifestyle and Residential Benefits project will consist of a holistic and collaborative regional effort with the goal of providing resources to promote physical activity for all ages and levels, improve air quality, increase access to subsistence sources, and foster a regional culture of wellness through the outdoors. To ensure coordination across the region and State, the Southeast AK Regional Outdoor Recreation Planning for a Healthy Lifestyle and Residential Benefits project will build on existing regional and statewide plans and asset assessments, such as the Tongass Sustainable Trails Strategy, the Tongass Outdoor Recreation Partnership, the Statewide Comprehensive Outdoor Recreation Plan, Alaska Statewide Active Transportation Plan, and others work being done throughout the region in the outdoor recreation space. Working with regional communities and tribes, Southeast Conference will prepare a Regional Outdoor Recreation Plan, resources that further the implementation of this plan beyond the project period, community active transportation audits and active transportation action plans. To achieve these outcomes, Southeast Conference (SEC) will conduct outreach and engagement with communities and outdoor recreation stakeholders, including health care providers to understand needs and goals for outdoor recreation. SEC will work with the Tongass Outdoor Recreation Partnership and others across the region to help guide the project. A contractor will be hired to help build a comprehensive regional outdoor recreation plan that emphasizes benefiting residents and promoting healthy communities for all. SEC will work with the Department of Natural Resources to pilot a asset marking and measuring program. SEC will partner with the Walkability Action Institute to conduct walkability audits and action plans. Finally, SEC will work with a contractor to complete asset mapping and revitalize the Southeast Alaska Trails website to house resources and remain a central connection point for these efforts. This project will enable communities to create a locally driven and clear plan with greater regional coordination, strengthening each projects long-term success.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Southeast Island School District	Prince of Wales Island Rural Health Transformation & Workforce Pathway Program	AK	Prince of Wales Island faces significant barriers to healthcare access and workforce sustainability. Most communities do not have on-site nurses or physicians, and students must travel 60–80 miles to access clinics in Craig or Klawock. For students interested in healthcare careers, there is currently no CNA training program available on the island; they must travel approximately 100 miles to Ketchikan, on a different island, incurring transportation and lodging costs. At the same time, regional providers such as PeaceHealth and SEARHC report ongoing difficulty recruiting and retaining trained medical professionals. This project addresses both limited preventive healthcare access for rural youth and the absence of a local healthcare workforce pipeline. By establishing school-based nursing services and a regional CNA pathway across four Prince of Wales Island districts, the initiative improves early intervention, strengthens referral coordination, and creates a sustainable, locally rooted healthcare workforce opportunity for rural students.	This project establishes a four district consortium on Prince of Wales Island to simultaneously expand school-based health access and build a sustainable rural healthcare workforce pipeline. Southeast Island School District, Craig City Schools, Klawock City School District, and Hydaburg School District will collaborate to implement a coordinated regional model serving students across multiple remote communities. The core of the approach is hiring five Registered Nurses, each assigned to support designated district sites. These RNs will serve in dual roles as clinical health service providers and Certified Nursing Assistant instructors within district Career and Technical Education programs. On the clinical side, the RNs will embed preventive and early-intervention services directly within schools. They will coordinate and facilitate vision, hearing, dental, and behavioral health screenings in partnership with PeaceHealth, SEARHC, Community Connections, and Tribal partners including the Kasaan Haida Tribe and Hydaburg Tribal leadership. The nurses will oversee vaccination clinics, provide chronic condition monitoring for students with ongoing medical needs, deliver drug and alcohol prevention programming, and implement structured health education modules focused on nutrition and chronic disease awareness. They will also lead CPR and First Aid certification for students and staff and develop standardized trauma-informed response protocols across all participating districts. A shared data system will track screening participation, referral completion, follow-up care rates, telehealth utilization, and attendance impacts to ensure accountability and continuous improvement. On the workforce development side, the RNs will deliver CNA-aligned instruction locally, eliminating the current need for students to travel to Ketchikan to obtain certification. Each participating district will be equipped with essential CNA skills lab equipment and instructional materials. Students will complete foundational coursework, earn CPR certification, and be prepared for CNA testing and advancement into Certified Medical Assistant or higher-level healthcare training. Formal partnerships with PeaceHealth and SEARHC will support clinical exposure, mentorship, and internship opportunities, while collaboration with Tribal partners will ensure culturally responsive engagement and workforce outreach.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Prince of Wales-Hyder Census Area	Deferred or Not Advanced

Southeast Region EMS Council	Building Regional Learning Networks to Integrate EMS and Rural Healthcare in Alaska	AK	In many rural and remote Alaska communities, EMS is the most consistent point of healthcare contact. EMS teams respond to emergencies, bridge homes and clinics, and often serve as informal health navigators. Yet EMS systems remain structurally underfunded and poorly integrated into broader healthcare planning, data systems, and transformation efforts. At the same time, Alaska is investing in care coordination and expanded chronic disease monitoring. These efforts are vital, but monitoring without reliable emergency response capacity creates a structural gap. In many rural communities, EMS encounters are early indicators of poorly controlled chronic conditions such as diabetes, heart disease, respiratory illness, behavioral health and substance use complications. Without structured integration, these encounters rarely inform prevention strategies or care coordination. This project addresses a core opportunity: strengthening rural healthcare outcomes by intentionally integrating EMS into community health systems through structured Learning Health communities. We seek to test whether rural EMS measurably improves survival and community health—and whether those outcomes are strengthened when healthcare systems deliberately invest in and coordinate with local EMS. By building regional learning networks grounded in community ownership and incremental improvement, this initiative positions EMS not as peripheral, but as a critical component of rural health transformation.	This initiative will establish regional Learning Health Networks within Alaska’s EMS regions. Rather than deploying a single statewide program, communities will voluntarily opt in and convene local, cross-sector learning groups with assistance and facilitation from their EMS Region. Each participating community will form a multi-stakeholder learning group that may include EMS agencies, clinics, Tribal Health Organizations, Community Health Worker (CHW) programs, local government, and community representatives. The group will identify a shared and locally relevant problem involving EMS and at least one other healthcare partner. Participants will examine cases and baseline data to understand current performance, interpret findings collectively, test small and feasible changes, evaluate results, and iterate over time. Regional coordination will support cross-community learning while preserving local autonomy. Communities may voluntarily pursue deeper integration pathways such as EMS and Community Health Worker cross-training and role clarification, Mobile Integrated Health or Community Paramedicine collaboration, bidirectional data integration between EMS and Health Information Exchange systems, joint EMS and receiving facility teamwork training, and regional knowledge-sharing models. Funding will support facilitation, regional travel and relationship-building, participation stipends to reduce barriers, light-touch local documentation and evaluation, and a robust data evaluation plan. This is not a compliance model. It is a practical, incremental improvement structure designed to strengthen integration, improve EMS-sensitive outcomes, and build durable rural health system capacity over time.	\$250K-\$1M	Statewide	Denali Borough; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Southeast Region EMS Council	Rural EMS Readiness & Integration Infrastructure Initiative	AK	Providing EMS services in Southeast Alaska presents challenges unlike most of the Lower 48. Each community must be prepared to function as a self-contained system capable of stabilization and transport. Many communities have small or nonexistent tax bases yet must respond to cardiac arrest, trauma, pediatric emergencies, and complex medical crises without external support. Chronic underinvestment has left some agencies operating with outdated or inadequate transport vehicles and monitoring equipment. Emergency response cannot depend on bandaids and duct tape. It requires reliable transport, monitoring capability, and safe working conditions for responders. Before agencies can expand into community paramedicine, chronic disease response, or deeper health system integration, reliable emergency infrastructure must be in place. This proposal addresses that foundational gap by ensuring every community has the transport and life-saving equipment required to provide equitable emergency care and support broader rural health transformation efforts.	This initiative will stabilize and standardize EMS infrastructure across 34 Southeast Alaska communities through coordinated regional procurement. SEREMS proposes to purchase 26 ambulances, 6 patient transport vehicles, 33 monitor and defibrillators, 14 AEDs, 33 powered stair chairs, and 48 vacuum mattress and splint sets. Because of geographic isolation, communities must independently stabilize and monitor patients for extended periods while awaiting medevac or marine transport. Monitor and defibrillator systems will enable real-time cardiac assessment and transmission of data to higher-level providers, supporting appropriate triage and reducing unnecessary transport. Powered stair chairs and vacuum immobilization systems improve responder safety and patient outcomes. The project will confirm final equipment specifications with each agency, coordinate bulk purchasing to reduce cost and ensure compatibility, support delivery and deployment, and assist smaller agencies with maintenance and lifecycle planning. By establishing a minimum standard of emergency transport and monitoring capability across the region, this initiative strengthens rural health access and creates the infrastructure necessary for future integration and expanded EMS roles, with an estimated budget of 15 million dollars	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

Southeast Region EMS Council	Southeast Alaska Regional EMS Academy Network	AK	The Southeast Alaska Regional EMS Academy Network will establish distributed training hubs in Ketchikan, Sitka, and Juneau in partnership with local fire departments. This model leverages existing municipal infrastructure while creating permanent regional workforce capacity. In its initial phase, the Academy will deliver Emergency Trauma Technician and EMT-1 certification programs, refresher courses, and focused skills workshops, later expanding to EMT-2, bridge programming to Alaska AEMT, potential EMT-3 offerings, and structured instructor development. This tiered pathway creates an in-region advancement ladder that reduces relocation barriers and supports long-term retention. The Academy prioritizes responders from small and remote communities who lack access to local course delivery. Funding removes structural barriers by supporting participant travel and subsidizing municipal training sites. In addition to certification programs, the Academy will host intensive regional simulation workshops that include EMS providers and emergency department or receiving facility staff. These joint trainings strengthen field-to-facility communication and improve care transitions, supporting stronger integration across Southeast Alaska’s emergency care continuum.	The Southeast Alaska Regional EMS Academy Network will establish distributed training hubs in Ketchikan, Sitka, and Juneau in partnership with local fire departments. These municipal partners will provide classroom and training space while SEREMS coordinates curriculum, instructor staffing, recruitment, and regional logistics. During the first two years, the Academy will deliver Emergency Trauma Technician and EMT-1 certification programs, refresher courses, and focused skills workshops. In later years, the program will expand to include EMT-2, bridge programming to Alaska AEMT, potential EMT-3 offerings, and structured instructor development to grow Southeast-based teaching capacity. The Academy model prioritizes responders from small and remote communities who prefer in-person instruction or whose agencies cannot yet support local course delivery. Training will be delivered in cohort-based formats that allow participants to attend shorter, intensive sessions when feasible. Participants traveling from smaller communities may also complete structured ride-along shifts with host EMS agencies during their training period. These supervised field experiences will expose participants to higher call volumes, diverse case presentations, and real-time field-to-facility coordination, reinforcing classroom learning and strengthening regional professional relationships. Funding will support participant travel by air or ferry, lodging, and per diem to remove financial barriers. It will also support contract instructor pay, educational materials, simulation equipment, and subsidized use of training rooms and apparatus bays at host fire departments. Facility support recognizes the operational costs borne by municipal partners and ensures long-term sustainability of the regional hub model. In addition to certification programs, the Academy Network will host two- to three-day intensive regional simulation workshops for EMS providers. Some of these intensives will be targeted to include EMS and emergency department or receiving facility staff. These joint trainings will use scenario-based exercises and structured debriefing to strengthen field-to-facility communication, clarify expectations during high-acuity events, and improve care transitions. By embedding cross-setting training into the regional culture, the project supports stronger integration across the emergency care continuum.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

Southeast Region EMS Council	ETT (Emergency Trauma Technician) Program Expansion & Modernization	AK	For more than 45 years, Alaska’s Emergency Trauma Technician (ETT) program has provided foundational emergency response training tailored to rural and remote communities. However, the core curriculum has not been comprehensively updated since 2015, instructor capacity remains limited in remote regions, and access barriers persist for small communities and high school programs. Many of Alaska’s smallest communities rely on volunteer or low-frequency EMS responders who are unpaid or minimally compensated, limiting eligibility for traditional workforce development funding. At the same time, Rural Health Transformation efforts are investing in Community Health Aide/Practitioner and Community Health Worker pathways, increasing the need for a flexible, cross-trained workforce capable of supporting both emergency response and broader health system stability. This project modernizes and expands the ETT program as a shared, locally accessible workforce entry point for both EMS and CHA/P systems. By improving access, updating curriculum, and strengthening instructor capacity, the initiative will build sustainable emergency response capability, reduce barriers to entry, and strengthen recruitment and retention of locally trained providers who can serve, remain, and lead within their communities. In doing so, it aligns community-based workforce development with statewide rural health transformation goals.	This initiative will modernize and expand the Emergency Trauma Technician program through a phased five-year strategy designed to build long-term sustainability. Curriculum Modernization (Years 1-2) The project will complete a full revision of the ETT curriculum aligned with current National EMS Education Standards. Updates will integrate rural Alaska clinical realities and embed cross-cutting competencies such as teamwork, cultural humility, responder wellness, and a culture of safety. Online learning will be strengthened to improve accessibility and quality. ETT will be established as a recognized career and technical education pathway within Alaska high schools, creating a structured entry point into rural healthcare careers. Access and Subsidization (Years 1-3) To reduce financial and geographic barriers, the project will subsidize online training for Level 1 and Level 2 communities and expand availability through high school programs. Training equipment support and instructor travel for rural skills validation will ensure full participation regardless of local revenue constraints. Instructor and Local Capacity Development (Years 2-3) A structured pathway will certify high school teachers and local EMS personnel as ETT instructors. Instructor workshops and regional mentorship will strengthen local leadership and reduce reliance on centralized delivery. Sustainability Transition (Years 4-5) Beginning in Year 3 and expanding through Years 4 and 5, the program will transition to community-specific sustainability models. These may include sliding-scale tuition, formal adoption within high school CTE programs, alignment with workforce development funding streams, voluntary EMS and Community Health Worker cross-training, and regional training hubs supported by local EMS coalitions. Together, these strategies create a distributed training infrastructure that strengthens access, improves quality, and stabilizes the rural emergency workforce while supporting long-term system resilience.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Southeast Region EMS Council	Southeast Alaska Resilient Responders and Communities: Psychological First Aid & Disaster Support	AK	Rural and remote communities across Southeast Alaska regularly face traumatic events including medical emergencies, environmental hazards, and natural disasters such as landslides, severe storms, and extreme weather. Small communities often rely on volunteer-based or mixed volunteer-career response systems that must manage both the operational and human impacts of these events. Responders and community members may experience repeated exposure to traumatic incidents while having limited access to resilience training or psychological support resources. The Southeast Alaska Landslide Risk Reduction Strategic Plan identifies community preparedness, response coordination, and recovery capacity as key priorities for reducing the impacts of landslides and other geodisasters across the region. Recent landslides and disasters across Southeast Alaska have demonstrated that recovery requires not only physical response capacity but also tools that help responders and communities process trauma and support recovery following disasters. Strengthening the ability of responders and community members to recognize psychological distress, support one another during crises, and navigate recovery is therefore a critical component of disaster preparedness in Southeast Alaska.	This initiative will establish a regional disaster preparedness and resilience training program coordinated by SEREMS in collaboration with SLIPP and T&H. As the regional EMS coordinating body for Southeast Alaska, SEREMS brings extensive experience delivering responder training across remote communities and is well positioned to coordinate implementation of this initiative. The 2026 Landslide Risk Reduction Plan calls for training community members and responders in psychological first aid. This program will focus on practical, evidence-informed approaches to supporting individuals and communities during and after disasters. Training will emphasize psychological first aid and responder resilience skills that promote stabilization, practical support, and connection to resources. The program will prioritize geographically isolated Southeast Alaska communities and help responders recognize when professional behavioral health services are needed and connect individuals to appropriate care. The initiative will provide three complementary training tracks: Responder resilience and distress management training Training for EMS personnel, fire departments, search and rescue teams, Tribal emergency operations teams, and other frontline responders focused on recognizing stress injuries, strengthening peer support, and managing distress following difficult calls. Psychological First Aid training for community partners Training for educators, clinic staff, Tribal program staff, public works personnel, local government staff, and community leaders focused on recognizing distress, supporting individuals following disasters, and connecting people with appropriate resources. Community preparedness workshops Community-based workshops integrating disaster awareness, landslide risk awareness, and psychological first aid principles to strengthen local preparedness and recovery capacity. Training will use a hybrid model combining online learning with regional in-person workshops. The initiative will leverage existing regional convenings including the SLIPP landslide preparedness workshop and the SEREMS Symposium, which already bring together responders, Tribal emergency management leaders, scientists, and community partners to strengthen regional preparedness. Participating communities will also share lessons learned through a regional learning network to strengthen disaster preparedness and responder wellbeing across Southeast Alaska and support continuous improvement.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Southeast Urgent Care Inc	Empowering Healthier Communities: Integrating Culinary Medicine and Preventive Lifestyles	AK	In Juneau, a critical gap exists between medical guidance provided in the clinic and patients’ ability to implement those recommendations in their daily lives. While healthcare providers routinely prescribe heart-healthy and low-glycemic diets to manage and prevent chronic conditions such as diabetes and cardiovascular disease, many patients face barriers to following this advice. High grocery costs, limited access to nutrition education, a lack of practical cooking skills, and an absence of a good support network make it difficult for individuals and families to translate medical recommendations into affordable, healthy meals at home. This project addresses the opportunity to bridge that gap by establishing a permanent, certified teaching kitchen that integrates culinary medicine with preventive healthcare. The program will empower patients, community members, and healthcare workers with hands-on skills to prepare nutritious, culturally relevant meals using locally available foods—including subsistence resources such as seafood and berries—along with affordable pantry staples. Beyond improving culinary literacy, the teaching kitchen serves as a community gathering space that helps address social isolation, a major risk factor in rural communities like Juneau. By connecting clinical care with practical food preparation skills and social connection this initiative aims to improve long-term health outcomes and support healthier, more resilient communities in Juneau.	We propose a three-year phased initiative to establish a Culinary medicine Teaching Kitchen as a hub for preventative care. Phase 1: Infrastructure (Year 1 - \$250k): The priority is the renovation of an underutilized second floor space in our building. We will convert this area into a clinical grade teaching kitchen designed for patient education. Key components include: Infrastructure: Installation of electrical and plumbing lines to support multiple cooking stations, ventilation systems, and medical-grade sanitation surfaces. Educational Layout: Creation of a large central preparation island, surrounded by four fully equipped cooking stations for hands-on instruction. Accessibility: Installation of commercial chairlift and adjustable counter heights to accommodate elderly patients and mobility limited individuals. Phase 2: Program implementation (\$50k): With the operational kitchen, we will launch a “Culinary Prescription” pilot program that translates clinical recommendations into actionable, affordable, and culinary relevant meals. Initially the program will be accepting medically referred patients who will receive hands-on instruction and practical skills to implement heart-healthy and low-glycemic diets at home. Community members and family and friends of patients will be invited to participate, fostering social connection and addressing social isolation. Phase 3: Community expansion and sustainability(\$50k): The final phase focuses on scaling and long-term sustainability. Workforce development: Medical students, clinicians,and health care professionals will be invited to participate and build their own knowledge base for preventative health education. Cultural and Economic Relevance: Classes will focus on Southeast Alaska traditional foods and pantry staples to help combat grocery costs. Sustainability: We aim to establish local partnerships to create a rotating curriculum to ensure ongoing program impact and inclusivity of all age ranges. These partnerships and established client bases will ensure ongoing access beyond the grant period. This phased approach directly bridges the gap between clinical advice and daily practice, improves dietary behaviors, addresses social isolation, and strengthens community health.	\$50,000-\$250,000	Other	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Southeast Urgent Care Inc	Strengthening Rural Diagnostic Imaging Capacity in Urgent Care Setting	AK	Our small medical practice has served the Juneau community for nearly 35 years, providing walk-in healthcare seven days a week. Our clinic currently operates a digital X-ray system installed in the early 2000s. While it has served well, the technology is outdated and no longer serviceable if it fails. Replacing this aging system with a modern digital radiography unit is essential to maintaining high-quality diagnostic services, workflow efficiency, and service reliability for our community locally. Seven-day access to imaging is critical to reducing strain on the region’s only hospital and its limited emergency services. Patients with fractures, respiratory infections, or musculoskeletal injuries experience delay of care. Modern digital radiography offers higher resolution images, faster processing, and lower radiation exposure, allowing faster, safer diagnoses while reducing repeat imaging. Replacing an X-ray system represents a significant financial challenge for a small independent practice. The cost of modern imaging equipment far exceeds what can be sustained through routine clinic operations alone. Without grant support, maintaining this critical diagnostic service will become increasingly difficult. Upgrading to a new X-ray system will ensure that Juneau residents and visitors receive timely, high-quality walk-in diagnostic care, prevent unnecessary emergency department visits, and reduce overall healthcare costs, addressing a critical gap in rural healthcare access.	To address the urgent need for reliable, high-quality imaging in Juneau, our clinic proposes replacing the aging digital X-ray system with a modern digital radiography unit. This upgrade will allow us to continue providing walk-in diagnostic services seven days a week, ensuring timely evaluation and treatment for fractures, respiratory infections, musculoskeletal injuries, and other urgent conditions. The approach involves: Acquisition and Installation – Purchase a state-of-the-art digital X-ray system with enhanced detector sensitivity, rapid image processing, and low-dose radiation technology. Installation will be coordinated to minimize service disruption, ensuring continuous access to imaging during the transition. Integration with Clinical Workflow – The new system will be fully integrated with our electronic health records and image archiving systems. This will streamline workflow, reduce turnaround times, and allow immediate image review by our clinicians, improving diagnostic accuracy and patient care. Staff Training and Competency – Clinic staff will receive comprehensive training on system operation, safety protocols, and advanced image processing to maximize efficiency and ensure high-quality diagnostic output. This bolsters our local healthcare workers workforce skill set. Community Impact Monitoring – We will track metrics including imaging volume, turnaround time, repeat imaging rates, and emergency department diversions to measure the system’s impact on patient care and healthcare costs. This project ensures that our small private practice can continue to serve the Juneau community reliably and safely, reducing strain on the region’s only hospital and emergency services. By maintaining local, seven-day access to imaging, patients avoid delays, unnecessary travel, and additional healthcare costs. Upgrading to modern technology will strengthen the clinic’s capacity to provide high-quality, accessible diagnostic care, sustaining an essential community resource for years to come.	\$50,000-\$250,000	Family or primary care	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Southern Region EMS Council	H.E.A.T.™: Hypothermia Emergency Assess and Transport Initiative for Rural Alaska	AK	Rural Alaska faces significant environmental and geographic barriers to emergency medical care. Trauma incidents frequently occur in extreme cold conditions, and long scene times and extended transport distances increase the risk of hypothermia in injured patients. Hypothermia is a preventable but serious contributor to trauma mortality and complications, particularly in remote communities where advanced medical care may be hours away. Many rural response agencies currently lack standardized equipment and protocols for hypothermia mitigation in the prehospital setting. This project addresses the opportunity to strengthen rural trauma response by equipping responders with consistent tools and training designed specifically for Alaska’s cold-weather and remote operating environments.	Southern Region EMS Council proposes the implementation of the H.E.A.T.™ (Hypothermia Emergency Assess and Transport) Initiative, a statewide effort to improve hypothermia mitigation in Alaska’s rural prehospital trauma environment. The project will deploy 1,000 H.E.A.T.™ bags to established rural response agencies across Alaska, providing standardized equipment designed to prevent heat loss and support early hypothermia intervention during prolonged scene and transport times. Each kit will include insulated vapor barrier systems, warming packs, waterproof ground insulation, thermal head protection, and laminated hypothermia assessment and treatment guides designed for use in cold-weather trauma conditions. In addition to equipment distribution, the initiative will provide targeted training for frontline responders focused on hypothermia recognition, mitigation strategies, and integration with trauma care protocols. Implementation will occur over five years through a phased regional rollout, allowing for coordinated distribution, responder training, and program evaluation. Partnerships with the State of Alaska Office of Emergency Medical Services, 68Medical, and Carlile Transportation Systems will support protocol alignment, kit assembly, and statewide logistics. Through this approach, the initiative will strengthen rural trauma response capacity and improve patient outcomes in Alaska’s remote and environmentally challenging communities.	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Southwest Region School District	Expanding Access to Mental Health Services in Rural Southwest Alaska Schools	AK	The Southwest Region School District (SWRSD) serves eight rural communities in Southwest Alaska: Aleknagik, Clarks Point, Ekwok, Koliganek, Manokotak, New Stuyahok, Togiak, and Twin Hills—educating 601 PreK–12 students and employing 150 staff. These communities are remote (not connected to the road system), creating significant barriers to accessing health care services. Over 95% of SWRSD students are Alaska Native, and each community has an active Tribal Council, highlighting the importance of accessible and culturally responsive care. Mental and behavioral health services in these communities are limited, and individuals often must travel long distances to access care. Weather conditions, transportation costs, and provider shortages frequently delay or prevent timely support. These challenges can negatively affect student well-being, staff wellness, and the broader community. The project 'Expanding Access to Mental Health Services in Rural Southwest Alaska Schools' seeks to address these challenges by expanding access to mental health services through a combination of on-site school counselors, online resources, and regional providers. By strengthening and coordinating these supports, SWRSD aims to improve access to care, provide early intervention, and support the overall well-being of students and staff across our rural communities.	The Southwest Region School District (SWRSD) proposes a comprehensive approach to improving access to mental health services for students and staff across the eight rural communities we serve: Aleknagik, Clarks Point, Ekwok, Koliganek, Manokotak, New Stuyahok, Togiak, and Twin Hills. Recognizing the limited availability of behavioral health providers in rural Alaska, SWRSD aims to expand both in-person and virtual mental health supports within the school environment. SWRSD currently works with the Bristol Bay Area Health Corporation (BBAHC) and an independent counselor in addition to providing access to a 24/7/365 counseling app for secondary students (grades 6–12) and staff. This app connects users with certified counselors through text-based communication, providing immediate, confidential support regardless of location or time of day. Building on these existing supports, SWRSD seeks to employ school counselors who will provide on-site mental health services across schools in the district. These counselors will work directly with students and staff to provide individual support, early intervention, and prevention-focused services. Having counselors available within the school setting will significantly reduce barriers to care by eliminating the need for travel and allowing individuals to access support in a familiar and trusted environment. In addition to providing direct services, school counselors will collaborate with BBAHC, independent counselors, and other regional providers, to ensure coordinated and comprehensive care. This collaborative approach will allow students and staff who require additional services to be connected with appropriate community or regional resources. By combining school-based counseling, online counseling resources, and collaboration with regional health providers, SWRSD will create a coordinated system of support that expands access to mental health care, improves early identification of concerns, and supports the overall well-being of students and staff across our rural communities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Dillingham Census Area	Deferred or Not Advanced

Special Olympics Alaska Inc	Inclusive Healthcare for Individuals with IDD - Phase 1	AK	Alaskans with intellectual and developmental disabilities (IDD) experience profound and preventable health disparities, including higher rates of untreated dental disease, vision and hearing conditions, obesity, neurological disorders, and premature mortality. In rural, remote, and frontier Alaska, these disparities are amplified by provider shortages, geographic isolation, limited specialist access, and fragmented referral systems. Families often travel out of state for specialized neurological care, while rural providers report limited training in IDD-informed practices. Preventative screenings are infrequent, and follow-up care is often inconsistent. Access to early intervention programs for physical fitness, such as the Special Olympics Young Athlete Program, is limited. This project addresses these gaps through a coordinated, statewide model that expands preventative Healthy Athletes® screenings into rural hub communities, strengthens referral-to-care systems within Alaska’s healthcare network, builds Community Health Worker (CHW) workforce capacity, expands the Youth Athlete Program and brings specialized neurological expertise directly to Alaska families. Rather than isolated events, this initiative creates an integrated rural health infrastructure designed to improve access, quality, and long-term sustainability of care for individuals with IDD.	In Phase 1 of this project, Special Olympics Alaska will implement a three-component Rural Health Transformation initiative designed to expand access, strengthen workforce capacity, and improve system coordination. Component 1: Expansion of Healthy Communities Programming We will expand Healthy Athletes® screenings to include a large-scale Summer Games event (200+ participants) and 2–3 regional hub screenings in communities such as Fairbanks, Kodiak, and Southeast Alaska. We will also strengthen targeted disciplines including podiatry (Fit Feet) and dental (Special Smiles) through established clinical partnerships. A key innovation is our embedded referral-to-care model in partnership with Providence Alaska, where athletes receiving referrals meet onsite with a dedicated care coordinator to schedule follow-up appointments before leaving the venue. We will replicate this model with additional partners, including Alaska Regional Hospital and Alaska Native Tribal Health Consortium, building a coordinated statewide referral network. Additionally, we will work on a statewide expansion of the Young Athletes Program (ages 2-10) through our partnership model with Infant Learning Program (ILP), specifically the Programs for Infants and Children (PIC), as well as expansion of our dryland fitness programming to strengthen preventative health engagement year-round. Component 2: Community Health Worker Workforce Expansion We will host an in-person CHW training in Anchorage for rural participants, develop partnerships with tribal health organizations and community clinics, launch a statewide online CHW training platform, and establish a recruitment and support pipeline. This builds sustainable, culturally responsive capacity within rural communities. Component 3: Access to Specialized Neurological Care In partnership with Dr. Jonathan Santoro and his research team, we will host 2–3 regional neurological screening events in Summer 2027, providing blood draws, transcranial Doppler testing, and baseline neurological assessments for individuals with Down Syndrome. This reduces costly out-of-state travel and integrates Alaska into national research initiatives. Together, these components transform episodic screenings into a coordinated, workforce-driven rural health model.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; Southeast Fairbanks Census Area	Advance to Implementation Application

SpheraNova	Improving Maternal Health, Infant Survival, and Family Stability in Alaska	AK	This project will pilot and refine a specialized regional workforce training program designed to strengthen the capacity of individuals who support pregnant and parenting people experiencing substance use and mental health challenges in rural Alaska. Many community-based providers, including Community Health Workers, doulas, Peer Support Specialists, and other frontline professionals, play a critical role in supporting families during pregnancy and early parenting but often lack access to training that addresses the intersection of maternal health, behavioral health, and peer-based support in rural service environments. The project will implement and evaluate the 10-module training program focused on recognizing early behavioral health concerns during pregnancy and postpartum, providing practical support strategies for families, and improving coordination between healthcare providers, behavioral health programs, and community services. The pilot training will be offered to a cohort of participants serving Southeast Alaska communities. Trainees will review the existing pilot curriculum and provide feedback on the relevance of training content, regional service realities, and workforce needs. Their input will guide targeted revisions to ensure the program reflects the health needs and service environments of Alaska communities. The refined training will create a scalable regional workforce development resource that can be expanded to additional rural regions of the state.	This project will implement an already developed 10-module training program designed to provide specialized training for frontline support professionals serving Alaska communities. The program will strengthen the knowledge and skills of community-based providers who may encounter or support pregnant and parenting individuals experiencing substance use and mental health issues. The training is intended to expand the capacity of this workforce to better recognize maternal behavioral health concerns, provide informed and supportive engagement, and connect families with appropriate services during pregnancy and early parenting. The training addresses key topics including maternal behavioral health, substance use during pregnancy, healing-informed approaches to care, stigma reduction, care coordination across healthcare and social service systems, and family support during the postpartum and early parenting periods. Emphasis will be placed on reducing stigma associated with substance use and mental health conditions during pregnancy so that professionals are better prepared to provide supportive, respectful, and informed care. Participants will engage in online virtual learning sessions, facilitated discussions, and case-based learning that reflect the challenges faced by professionals working in rural Alaska communities. These learning activities will focus on practical strategies to recognize early concerns, connect families with available resources, and strengthen collaboration across healthcare, behavioral health, and community support systems. During the Southeast Alaska pilot phase, the project team will gather feedback from professionals currently serving communities across the region. Participants bring firsthand knowledge of the barriers families face when seeking care. Structured feedback will be collected through participant surveys, facilitated discussions, and follow-up consultations and will be used to refine training modules to better reflect the needs of Southeast Alaska communities and rural service environments. Evaluation support will be provided through collaboration with ORAU to assess training outcomes and identify opportunities for program improvement. In Year 2, the project will expand to Southwest Alaska and continue building relationships with Traditional Healer Peers to help ensure the training reflects cultural knowledge and community practices important to Alaska families.	\$50,000-\$250,000	Maternal health	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Spine Care Specialist of Alaska	Rural Spine Care Access and Referral Optimization Project	AK	Residents of rural and frontier communities in Interior Alaska face significant barriers to accessing specialty spine care. Many patients must travel long distances to larger regional centers for evaluation of chronic back pain, radiculopathy, or other spinal conditions. These barriers often lead to delayed diagnosis, prolonged pain and disability, unnecessary medivacs /emergency department visits, and referrals that may not require surgical evaluation. At the same time, rural primary care providers often have limited access to specialty consultation when managing complex spine-related conditions. This project addresses this gap by expanding access to neurosurgical expertise through a traveling neurosurgery Physician Assistant who provides outreach clinics, referral coordination, and provider consultation. The program creates an opportunity to improve early evaluation, strengthen referral pathways, and support rural clinicians in managing spine conditions locally whenever appropriate, reducing unnecessary travel while ensuring patients who require surgical evaluation are identified in a timely manner.	This project will address gaps in access to specialty spine care for rural and frontier communities in Interior Alaska through a combined outreach clinic and telehealth consultation model led by a neurosurgery Physician Assistant (PA). The program will provide periodic in-person outreach clinics in designated regional hub communities, where the PA will conduct specialty evaluations for patients with spine-related conditions, review imaging, provide recommendations for conservative management, and identify patients who may require neurosurgical referral. In addition to in-person clinics, the program will incorporate telehealth consultations to expand access to neurosurgical expertise between outreach visits. Rural healthcare providers will be able to consult with the PA via telehealth or telephone during program work hours to discuss complex cases, review imaging, and receive guidance on patient evaluation and management. Telehealth visits may also be used for follow-up care, patient education, and coordination of referrals, reducing the need for patients to travel long distances for specialty input. The PA will also assist with referral management, surgical triage, and care coordination, ensuring that patients who require neurosurgical evaluation are identified and referred appropriately while supporting rural providers in managing non-operative conditions locally when appropriate. This approach is designed to improve the quality and appropriateness of referrals, increase surgical conversion rates, reduce non-operative specialty clinic burden, and support earlier identification of urgent spinal pathology. Program data will be collected to monitor patient encounters, telehealth consultations, referral patterns, and outcomes. By combining in-person outreach clinics with telehealth consultation and referral coordination, the project expands specialty access, strengthens collaboration between rural providers and neurosurgical services, and creates a sustainable model for delivering specialty care to rural and frontier communities.	\$50,000-\$250,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Sprout Family Services	Rural Community Family Engagement Project	AK	With the proposed Rural Community Family Engagement project we hope to engage those at risk and most vulnerable families that often fall through the cracks of society. Eventually these children enroll in schools with incredible functional deficits that were never addressed at a young age. This puts extreme strain on the families, schools and our state government. This grant would allow us to not only reach these children but also their parents, and over the course of months or years, be able to give the tools necessary to reach their fullest potentials and also be contributing members of society.	This Rural Community Family Engagement project would provide Sprout with the opportunity to engage at-risk children at a deeper level and to more intentionally support families whose children have experienced maltreatment. Through this funding, Sprout would be strengthening its partnership with the Office of Children's Services (OCS) and other partners across the communities we serve. The grant would expand our capacity to travel to outlying areas for information sharing, strengthen community partnerships, and increase collaboration among service providers. It would also allow us to designate a Referral Intake Specialist role to support Infant Learning Program referrals, enhancing timely engagement and connection to services. This focused intake support would help families access resources more efficiently and promotes overall family health, stability, and well-being while strengthening protective factors and reducing risk.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Kenai Peninsula Borough	Deferred or Not Advanced

Spruce Root Inc	Community-Led Regional Health Care Delivery Planning for Southeast Alaska	AK	Southeast Alaska encompasses over 35,000 square miles, with approximately 73,000 residents spread across more than 30 communities. Many smaller rural communities are accessible only by floatplane, small aircraft, or boat, and only three communities have road connections. Rural residents face some of the most severe health care access challenges in the state: provider shortages across primary, behavioral and dental care; long travel distances to reach specialty services; limited long-term care and aging-in-place supports; and chronic disease rates that exceed state averages among Alaska Native populations. While individual organizations may have developed their own strategic plans, the region currently lacks a comprehensive, cross-sector regional health care delivery plan that coordinates across Tribal, municipal, and provider entities in the way RHTP envisions. Without such a plan, communities and providers risk operating in silos, duplicating some efforts while leaving critical gaps unaddressed. Alaska’s RHTP Project Narrative explicitly calls for the development of “community-led regional health care delivery and system plans” to enable local innovation, coordinate new services, ensure sustainability of existing service lines, and align resources to meet regional and statewide health needs. This project will fill that foundational gap, creating the planning infrastructure necessary for the region to effectively access and deploy RHTP implementation funding in Years 2–5.	Project Goals: Understand the problem and barriers to healthcare in each community Identify and develop potential solutions Cross-collaboration and learning about what others are doing outside of region Create priority action list and assign roles/responsibilities and next steps to share with in-region and statewide healthcare providers The project accelerator framework centers ways rural, urban, and Indigenous communities come together to share knowledge by prioritizing dialogue. Each workshop is facilitated by Spruce Root staff with input from regional and local community partners to identify and invite community leadership, healthcare professionals, and patient representatives, ensuring each workshop meets community needs. Subject Matter Experts inform rural healthcare presentations and discussions during the workshops and provide technical expertise to carry workshop outcomes and implementation plans forward. RHTP Initiative project teams examine both surface and systemic-level facets of their project topics, diverge from traditional ways of identifying the causes, impacts, and resources, and converge upon tangible next steps and plausible solutions. Phase 1 (Years 1–2): Strategic Planning and Workshops The project will distribute baseline surveys and convene 25–50 local healthcare providers, patients, and leaders across twelve 3-day facilitated workshops. These sessions will focus on scenario planning for all six State RHTP initiatives, producing actionable reports and high-level implementation plans for local decision-makers. Phase 2 (Years 3–5): Sustainability and Ongoing Collaboration To sustain momentum and maximize access to technical assistance, Spruce Root will facilitate 2-hour monthly virtual meetings alongside annual relationship-building gatherings. To guarantee that the project continuously prioritizes and addresses community needs, progress will be tracked through annual stakeholder reports and biannual project staff debriefs. Spruce Root facilitators guide attendees through a project accelerator model with support from statewide and regional Subject Matter Experts (SMEs) for the following topics: Appropriate care availability Behavioral health Capital expenditures and infrastructure Consumer tech solutions Fostering collaboration Innovative care IT advances Prevention and chronic disease Provider payments	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Workforce

Statewide Independent Living Council	AI Assistive Needs Technology Tool	AK	Assistive technology plays a critical role in healthcare, helping individuals manage chronic illnesses, adhere to medications, connect with providers through telehealth, and prevent injuries at home. Research shows that when assistive technology matches an individual's needs, well-being improves and caregiver burden decreases. However, only 8 to 38 percent achieve successful accommodation, often because recommendations are based on diagnosis alone rather than the whole person. Effective assistive technology must fit the individual's actual life: their preferences, living environment, physical capacity, and local conditions. In Alaska, this means considering whether devices work in extreme weather, function without reliable electricity, or fit in small rural homes. A person-centered approach accounts for these factors, but qualified assessors are scarce. SILC previously partnered with the Alaska Mental Health Trust and Mat-Su Health Foundation on a successful pilot for home modifications and assistive technology. The pilot was hampered by too few qualified assessors, leaving Alaskans waiting for technology that could improve their health. This shortage is acute in rural Alaska, where specialists are scarce and travel distances make in-person assessments impractical. Rural Alaskans may lack medication reminders, fall prevention devices, or telehealth equipment that could keep them healthier.	SILC proposes to develop an AI-powered assistive technology needs assessment tool built on a person-centered approach. Rather than matching individuals to technology based solely on diagnosis, the tool conducts conversational assessments that consider the whole person: their symptoms, functional needs, personal preferences, and real-world environment. The tool will assess factors including weight and portability preferences, desired functionality, available space in the living environment, usage capacity and physical abilities, whether devices need to withstand indoor or outdoor use, durability for Alaska weather conditions, and whether the person has reliable electricity. This individualized approach ensures recommendations fit the person's actual life, not just their medical profile. The tool will provide recommendations across health-related domains including chronic illness management, medication adherence, telehealth connectivity, fall prevention, and home safety. It will identify funding sources such as ATLA, Medicaid Waivers, and DVR, and refer users to experts for follow-up review and device demonstrations. Users include individuals with disabilities and chronic conditions of all ages, family caregivers, direct support professionals, CIL staff, schools, businesses, job coaches, and healthcare providers unfamiliar with assistive technology options. Year 1 is a discovery phase for stakeholder engagement and viability assessment. Year 2 focuses on prototyping with Delve Group. Year 3 begins a pilot with supplemental funding for participants to acquire recommended technology and be surveyed on health outcomes. Year 4 expands the pilot and develops sustainability. Year 5 launches statewide. SILC has extensive experience developing AI tools with Delve Group, including our Person-Centered Planning Assistant. This project applies that expertise to health-focused assistive technology.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Statewide Independent Living Council	Community Partners Improving Home Accessibility	AK	Falls are the leading cause of serious injury, fatal and non-fatal injury, and long-term disability among Alaskans 65 and older. A 2023 survey found 32.3 percent in that age group fell within the last year. For those with a mobility disability, 49.1 percent fell, and for those with an independent living disability, 69.2 percent. Nationally, non-fatal older adult falls cost \$80 billion per year, projected to exceed \$101 billion by 2030. Home accessibility is critical to preventing these falls, yet thousands of Alaskans lack safe entry access. Existing pathways to home modifications are complex, leaving many waiting years for solutions they urgently need. Wooden ramps last only three to five years in Alaska's climate. Freeze-thaw cycles cause screws to back out, boards to warp, and coatings to peel. Many become non-compliant within months. Some homes lack sufficient land for a ramp footprint, leaving residents with no path to accessibility. Modular ramps and platform lifts from durable aluminum and composite materials solve this. They include custom features for snow, freeze, rain, and frost heave, last multiple generations, and can be installed in winter. Platform lifts serve homes where terrain or lot size cannot accommodate a ramp. SILC demonstrated this through our Rural Ramp Pilot from 2020 to 2021, and ramps from that pilot remain fully functional over five years later. With Alaska's 85-and-older population the fastest growing demographic, demand will only increase.	SILC proposes a statewide modular ramp program that installs durable, ADA-compliant aluminum and composite ramps at the homes of Alaskans with disabilities and aging Alaskans who need safe access to remain in their homes and communities. The program builds on SILC's successful Rural Ramp Pilot, carried out from 2020 to 2021 with support from the Alaska Mental Health Trust Authority, and is ready to launch statewide the moment funds are available. The core innovation is a community ownership model. Rather than making ramps the property of individual homeowners, each ramp is held as a community asset by a local partner organization. When a ramp is no longer needed by the original recipient, it is repurposed at a new home for a fraction of the cost of a new installation — as little as 10 percent within the same community or 25 percent to another community. SILC will develop clear repurposing agreements with each community partner that establish need-based criteria for reallocation, ensuring ramps are directed to individuals with the greatest need. This creates a sustainable reverse supply chain where modular ramps continuously serve changing community needs across their multi-generational lifespan. Ramps are built using standardized modular sections that can be customized for each location's specific requirements. In Year 1, SILC will pre-purchase materials and shipping containers and focus on building as many modular sections as possible to establish an inventory ready to send to identified locations. Pre-purchasing materials in Year 1 mitigates expected price increases over the life of the project. Alaska's four Centers for Independent Living carry out the frontline work. CILs identify individuals needing ramp access, conduct site assessments, determine site preparation needs, and gather measurements for ramp configuration. SILC coordinates with Kasilof Wood and Metal to load shipping containers with standardized modular components, reducing per-unit costs for multiple installations in the same region. SAIL can store containers at four to six sites in Southeast Alaska, and Arctic Access has locations in Kiana, Kotzebue, Unalakleet, and Nome, creating staging points across the state's most remote regions. Local community members install the ramps with no professional construction experience required. Arctic Access maintains a waiting list of more than 100 individuals needing ramps in the Northwest Arctic.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Statewide Independent Living Council	Advancing Independence Through Innovation	AK	Alaskans with disabilities face two interconnected barriers that undermine their autonomy, particularly in rural and frontier communities. First, despite having one of the nation's most robust Supported Decision-Making Agreement statutes, Alaska has one of the highest guardianship rates in the country. Public guardians with the Office of Public Advocacy carry caseloads so extreme that many can dedicate only 15 minutes per person per month. Very few organizations support individuals through the SDMA process, and access is even more limited rurally. The result is unnecessary guardianship, loss of autonomy over health care, finances, relationships, and daily life, and institutionalization for individuals who could live independently with support. This costs the state significantly through guardian caseloads, institutional care, and ongoing court oversight. Second, youth with disabilities in rural Alaska lack person-centered planning tools that build self-determination. SILC's Person-Centered Planning Assistant (PCPA) has tripled workshop capacity, doubled completion rates, and produced more thorough goal development, but it requires computer lab access — scarce or nonexistent in most rural communities. Both barriers share a common thread: Alaskans with disabilities lack accessible, technology-enabled tools to take charge of their own lives. SILC has invested over \$85,000 developing AI-powered solutions and proven they work. This project takes those tools to scale statewide.	SILC proposes a five-year project to develop, test, and deploy two AI-powered tools and a shared database that expand decision-making support and self-determination for Alaskans with disabilities. The first tool is the Supported Decision-Making Agreement Assistant. SILC completed Phase 1 with Anne Applegate, Alaska's foremost SDMA expert. This closed AI solution is trained on expert-curated content, ensuring privacy, accuracy, and safety. It guides staff through helping individuals create SDMAs as alternatives or companions to guardianship, covering decisions about health care, finances, education, relationships, and medication management. The Disability Law Center of Alaska has agreed to review output during each pilot to ensure guidance does not cross into legal advice. Phase 2 deploys the tool to four to six facilitating organizations including CILs, Aging and Disability Resource Centers, and Developmental Disability Resource Connection offices (DDRCs) for pilot testing. Phase 3 launches real-world use statewide via virtual service delivery. Phase 4 develops a consumer-facing version individuals can access independently. The second tool is a mobile and voice-enabled upgrade to the Person-Centered Planning Assistant (PCPA), used in SILC's Youth Leadership Forum. The PCPA helps youth develop SMART goals across five life areas including health and wellness but requires computer lab access. This upgrade enables mobile devices with typed and verbal interaction. Enhancements will be completed in Year 1 for the Summer Youth Leadership Forum. The AI tools are developed with Delve Group, SILC's confirmed Alaska-based development partner. The two tools connect through a deliberate pipeline. PCPA sessions with transitioning youth surface conversations about autonomy, and SILC will connect interested youth to the SDMA Assistant, creating a pathway from self-advocacy to formal supported decision-making. The project also develops a cross-tool database tracking users across all SILC AI tools, managing referrals to community partners and state agencies, compiling reports, and collecting outcomes data for RHTP reporting. A database development partner will be identified during the scoping phase. Two full-time staff join in Year 2 to oversee deployment, the pilot, and training. Year 5 delivers training to disability organizations, state agencies, and court staff on SDMAs and statutory changes including potential provisions under SB190.	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Statewide Independent Living Council	Alaska Rural Airports Accessibility Project	AK	Eight in ten Alaska communities are not connected to the road system. Air travel is the only way to reach medical care, transport patients in emergencies, and connect to the rest of the state. Yet only 20 of more than 700 FAA-registered airports and airstrips in Alaska fall under the Air Carrier Access Act, which requires accessible boarding for passengers with disabilities. The rest have no accessibility requirements. Department of Transportation analyses acknowledge that passengers with disabilities sustain injuries, including fatalities, during physical transfers at airports, and that even light injuries before departure cause larger complications because remedies may not be available in flight. These analyses also document passengers being dropped, having clothing disarrayed, and body parts exposed. In rural Alaska, where passengers are transferred through cargo doors with no equipment, these risks are acute. Medevac teams face the same challenges loading patients, sometimes causing dangerous delays. Some individuals avoid seeking medical care entirely. The COVID-19 pandemic exposed how inaccessible air transportation undermines both healthcare access and emergency response in rural Alaska. No commercial solution exists. The few aircraft boarding ramp manufacturers worldwide design for large aircraft with 60 or more passengers. Their products are prohibitively expensive and impractical for gravel runways, extreme weather, and limited ground crews.	SILC proposes a five-year project to design, manufacture, and install ADA-compliant boarding ramps at rural Alaska airports and airstrips, making air travel accessible for passengers with disabilities who depend on small aircraft to reach healthcare and emergency services. If there is an expressed need in a community, SILC may also build mechanical versions of ramps for locations that require them. Year 1 is a planning phase. SILC will hire a dedicated project lead to identify airport possibilities and establish community contacts and relationships, including travel to communities for listening sessions. The project lead will also establish relationships with air carriers and medevac teams who will use the ramps, and will be responsible for gathering ongoing feedback from carriers, medevac teams, and communities on their experiences using the equipment, including boarding efficiency and injury reduction. SILC will acquire shipping containers for future ramp transport and storage. Two past SILC council members from Bethel and Utqiagvik have agreed to help identify community airstrips within their regions to prioritize for the project and provide contacts necessary to assess community readiness and buy-in. Alaska's four Centers for Independent Living have agreed to conduct outreach to rural communities to identify need and local contacts across their service areas. Toward the end of Year 1, Kasilof Wood and Metal will build eight ramps, with four installed at remote locations to gather feedback on design, any needed modifications, and operational considerations before larger implementation. Building these early ramps also locks in material pricing. The ramp design proven at the Nome airport is compatible with a wide range of aircraft common across rural Alaska through a high level of adjustability built into each unit. If additional modifications are needed to accommodate specific aircraft at a particular location, Kasilof Wood and Metal can make those adjustments on a case-by-case basis. Equipment is built for Alaska conditions: functional on tarmac and gravel, durable in extreme weather, easy to operate and store. SILC will use shipping containers to transport ramps and to provide storage at airports that lack it. Multiple ramps may be shipped to a regional hub at one time to save on shipping costs. Kasilof Wood and Metal trains local community members on operations at each site.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Statewide Independent Living Council	Individual Reentry Planning for Alaskans with Disabilities	AK	Alaskans with disabilities are significantly overrepresented in the state's correctional system. Nationally, over 40 percent of people in state prisons have a disability, and one in five justice-involved individuals has a serious mental illness. When these individuals are released, they return to communities—many of them rural, remote, or frontier—without a coordinated plan for reconnecting with the health services critical to their stability. This includes behavioral health care, substance use disorder treatment, medication continuity, and primary care. The gap between discharge and connection to community-based health services is a period of acute vulnerability. Prison case managers are stretched thin, with ratios averaging 45 to 1, resulting in generic discharge information that fails to address individual needs. There is no adequate screening for traumatic brain injury in corrections, leaving many individuals undiagnosed. Without coordinated, health-focused reentry planning, individuals with disabilities cycle through emergency services, crisis behavioral health interventions, and re-incarceration—straining rural health systems and producing poor outcomes. Alaska's Centers for Independent Living already serve people with disabilities transitioning to independent living, but currently lack a structured, health-focused framework for supporting individuals reentering from correctional settings.	SILC proposes a two-year planning and development project to create an Individual Reentry Plan framework for Alaskans with disabilities leaving incarceration. This framework will be a structured, person-centered process that CIL staff facilitate with individuals preparing to reenter Alaska communities from correctional settings, with a focus on health service continuity. Year 1 is a short discovery phase running through September 2026. Activities include stakeholder engagement sessions with Alaska's four Centers for Independent Living to assess current reentry practices and capacity; a needs assessment focused on health-related reentry challenges for people with disabilities in rural communities; framework design for the Individual Reentry Plan covering behavioral health continuity, SUD treatment access, medication management, and primary care connections; technology scoping for an AI-assisted planning tool; and partnership development with the Department of Corrections, Department of Juvenile Justice, tribal health organizations, and community behavioral health providers. SILC will work with a consultant from the Alliance of Disability Advocates in North Carolina, which operates a CIL-based reentry program that has achieved an 11 percent recidivism rate compared to the state average of 47 percent. This proven model will be adapted for Alaska's unique context, including our extreme rural geography and tribal health system. Year 2, running October 2026 through September 2027, focuses on developing an AI-assisted Individual Reentry Plan tool in partnership with Delve Group, an Alaska-based technology company. SILC has extensive experience developing AI tools with Delve Group, including our Person-Centered Planning Assistant and Supported Decision-Making Agreement Assistant. The Year 2 phase includes in-house testing with CIL staff followed by a pilot with individuals being released from DOC or DJJ facilities. The deliverable is a fully developed, tested intervention ready for statewide implementation funding in a future request.	\$50,000-\$250,000	Statewide	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area	Deferred or Not Advanced

Statewide Independent Living Council	Self Directed Individualized Learning Programs with Health Objectives	AK	The Individualized Education Program process is intended to ensure students with disabilities receive tailored support, yet families often struggle to participate as equal partners. The process is largely driven by school professionals, and students are rarely meaningfully involved in shaping their own goals. Parents may not know what they can ask for, how to articulate their child's needs across academic, functional, and health domains, or how to translate their knowledge into the structured language IEP teams use. Health-related needs are particularly underserved. IEPs can legally include goals for chronic condition management, medication adherence, mental and behavioral health, and healthcare navigation, but these objectives are rarely incorporated because families lack a practical way to identify and request them. Research shows that students who develop health self-management skills early are better equipped to live independently as adults, require less costly care, and place less strain on the healthcare workforce. In Alaska, these challenges are amplified. Workforce shortages mean fewer specialists to support IEP development, and rural families face additional barriers accessing advocacy resources. When youth with disabilities enter adulthood without skills to manage their education, health, and daily living, they require higher levels of support that are more expensive and harder to access in a state with significant workforce constraints.	SILC proposes to develop a free, AI-powered web-based tool that helps families prepare for IEP meetings by working through the full scope of their child's needs — academic goals, functional performance, accommodations, related services, transition planning, and health-related objectives including physical health, mental and behavioral health, chronic condition management, and healthcare navigation. The tool takes a whole-person approach to IEP preparation while ensuring that health needs, which are often overlooked, are included as an integral part of the plan. The tool has two parts. First, a parent documents their child's conditions, functioning, strengths, challenges, and support needs. The AI then adapts the language complexity of a student-facing section so the child can engage directly to answer questions about their own goals, preferences, and priorities at an appropriate level. The output gives families prepared IEP goals they can bring to their meeting, arriving as informed, equal partners. If the tool identifies that assistive technology may benefit the student, it directs families to appropriate resources. Some districts have AT Specialists on staff, and the AT assessment tool will enable Special Education teachers to more easily participate in the At assessment process. For districts without these resources, the tool points to external organizations including CILs and those using SILC's AT Needs Assessment Tool developed under a separate RHTP project. Many forms of assistive technology have direct health implications, including tools like mobility aids, magnification, communication devices, and listening devices. Families access the tool through partners including Stone Soup Group, The Arc of Anchorage, and LINKS, whose parent navigators help with setup. Alaska's four CILs provide statewide access. SILC will conduct outreach to school districts and tribal educational systems to encourage referrals. The five-year phased approach includes discovery in Year 1, prototyping with Delve Group in Year 2, a small pilot in Year 3, expansion with Section 504 functionality in Year 4, and statewide launch in Year 5. Accessibility features will be developed with the Brain Injury Council of Alaska and the Alaska Center for the Blind and Visually Impaired.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

StationMD	Specialized Telehealth and Telepsychiatry for Alaskans with IDD who Lack Coverage	NJ	About 2,700 Alaskans who have IDD are receiving services under the two Home and Community Based Services waiver programs operated by the state (IDD waiver and Individual Supports waiver). These waivers cover some on-demand telehealth services and other services and supports that enable them to live independently and to perform activities of daily living required for self care. Another 700+ individuals with IDD are on waiver waitlists or registries, waiting for a slot to open so they can join Medicaid waiver programs. About half live in rural areas. They do not have access to all the services and supports they need so are at increased risk for preventable hospital admissions and Emergency Department (ED) use, reduced quality of care and life, and increased costs of care. Individuals with IDD represent an outsized share of healthcare service use and spending – they’re twice as likely to visit the ED, more likely to have a mental health condition, and have higher costs than other populations. Relying on hospitals and Emergency Medical Service (EMS) providers to serve these individuals introduces preventable workforce strain and service expenditures, and it threatens quality of care. Typical telemedicine and innovation solutions are not effective for people with IDD. A specialized solution is needed to address barriers related to communication, social challenges, mobility, support systems, and co-morbid medical and psychiatric conditions.	We propose to provide STAT – Specialized Telehealth and Assessment Team – services to individuals with IDD who are on Medicaid waiver waitlists or registries for the two Home and Community Based Services waiver programs operated by the state – the IDD waiver and the Individual Supports waiver (ISW). We will also provide this service to up to 100 other Medicaid-enrolled or uninsured individuals with IDD identified by the Alaska Department of Health or its designees. STAT furnishes a right-on-time telehealth assessment and triage when the individual’s primary care physician is unavailable or unable to determine the best clinical course of action, often avoiding unnecessary emergency department (ED) and urgent care visits. Clinicians are available 24/7 and specially trained to serve individuals with IDD. Below we describe the typical STAT patient encounter: - Change in Condition: Individual/caregiver notices a change and decide to initiate a STAT encounter. - Activate StationMD: Staff and individual initiate the encounter together. - Clinician Assessment and Triage: Next, the medical encounter is initiated by the clinician. During the encounter, If it is determined that the issue can be resolved without urgent in-person care, a detailed medical encounter is performed, including establishment of a diagnosis, plan and testing or prescription if necessary. (Note: For those with Medicaid or other insurance coverage, the cost of the visit is excluded from this proposal.) Our median call-to-clinician face-to-face encounter is <8 minutes, so all cases are seen extremely quickly. - Warm Handoff: In cases where the individual immediately requires a physical visit to a hospital ED, StationMD provides a “warm handoff” to the ED physician – clinician-to-clinician. - Sharing Documentation: Formal encounter documentation distributed after every visit. - Aftercare/Care Coordination: StationMD’s service includes follow-up consultations with the treated individual and provider, in the appropriate timeframe, depending on the issue after the initial call. - STAT+. For individuals who have co-occurring psychiatric conditions, we offer STAT+, which includes facilitation and scheduling of telepsychiatry appointments to assure timely access to necessary psychiatric assessment and treatment by psychiatrists, psychiatric nurse practitioners, or psychiatric physician assistants who have completed the specialized training required of all STAT+ providers.	\$250K-\$1M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Step-In Autism Services of Alaska, LLC	Statewide Telehealth Behavioral Stabilization & Caregiver Services for Rural Alaska	AK	Rural Alaska families raising children with autism, intellectual/developmental disabilities, or other behavioral needs face major barriers to timely support for communication, daily living skills, and safety-related behaviors. In many communities, families wait months or years for services because providers are scarce, travel is difficult, and specialty care is concentrated in hub communities. These delays create a costly pattern: needs intensify, caregiver stress rises, and children are more likely to require crisis response or high-acuity services, including inpatient or residential placements and law-enforcement involvement. Families also miss early intervention windows, where practical support can have the greatest long-term impact on functioning and stability. Applied behavior analysis (ABA) is an evidence-based approach for reducing challenging behavior and teaching functional skills, but access in rural Alaska remains limited. National cost growth and reliance on high-intensity service models make care harder to reach and harder to sustain in rural settings. This leaves Alaska with a clear opportunity: improve early access in rural communities while using state dollars more efficiently and reducing long-term crisis-related costs.	Step-In Autism Services (SiAS) will develop and launch a HIPAA-compliant statewide telehealth service line with onsite buildout to serve children and families in rural Alaska. The project targets children whose challenging behaviors place them at risk for escalation to higher-acuity services when support is delayed or unavailable. SiAS will use a tiered service pathway to match care intensity to clinical need. • Tier 1: Prevention and caregiver capacity-building. SiAS will provide caregiver guidance and community training through telehealth and rural hub sites. All Tier 1 families will have access to KALi, a mobile app that uses evidence-based visual supports and prompts to help prevent escalation. • Tier 2: Assessment and individualized support. Licensed behavior analysts (LBAs) will complete assessments, develop behavior support plans, and provide individualized telehealth coaching and intervention in the child’s natural environment when clinically indicated. • Tier 3: Rapid stabilization. For children at risk of emergency department use, psychiatric admission, law-enforcement involvement, or out-of-home placement, LBAs will lead real-time de-escalation protocols, safety planning, and cross-setting coordination. SiAS will activate community-based supports to prevent system escalation. When hands-on services are needed, locally trained behavior technicians will deliver in-home and community-based support under LBA oversight. SiAS will compile and monitor a dataset to measure clinical outcomes and cost-effectiveness. SiAS will analyze outcomes across tiers, service modalities, and participant characteristics to identify which approaches produce the best results for which children and families. These findings will inform future value-based care and payment models. RHTP funds will support planning, capacity-building, start-up, innovative payment model data set development and analysis activities only. They will not fund ongoing operating expenses or payer-covered services.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

StethX Inc	SeismicPatch™ for Rural Health Asthma Control and Mgmt - Data Collection to train our algorithm	GA	Rural and frontier communities face unique challenges in managing asthma—limited access to specialists, long travel distances, and delayed recognition of worsening symptoms that often lead to emergency department visits and preventable hospitalizations. These gaps in care take a toll not only on patients’ health but also on families, schools, and small care teams already stretched thin. Our project recognizes that where someone lives should not define the quality of care they receive. SeismicPatch™ offers a practical, human-centered solution: a small wearable device that helps patients and clinicians detect early respiratory changes and act before emergencies occur. By turning real-time data into timely action, it empowers patients to better manage their asthma and enables care teams to intervene sooner—even from miles away. Beyond improving asthma outcomes, this project builds trust and connection within rural healthcare systems. It supports self-management, strengthens the patient-provider relationship, and replaces crisis-driven care with proactive, preventative support. In essence, SeismicPatch™ gives rural communities a powerful tool to take control of their health and breathe easier. We are in the testing phase of developing our patch, and need to collect data (wheeze signatures, cough frequency, respiratory and heart rate, and work of breathing) to train our algorithms to correctly identify these sounds.	Our project will use the Alaska Rural Health Transformation Program to conduct an observational validation study of SeismicPatch™, an ultra-low profile, chest-worn respiratory sensor for adults with asthma in rural and frontier communities. In Alaska, our sole focus is data collection to train and refine the device’s detection algorithms, not broad clinical deployment or commercialization at this stage. Working with rural and Tribal partners, we will enroll adult asthma patients, collect continuous real-world physiologic data (wheeze signatures, cough frequency, respiratory and heart rate, work of breathing), and evaluate performance during activities of daily living and within existing primary care and tele-health workflows. This staged data collection will generate the evidence needed to validate SeismicPatch™ in frontier conditions, assess feasibility of integration into rural care settings, and build the foundation for future commercialization and scale. StethX has developed this approach to tightly align with Alaska’s Spark Technology & Innovation initiative and its goals to strengthen access, workforce, and preventive chronic disease management in rural communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Stone Soup Group	Expansion of Mentor Advocate Partner (MAP) Program	AK	Rural families raising children with intellectual and developmental disabilities (IDD) and complex medical needs face significant gaps in coordination across Alaska’s hub-and-spoke healthcare system. Specialty care is concentrated in Anchorage, Fairbanks, Juneau, and out-of-state centers like Seattle, requiring families to travel long distances for diagnosis, treatment, and extended hospitalization. When returning home, families often lack coordinated support to implement medical recommendations and navigate services across healthcare, education, and community systems. Critical transitions—such as hospital discharge, new diagnoses, and pediatric-to-adult care transitions—frequently occur without clear communication between hospital teams, local providers, and school systems. Schools are expected to implement complex medical and developmental supports but rarely receive structured guidance from healthcare providers. As a result, families must translate medical plans into educational supports and coordinate care across systems without formal assistance. Rural workforce shortages and turnover further weaken continuity of care. These gaps contribute to fragmented services, delayed implementation of care plans, caregiver burnout, and preventable health crises that increase emergency department utilization and higher-cost interventions. These systemic challenges highlight the need for coordinated navigation that bridges healthcare providers, schools, and community supports	Stone Soup Group will expand our existing MAP (Mentor, Advocate, Partner) Program to strengthen coordinated care for families with loved ones who have intellectual and developmental disabilities (IDD) and complex medical needs. The project will develop a statewide network of trained Mentor Parents—family leaders with lived experience—who will augment SSG’s professional Parent Navigation staff and will work alongside families as trusted guides and connectors between healthcare providers, schools, and local community resources. SSG will hire a full-time MAP Coordinator to oversee the expansion of the MAP Program. Consultant, Rain Van Den Berg, will advise on the adaptation of the existing MAP training curriculum—the current curriculum is focused on a one-to-one mentoring model—into a broader community navigation model to support program expansion. SSG’s current partnership with Southcentral Foundation, where a SSG Parent Navigator is embedded on their campus and in their pediatric specialty clinics, will further guide and inform the expansion of our MAP Program. SSG will recruit, vet and train cohorts of Mentor Parents from rural communities. Training will be a combination of distance-delivered and in-person sessions. Trained Mentor Parents will support families during critical points, including diagnosis, hospital discharge, medical travel, and transitions between pediatric and adult healthcare systems. Mentor Parents will also help families understand medical recommendations and how to implement care plans across healthcare providers, schools, and community services. Partnership Agreements with key organizations will be used to facilitate collaboration and reduce barriers for families. Having local Mentor Parents available as guides and resources helps to minimize isolation which can too often lead to tragic outcomes. Caregiving for a loved one with complex and demanding needs can be overwhelming and exhausting and we often see families disconnect and isolate because they feel they no longer belong. Sometimes the simplest intervention of connecting families to a trusted support person can have the greatest positive impact. By supporting non-clinical needs, Mentor Parents allow healthcare providers to work at the top of their licenses, knowing that the other needs are going to be addressed with the Mentor Parent. They are a partner to healthcare providers and families working to reduce avoidable crises and build strong support networks.	Under \$50,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Strategic Command Centers	Alaska Remote Clinic Security Research Program: Rural and Tribal Workforce Safety	NJ	Remote and village healthcare clinics across rural and Tribal Alaska face a security challenge that no existing national policy framework addresses. These facilities operate with minimal staff in extreme geographic isolation, often hours from law enforcement, in communities where weapons-carrying is a normalized part of the subsistence lifestyle. Behavioral health crises and substance use encounters are common, psychiatric services are scarce, and evacuation options are severely limited by weather and terrain. Healthcare workers at these facilities frequently leave not because of compensation, but because they do not feel physically safe and have no institutional framework to guide their response to threats. This workforce attrition directly undermines Alaska's RHTP investment in rural healthcare access. The problem cannot be solved by adapting existing hospital security policies as it requires original research followed by purpose-built standards.	Baseline Research Study: A comprehensive study conducted in partnership with an Alaska institution of higher education, combining quantitative surveys of remote facility administrators with qualitative stakeholder interviews including clinical staff, Tribal health leadership, and Alaska State Troopers. The study maps the actual threat landscape before any standards are written, ensuring solutions are grounded in evidence rather than assumptions. Standards Development: Based on research findings, a custom policy library is developed for remote and village clinic settings. Policies address workplace violence prevention adapted for limited law enforcement backup, weapons management protocols that respect the subsistence lifestyle, active threat response for extreme isolation, behavioral health crisis encounters, emergency communications with limited connectivity, and Tribal community coordination frameworks. GRC Platform with Quarterly Updates: Because these are first-generation standards never tested in practice, the GRC platform includes quarterly refinement cycles throughout the performance period. Implementation feedback from participating facilities drives continuous standards improvement, evolving the framework from theoretical to field-tested. Longitudinal Research Program: Annual research studies conducted through Alaska university partnerships measure implementation effectiveness, track workforce retention trends, and validate standards refinements. This produces a multi-year dataset demonstrating RHTP workforce impact that ACF can report to federal funders.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Strategic Command Centers	Rural Hospital Workplace Safety: Workforce Retention Through Security Policy Standardization	NJ	Alaska faces a critical workforce challenge where clinicians frequently leave hospitals because they do not feel physically safe in isolated settings. Limited operational resources currently prevent rural hospitals from developing the professional physical security and emergency management standards necessary to protect their staff and their federal funding.	This project consists of three main parts designed to modernize hospital security infrastructure: Metapolicy Library: A comprehensive resource for all hospitals, providing a physical security and emergency management framework that is 95% applicable across the network while being optimized for rural settings. GRC Platform: This system ensures continuous compliance and demonstrates Evidence of Implementation (EOI) for federal oversight. It provides direct alignment with 2026 CMS Emergency Preparedness standards, Joint Commission Accreditation 360 (2026) requirements, and DNV NIAHO accreditation pathways. Research Partnership: This component establishes a partnership with an Alaska institution of higher education to scientifically validate how these security standards impact healthcare workforce retention and rural hospital security.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Strategic Impact Consulting	Strategic Impact Technical Assistance and Training	AK	Remote communities in Alaska face persistent barriers to accessing high-quality, sustainable health care. Geographic isolation, limited infrastructure, workforce shortages and high operating costs make it difficult for organizations to expand services and implement innovative care models. Many Tribal Health Organizations, Tribes and rural providers also operate with limited administrative capacity, which can hinder their ability to compete for and manage complex funding opportunities that can address these gaps and barriers. The RHTP provides critical resources to improve care delivery, strengthen health systems and expand access to services; however, many eligible entities lack technical expertise and staffing capacity necessary to develop competitive applications and successfully implement projects. Without targeted TA and training, these organizations may be unable to fully access or utilize resources intended to strengthen health care systems and improve health outcomes. This project addresses these challenges by providing TA and training to RHTP eligible entities to strengthen their capacity to develop high-quality funding applications and successfully implement funded initiatives. By building administrative, planning and project management capacity, the project will support rural organizations in securing funding, implementing innovative health initiatives and improving access, quality and sustainability of health care services for Alaska’s remote communities.	The proposed approach will deliver training and TA through a phased model designed to strengthen the capacity of RHTP eligible entities to successfully implement funded initiatives and develop competitive projects for future funding opportunities. During the initial phase, the project will prioritize training and individualized technical assistance for RHTP awarded grantees to support successful project implementation. This support will include guidance on project management, financial oversight, compliance with program requirements, performance monitoring and reporting. The project team will work directly with funded entities to address implementation challenges, strengthen administrative systems and ensure projects are delivered effectively and in alignment with RHTP goals. Following this initial implementation support, the project will expand training and outreach to other eligible entities interested in participating in RHTP. Introductory training sessions will provide an overview of RHTP priorities, program requirements and key elements of successful project design. These sessions will be delivered through accessible virtual formats, including webinars, workshops and written guidance to ensure organizations in remote communities can participate. Entities preparing for future RHTP submissions will have access to individualized technical assistance tailored to their project concepts. This support will include guidance on project planning, partnership development, budgeting, data strategies and aligning initiatives with RHTP priorities to support strong Year 2 proposals. Throughout the program, training and TA will focus on building sustainable organizational capacity. Toolkits, templates, and best practice guidance will support improvements in grant management, program evaluation and health system innovation. Due to the anticipated number of participating entities, the project team will establish transparent criteria to prioritize organizations that may benefit from more intensive technical assistance. Core training will be available to all eligible entities, with individualized support provided based on prioritization criteria and, when appropriate, on a first-come basis. By combining implementation support for awarded grantees with training and project development assistance for future applicants, this approach will strengthen the pipeline of high-quality RHTP projects and support sustainable health initiatives across Alaska’s communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Strategic Prevention Solutions	Art-Based Storytelling: Bridging Recovery Readiness and Service Access in Alaska Native Communities	AK	Across rural Alaska, Alaska Native people seeking mental health and substance use services frequently encounter a critical gap between the moment they are ready to engage in services and the point at which those services are actually available. This gap—driven by provider shortages, geographic isolation, long wait lists, and fragmented referral systems—results in missed treatment opportunities, deteriorating health, and deepening distrust of the health care system. Despite widespread recognition of this problem among providers and communities, there is limited systematic documentation of how individuals experience this gap, what happens during the waiting period, and what supports or interventions could bridge the divide. This project addresses that gap in understanding by using culturally appropriate, community-centered methods to capture the voices and stories of those most affected.	Our team will employ art-based storytelling methodologies—including visual art, oral narrative, and creative expression workshops—to gather personal stories from Alaska Native people in rural communities who have experienced the gap between treatment readiness and service access. The project unfolds in three phases: Phase 1 — Community Engagement and Design (Months 1–4): SPS will lead the development of the research framework and data collection protocols in collaboration with Christina Love Consulting and Black & White Raven Company. Christina Love and Chloey Cavanaugh will engage community members and local leaders in rural Alaska to co-design the art-based storytelling workshops, ensuring methods are culturally grounded and community-approved. This phase includes institutional review, partnership formalization, and logistical planning for community-based workshops. Phase 2 — Art-Based Storytelling Workshops and Data Collection (Months 5–12): Christina Love and Chloey Cavanaugh will facilitate a series of art-based storytelling gatherings in selected rural communities. These workshops will create culturally safe spaces where participants can share their experiences through visual art, spoken narrative, and other creative modalities. SPS will provide research support including qualitative data collection, documentation, and preliminary analysis of emerging themes. Workshops will explore questions such as: What was happening when you were ready for help? What barriers did you face? What would have made a difference during the wait? Phase 3 — Analysis, Synthesis, and Guidance (Months 13–18): SPS will lead the thematic analysis of all collected stories and data, identifying patterns in the mental health, addiction and recovery services access gap and community-identified solutions. The team will synthesize findings into a final report and a set of actionable guidance documents designed to inform the development of interventions that address the gap in services. Findings will be shared with participating communities, health care providers, tribal organizations, and state agencies to support evidence-informed system improvements.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Prince of Wales-Hyder Census Area; Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Straw For Dogs	Healthy Communities Through Healthy Pets	AK	The problems that the majority of our rural communities throughout Alaska face with having to live amongst packs of ferrel dog and cat populations are not only physical, mental, and emotional health issues, but also financial hardships that add to the anguish. Other associated downstream effects such as, spread of zoonotic disease risks, added strain to an already limited local health system and public safety resources, bites on humans, disproportionate impacts on remote Alaska Native communities, reduced neighborhood safety and walkability especially amongst children to engage in outdoor activities for fear of bites on human and attacks on livestock that sustain a foods source for isolated communities. The objective of this project is to provide access to spay and neuter services to areas throughout Alaska where this service is not readily available, in an effort to reduce the overpopulation of stray/ferrel animals that are causing these problems listed above.	The Healthy Communities through Heathy Pets Project will successfully combat and mitigate the problems associated with overpopulations of ferrel animals by using several methods. All methods are effective independently, however when all three are implemented in tandem that is when our goal will be achieved and better sustained. The three pillars of our Program are: Education, Access, and Sustainability. We all know that "education" is critical when identifying and resolving any problem, that is why bringing awareness and information about the issues associated with the negative health effects that living with populations of ferrel animals has on a community is an important element in the success of this Program. Once understanding through education is recognized, the element of "access" will be the physical work portion of the Program. Once both of these elements have taken root, the "sustainability" key is more easily accomplished because communities will have seen and felt the results of what living life without the fears of being forced to live with ferrel packs of animals is like. With the infusion of RHTP funding to an already established non-profit driven system that includes education, access, and sustainability elements by being able to perform more and better organized regular scheduling of spay/neuter/vaccination/care clinics to these most difficult to reach rural, disproportionate native communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Strong Solutions, LLP	Public-Private Partnership AI Innovative Care Model	AK	Rural Alaska’s health crisis is driven by an "Innovation Gap." While Silicon Valley leads the world in AI, these solutions rarely survive the realities of the frontier. This gap forces the relocation of high-acuity rural Alaskans to urban centers, away from their homes. The opportunity is to capitalize on a Public-Private Partnership AI Innovative Care Model that bridges this gap. Strong Solutions is leveraging 14 winters of Kodiak "Living Lab" data to attract additional capital into a specialized AI Innovative Care Model. Our model is supported by a \$2.5M private capital commitment, ensuring that RHTP funds are used exclusively for community deployment and workforce scaling, while the private sector bears the primary risk of technical development and engineering. We are offering the Department of Health a seat at the table in an existing Frontier-to-Incubator Feedback Loop—including access to our Ivy League research and Silicon Valley engineering teams—to solve the Workforce and Spark Tech crises. We are offering the DOH a partnership in the world’s most advanced rural health R&D engine.	Pre-existing patent-pending/trademarked tech was developed via private R&D. RHTP funds will scale deployment, not primary research. Our approach centers on a Reciprocal Innovation Cycle between Alaska providers and our AI Innovative Care Lab (based in Palo Alto, CA). We utilize a Public-Private Partnership to pilot and scale solutions for Alaska Healthcare providers. 1. AI Innovative Care Lab: We’ve engaged global innovators to develop frontier-ready tools like "The Guardian" (PIERS). Currently in prototype, it uses Edge Technology and Zero-Knowledge agents for 24/7 safety and federal match audit loops, unlike cloud-dependent tech. We will utilize a 'Learning & Adaptive Management' framework where data from our Yale University Research Fellow is reviewed quarterly to pivot technical protocols and workforce training modules in real-time, ensuring the model evolves alongside beneficiary needs. 2. Lived Experience Exchange: We ensure tech is built with Alaskans. Kodiak residents pilot tech in Palo Alto; a Yale Research Fellow joins our Living Lab this summer to validate outcomes. This ensures IP, like "This Is Me" (TIM), is grounded in rural care reality and digital literacy. 3. Peer DSP/LRI Workforce: We integrate our tech with proven Peer DSP/LRI programs. Training Alaskans with disabilities and LRIs to use AI Aide’s tools transforms care recipients into "Tech-Enabled" providers—creating a permanent, high-wage local workforce that overcomes traditional staffing turnover. 4. Sustainability & Integrity: Backed by \$2M+ private equity, we optimize federal matches (1915(k)/1115/IHS). Our patent-pending Fraud Signaling allows patient-verified care via wearables, providing the DOH a revolutionary Medicaid integrity tool. By 2031, this AI Innovative Care Model will be self-sustaining and attractive to private investment, reducing the long-term burden on Alaska’s budget.	Over \$5M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Struct, Inc	Alaska Coalition of Integrators (ACI) Certification & Rural Health Resilience Program	AK	Rural Alaska communities face chronic workforce shortages in utilities, infrastructure, and allied health roles and frequently must pay to import engineers and consultants for maintenance, planning, and emergency response—incurring high costs and delayed service. Structure proposes a statewide, scalable certification and workforce pipeline delivered from a Yakutat training facility that trains local personnel to perform technical tasks, reducing reliance on external contractors. By creating locally accredited credentials aligned to employer needs, the program increases community resilience, lowers long term costs, and builds a replicable model for other rural Alaskan communities. Yakutat is an off the road system village that is uniquely positioned with daily jet service, strong tribal partners, a rich history, and worldclass outdoor opportunities. Yakutat Tlingit Tribe recently opened a modern health clinic that serves the entire community. Like many rural communities, Yakutat’s population has been declining largely due to lack of investment in the local school system. This project will deliver high skilled training in a rural location, helping reverse outmigration, serve as a model for problem solving and economic stability, and overall community health.	The program will: 1) co design competency based curricula with Yakutat and statewide partners for utilities operations, infrastructure maintenance, allied health support, and technical problem solving; 2) deliver blended cohorts combining on site practicums in Yakutat, remote ECHO style tele mentoring, simulation, and asynchronous microlearning; 3) establish credentialing, apprenticeships, and employer aligned pathways with ANTHC, SHI, YTT, CBY, and regional employers to ensure local job placement and replace external contractor use; 4) implement instructor training and train the trainer models to localize delivery and enable statewide replication; and 5) evaluate credential attainment, job placement, retention, reductions in external consultant/engineer expenditures, service continuity metrics, and contractor dependence. Structure leads curriculum and program operations; YKI leads facility renovation and repurposing; YTT, CBY, AVEC, ANTHC and SHI provide employer partnerships, practicums, and technical input. Quarterly governance and data sharing will drive iterative improvement and statewide scaling.	\$250K-\$1M	Statewide	Bethel Census Area; Bristol Bay Borough; Juneau (City and Borough); Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Struct, Inc	Health OT Network Operations Center — Remote Infrastructure & Clinical Data Operations Monitoring	AK	Rural Alaska clinics face combined threats to access from infrastructure failure (HVAC, generators, water, refrigeration) and degraded clinical communications (tele-health outages, high latency, device interoperability failures, cybersecurity events). Because facility uptime and communication integrity equal access in remote Alaska, there is an urgent need for an integrated Health OT NOC that monitors both physical and clinical data operations to prevent service loss and enable data-driven continuity of care. Without reliable infrastructure, maternal and child health services, behavioral health access, chronic disease management, and telehealth-enabled specialty care for Alaska Native communities and rural elders are disrupted.	Deploy Structure SCADA as a Health OT Network Operations Center for participating clinics: - Monitor physical infrastructure: HVAC, backup generators and fuel levels, water/sanitation, vaccine refrigeration (temp excursion alarms), medical gas inventory, remote pharmacy dispensers, tele-health kiosk status and uptime. - Monitor data operations backbone: ingest clinic/device/tele-health telemetry, monitor interface health, track latency and communications integrity (CommsVault connectivity), and detect cybersecurity intrusion events. - Provide multi-protocol device normalization, real-time system health dashboards, alarm correlation, and Geographic visualization (GIS overlays) to show clinic and device geography and status. - Surface Alaska-relevant operational indicators to stakeholders: clinic online/offline status, connectivity health, tele-health session capacity (concurrent session capacity and current utilization), device fleet health, and intrusion/cybersecurity alerts. - Integrate tiered alarm routing (SMS/email/IVR) to local staff, tribal/regional ops, and on-call technicians; enable remote diagnostics and over-the-air updates to reduce emergency dispatches. - Produce compliance-ready logs and automated reports to support value-based care metrics, population health analytics, and detection of fraud/waste patterns. - Connectivity: hybrid cellular/satellite gateways with store-and-forward for intermittent networks. - Pilot: Chignik Lagoon + two rural clinics; LKSD and City partners engaged for coordination. - Partner with Alaska workforce development programs to create “grow our own” Health OT technician pipelines. Provide structured mentoring and continuing education to sustain local operational expertise. - Engage THOs and clinics as co-designers: ensure community-driven implementation that respects local priorities, preserves Tribal data governance and provider autonomy, and supports the enhancement and expansion of Tribal health programs.	\$1M-\$5M	Statewide	Bethel Census Area; Bristol Bay Borough; Juneau (City and Borough); Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Struct, Inc	Structure SCADA for Rural Health Access – Secure Clinic Infrastructure and Community Resilience	AK	Across rural Alaska, clinics and regional health hubs depend on aging power, water, heating, and telecom systems that lack modern remote monitoring, predictive alerts, or robust cybersecurity. When these systems fail, clinics close unexpectedly, telehealth visits are cancelled, vaccines and medications are compromised, and patients are transferred for non clinical reasons because local sites cannot safely operate. These disruptions directly undermine Initiative Health Care Access by limiting timely, integrated primary and specialty care by interrupting routine prevention and chronic disease management. At the same time, rural health employers struggle to recruit and retain staff due in part to unpredictable working conditions. This contributes to persistent provider shortages and reduced service hours in high need communities. There is a clear opportunity to apply proven industrial SCADA and control technologies—already standard in critical infrastructure—to health serving facilities so that clinics, telehealth nodes, and community wellness spaces can operate more reliably and efficiently. By pairing resilient remote monitoring with targeted workforce supports, the project can reduce downtime, protect clinical assets, and stabilize the workforce, thereby advancing RHTP goals for expanded access, stronger community based prevention, and more sustainable rural health systems.	The project deploys Structure's cloud-enabled, edge-capable SCADA platform to monitor and manage critical infrastructure at rural clinics and regional hubs in a multi-community hub-and-spoke model, initially prioritizing confirmed partners Yakutat Health Clinic and Chignik community health clinic with Juneau, Sitka, Wrangell, ANTHC in discussion and SEARHC arranging discussion. Key technical components include: Unified real-time dashboards integrating power, generators, HVAC, water, refrigeration, and connectivity status across participating health facilities. Edge controllers maintaining autonomous safe modes during connectivity loss, with store-and-forward telemetry ensuring no data gaps when links restore. Configurable alerts and automated routines (load shedding, generator start, temperature adjustments) preventing outages from escalating into clinic closures or cold-chain failures. Integration modules linking infrastructure telemetry with scheduling and telehealth platforms to proactively reroute appointments when site capacity drops. A Juneau/Sitka-based remote operations center provides 24/7 monitoring, alert triage, and field response coordination, reducing mean time to detection and resolution. Local staff, including tribal health and municipal partners, receive role-based training, SOPs, and ongoing coaching so communities manage daily operations while relying on Structure for higher-tier support. To reinforce Health Care Access, the project prioritizes sites where improved reliability directly increases primary, behavioral, and dental care availability and supports telehealth connections to regional specialists. To advance Healthy Communities, the project coordinates with local public health organizations so reliable power, water, and climate control support prevention programs, chronic disease management, and community wellness activities in clinic and shared spaces. Where Structure is employer or formal partner, the project pilots employer-provided healthcare and subsidized childcare for operations staff. Throughout the 18-24 month pilot, the team tracks uptime, appointment continuity, telehealth usage, workforce retention, and community indicators to refine automation, training, and benefit models before scaling.	\$1M-\$5M	Statewide	Bristol Bay Borough; Juneau (City and Borough); Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Structured Communication Systems, Inc.	(AK) Rural Health Transformation Program	OR	Alaska-Specific Design Principles • Consider edge-first architecture: local cache, store-and-forward, and graceful offline operation. • Lean staffing: automate, standardize, and centralize where possible; keep local workflows simple. • Sovereignty by design: embed consent, data-use governance, and auditability in all systems. • Cyber as a clinical safety risk: treat cybersecurity events as patient-safety events. • Urban–Rural interconnectivity as a design norm: ensure core systems, monitoring, and specialty consult platforms can extend seamlessly between Alaska’s hub cities (Anchorage, Fairbanks, Juneau) and rural/tribal sites. • Funding harmonization: align with federal Telecommunications and HCF programs, including consortium models that enable cost-effective scaling. • Dedicated/symmetric performance guarantee: design networks to deliver consistent, predictable performance with symmetric upload/download speeds to support telehealth, imaging, and cloud-based health records.	Alaska’s Rural Health Transformation Cybersecurity and EHR Management Overview Alaska’s rural and Tribal health providers face extraordinary barriers in maintaining secure, resilient, and interoperable health IT systems. Without intentional investment, Alaska’s rural and Tribal health providers remain at high risk of cyberattacks, system outages, and data silos that undermine patient care. A comprehensive Rural Health Transformation Cybersecurity and EHR Management initiative would harmonize with the FCC’s RHC program funding. Effective harmonization would further the following: • Reduce health disparities by ensuring secure, reliable data flows. • Safeguard patient privacy and clinical records. • Build resilient networks capable of supporting advanced telehealth. • Empower communities through shared governance and consortium-driven cost savings. By strengthening cybersecurity, EHR interoperability, and network resilience, Alaska’s Rural Health Transformation initiative will not only improve access and outcomes but also drive down healthcare costs across the system, primarily through remote patient monitoring, tele-imaging tele-stroke, avoided medevacs, fewer hospitalizations, reduced duplication of services, and shared IT efficiencies.	Under \$50,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Stryker Medical	Advancing Breast Health Programs	CA	Access to breast health can be difficult in small communities, especially when it comes to surgical procedures. Using MOLLI, a wire free tumor localization platform, and SPY PHI, a real time lymphatic mapping and perfusion assessment tool, patients can have access to innovative, reliable care within their community. SPY technology can also be used in a wide range of surgical procedures to assess perfusion which makes it a perfect fit in smaller hospitals when other resources may be limited.	The approach is to combine MOLLI and SPY PHI Technology to make breast surgery more accessible and easier for patients. MOLLI is a wire free soft tissue localization device used commonly in lumpectomies to identify lesions. Unlike current systems, MOLLI will not break, deactivate and is detectable even with calcifications and hematomas that correct technologies get interference from. MOLLI's user interface is simple with 3D directionality to guide surgeons to their lesion in real time for removal. This simple device will allow confidence in surgical teams to use wire-free technologies safely and effectively. Using SPY Technology for lymphatic mapping in breast cases allows surgeons to visualize lymphatic mapping in real time for sentinel node identification. There are many barriers in current methods including scheduling conflicts or accessibility issues with nuclear medicine, and allergic reactions with other dyes. SPY addresses these barriers and is research backed. Furthermore, in addition to lymphatic mapping, SPY technology also offers perfusion assessment which supports majority of other surgical services.	\$50,000-\$250,000	Statewide	Anchorage (Municipality); Denali Borough; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Matanuska-Susitna Borough; Sitka (City and Borough); Southeast Fairbanks Census Area	Deferred or Not Advanced

Sunrise Community Living	Alaska IDD Complex Needs Resource Center	AK	Alaska faces a significant shortage of services for individuals with intellectual and developmental disabilities (IDD) who have high acuity medical or behavioral support needs. Many communities lack the workforce, facilities, and stabilization resources required to safely support individuals when care needs increase. When providers cannot stabilize situations locally, individuals may experience emergency placements, hospitalizations, or disruptive relocations away from their home communities. These disruptions are especially challenging for individuals living in rural or remote regions where provider capacity is limited and specialized supports are difficult to access. Alaska currently serves more than 2,300 individuals through the IDD waiver system, and providers frequently report limited ability to support individuals with dual diagnosis behavioral health conditions or higher medical acuity. Without access to stabilization resources and trained staff, providers often have few options when needs escalate. This project addresses an opportunity to strengthen Alaska’s community-based care system by expanding stabilization capacity, improving provider coordination, and increasing workforce training focused on complex IDD care. Expanding these resources will help providers maintain services locally, reduce disruptions, and allow individuals to remain connected to their families and communities whenever possible.	Sunrise Community Living proposes development of a regional stabilization and service hub designed to expand Alaska’s capacity to support individuals with complex intellectual and developmental disability (IDD) needs while strengthening the statewide provider network serving rural communities. The project renovates an existing commercial or institutional facility in Anchorage to establish a center providing residential services, stabilization placements, workforce training, and provider consultation. Sunrise Community Living is evaluating facilities suitable for renovation. Using an existing structure reduces development timelines and allows services to launch faster than new construction. The center supports residential pods serving Medicaid HCBS waiver recipients with intellectual and developmental disabilities whose needs exceed what traditional community residential programs can safely support. The facility provides capacity for up to 24 residents through specialized six-bedroom pods serving individuals with high acuity needs, individuals with co-occurring IDD and behavioral health conditions, and short-term stabilization placements for providers or families managing complex situations. The stabilization component allows individuals from rural communities to receive short-term support when service disruptions occur or when additional clinical coordination is required. These placements support stabilization, assessment, and care planning that allows safe return to services within the individual’s home community whenever possible. This approach helps prevent unnecessary hospitalizations, out-of-state placements, and loss of residential capacity within rural communities. The center also strengthens Alaska’s rural provider network through workforce development and provider consultation. Training space supports high-acuity care training for direct support professionals, rural providers, and community partners. Telehealth consultation and coordinated care planning allow rural providers to access guidance and stabilization resources when complex situations arise. By combining residential stabilization services, workforce development, and provider support within a single hub, this project expands statewide service capacity while strengthening Alaska’s community-based care system and improving access for rural Alaskans.	\$1M-\$5M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Sunrise Community Living	Alaska IDD Rural Clinical Consultation and Stabilization Support Network	AK	Across Alaska, providers supporting people with intellectual and developmental disabilities (IDD) frequently encounter complex behavioral health (BH) and medical situations without access to specialized clinical consultation or stabilization resources. This challenge is especially acute in rural and remote communities where providers operate small programs with limited access to clinicians experienced in high-acuity IDD care. When complex situations arise, providers may struggle to stabilize people locally. Without timely consultation and coordinated stabilization support, situations can escalate to ER visits, service disruption, or relocation outside the person’s home community. While Alaska has strong community services, the system lacks a coordinated statewide mechanism allowing providers to quickly access specialized expertise when complex situations occur. This gap strains rural providers and contributes to avoidable hospitalizations, provider burnout, and loss of residential capacity in rural communities. This project strengthens Alaska’s IDD service system by creating a statewide consultation and stabilization support network that allows rural providers to access specialized guidance and coordinated stabilization resources when complex situations arise. Expanding access to clinical expertise and crisis coordination helps providers maintain services locally and improve continuity of care for people with complex needs.	Sunrise Community Living proposes development of a statewide clinical consultation and stabilization support network designed to strengthen Alaska’s ability to support people with intellectual and developmental disabilities (IDD), particularly in rural and remote communities where access to specialized clinical expertise is limited. The program will establish a coordinated consultation network connecting rural providers with clinicians experienced in high-acuity IDD care and co-occurring behavioral health (BH) conditions. Through secure teleconsultation services, providers will be able to request timely guidance when complex situations arise, including behavioral escalation, medication coordination, and crisis response planning. Consultation services will assist providers with stabilization strategies, care planning, and identification of appropriate interventions that allow individuals to remain safely supported within their home communities whenever possible. When situations require support beyond local capacity, the network will assist providers in coordinating stabilization resources and transition planning so individuals can safely return to services in their home region following stabilization. In addition to real-time consultation, the program will provide scheduled case consultation sessions and technical assistance focused on high-acuity IDD and IDD/BH populations. These activities will help providers strengthen internal capacity to manage complex situations and improve long-term service stability within rural communities. The consultation network will also serve as a coordination and learning resource for Alaska’s IDD provider system. Program data and case experience will help identify recurring service challenges, support provider collaboration, and inform improvements in stabilization planning across the provider network. By combining real-time consultation, stabilization coordination, and ongoing provider support, this project expands access to specialized expertise while strengthening the statewide IDD service system serving rural Alaska. Earlier access to clinical expertise can help providers intervene sooner when complex needs emerge, reducing avoidable hospitalizations, preventing service disruption, and helping individuals remain safely supported within community-based settings.	\$1M-\$5M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Sunrise Community Living	Alaska IDD Workforce Training and Provider Capacity Initiative	AK	Alaska faces a growing workforce challenge in supporting individuals with intellectual and developmental disabilities (IDD) who have high-acuity medical or behavioral support needs. Many providers, especially in rural and remote communities, lack access to specialized training needed to safely support individuals with complex needs. As a result, providers may struggle when care needs escalate. Individuals with complex needs can experience service disruption, hospitalization, or relocation away from their home communities when local providers lack the training or support needed to stabilize situations safely. Alaska currently has more than 2,300 individuals receiving IDD waiver services, and providers across the state report limited ability to support individuals with dual diagnosis behavioral health conditions or high medical acuity. Alaska benefits from foundational workforce programs, but providers serving high-acuity IDD populations often need more specialized training and consultation than existing programs typically provide. This creates an opportunity to strengthen Alaska’s community-based care system by expanding specialized workforce training, provider consultation, and technical support so rural providers can safely support individuals with complex needs within their home communities whenever possible.	Sunrise Community Living proposes development of a statewide workforce training and provider support initiative designed to strengthen Alaska’s capacity to serve individuals with intellectual and developmental disabilities (IDD) who have complex behavioral health or medical needs. The project will establish specialized training, consultation, and technical assistance focused on high-acuity IDD care and co-occurring behavioral health conditions. Training programs will provide direct support professionals and provider organizations with practical skills in crisis stabilization, behavioral support strategies, trauma-informed care, and safe response practices for individuals with complex needs. Training will be delivered through a combination of in-person instruction, remote learning, and teleconsultation so providers in rural and remote communities can participate regardless of location. This model allows providers across Alaska to access specialized workforce development that is often difficult to obtain due to geographic distance and limited local training infrastructure. The initiative will operate as a shared training resource available to provider agencies, direct support professionals, and community partners statewide. In addition to structured training programs, the project will offer consultation and technical support that allows providers to receive guidance when complex situations arise. Access to expert consultation and practical training helps providers stabilize situations locally and maintain services within community settings. This project complements Alaska’s existing workforce development efforts by expanding specialized training resources focused specifically on high-acuity IDD and IDD/behavioral health support. By strengthening workforce skills and expanding access to consultation, providers will be better equipped to safely support individuals with complex needs within their communities. Over time, this approach strengthens Alaska’s provider network, improves workforce retention, and expands the number of providers capable of safely supporting individuals with higher needs. The result is a more stable community-based service system that improves care continuity and helps individuals remain connected to their families and communities across Alaska.	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Sunrise Community Living	Alaska Rural IDD Residential Capacity and Community Readiness Initiative	AK	Across Alaska, individuals with intellectual and developmental disabilities (IDD) living in rural communities often have limited access to residential support options when family or informal care arrangements change. While small community-based residential programs could meet these needs in many locations, providers frequently lack the information necessary to determine whether expansion into rural communities is feasible. Key factors such as local demand, workforce availability, community support, and housing suitability vary significantly across Alaska’s rural communities. Without a coordinated process to assess these factors, providers face substantial uncertainty when considering rural expansion. This uncertainty can prevent development of residential services even in communities where they may be viable. This project addresses the opportunity to strengthen Alaska’s IDD service system by conducting a statewide assessment of rural communities to determine where residential programs could be successfully developed. By identifying communities with the highest readiness for residential services, the project will reduce risk for providers and help guide future investments that expand community-based care options for individuals with IDD across rural Alaska.	This project will establish a structured statewide process for evaluating rural communities in Alaska to determine where small residential programs serving individuals with intellectual and developmental disabilities (IDD) could be successfully developed. The initiative will begin with statewide data review and consultation with service coordinators, providers, and state agencies to identify rural communities where individuals may benefit from additional residential service options. These findings will guide targeted outreach and community engagement. A project manager will coordinate community-level assessments across multiple regions of the state. Engagement will include discussions with families, providers, tribal organizations, and local government leaders to evaluate demand for residential services and assess community readiness to support them. Site assessments will evaluate potential housing options, renovation feasibility, infrastructure considerations, and estimated development costs. The project will also assess workforce considerations and potential partnerships that could contribute to long-term service sustainability. Information gathered through these assessments will be used to develop a statewide rural residential capacity roadmap. Communities will be evaluated based on factors including demonstrated service demand, community support, housing feasibility, workforce availability, and estimated development costs. The final roadmap will identify communities with the highest probability of successfully supporting small residential programs. This work will complement broader efforts to strengthen Alaska’s IDD service system, including stabilization resources that allow individuals with complex needs to receive short-term support and return safely to services within their home region. By reducing uncertainty and providing clear feasibility data, the project will strengthen Alaska’s ability to expand residential services in locations where they can be sustainable and responsive to community needs. The final roadmap will also provide implementation guidance that allows providers, tribal organizations, and state agencies to prioritize future rural residential development in communities where services can be successfully sustained.	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Sunshine Community Health Center	Mat-Su Rural Teaching Health Center: Family Medicine Residency Program Development	AK	Alaska faces a physician workforce crisis conventional recruitment cannot solve, ranking last nationally in residency training slots per capita with an over-reliance on out of state recruitment with high turn over. The Mat-Su Valley experiences persistent primary care physician shortages, high turnover, reliance on locum tenens staffing, and growing unmet demand for primary care. Workforce gaps constrain every other aspect of rural health transformation. Access expansion, chronic disease management, behavioral health integration, maternal-child health, and value-based care models all require a stable, skilled physician workforce. Without a structural solution, Alaska will continue to see physician turn-over that undermines transformation investments. The opportunity is to build a permanent physician workforce pipeline for rural Alaska through a community-based Teaching Health Center residency program. Evidence consistently demonstrates that physicians who complete residency in a community are far more likely to remain in that community to practice. A Mat-Su-based Family Medicine residency, embedded in the FQHC and community settings where rural Alaskans receive care, will create a self-sustaining workforce infrastructure. RHTP funding for the development and early clinical ramp-up phase is the catalytic investment that launches this pipeline. Once operational, the program is designed to be fully financially sustainable through federal GME funding and clinical revenue.	SCHC will develop a new Rural Teaching Health Center Family Medicine residency program through a sequenced, accreditation-driven process governed by Accreditation Council for Graduate Medical Education (ACGME) requirements. RHTP funding supports the essential development-phase work and early clinical ramp-up that must occur before a single resident can be recruited or trained. Months 1–6, Development Foundation (Apr–Sep 26): Foundational development launched with contracted Program Director and Residency Manager, begin ACGME Sponsoring Institution accreditation, initiate curriculum development, establish the Graduate Medical Education Council, and begin training site identification. Program Development Consultant provides accreditation technical assistance and project management throughout. Months 7–12, Accreditation and Leadership Build (Oct 2026–Mar 27): Program Director and Residency Manager transition to permanent employment. ACGME accreditation process advances. Curriculum framework finalized. Training site agreements developed with partners. DIO provides institutional oversight. Financial systems support ensures GME-ready fiscal infrastructure. Months 13–18, Clinical Ramp-Up and Faculty Launch (Apr–Sep 27): 2 core faculty physicians hired and begin establishing continuity clinics. Clinic support staff hired. Faculty clinics begin generating clinical revenue, with productivity ramping through the period. Residency program application submitted to ACGME. Clinical readiness coordination aligned with facility development being led by the Mat-Su Health Foundation. Post-RHTP Period, Residents and Full Sustainability: First resident class begins Jul 1, 29. Federal Teaching Health Center/CMS funding begins. By Year 5, program reaches full operational complement with full financial sustainability achieved through combined federal GME funding and clinical revenue. The curriculum will emphasize community-based care, cultural competency, use of technology, and specific clinical skills necessary for rural Alaska practice, including broad-scope family medicine, behavioral health integration, prenatal and pediatric care, chronic disease management, and emergency stabilization. The program is being developed as a community-based partnership with Mat-Su Health Foundation (facility development), Mat-Su Health Services, Southcentral Foundation, and Mat-Su RMC, each with a defined role and a seat on the program’s Graduate Medical Education Council (GMEC).	\$1M-\$5M	Federally qualified health center	Statewide	Matanuska-Susitna Borough	Advance to Implementation Application

Sunshine Community Health Center	RN Care Management Billing Innovation & Outcomes Analytics Infrastructure	AK	Rural health system sustainability in Alaska requires structural transformation, not incremental change. SCHC communities face high chronic disease burden, limited specialty access that drives avoidable escalation and transfers, workforce shortages that require team-based care at top of license, growing pressure to demonstrate outcomes under value-based contracts, and persistent crisis-driven utilization patterns that increase cost without improving health. As Alaska shifts toward value-based care, rural providers must have infrastructure to coordinate care proactively, secure reimbursement for care management, measure outcomes and cost avoidance, and sustain models beyond grant funding. SCHC’s RN care managers currently deliver essential coordination—managing high-risk patients, preventing hospitalizations, and coordinating specialty care—but there are no reliable reimbursement pathways to sustain this work. At the same time, SCHC lacks the population health analytics needed to stratify risk, track value-based performance, and demonstrate the financial impact of care coordination. This project addresses a foundational gap: building the payment and data infrastructure needed to sustain SCHC’s broader RHTP transformation investments beyond the grant period. Without durable reimbursement mechanisms and measurement capacity, clinical expansions funded by RHTP cannot persist.	SCHC proposes a 3-phase Pay for Value initiative designed to build sustainable rural value-based care infrastructure over the full RHTP funding horizon. This LOI covers Phase 1 (through Sep 2027), which establishes the analytics and documentation foundation. Phases 2 and 3 will be submitted as separate LOIs in future cycles. 3-Phase Overview: Phase 1 (this LOI, through Sep 2027): Build analytics infrastructure and care management documentation systems. Begin capturing data. Phase 2 (Oct 2027 – Sep 2029): Produce comprehensive business case, conduct formal payer engagement, and initiate pilot billing arrangements. Phase 3 (Oct 2029 - Sep 2031): Execute full billing pilot, validate reimbursement model, and produce replicable framework for Alaska rural providers. Phase 1 Detail—Foundation (18 months, this LOI): Component A: Outcomes Analytics and Population Health Infrastructure (Months 1–12): SCHC will build the data foundation for value-based care by deploying pop health analytics and risk stratification tools. This includes implementing risk stratification to identify and prioritize high-risk/high-utilizer patients, building integrated dashboards aligned with RHTP metrics and value-based performance indicators, automating data aggregation to reduce manual reporting burden, and strengthening interoperability across SCHC’s clinical systems. This infrastructure will serve as the measurement backbone for all RHTP investments. Component B: RN Care Management (CM) Documentation and Activity Capture (Months 3–15): SCHC will implement standardized systems to document and quantify RN CM activities that currently go untracked. This includes establishing structured documentation workflows that capture every coordination touch, patient outreach, care plan development, specialist coordination, post-discharge follow-up, and crisis prevention. It also includes building activity volume and time-tracking data to quantify CM work, and linking activities to patient outcomes through the analytics infrastructure. Component C: Baseline Data Collection and Preliminary Analysis (Months 6–18):, Collect 12 months of structured baseline data on CM activities, patient outcomes, utilization patterns, and preliminary cost trends using the analytics infrastructure and documentation systems. By Sep 2027, SCHC will produce a baseline data report and a preliminary landscape analysis of existing CM billing codes identifying reimbursement gaps specific to SCHC’s rural care management model.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Sunshine Community Health Center	Rural/Frontier Access & Outreach, Stabilization, Workforce Advancement, & Oral Health Modernization	AK	SCHC’s service area experiences high reliance on emergency transport and costly transfers for conditions that could be managed locally with appropriate diagnostic, stabilization, and in-home intervention tools. Patients travel long distances to access specialty services including ophthalmology, wound care, and advanced dental care. Limited local tools for assessment and acute events mean that conditions requiring rapid evaluation often result in expensive transfers to Wasilla or Anchorage rather than lower-cost local treatment. Specific access gaps include: no point-of-care laboratory testing capability for rapid diagnostics and lab spaces designed for specimen collection rather than expanded on-site testing; staff lacking training in portable ultrasound equipment; diabetic retinal screening availability limited to once per month; limited wound care specialty service, increasing risk for hospitalizations; aging dental diagnostic and fabrication infrastructure that requires patient travel for crowns; and no ability to physically reach patients in roadless communities, leaving the most isolated, highest-risk patients without access to in-home care. These gaps create avoidable costs, unnecessary patient burden, and preventable health deterioration. This project addresses the opportunity to build comprehensive treat-in-place capacity, frontier outreach infrastructure, local specialty access, modern dental services, and the trained workforce to operate every new service line.	Expand essential services through 8 coordinated investments: 1. Rural Diagnostic Expansion: Expand on-site diagnostics through lab remodels and purchase of rapid diagnostic tools to enable point-of-care testing for real-time decision making. 2. Portable Ultrasound Training: Provide training so providers can perform bedside ultrasound-guided evaluations utilizing SCHC’s current ultrasound equipment. 3. Specialty Access Expansion - Diabetic Retinal Screening: AI-enabled retinal screening integrated into routine visits so patients can be screened on any clinic day to improve early detection and prevent vision loss. Funding covers the first-year subscription while SCHC builds screening volume for sustainability. 4. Rural Specialty Service Line - Wound Care Program: Establish a wound care program focused on chronic diabetic wounds to prevent amputations and reduce hospitalizations. Investments include specialized clinical training, advanced wound therapy tools, and care tracking infrastructure. 5. Rural In-Home Care Access - Mobile Integrated Health Vehicle: Purchase a Toyota 4Runner to expand MIH services across the remote service area. This will facilitate in-home care for chronic disease management, post-discharge follow-up, high-risk patient stabilization, and preventive intervention to reduce emergency department and hospital admissions. 6. Frontier Access for Roadless Residents - SHERP AT Vehicle: Acquire a SHERP AT vehicle for year-round access to patients in Upper Su’s roadless frontier communities, enabling outreach to isolated patients managing chronic disease, recovering from hospitalization, or at risk of acute deterioration.. 7. Clinical Workforce Advancement and Top-of-License Training: Strengthen workforce capacity through diabetes education certification for 6 nurses, mentorship for new MAs and nurses, and top-of-license training for RNs, LPNs, and MAs in wound care, telehealth protocols, chronic disease management, and clinical stabilization. Wellness coaching and nutrition training will expand preventive care capacity. 8. Oral Health Access Modernization: Modernize dental services using 4 investments: • A 3D panoramic X-ray system with training to eliminate patient travel for cone beam scans; Intraoral scanners for crowns, bridges, and dentures; Advanced prophylaxis equipment with certification training for hygienists; Chairside 3D printers enabling same-day fabrication of crowns and dental appliances to reduce reliance on external providers.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Sunshine Community Health Center	Cybersecurity, Connectivity Resiliency, Clinical Workflow Modernization, & Teleconsult Partnerships	AK	Rural health transformation in Alaska cannot occur without secure, resilient, and interoperable digital infrastructure. SCHC’s rural communities face frequent connectivity disruptions due to weather and infrastructure instability, cybersecurity threats that jeopardize continuity of care, limited internal IT capacity, provider administrative burden, specialty access gaps requiring tele-enabled support models, and increasing expectations for interoperability, reporting, and digital accountability. Every other RHTP priority - expanded clinical access, maternal-child tele-specialty, remote patient monitoring, value-based analytics, patient engagement platforms - depends on secure, reliable digital infrastructure. Without modern cybersecurity, connectivity resiliency, and innovation-enabled workflows, SCHC cannot safely expand telehealth, manage data-driven care models, or sustain transformation investments. A single cybersecurity incident could compromise patient data and halt clinical operations across multiple sites. Provider burnout from documentation burden undermines workforce retention. And every new software platform SCHC deploys through RHTP increases the computational demands on end-user hardware that is already aging, creating bottlenecks at the point of care delivery that undermine the full portfolio investment. This project addresses the foundational opportunity to build the digital backbone that supports and protects every other RHTP transformation investment.	SCHC proposes a cohesive Spark Technology initiative modernizing rural digital infrastructure through four integrated investment workstreams organized by priority: 1. Cybersecurity and Access Security: SCHC will implement centralized cybersecurity monitoring through a SOC/SIEM platform providing continuous threat detection, alerting, and incident response across all systems. A single ransomware attack on a rural FQHC can shut down care for an entire region. SCHC will also deploy comprehensive identity and access management including universal MFA, conditional access, role-based provisioning, and fully automated account lifecycle management — ensuring new hires receive appropriate access immediately and departing staff lose access completely without manual intervention. 2. Compliance Automation and Independent Security Testing: SCHC will implement the Drata compliance management platform, retain EdenData as ongoing compliance consultants, and conduct regular third-party penetration testing. This replaces manual evidence collection and reactive audit preparation with repeatable, sustainable compliance processes while providing independent validation that RHTP-funded cybersecurity investments function as designed. 3. Internet and Telephony Resiliency: SCHC will deploy Starlink failover internet at both clinic sites and migrate to SIP trunk telephony with session border controller infrastructure. Starlink ensures clinical operations continue during connectivity outages common in rural Alaska. SIP/SBC migration ensures patients can reliably reach care. SCHC will also engage a network consultant to validate the existing Ubiquiti deployment following an incomplete Cisco transition, ensuring the foundation is sound before layering additional RHTP-funded investments. 4. Clinical Workstation Modernization: (Phased: 3 RHTP Cycles) SCHC will replace approximately 50 laptops and 5 docking stations per RHTP cycle across its 150-unit fleet, prioritizing staff operating the most demanding RHTP-funded platforms. Every RHTP technology investment increases computational demands on end-user hardware; deploying advanced software on outdated hardware creates bottlenecks that undermine the full portfolio investment. Modern workstations also position SCHC for emerging AI capabilities that will deliver enhanced clinical decision support, automated workflow optimization, and operational efficiencies that produce measurable time savings and cost reduction.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Sunshine Station Childcare Center	Closing the Gap: Final Funding for a New Rural Daycare Facility	AK	Rural communities across Alaska face a significant shortage of licensed childcare, limiting opportunities for families to live and work in these communities. Our current licensed daycare facility can serve a maximum of 26 children, which does not meet the growing demand from families in our area. Many parents face long waitlists or are unable to secure childcare at all, creating barriers to maintaining employment, accessing healthcare services, and supporting their families. Our organization has secured \$4.5 million in federal funding through the office of Lisa Murkowski to build a new childcare facility that will better serve our growing rural community. However, an additional \$2 million is still needed before construction can begin and the project can be completed. The new building will include four classrooms and a multipurpose room and will allow us to increase our capacity from 26 children to approximately 60. As a licensed childcare provider, we are also able to accept Child Care Assistance, allowing us to serve families across a wide range of income levels. Completing this project represents an important opportunity to expand access to reliable childcare in our rural community. By increasing capacity and maintaining a licensed program that accepts Child Care Assistance, we will be able to support more working families, create additional local jobs, and provide a safe, nurturing environment where children can learn and grow.	Our approach is to expand access to licensed childcare in our rural community by constructing a new childcare facility designed to meet the growing needs of local families. Our organization has secured \$4.5 million in federal funding through the office of Lisa Murkowski to support the development of this project. To move forward with construction and complete the facility, we are seeking an additional \$2 million in funding. The new facility will include four classrooms and a multipurpose room and will allow us to increase our capacity from 26 children to approximately 60. This expanded space will enable us to serve more families while maintaining a safe, structured, and high-quality environment that supports early childhood development and family stability. As a licensed childcare provider, we will continue to accept Child Care Assistance, ensuring that families across a range of income levels are able to access care. This approach supports working families by providing reliable childcare, allowing parents to maintain employment, pursue education, and access healthcare services when needed. Expanding our childcare capacity will also allow us to hire additional qualified staff, strengthening the early childhood workforce in our rural community. By creating a larger, stable childcare program that serves more families regardless of income, this project supports the goals of rural health improvement by promoting family stability, reducing stress for working parents, and ensuring children have access to a safe and supportive environment during critical stages of development.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Sunshine Station Childcare Center	Nutritional Sustainability	AK	Rural communities face significant barriers to accessing affordable, nutritious food. Rising food costs and the additional expense of transporting groceries from create ongoing challenges that are often more costly. Due to these barriers we often struggle to consistently provide fresh, healthy food. This project addresses the opportunity to strengthen food sustainability by alleviating the burden on our small, non-profit daycare. Funding would allow reliable food purchasing strategies and partnerships that reduce transportation burdens. SSCCC will be able to ensure that children in our care receive balanced, nutritious meals and families know they have a reliable food security option for their children while in our care. Establishing positive eating habits at a young age helps children develop lifelong healthy behaviors. By investing in sustainable nutrition for young children today, this project contributes to building a healthier future for families and the Upper Susitna community.	Our approach focuses on ensuring consistent access to nutritious foods while teaching young children healthy eating habits during their early developmental years. As the only licensed daycare in our community, we have a unique opportunity to positively influence children’s relationship with food and nutrition at a critical stage of growth. Our program will also engage families by sharing information about healthy eating and meal ideas that can be used at home, helping extend healthy habits beyond the daycare setting. By supporting both children and families, we aim to create lasting changes in eating patterns that promote long-term health and healthy relationships with food. Grant funding will support sustainable food purchasing practices and strategic ordering to reduce transportation costs and supply disruptions. These improvements will help ensure that healthy foods such as fresh fruits, vegetables, whole grains, and balanced proteins are consistently available for the children in our care.	Under \$50,000	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Sunshine Station Childcare Center	Supporting Rural Families with Childcare Tuition Assistance	AK	Rural families in Alaska face significant barriers to accessing reliable, high-quality childcare. While our licensed daycare accepts Child Care Assistance, families are often responsible for covering the remaining tuition costs, which can make childcare unaffordable for many households. This financial gap can limit access to care, leaving parents without reliable childcare and creating challenges for maintaining employment, attending school, or accessing healthcare services. This project addresses the opportunity to expand access to childcare by providing tuition assistance for families who would otherwise be priced out of care. By reducing financial barriers, we can ensure that children have consistent, nurturing, and developmentally appropriate care, while parents can maintain stable employment and support household health. This approach strengthens both family stability and the sustainability of our childcare program in our rural community.	Our approach is to provide tuition assistance to families who struggle to cover the portion of childcare costs not covered by Child Care Assistance. By offering this support, we reduce financial barriers that might otherwise prevent children from accessing licensed, high-quality care. Families will apply for tuition assistance through a simple, equitable process, ensuring that funds are distributed based on need. This support allows children to maintain consistent enrollment, which is critical for early childhood development, including emotional regulation, social skills, and learning outcomes. Providing tuition assistance also strengthens workforce stability and family well-being. Parents can continue working, attending school, or accessing healthcare services without the stress of unaffordable childcare costs. By reducing financial stress for families and supporting consistent enrollment, this project promotes a sustainable, reliable childcare program that benefits children, parents, and the broader rural community	Under \$50,000		Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Sunshine Station Childcare Center	Sustaining Quality Childcare Through Staff Retention and Compensation Support	AK	Rural childcare providers face significant challenges in recruiting and retaining qualified staff due to high living costs, limited workforce availability, and wages that often do not reflect the true cost of living in rural Alaska. We can not raise wages without raising tuition which would likely price many families out of childcare altogether. These challenges can lead to high staff turnover, which affects the stability and quality of care that young children need during critical stages of development. For our small, nonprofit daycare, maintaining a consistent and experienced staff is essential to providing a safe, nurturing, and high-quality environment for the children and families in our care. However, without the ability to offer livable wages, it can be difficult to retain skilled, trained and dedicated caregivers who are committed to long-term employment. According to a recent THREAD convention, the average childcare provider stays in the field for less than 1.5 years primarily due to low wages. This project addresses the opportunity to strengthen community health by supporting livable wages for childcare staff, improving staff retention, and creating a more sustainable workforce. When caregivers are able to earn stable, fair wages, they experience improved financial security, reduced stress, and a higher quality of life. This contributes to a healthier, more resilient workforce that is better able to provide consistent, high-quality care for young children.	Our approach focuses on strengthening workforce stability in our rural childcare program by investing directly in staff retention through improved wages and compensation support. Funding from this project will be used to supplement staff salaries, helping our nonprofit daycare offer more competitive and livable wages that reflect the cost of living in rural Alaska. By improving wages, this project will reduce staff turnover and retain experienced caregivers who are trained, dedicated and understand the culture and mission of our daycare. Maintaining a stable team of caregivers allows children to build secure, trusting relationships with the adults who care for them each day. These stable relationships are essential for emotional well-being, healthy development, and positive early learning outcomes. This approach also supports the health of our caregivers and their families. When we are able to pay our staff comparable livable wages, they experience greater financial stability which reduces stress and improves quality of life. Supporting the well-being of caregivers strengthens the overall childcare culture and contributes to a healthier, more resilient community. In rural communities where childcare options are limited, dependable services allow parents to maintain employment, support their households, and access essential health and community resources. Through this approach, the project will support a vital infrastructure for our rural community. Creating stability, quality, and sustainability of childcare services will support the broader health and well-being of children, caregivers, and families in our rural community.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced
Sunshine Transit	Sunshine Transit	AK	Sunshine Transit is currently a public transit service that is limited by local funding match resources. With additional resources, we would be able to offer more services and expand service hours. Sunshine Transit is currently a certified Medicaid Transportation provider. The problem is that many residents that need help, do not have Medicaid coverage. Medicare does not cover transportation cost to healthcare appointments.	With additional funding sources, Sunshine Transit can expand services. We currently operate 27 transit vehicles and have the opportunity to purchase 10 more within the next year through a 5339 Bus & Bus Facilities grant from AK DOT.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Sunstar Clinical Virtual Behavioral Solutions, LLC	Connecting Alaska: 24/7 Behavioral Health Without Geographic Barriers	WA	Recent statewide assessments have detailed Alaska's unique health care challenges specific to the behavioral health crisis services continuum of care, the behavioral health crisis strain of Alaska' emergency departments, and limited access to acute behavioral health services, among others. Contributing factors related to Alaska's vast geography and adverse weather, community remoteness, workforce shortages, and high costs of care delivery are well known. Alaskan's living in rural, remote, or frontier communities face persistent inequities, including shortages of behavioral health providers, impaired access to emergency services, and fragmented care coordination across agencies. These barriers contribute to delayed crisis assessments and poorer patient outcomes for adults and youth. Our approach addresses long-standing gaps in emergent behavioral health access for Alaska's remote and rural medically underserved communities and populations, including Alaska Native peoples and youth, among others. Alaska's health care providers are actively seeking ways to better meet patient needs. For example, in 2024 we received an unsolicited inquiry from PeaceHealth Ketchikan Medical Center interested in expanding their behavioral health crisis assessment and stabilization services utilizing Sunstar's virtual model and services. Through RHTP's Spark Technology and Innovation Initiative, Sunstar has opportunity to strengthen Alaska's telehealth infrastructure and virtual care access.	By integrating virtual crisis assessment into existing emergency workflows, the project will improve access to timely behavioral health care, support overstretched rural providers, and create a scalable model that strengthens crisis response across Alaska’s geographically dispersed health systems. There will be implementation focus on rural and remote hospitals, tribal health organizations, and community clinics where psychiatric coverage is limited or unavailable and there is unmet need. Sunstar's approach ensures that patients in crisis receive timely, expert care while supporting hospital teams with specialized psychiatric assessments and recommendations. Better outcomes are realized for patients and providers alike. Our approach includes three strategies: expanding telehealth for emergent behavioral health assessments, strengthening partnerships with rural committees, health care providers, and tribal health organizations to co-design culturally responsive crisis systems, and investing in Alaska telehealth infrastructure development. Sunstar will intentionally prioritize collaboration with hospitals, health care providers, tribal health organizations, and regional partners to ensure culturally responsive care and alignment with existing crisis systems. Telehealth services will complement—rather than replace—local behavioral health resources, strengthening community-based capacity while extending access to specialized crisis clinicians. As an innovative healthcare organization created by clinicians, Sunstar has experience tailoring services to meet the needs of patients, partnering organizations, and communities. While we have a proven virtual emergency behavioral health assessment model with strong outcomes (i.e., measurable reductions in emergency department (ED) boarding, faster crisis evaluations, and fewer unnecessary interfacility transfers) validated in both urban and rural settings in the PNW, we recognize that intentionally adapting and scaling the model in consideration of Alaska's unique and varied operating environment is crucial. To effectively expand access to care while leveraging existing resources, we will pursue a phased approach that includes implementation planning and partnership development in year one and piloted implementation and evaluation by a third-party evaluator in year two. If successful, Sunstar would seek to expand its services and strengthen sustainability efforts during project years three through five.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Susitna Women’s Health	Strengthening Rural Maternal Health Access Through Preconception, Prenatal, and Telehealth Services	AK	Alaska Native mothers experience significantly higher pregnancy-related acuity compared to the national average across multiple clinical domains. They are 13% more likely to develop intrahepatic cholestasis of pregnancy, three times more likely to have preexisting or gestational diabetes, three times more likely to experience hypertensive disorders of pregnancy, and four times more likely to experience postpartum hemorrhage. These disparities contribute to increased maternal morbidity and neonatal complications. These elevated risks are compounded by a critical shortage of specialized women’s health providers across Alaska, particularly in rural and frontier communities. Limited access to timely prenatal and preventive care results in prolonged wait times, delayed diagnosis and intervention, increased travel burden to Anchorage-based facilities, fragmented care coordination, and potentially avoidable emergency department visits and hospital admissions. This project addresses the opportunity to expand early, consistent, and locally accessible women’s health services through a hybrid in-person and telehealth model serving the Mat-Su region and surrounding rural communities. By increasing surveillance capacity, improving care coordination, and providing evidence-based management of high-risk conditions, this initiative aims to reduce preventable complications, strengthen continuity of care, and improve maternal and neonatal outcomes for Alaska Native and rural families.	This funding will enable Susitna Women’s Health to accelerate implementation of a hybrid care delivery model that expands access, strengthens early surveillance of pregnancy-related complications, reduces avoidable emergency department visits and hospital admissions, and improves maternal and neonatal outcomes across rural Alaska. The proposed investment represents a strategic use of RHTP funds to build sustainable clinical infrastructure that will continue serving Alaskan families beyond the grant period. The model emphasizes preventive well-woman care, access to contraception, preconception counseling, and early first-trimester entry into prenatal care to identify and manage high-risk conditions such as preexisting or gestational diabetes, hypertensive disorders of pregnancy, and intrahepatic cholestasis at earlier stages. Standardized, evidence-based clinical protocols will guide screening, monitoring, and escalation pathways to ensure timely intervention and coordinated multidisciplinary care when higher-acuity conditions are identified. Telehealth will be intentionally integrated to shorten appointment wait times, increase visit frequency for high-risk patients, provide timely follow-up between in-person visits, and reduce travel burden for rural and frontier families. By strengthening surveillance capacity, improving care coordination, and expanding access to specialized women’s health services closer to home, this initiative advances safer pregnancies, improved maternal and neonatal outcomes, and more sustainable health system utilization across Alaska’s rural communities.	\$250K-\$1M	Maternal health	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

SvoCo LLC	Aeromedical Access Assessment for Rural Southeast Alaska and NGO Feasibility Study	AK	Over the past several years, Southeast Alaska’s aeromedical transport landscape has experienced structural shifts in base distribution, aircraft platform configuration, and service coverage. Changes in fleet capabilities, particularly related to runway compatibility and operating models, may affect access dynamics for certain rural communities. Seasonal population fluctuations, increased visitor activity contribute to system demand. In Southeast Alaska, where communities are isolated, aeromedical transport is not a convenience but a necessity—often serving as the decisive factor in critical medical outcomes. Public reporting indicates continued reliance on rescue resources, including the USCG, for certain categories of patient transport. While these assets remain essential to regional safety, there has been no comprehensive regional analysis evaluating current patterns of aviation reliance, cost exposure, or structural vulnerabilities in the transport system. As a result, Southeast Alaska lacks consolidated, decision-grade data to assess how today’s aeromedical configuration compares to prior years, or to evaluate whether complementary civilian transport models could strengthen rural healthcare access. This project seeks to provide a structured, assessment of current aeromedical transport reliance in Southeast Alaska and to model feasible configurations that may enhance resilience and continuity of care and will evaluate an opportunity for an aeromedical NGO model.	This 4–6 month assessment will use a multi-source data collection and modeling framework to evaluate aeromedical transport reliance in Southeast Alaska. Timeline flexibility will account for data availability from participating organizations. Phase 1 – Data Aggregation & Access Mapping The project will request aggregated, de-identified operational data from aeromedical providers, hospital transfer reporting, and publicly available federal records. Data elements will include annual mission counts, origin communities, documented access limitations, reported delays or cancellations, and federal rescue activation frequency. Where datasets are incomplete, structured stakeholder interviews and public reporting will supplement analysis. Phase 2 – Transport Reliance & Trend Analysis Data will be categorized by community, access constraints, and mission characteristics to evaluate trends over the past 3–5 years. The analysis will identify high-dependency communities, runway compatibility considerations, and patterns of federal resource reliance. Phase 3 – Feasibility Modeling & Blueprint Development Using aggregated findings, the project will develop comparative modeling of the current transport configuration and a conceptual, mission-driven aeromedical nonprofit framework. Exploring the feasibility of a nonprofit air medical program allows for examination of whether a community-oriented, access-first model could enhance regional coverage, reduce strain on federal assets such as USCG medevac, and improve system-wide coordination without displacing existing providers. The blueprint will outline governance structure, aircraft capability assumptions, staffing framework, activation criteria, regulatory considerations, high-level financial projections, and risk analysis. This blueprint will serve as a decision-support tool rather than an implementation proposal. Phase 4 – Synthesis & Reporting Deliverables will include a Regional Transport Reliance Report, feasibility modeling, blueprint documentation, and structured decision-support materials for policymakers. The project will remain focused on regional systems resilience and long-term access stability.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Talkspace Provider Network PA	Talkspace for Rural Alaska	NY	Many rural, remote, and frontier communities across Alaska face major barriers to timely behavioral health care. Geographic isolation, limited transportation infrastructure, severe weather, and ongoing workforce shortages make it difficult for residents to access consistent mental health services. In many areas, individuals must travel long distances—sometimes by plane or seasonal routes—to see a provider, delaying care or preventing it altogether. These challenges contribute to unmet behavioral health needs, delayed treatment, and added strain on local health systems, including emergency departments and primary care providers that may lack the capacity or specialized training to address complex mental health conditions. Demand for behavioral health services continues to rise, especially in rural communities where stigma, limited provider availability, and logistical barriers further reduce access. This project addresses the opportunity to expand access to high-quality behavioral health services through a scalable, technology-enabled model that connects individuals in rural and frontier communities with licensed clinicians regardless of location. By reducing travel barriers and expanding the available provider network, the project helps ensure residents can access timely mental health support while strengthening Alaska’s broader behavioral health infrastructure.	To address barriers to behavioral health access in Alaska’s rural, remote, and frontier communities, Talkspace proposes a virtual behavioral health program that enables residents to connect with licensed clinicians through a secure platform accessible by smartphone, tablet, or computer. Through the Talkspace platform, individuals can access therapy via asynchronous messaging and scheduled live video sessions, allowing them to engage in care in a flexible format that accommodates varying schedules, connectivity limitations, and comfort levels. This model removes the need for long-distance travel and allows residents to receive support privately from their own communities. Participants will be matched with licensed therapists through Talkspace’s QuickMatch™ algorithm, which pairs individuals with providers based on clinical needs, preferences, and therapist expertise. This process helps individuals begin care quickly—often within 24 hours—while expanding access beyond the limited pool of local providers available in many rural areas. Talkspace will support outreach and engagement in partnership with local health systems, community organizations, and regional stakeholders to help ensure residents are aware of and able to enroll in services. The platform also includes a library of self-guided mental health resources for individuals who may be hesitant to begin therapy immediately or who benefit from supplemental tools alongside clinician care. Clinical quality and outcomes will be monitored through Talkspace’s evidence-based care framework. Participants complete validated assessments such as PHQ-9 and GAD-7 at regular intervals to track symptom improvement, while Talkspace’s Quality Management program monitors provider performance, engagement trends, and satisfaction metrics. These insights support ongoing program evaluation and continuous improvement. Additionally, Talkspace’s AI-assisted suicide risk detection system, developed in collaboration with NYU Grossman School of Medicine, helps identify potential safety concerns in therapy communications so clinicians can intervene quickly and connect individuals with appropriate crisis resources when needed. By combining flexible virtual care delivery, evidence-based clinical oversight, and collaboration with local stakeholders, this project will expand access to timely behavioral health support and help ensure residents in rural and frontier communities can receive care regardless of geographic barriers.	\$250K-\$1M	Behavioral health/su bstance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Tanaina elemetary	Health, Education and Community focus grant	AK	Schools in Alaska often serve as critical access points for health services, family support, and educational stability. In semi-rural communities, these needs are often amplified as schools serve not only local students but also students who transition from more remote rural villages for educational opportunities. These transitions can create gaps in health care access, social supports, and educational resources. Our school community serves a diverse population of students, including those who have relocated from rural communities where access to healthcare and specialized educational supports may have been limited. When students transition into our school system, they may arrive with unmet health needs, limited winter clothing, and gaps in communication or literacy development due to disruptions in services or differences in available resources. Alaska’s unique geographic challenges and dispersed population have long contributed to barriers in accessing consistent healthcare services. Many families must travel significant distances to reach medical providers, and in some cases routine care is delayed or unavailable. Schools frequently become the first place where health concerns can be addressed. In addition our community needs support in communication and literacy development, particularly those who are adjusting to new learning, or due to disabilities ,environments or who require structured supports to build reading and writing skills.	This proposal seeks funding for a five-year initiative designed to strengthen student health services and provide essential supports that allow students to fully participate in school. The initiative focuses on three key areas: school-based healthcare access, essential clothing resources, and communication and literacy support tools.. School-Based Health Services Grant funding will support the presence of a qualified school nurse who can provide consistent, on-site health services for students. The school nurse will serve as a critical link between families, healthcare providers, and the school community. Key responsibilities will include: Addressing immediate health needs and minor injuries Monitoring chronic health conditions such as asthma, diabetes, and allergies Assisting with medication management Providing preventative health education Supporting students transitioning from rural communities who may not have established healthcare connections locally Coordinating care with families and healthcare providers Access to a school nurse helps ensure early identification of health concerns, reduces unnecessary emergency visits, and supports improved student attendance and readiness to learn. Essential Clothing and Basic Needs Support Funding will also support the creation of a school-based clothing resource that provides students with essential cold-weather gear when needed. Items will include: Winter coats Snow pants Gloves or mittens Hats	\$50,000- \$250,000	Other	Matanuska-Susitna Borough	Deferred or Not Advanced

	Warm socks
	Boots
	For many students, particularly those newly arriving from rural communities or experiencing economic hardship, access to warm clothing can make a significant difference in their ability to attend school regularly and participate fully in outdoor activities. Ensuring students have proper winter gear promotes physical health, emotional well-being, and inclusion in school activities. Communication and Literacy Support Tools The grant will also support the acquisition of tools that help students develop communication, reading, and writing skills. . Possible resources include: Communication supports and assistive technology
	Visual communication systems
	Literacy intervention materials
	Structured reading and writing supports
	Instructional tools for small-group learning
	These tools will help students strengthen foundational literacy skills while also building confidence in their ability to communicate and participate in the classroom.

Tanana Chiefs Conference	“Strong Traditions, Healthy Communities” Lifestyle and Preventive Medicine Initiative	AK	Alaska Native communities served by TCC experience disproportionately high chronic disease burdens: obesity affects 42% of adults (vs. 31% statewide), diabetes 11%, and metabolic-associated steatotic liver disease (MASLD) is a leading cause of liver morbidity. Preventive screening remains critically low—colorectal cancer screening near 48%, cervical cancer screening below 55% in remote villages. Geographic isolation across 27 villages spanning 235,000 square miles, combined with workforce shortages, high provider turnover, food insecurity, and transportation costs exceeding \$500 per round-trip visit, creates persistent barriers to preventive care. Current healthcare delivery prioritizes acute, episodic care over integrated prevention, delaying diagnosis and widening health disparities. This project addresses a critical opportunity to embed culturally grounded, evidence-based screening, risk assessment, and lifestyle medicine into clinical workflows across all TCC sites. By strengthening prevention infrastructure, TCC will improve early detection, increase preventive service utilization by 50%, build durable rural workforce capacity, and establish a scalable prevention-focused care framework aligned with Alaska’s Rural Health Transformation Program priorities.	This initiative integrates Lifestyle Medicine and Clinical Prevention across all TCC sites, embedding evidence-based screening, risk reduction, and culturally grounded intervention into clinical workflows. Year 1 establishes infrastructure and pilot implementation at hub clinics; Years 2-5 scale protocols to all 27 villages. Lifestyle Medicine addresses chronic disease through six pillars—nutrition, physical activity, risky substance avoidance, sleep, stress management, social connectedness—integrated with Alaska Native healing practices and traditional foods education. Intensive obesity and cardiometabolic risk reduction combines medical evaluation, team-based care, and structured follow-up. Dietitians provide subsistence nutrition counseling; group visits incorporate Elders' knowledge; care plans honor seasonal rhythms and land-based wellness. Clinical Prevention expands screening for colorectal cancer, cervical cancer, diabetes, and MASLD through equipment investment, workforce training, and mobile outreach. Community Health Aides (CHA)/Practitioners lead village-level screening supported by telehealth consultation and hub-based specialty services. Early identification triggers seamless Lifestyle Medicine referral, creating a closed-loop system from screening to treatment. Scalable workflows adapt to all clinic sizes. Workforce training for physicians, APPs, nurses, dietitians, and CHAs builds rural capacity. Quality metrics (Uniform Data System {UDS}, Government Performance and Result Act {GPRA}, patient-reported outcomes) track outcomes and inform continuous improvement. Partnerships with Tribal health organizations and Alaska public health infrastructure align resources. This approach advances RHTP priorities: lifelong prevention, rural systems strengthening, workforce sustainability, and technology-enabled access. By Year 5, this model serves as a replicable framework demonstrating how culturally grounded prevention achieves health equity in frontier communities.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Tanana Chiefs Conference	AI Powered Community Health Aide Manual	AK	Alaska’s frontier care environment is unique: roughly 733,000 residents are spread across 570,000 square miles, and most remote communities are disconnected from the road system. Within the ATHS, clinics deliver care where internet outages can last for months. Rural Alaska faces challenges driven by geography, workforce shortages, and limited access to specialty care. Community Health Aides frequently serve as the only clinical provider and must manage complex needs while navigating significant documentation requirements. Frontline providers face a documentation crisis known as "pj" hours, spent reconstructing notes after-hours, a primary driver of burnout and high vacancy rates. The eCHAM currently functions as a static reference requiring manual searching and duplicative data entry. This cognitive workload slows care and limits structured data capture needed for 1115 waiver quality reporting. Nearly 75% of Alaskans have chronic conditions, requiring high-fidelity monitoring that is currently difficult to track in isolation. eCHAM-AI addresses this gap by transforming the manual into a structured, edge-capable clinical workflow platform. It supports voice-enabled documentation and reliable data capture even when connectivity is degraded, allowing CHAs to practice at the top of their certification in environments where they are often the sole provider.	The eCHAM-AI initiative will be implemented through a phased five-year strategy focused on developing and deploying a statewide AI-enabled clinical workflow platform. Year 1 - focuses on governance led by the Academic Review Committee (ARC) and the Community Health Aide Program (CHAP) Directors. These standing committees will establish the Alaska AI Clinical Council (A2C2) as a technical subcommittee to serve as the human-in-the-loop oversight body, ensuring AI outputs remain strictly within the authorized eCHAM scope. This ensures Tribal leadership retains direct control over clinical safety while meeting federal requirements for AI governance. We will also implement "Indigenous Language Tokenization" to ensure symptoms are described in culturally appropriate ways that maintain "Language Trust" with Tribal members. Year 2 - Platform Development and Integration: Expand structured protocol content, strengthen voice-enabled workflows, develop human-in-the-loop AI documentation support, and build Health Level Seven (HL7) Fast Healthcare Interoperability Resources (FHIR) integration pathways with Oracle Cerner Millennium (MIL) and statewide Health Information Exchange (HIE) environments. Year 3 - Pilot Implementation and Validation: Deploy in selected rural clinics representing different connectivity conditions; measure usability, documentation time, protocol adherence, and clinical safety; and refine the platform using pilot feedback. Year 4 - Regional Deployment: Expand to additional Tribal Health Organizations (THOs), support workforce training, advance regional interoperability and reporting functions. This phase includes the initial hardware refresh for pilot sites. Year 5 - Statewide Optimization and Sustainability: Scale implementation, optimize workflows for performance measurement, and transition to a shared-service operating model for long-term sustainability. Across all phases, the project remains grounded in authorized eCHAM protocols, local workflow co-design, edge reliability, and continuous monitoring. We will implement Indigenous Language Tokenization to ensure the AI respects culturally specific symptom descriptions and maintains "Language Trust" with Tribal members. The platform functions as permanent statewide rural health infrastructure rather than a standalone software tool.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Tanana Chiefs Conference	Community Health Aide (CHA) and Behavioral Health Aide (BHA) Training Center	AK	Rural clinics face persistent CHA and BHA vacancies, limited training slots, continuing education (CE), and fragmented competency assessment pathways. The expense of operating a health aide training center for most is cost prohibitive. Recruiting instructor staff to work in remote areas combined with smaller patient populations limiting where it is feasible to operate a clinical training site. Yet Employers duplicate effort to meet required recertification and skills checks. The result is longer vacancies, higher turnover, variable quality assessments, and increased travel or medevac costs for patients who could otherwise be managed locally. After 60 years of operations and growth, statewide Community Health Aide Program (CHAP) leadership has identified a need for standardized orientation and field operations. This project will develop and provide training tailored for clinical and administrative staff new to CHAP. This project will standardize a mentorship model, expand throughput, and support field-based CE to close these critical gaps.	We will establish a training center of Excellence for CHA/BHA training. Key components: (1) expand session-based training throughput with additional licensed instructors; (2) develop field training, CE, skills evaluation biannually in addition to asynchronous sessions; (3) establish CHAP Clinician Orientation for physicians, advance practice providers and licensed BH providers; (4) develop a mobile BHA float pool to support communities where local ties complicate care; (5) identify a shared learning management system (LMS), common curriculum and shared evaluation tools across partner tribal health organizations (THOs); Culture: Assess priority of needs through survey and focused groups to co-develop relevant curriculum with tribal partners and CHAP Certification standards, embed Alaska unique models and recruit CHAP alumni as adjunct faculty. Technology: deliver tele-simulation over low-bandwidth pathways for live and asynchronous learning options.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Tanana Chiefs Conference	Healthy Beginnings: Comprehensive Prenatal & Postpartum Care for Alaska Native Families	AK	Rural and remote families across 27 villages face a critical maternal health crisis: Alaska Native women are 2.3 times more likely to die from pregnancy-related causes than non-Hispanic White women, and nearly half of these deaths are linked to healthcare access barriers. With 75% of Alaska communities lacking road connectivity to hospitals, pregnant families struggle to obtain coordinated prenatal and postpartum care. Current services are fragmented and episodic, leaving gaps in postpartum depression screening, substance use disorder support, and infant health monitoring. These gaps contribute to intergenerational cycles of trauma and adverse childhood experiences that compromise lifelong health outcomes. The Healthy Beginnings program addresses this need through a comprehensive, evidence-based maternal and infant care model serving approximately 300 mother-baby dyads annually across TCC villages. The program integrates prenatal education, postpartum home visits, lactation support, developmental screening, doula services, and coordinated maternal–pediatric care, while strengthening behavioral health connections for mothers experiencing postpartum depression or substance use disorder. By hiring and training local certified lactation consultants and CMAs, Healthy Beginnings builds a rural maternal health workforce. This approach strengthens prevention-focused care, improves birth outcomes, supports family stability, and advances health equity for Alaska Native families.	The program delivers a comprehensive, community-centered maternal and infant care model across TCC's 27-village service area throughout pregnancy, birth, and the postpartum period, integrating clinical care, Alaska Native midwifery practices, behavioral health support, and home visiting. Core Service Delivery: IBCLC-certified nurses and CMAs conduct prenatal and postpartum home visits for medical monitoring, breastfeeding support, newborn health assessment, and early complication identification. Village-based outreach and prenatal classes prepare families for childbirth and infant care. Doula support improves birth outcomes and maternal well-being. A maternal home model near emergency obstetric care provides a safe environment prior to delivery, supporting health education, peer connection, and clinical monitoring. The program incorporates developmental screening, maternal-pediatric care coordination, and pregnancy loss support. Cultural Integration: Community Health Aides trained in Alaska Native birthing traditions lead culturally responsive care, ensuring traditional knowledge informs evidence-based clinical protocols. Behavioral Health: Screening and support services for postpartum depression, plus coordinated care and recovery support for mothers experiencing substance use disorder, connect families to appropriate treatment and community resources. Phased Implementation: Year 1 establishes the Fairbanks hub with maternal home model and workforce recruitment, piloting 100–150 mother-baby dyads. Year 2 scales to 300 dyads with expanded village outreach through trained IBCLC nurses and CMAs, including subregional integration at Tanana and Galena. Years 3–5 sustain 300-dyad capacity and achieve full financial sustainability through continued regional care network integration. Workforce Development: The program creates career pathways for Alaska Native community members through competitive hiring of IBCLC nurses and CMAs, with training in lactation support, behavioral health, and cultural competency. Outcomes and Sustainability: Serving 300 mother-baby dyads annually by Year 2, target metrics include 80% postpartum visit completion and 60% breastfeeding initiation by Year 3. Prevention-focused design reduces complications and improves care engagement. Medicaid and third-party reimbursement support a scalable, financially sustainable framework that improves access, quality, and long-term maternal and infant health outcomes across rural Alaska.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Tanana Chiefs Conference	Indigenous Healing Integration & Rural Wellness Transformation Initiative	AK	Novel models integrating Alaska Native and Indigenous healing methods are urgently needed. Traditional healing improves outcomes but sits outside formal healthcare systems—inconsistent, inaccessible, non-reimbursable—while communities call for services honoring Indigenous knowledge. The opportunity is structural integration into clinical operations, workforce development, and prevention infrastructure. TCC will establish a Department of Indigenous Healing with credentialed Alaska Native practitioners delivering billable services within the rural health system. Hire a physician trained in Western and Indigenous medicine; train two PAs in healing methodologies within six months, creating immediate scalable workforce. Services include hands-on healing, botanical remedies, indigenous lifestyle counseling, Alaska Native birthwork, and substance use recovery—guided by a regional Council of Advisors ensuring cultural integrity and community governance. Infrastructure investments (steam bath, teaching kitchen) create dedicated healing environments, moving services from informal to sustainable, scalable care. Timing is urgent: without integration now, an aging healer workforce may retire before knowledge transfer occurs, permanently widening health inequities.	Our approach integrates Indigenous healing directly into TCC’s clinical operations so patients can access Western and traditional medicine through one coordinated, documented, and reimbursable care pathway. We will establish a Department of Indigenous Healing and embed services into primary care, behavioral health, prenatal care, and recovery across our hub and subregional system. Integrated Traditional and Clinical Care Model Establish a dedicated traditional healing clinical space to include rooms enabled with telehealth technology. Employ a Tribal Medical Director, Indigenous Healers, and support staff. Provide hands on healing, distance healing, indigenous lifestyle medicine, and coordinated behavioral health referrals. Develop culturally appropriate documentation, consent and safety procedures, EHR workflows, and billing and integration protocols. Rural Telehealth and Technology Expansion Install telehealth equipment in hub and subregional village sites. Deliver virtual Indigenous healing sessions and cultural education programming. Implement immersive technology tools to strengthen rural engagement and continuity. Improve data collection and outcome tracking systems. Community Based Cultural and Recovery Programming Offer biannual land-based healing camps (summer and winter). Provide recovery supports including steam bath, talking circles, and peer recovery support. Establish a Healing Garden and medicinal plant cultivation program. Deliver traditional foods programming through a renovated kitchen space to strengthen prevention and wellness. Workforce and Apprenticeship Development Employ Indigenous Healers and establish apprenticeship pathways. Provide cultural humility and integration training for clinical staff. Partner with behavioral health teams for coordinated trauma informed care. Support participation in regional cross cultural medicine workshops. Monitoring and Improvement We will track encounters, referrals, rural access by site, patient experience and cultural safety, and prevention and recovery indicators using EHR data, standardized surveys, and community feedback. Quarterly review and continuous quality improvement will ensure services remain effective, culturally grounded, and scalable. This approach embeds prevention, treatment, culture, technology, and workforce development into a single coordinated rural health framework that can be replicated across rural Alaska	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Tanana Chiefs Conference	Patient Travel Modernization: Integrating intake, reservations, communication into a single platform	AK	TCC is modernizing its patient travel program to reduce delays in care due to travel requests that are not coordinated in time or not coordinated at all. Salesforce was implemented in 2024, and Phase 2 is in progress, delivering functional enhancements, integrations, and automation to streamline work. Additional planned capabilities are needed to complete the solution. TCC has already purchased the required licenses; the remaining gap is unfunded implementation services. In CY2025, travel no-shows/cancellations attributable to communication gaps were approximately 50% lower than prior years—demonstrating the value of modernization and the opportunity to extend impact. The next set of enhancements includes: • Integrated collaboration/communication tooling tied to operational data • Modernized call management and intelligent routing/documentation • Expanded integrations and AI-enabled workflow support to prevent missed requests • Salesforce-to-Salesforce integration between TCC and ANMC to reduce manual re-entry, errors, and coordination delays RHTP alignment: This project advances Alaska’s RHTP initiatives of Health Care Access, Healthy Communities, and Spark Technology & Innovation, and supports allowable uses including IT Advances, Consumer tech solutions, Innovative care, and Appropriate care availability by improving care coordination, reducing missed/delayed care, and increasing scheduling efficiency for rural residents who must travel for specialty services.	Transformation potential: This initiative modernizes patient travel as a system-level capability—integrating intake, scheduling, reservations, communication, and care coordination into a single operational platform. The architecture is repeatable and scalable, enabling shared approaches and future interoperability with other Tribal Health Organizations and regional partners. ANMC integration, standardized workflows, and unified patient profiles create a durable foundation for regional coordination and long-term modernization. TCC has already secured the software licenses required to build this solution. This request is for implementation funding. Delivery will follow Agile best practices with iterative development, user validation, and early releases to production to accelerate impact. Discovery (confirm and plan): • Confirm goals and key value levers (KPIs) and how they will be measured and reported in Salesforce. • Conduct workshops and user interviews with functional areas to document processes and requirements. • Capture, prioritize, and sequence requirements into a roadmap and release plan; evaluate solution options; and produce a high-level design. • Conduct a Discovery Readout (Design Overview) to ensure alignment on scope and near-term releases. Build (iterate and deliver): • Configure and develop prioritized features and integrations in short sprints; demo working software; and incorporate feedback. • Test continuously (unit/integration/UAT) and refine/reprioritize the backlog as learning occurs. • Deliver early production releases for high-impact capabilities, followed by incremental enhancements and additional integrations. Validate (prove end-to-end fit): • Execute client-led testing; triage and resolve defects; confirm the solution supports end-to-end business processes. • Finalize readiness for each release (training, cutover, support). Enable (launch and stabilize): • Deliver role-based training; deploy to production; support go-live stabilization and troubleshoot critical issues. • Provide final documentation and knowledge transfer. Monitoring and adaptive management: Establish KPI dashboards (access, timeliness, no-shows, cost avoidance, call center performance, notification reliability); review bi-weekly during build/test and monthly post go-live. Use structured issue triage for rapid iteration, with quarterly stakeholder reviews to validate rural impact and reprioritize enhancements.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Tanana Chiefs Conference	Village and Home Based Culturally Grounded End of Life Care	AK	Remote Tribal communities in Interior Alaska face persistent gaps in timely, culturally aligned palliative and end of life care. Currently Tanana Chiefs Conference provides comfort kits, limited supplies, caregiver binders, and telephonic case management. However, current support is not enough for Tribal members with an estimated life expectancy of six months or less. Families often lack hands on training, real-time clinical guidance, and respite, leading to caregiver fatigue, unmanaged symptoms, and preventable medevacs. Limited village-based staffing and the absence of a structured tele-palliative model force some patients to leave their home communities to receive appropriate care. At the same time, community feedback and case trends demonstrate a strong desire for village end of life care and expanded remote palliative services. National evidence shows that tele palliative models can reduce avoidable transfers and improve symptom control in rural settings. TCC is well positioned to build on its current foundation to deliver a more comprehensive, culturally grounded model that integrates telehealth, remote monitoring, and village-based caregiver support. This project directly addresses a critical, well-informed need by transforming limited, reactive services into a coordinated, high-quality system of care. The model will improve access, decrease unnecessary travel, and allow more Elders to remain at home with comfort, dignity, and family presence in their final months.	Tanana Chiefs Conference (TCC) proposed approach responds directly to a clearly documented regional need. Rural Tribal communities face major barriers to timely symptom management, culturally aligned end-of-life support, and consistent caregiving resources. Geographic isolation, limited clinical staffing, and high medevac rates cause fragmented care and prevent many patients with a life expectancy of six months or less from safely remaining at home. Community feedback, clinical trend data, and regional planning efforts consistently highlight urgent gaps in palliative care access, caregiver support, and coordination across settings. This project offers a coordinated, evidence- informed solution tailored to these realities. TCC will implement a comprehensive, culturally grounded tele palliative care model designed to stabilize symptoms, strengthen caregiver capacity, and reduce avoidable transfers. A Palliative Care Clinical Dyad, a Palliative Care Medical Provider partnered with an RN Case Manager, will deliver structured assessments, chronic disease co-management and advance care planning via telehealth and periodic in-village clinics. This ensures timely specialty input for even the most remote communities while maintaining continuity with primary care and local teams. The Village Caregiving Track addresses the urgent need for hands-on, locally delivered support. An itinerant CNA, supervised by the Home Care RN, will provide caregiver skills training, monitor changes in condition, and deliver scheduled respite to reduce caregiver burnout, one of the most frequently reported community concerns. Regular reassessments and equipment recommendations ensure care plans stay responsive as needs change. A telehealth first model, with audio only capability, ensures reliable access regardless of bandwidth constraints, reduces travel burdens, and enables family participation from multiple locations. Remote Patient Monitoring (RPM) and Chronic Care Management (CCM) offer daily insight into symptom trends, enabling early intervention and reducing crisis-driven medevacs. Enhanced enabling supports including Comfort Kits related to diagnoses, supply boxes, and an education binder ensure families are equipped, informed, and confident. This approach fills documented gaps, strengthens village-based capacity, reduces costly emergency utilization, and delivers culturally aligned care that allows more Elders to remain at home with comfort and dignity.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Tanana Chiefs Conference	Pharmaceutical and Medical Supplies Drone Transportation System For Interior Alaska Villages	AK	Interior Alaska's rural healthcare system faces significant challenges in providing reliable access to medications, especially during winter. TCC operates 28 village clinics in 42 communities where pharmaceutical deliveries depend on regular or charter flights that are vulnerable to extreme temperatures, chain of custody risks, and frequent delays. Transportation records show that 15% of deliveries are delayed more than 48 hours, with winter delays often lasting 5-7 days. These gaps lead to insulin rationing, untreated infections that escalate to hospitalizations requiring costly medical evacuations, and chronic disease flare ups caused by missed medications. The geography of Alaska worsens these problems. Villages have no road access, winter temperatures reach –35 to –70°F, and limited daylight shortens flight windows to 4-6 hours. Traditional aviation cannot overcome these constraints. A promising solution is to use Arctic tested drone technology from UAF's ACUASI and integrate pharmaceutical temperature control systems developed with Merck for drone-based vaccine delivery. Implementing this approach requires planning to meet Federal Aviation Administration (FAA) Beyond Visual Line of Sight (BVLOS) regulations, Department of Transportation (DOT) and Drug Enforcement Administration (DEA) requirements, hazardous materials protocols, weather related safety standards, medical grade technical needs, community engagement, and long-term financial sustainability.	This concept formation project will develop a comprehensive implementation plan through intensive partnership with the University of Alaska Fairbanks' Alaska Center for Unmanned Aircraft Systems Integration (ACUASI) and federal regulatory agencies. The first 6-7 months will focus on critical planning and preparedness activities to ensure safety and regulatory compliance, recognizing that any issues with FAA authorization will significantly impede future success. Year 1 priorities include: (1) Regulatory Framework Development - engaging FAA Alaska Region and DOT on BVLOS waiver requirements, flight decision-making protocols, and FAA legislative/regulatory advocacy; consulting with DEA on controlled substance transportation protocols; coordinating with Alaska Board of Pharmacy on pharmaceutical handling standards. (2) Safety and Compliance Planning - developing comprehensive policies and procedures for chain of custody workflows, hazmat shipping compliance for pharmaceutical transport, safety procedures and redundancy planning, contingency protocols for adverse weather (fog, icing, wind, Instrument Flight Rules {IFR} conditions), and temperature maintenance testing during flights. (3) Technical Feasibility Assessment - partnering with ACUASI to evaluate Arctic-hardened drone capabilities, leverage Merck Pharmaceuticals' temperature maintenance technology from their vaccine drone delivery partnership, conduct initial flight testing at short distances based out of ACUASI's Nenana hangar facility, identify optimal aircraft configurations, and determine infrastructure requirements. (4) Community Engagement - consultation with tribal councils across 42 villages to address cultural considerations and identify priority communities. (5) Partnership Development - establishing formal agreements with ACUASI and exploring collaboration opportunities with Merck Pharmaceuticals' leadership team (Vice President level) who are championing vaccine drone delivery technology that could be adapted for our pharmaceutical needs. This planning phase will produce detailed specifications for Year 2 defined approach activities and Years 3-5 implementation readiness.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Planning

Tanana Chiefs Conference	Licensed Provider Triage Line	AK	Reliance on rural clinics to manage community needs after-hours is proven to be unsustainable and is identified as a primary source of provider burn-out. Contracted vendors for triage call services are based on a nursing model. The advice a nurse can offer a patient is restricted to the nursing scope of practice. In rural Alaska, this creates unmet need and patients not feeling heard or cared for. A diagnosis or 2nd opinion then encumbers calling the local provider or patient travel. The project establishes a replicable, LIP-led after-hours care model with standardized protocols, Electronic Medical Record (EMR)-integrated documentation, and telehealth billing workflows. This creates a foundational architecture for after-hours of care that can be adopted by other services providers using a hub and spoke system. By shifting the statewide after-hours paradigm away from outsourced nurse protocol models toward integrated clinical triage, this project drives durable structure change and amplifies the goals of multiple RHTP initiatives. Contracting vendors for this service is an expense with no opportunity to recoup dollars through revenue-generating encounters. This model moves from an expense only line item to a framework for not only cost avoidance but revenue capture.	This approach for after-hours triage is a TCC managed extension of primary care operations. Utilizing TCC licensed providers to staff on the after-hours triage line is an innovative solution to mitigate several issues identified by clinical staff, administrative leadership, and patients. Currently, a patient calling in after-hours in most cases will be told, ‘go be seen at your local clinic’ or ‘call 911’. Most of the rural communities do not have 911 separate from the clinic. In places 911 does exist, the patient, if transported, is brought to the local clinic. Either way, the patient is still waking up with the local clinic provider. In this typical scenario, there is no value added by paying for a contracted triage system. Staffing a triage line with licensed providers creates a workflow where a diagnosis and treatment plan can be made in real time. No transfer, no call back, no referral. This model has demonstrated success at other tribal health organizations with a similar hub and spoke model of care in remote Alaska. Contrary to paying a contracted vendor for nursing level advice, some visits will convert to a billable telehealth encounter. Access to higher-level clinical decision-making through LIPs enhances patient safety by reducing delays in appropriate care. Providers familiar with Alaska’s complex and resource-limited healthcare system are better equipped to recognize high-risk presentations, navigate logistical constraints, and initiate timely interventions. Earlier, context-informed decision-making has the potential to reduce preventable complications and improve overall health outcomes. Acceleration (FFY 2026): (1) Hire project manager and lead provider, (2) Develop protocols for call management and referral, (3) Identify and procure technology infrastructure. Monitoring: Design metrics to track call answering time, calls resolved, calls converted to telehealth, transfers avoided, patient satisfaction, and attrition. Risks & Mitigation: Workforce shortages will necessitate creative solutions. Technology failures necessitate downtime policies. Adaptive Management: quarterly assessments to evaluate metrics. FFY 2026-2027: (1) Finalize standard operating procedures, (2) integrate with EMR, (3) hire 3-5 licensed providers. This project will provide lived scenarios to inform future growth in areas such as network expansion, remote patient monitoring, and workforce needs.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Tanana Chiefs Conference	Rural Clinic Vehicle Transportation	AK	Offroad communities encounter limited access to local transportation. Without typical road infrastructure large items must be barged or air lifted. The added expense of shipping makes vehicles unattainable for most rural residents in communities with high rates of low-income households. The lack of local transportation in rural Alaska is a defining social determinant of health limiting access to healthcare services particularly in times of emergency or subzero temperatures when walking is not safe. Lack of reliable transportation directly correlates to missing appointments. The rural staff are the ‘911’, with no dedicated transportation, response time is delayed when time is most critical. Closing the rural disparity gap includes support for operations. Caring for patients in a rural site entails daily, sometimes multiple times a day, trips from clinic to local air landing strip. Interruptions in ability to meet aircraft result in expensive wastage of temperature/time sensitive items and delays in patient care. Lack of reliable clinic transportation limits when labs can be drawn and if they are delivered in time to be processed at referral lab. Responding to emergencies. Staff and a building are only part of the care process for rural patients. A vehicle for clinic operations eliminates barrier for patient access and mitigates challenges of logistics the rural clinics navigate when caring for patients.	Purchase and deploy vehicles dedicated to rural clinic operations. Create recurring schedule for pick-up/drop-off for elders needing transportation.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Tanana Chiefs Conference	Rural Primary Care Initiative – Effective Care Coordination Across Interior Alaska	AK	Village-based patients face significant health disparities and higher rates of chronic diseases. While the cause is multifactorial, one modifiable factor is the system in which they seek care. Care is delivered in a wide range of settings – specialists in Fairbanks, Anchorage, or out-of-state; clinicians traveling to the village from Fairbanks or subregional clinics; and village clinics that may be staffed by a health aide full-time or only intermittently. Different coverage rules for IHS or Veteran beneficiaries and rural non-IHS patients add additional layers of complexity. Reliance on flights often affected by weather delays or cancellations can create a chain reaction of no shows, rework, or loss to follow-up. Without dedicated care coordination, this complexity results in fragmented care, duplicative work, missed opportunities, unnecessary travel, higher costs, frustrated patients, and burned-out clinical staff. Effective care coordination has been proven to improve health outcomes and reduce costs, yet current referral tracking processes rely on manual workarounds. The time spent managing these manual processes could be directed toward meaningful, patient-centered support and proactive village travel preparation. The Rural Primary Care Initiative aims to strengthen care coordination and employ population health principles to improve preventive care and provide robust preparation for village medical travel, improving efficiency and overall patient care.	Our approach builds a structured care management program that strengthens preventive care, chronic disease management, and referral coordination across the region. To implement this model, TCC will hire one Registered Nurse (RN) and one Certified Medical Assistant (CMA) to form a dedicated care coordination team alongside our existing Clinical Pharmacist. This team, acting as an extension of the medical primary care team, will use population-health methods to identify patient needs, reduce care fragmentation, and ensure timely follow-up across settings. Once hired, the RN will focus on higher-risk patients, providing disease-specific education, proactive check-ins, and advanced care coordination, including support for village-based patients receiving end-of-life care. The CMA will manage foundational care coordination tasks for rural patients and plan village medical travel with consistent, proactive follow-up. The clinical pharmacist will continue providing medication management and routine education to improve adherence and health outcomes. This model is supported by strong evidence and TCC’s own demonstrated results. A recent two-year pilot in three remote villages significantly improved key quality measures – including preventive screenings, chronic disease control, and healthy lifestyle counseling. Across 11 metrics, scores increased by 23.4% in year one and an additional 15.3% in year two. The pilot demonstrated the need for additional nursing and clinical support staff, which has not been added due to lack of available funding. RHTP support is essential to launch and scale this model. In addition, we will conduct a Rapid Improvement Event to map current referral processes, identify gaps, and guide selection of a software solution that streamlines referral tracking, reduces duplication, and integrates real care-coordination tasks into daily workflows. We will also partner with a physician to analyze patterns of excessive travel use and develop corrective strategies, beginning with Return-to-Village Clearance protocols and targeted high-utilization review. Year 1 will focus on hiring the RN and CMA, protocol development, workflow design, refining pharmacist billing processes, and completing software discovery. Year 2 will implement the selected software and refine workflows. These improvements will clarify future workforce needs and establish the foundation for expanding into Remote Patient Monitoring (RPM) and Chronic Care Management (CCM).	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; North Slope Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Tanaq Technical Services, LLC	One Tanaq Rural Health Transformation Initiative	AK	Alaska’s Rural Health Transformation Program presents a historic opportunity to modernize healthcare delivery across rural and frontier communities where geographic isolation, workforce shortages, and infrastructure limitations create persistent barriers to care. Many rural providers face challenges including limited access to specialty care, fragmented health data systems, cybersecurity vulnerabilities, limited telehealth capacity, and challenges managing chronic disease across dispersed populations.	The One Tanaq initiative proposes to address these challenges through the implementation of a secure, interoperable rural health technology and care coordination platform designed to support healthcare providers, community health workers, and patients across Alaska. This initiative integrates expanded telehealth capabilities connecting rural patients with specialty care; remote patient monitoring technologies supporting chronic disease management; secure cloud-based health data platforms enabling interoperability and analytics; population health dashboards supporting data-driven decision making; and community health worker engagement tools supporting prevention and care coordination.	\$250K-\$1M	Statewide	Anchorage (Municipality)	Deferred or Not Advanced
Tangirnaq Native Village	Tuknisqat Ilat, Tuknisqat Acigtat (Strong Families, Strong Foundations)	AK	Our community faces ongoing challenges in ensuring consistent access to maternal, child, and preventative behavioral health services across the rural Kodiak Archipelago. Geographic isolation, weather-dependent travel, high transportation costs, and limited local service availability contribute to delays in care and fragmented coordination between community-based supports and regional providers. Pregnant and postpartum women often leave their community for services, and families may encounter barriers to early behavioral health engagement. At the same time, our community holds strong cultural foundations that serve as protective factors for long-term wellness. This project represents an opportunity to strengthen place-based, culturally grounded prevention systems rooted in Sugpiaq values, kinship, and land-based learning. By delivering prevention programming locally, formalizing referral pathways, and improving coordination with regional partners, TNV can expand access, strengthen continuity of care, and build sustainable Tribal infrastructure that supports healthy families and strong generations while advancing rural health system responsiveness.	Tangirnaq Native Village proposes a Tribal-led, prevention-centered approach that strengthens maternal, child, and family wellness by building durable community systems rooted in Sugpiaq values, kinship, and land-based knowledge. Year 1 will serve as a planning and foundation-building year. TNV will engage community leadership and families to refine a culturally grounded maternal and family wellness framework. The Tribe will formalize partnerships with regional providers, establish referral and communication pathways, identify service gaps affecting pregnant and postpartum women, children, and families, and develop evaluation measures to guide long-term sustainability. This planning phase strengthens Tribal infrastructure and coordination capacity while maintaining TNV’s role as a sovereign government, not a clinical provider. In Years 2–3, TNV will implement place-based prevention programming. Maternal and family wellness gatherings will strengthen early protective factors, provide parenting education grounded in Sugpiaq values, and support prevention-focused behavioral health referrals. Programming will incorporate land-based learning and intergenerational engagement as core elements of long-term wellness. Embedding prevention within trusted community settings increases early engagement, reduces stigma, and supports families before challenges escalate. Throughout the project, TNV will reinforce coordinated partnerships that align community prevention with regional clinical services. Rather than duplicating healthcare systems, the Tribe will strengthen referral alignment and follow-up practices to ensure smoother transitions across rural systems of care. In Years 4–5, TNV will expand participation, deepen partnerships, and strengthen sustainability through durable infrastructure and continued advocacy for improved rural access. Evaluation findings will guide refinement and support replication across the Kodiak Archipelago. Through sovereign leadership, culturally grounded prevention, and coordinated system-building, Tangirnaq Native Village will advance a	\$250K-\$1M	Single Community	Kodiak Island Borough	Advance to Implementation Application

responsive rural health framework that expands access, strengthens continuity of care, and supports healthy families and strong generations for the long term.

TeleTracking Technologies, Inc.	Rural Alaska Operations Hub: Unified Access & Patient Flow Across the Frontier	PA	Alaska faces a frontier health access challenge: care is often available somewhere, but not always visible, coordinated, or reachable in time. Distance, weather, workforce shortages, limited local services, and fragmented communication can delay referrals, transfers, maternal care, behavioral health access, pharmacy support, and follow-up for rural patients. In this environment, even small operational breakdowns can create major clinical and financial consequences. The opportunity is to build a more connected rural health operating model for Alaska—one that helps providers, referral sites, and regional partners better see capacity, coordinate movement, and connect patients to the right care setting faster. Rather than relying on isolated sites to solve these problems alone, this project would create stronger statewide and regional coordination across hospitals, clinics, EMS, and other partners. For Alaska, this is not just a technology opportunity; it is an opportunity to improve access, reduce avoidable delays, support vulnerable populations, and make better use of scarce workforce and infrastructure across remote communities.	Our proposed approach is to help Alaska build a Boundaryless Healthcare operating model for rural and frontier care—one in which distance, organizational silos, and handoff failures no longer define the patient experience. Rather than asking each site to solve access challenges alone, we would help create a connected coordination framework across participating providers and regional partners, including systems such as Providence Alaska, Alaska Native Tribal Health Consortium, Southcentral Foundation, Yukon-Kuskokwim Health Corporation, Norton Sound Health Corporation, Foundation Health Partners, Bartlett Regional Hospital, and Bristol Bay Area Health Corporation.. Using TeleTracking’s platform, the project would establish shared operational visibility across hospitals, clinics, referral partners, EMS, and other stakeholders. This would support real-time insight into capacity, transfer needs, referral pathways, patient movement, and operational bottlenecks. In Alaska, where weather, geography, and workforce shortages can quickly turn a routine care issue into a serious access problem, this kind of visibility is essential. The work would begin with an assessment and design phase focused on Alaska-specific use cases, participating partners, workflow gaps, and data requirements. From there, we would configure the model around the state’s highest-value priorities: rural access, maternal care, behavioral health, pharmacy coordination, and inter-facility transfer management. The goal is not just better technology, but a better operating system for statewide care coordination. Our approach also emphasizes governance, workflow standardization, and partnership alignment. Technology matters, but success depends on clear escalation paths, agreed operating protocols, role clarity, and stronger collaboration across regional and Tribal health networks. This is especially important in Alaska, where a failed handoff may mean another flight, another delay, or another patient unable to receive timely care close to home. Where appropriate, the model could incorporate advanced analytics and AI-enabled decision support through TeleTracking and partners such as Palantir and Faculty AI to identify bottlenecks, forecast demand, and strengthen planning over time. This approach is designed to help Alaska move from fragmented access points to a more coordinated frontier care network—more visible, more resilient, and more capable of delivering timely care across the state.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Terawatt, Inc.	ANCHOR: Alaska's Network for Community Health, Outcomes, and Retention	CT	Rural Alaska does not have a recruitment problem. It has a retention and culture problem. Providers leave because of their experiences inside facilities. Management culture and toxic environments are the top drivers of staff exits, outranking geographic isolation (Linzer et al., 2009; Labrague, 2023; NSI, 2025). The fiscal consequences are severe. Each RN departure costs \$61,110. Locum replacements cost more and deliver 2–6 week rotations that destroy care continuity for AI/AN communities already facing 25%+ vacancy rates. Alaska projects a 40% primary care shortage by 2030, yet policy responses remain focused on recruitment. Why us: Nine years of validation at Poudre Valley Hospital System (turnover 23% → 4%; \$32M retained earnings). Terawatt's vetted coach network activates immediately while Dr. Thomas builds an Alaska-specific cohort for local ownership. Dr. Sarnecki's Unangan relationships make Year 1 credible rather than extractive. Why now: RHTP's five-year window is precisely the timeline psychological safety research requires. ANCHOR measures progression using the Edmondson Psychological Safety Scale at Months 1 and 12, with Provider Retention tracked at 6, 12, 24, and 36 months. By Year 5, the retained savings fund will care for delivery itself — advancing Initiative #4 (Pay for Value) and creating a rural health economy no longer dependent on federal subsidy.	ANCHOR operates through a hub-and-spoke delivery model, launched in Year 1 in Unalaska and replicated across six additional hubs by Year 5. Every element of the approach is operational, not aspirational. How delivery works: Terawatt's network of 80+ vetted coaches, selected through written content review, online presence audit, structured interview, and background screening, delivers facilitated group coaching sessions at each hub. Sessions are held in-person at neutral community venues, beginning with the Unalaska Community Center in Year 1, welcoming all healthcare-touching staff regardless of employer or role. This cross-functional design is deliberate: psychological safety requires a shared and inclusive environment. We reach satellites: Atka, Nikolski, and St. George receive quarterly in-person coach visits, coordinated through existing APIA CHA/P relationships. CHA/Ps serve as permanent on-the-ground cultural anchors, not logistical conveniences. Their community presence makes delivery credible rather than extractive. When weather disrupts travel, a Digital Twin virtual curriculum (live virtual sessions replicating in-person content exactly) activates immediately. No session is lost. Alaska owns the curriculum: Dr. Tommy Thomas trains Alaska's inaugural coach cohort in Opposite Strengths, a communication-first methodology. Alaska holds a lifetime license from Year 1. The curriculum belongs to Alaska permanently, eliminating vendor dependency as a sustainability risk. Sequencing: C-suite and senior leadership receive training first. When frontline staff see that supervisors have already participated, curiosity drives enrollment without mandates. This sequencing drove nine years of uninterrupted gains at Poudre Valley Hospital System. Track outcomes: Columbia University Professor Solange Charas provides quarterly human capital analytics that correlate cultural shifts with financial outcomes, including locum tenens spend reduction, HCAHPS improvement, Edmondson Psychological Safety Scale scores, and provider retention at 6, 12, 24, and 36 months. Reported quarterly to RHTP administrators. Phased expansion: Year 1 establishes Unalaska as the replication template. Hub 2 launches Year 2, selected by vacancy rates, HPSA scores, and community readiness indicators from Year 1. All seven hubs are active by Year 5. Tribal Health Organization coaches deliver and certify independently by Year 6, permanently independent of federal funding.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough	Deferred or Not Advanced

The Alaska Hospitalist Group, LLC	Mat-Su Rural ICU Physician Housing Support Program	AK	The project will also enhance quality of care for patients in rural and frontier communities served by Mat-Su Regional Medical Center. When ICU physicians are housed locally during service rotations, commute times, often exasperated by weather conditions, are reduced and physicians are more readily available to respond to patient needs in the ICU. This proximity improves response times for emergent situations, supports greater participation in multidisciplinary rounds, and allows for stronger collaboration with hospital staff, hospitalists, and nursing teams. Increased on-site availability also strengthens continuity of care and allows intensivists to remain engaged in quality improvement initiatives, protocol development, and provider education, all of which contribute to better clinical outcomes for critically ill patients.	TAHG would provide housing with close proximity to the hospital that ICU physicians would use when on service.	Under \$50,000	Private practitioner	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced
The Alaska Hospitalist Group, LLC	Rural Physician Workforce Retention and Housing Support Program	AK	TAHG has experienced significant challenges with recruiting and retaining physicians to the Kenai Peninsula. In 2023, we experienced a 50% turnover rate of our physicians. This was devastating to our group and the Kenai Peninsula. We have been working to replace those physicians while staffing up to meet the growing needs of the hospital. We continue to experience turnover each year.	Our approach to the physician workforce shortage is to offer a retention bonus for individuals willing to commit to an additional five years of service with TAHG in the Kenai Peninsula.	\$250K-\$1M	Private practitioner	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

The Alaska Hospitalist Group, LLC	Telehealth Innovation/Care Coordination for Hospital Post Discharge Patients	AK	Alaskan patients discharged from hospital care often face delays in follow-up appointments due to limited provider availability, travel challenges, and geographic isolation. These gaps in care can result in medication errors, worsening conditions, and avoidable hospital readmissions. Rural patients are particularly vulnerable when timely primary care follow-up is not available. The Alaska Hospitalist Group (TAHG) would like to help bridge that gap with tele-health services.	This project proposes the creation of a Post-Discharge Telehealth Program designed to provide short-term follow-up care after hospital discharge. Key elements of the program include: • A medical provider available through a telehealth platform to provide outreach to patients shortly after discharge. • Visits scheduled within a defined timeframe following hospitalization for patients identified as higher risk for readmission or those experiencing barriers to timely primary care follow-up. • The program would operate several days each week and serve patients until they are able to establish care with their primary care provider. Services may include: • Medication reconciliation • Symptom monitoring and clinical reassessment • Reinforcement of discharge instructions • Coordination with primary care and specialty providers and the patient’s care teams	\$250K-\$1M	Private practitioner	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

The Arc of Anchorage	Electronic Health Record and Technology Alignment Project	AK	Currently, several of The Arc’s technology systems including health records, documentation platforms, scheduling tools, and communication systems operate across multiple platforms that are not fully aligned. This fragmentation creates inefficiencies for staff, increases administrative workload, and contributes to higher operational costs for the organization. It also creates barriers for individuals and their guardians who must navigate multiple systems to complete intake steps, submit documentation, and communicate with care teams, often from rural communities with limited connectivity. This project presents an opportunity for The Arc to partner with technology and health IT experts to better align these systems and improve the overall technology infrastructure that supports service delivery. By creating more integrated systems and expanding consumer-facing digital tools, The Arc can reduce administrative burden, improve care coordination, and make it easier for individuals and families, particularly those from rural Alaska—to initiate and maintain services without unnecessary travel or administrative barriers.	The Arc proposes to partner with experienced health technology and systems integration experts to evaluate, align, and modernize the organization’s technology infrastructure that supports behavioral health and community-based services. The goal of this project is to create a more integrated and efficient technology ecosystem that improves care coordination, reduces administrative burden, and expands digital access for individuals and families across Alaska. The project will begin with a comprehensive assessment of The Arc’s current technology environment, including clinical documentation systems, scheduling platforms, communication tools, and consumer-facing systems used by individuals and their guardians. This assessment will identify opportunities to better align platforms, improve interoperability between systems, and streamline workflows that currently require duplicative administrative work across multiple platforms. Based on the findings of this assessment, The Arc will work with technology partners to implement system alignment and integration strategies that allow information to move more efficiently between systems. This may include improving data integration, modernizing user interfaces, strengthening communication tools used by staff and families, and implementing solutions that simplify administrative processes such as intake, documentation submission, and care coordination. A key component of the project will focus on enhancing consumer-facing digital tools so individuals and their guardians can more easily complete intake steps, upload required documentation, communicate with care teams, and participate in care planning remotely. These improvements are particularly important for individuals and families in rural and frontier communities who often face travel barriers and limited access to local services. Because The Arc serves as a hub provider for individuals coming from communities across Alaska, the project will prioritize solutions that function effectively in low-bandwidth environments and support remote engagement with care teams. By improving system alignment and expanding digital access, this project will strengthen operational efficiency, reduce administrative costs, improve coordination among care teams, and make it easier for individuals and families, particularly those in rural and remote communities, to initiate and maintain services.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

The Dome	Preserving The Dome for Community Health	AK	The Dome addresses a statewide gap in year-round athletic and health infrastructure in Alaska. Due to harsh winter conditions and limited indoor facilities, many Alaskans, particularly those from rural, remote, and frontier communities, have few opportunities to train, stay active, or participate in organized athletic programming during much of the year. As the only full size indoor track and field facility in Alaska operating year round, The Dome provides a critical hub where athletes, teams, and community members from across the state can access safe indoor space for physical activity, training, and competition. Each year, individuals from communities including Bethel, Nome, the North Slope, and Southeast Alaska travel to Anchorage to participate in athletic events, training programs, and statewide competitions hosted at The Dome. These opportunities support both physical health and mental wellbeing, enabling rural athletes to compete and prepare at the same level as their peers elsewhere in the state. Many rural Alaskans also travel to Anchorage for medical appointments and specialty care. Through The Dome’s Community Health Initiative, these individuals and families can access the facility free of charge for walking, light exercise, and recovery activity. The Dome’s air supported fabric structure has reached the end of its service life and requires replacement. Replacing the Dome fabric will ensure that this infrastructure remains available for rural Alaskans.	The proposed approach is to complete a fabric replacement for The Dome’s air supported structure in order to preserve this critical statewide health and athletic facility. The Dome has worked with Yeadon Fabric Domes, Davis Constructors, and Kuna Engineering to develop the scope and execution plan for this capital project. The Dome has advanced the project to approximately 35 percent architectural documentation and is ready to proceed once funding is secured. Replacing the fabric will ensure the continued operation of Alaska’s only year round full size indoor track and field facility. The Dome enables athletes, teams, and community members from across the state to participate in physical activity, training, and events that support both physical and mental health. Many rural Alaskans travel to Anchorage for medical appointments and specialty care. Through scholarships and complimentary memberships, rural residents who regularly utilize The Dome will have access to the facility for preventive health activity, physical recovery, and safe indoor exercise while they are in Anchorage. Maintaining The Dome through this fabric replacement will ensure that these programs and services remain available to rural Alaskans in a safe, weather protected facility that supports long term community health.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough	Deferred or Not Advanced

The Eskimo Ninja	Bridging Mental Stability through Physical Activity	AK	Rural Alaskans and Alaskan Native people are literally the youngest culture to alcohol - our low tolerance leads to some of the highest domestic violence rates, suicidal ideation and completions, and homeless/multi-generational homes in the country - our purpose has been lost in a bottle. Our program is an opportunity to revitalize that purpose and build an understanding of how important it is to bridge the gap between our traditional ways and modern living. Living a healthy lifestyle and choosing to be the change is the key to overcoming this challenge in our villages.	Our approach is simple. Coach. As Alaskan Natives we have a unique ability to connect with the communities we visit - we literally are the demographic we hope to inspire. By traveling to communities across Alaska it gives us a chance to truly put boots on the ground and connect with the people. The draw: an American Ninja Warrior and Traditional Native Games residency. We bring or build Ninja Warrior style obstacles in the villages we visit and show them the importance of physical activity, but more importantly we work one on one "talking circle style" with the community to help them understand the unique challenges they face, and how to overcome them.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

The Glory Hall	CRITICALLY NEEDED Supportive Treatment Housing	AK	Our organization has been providing housing for people NOT in recovery since 2017, at the Forget-Me-Not-Manor facility, which now consists of 92 apartments. We developed the apartments in 3 phases, together with our partners Bartlett Regional Hospital and Southeast Alaska Regional Health Consortium and we used a community referral process to fill every single unit. The outcomes are impressive, particularly in the context of health care. Hospital admissions and interactions with emergency services drop dramatically for our tenants, almost right at move in. What is also notable is the length of hospital admissions. Even if individuals are admitted to the hospital, discharge is great because their is a home to discharge to. People do not spend weeks and months unnecessarily at the hospital because they have a home. Most outcomes are better. What we want to do is use the same model but for people in recovery. The problem we are addressing is profound and simple. How can we make recovery last? How do we end the revolving door of people going to rehab over and over again only to return to using, crime committing, often homelessness as soon as they come out of treatment or jail? We solve the problem through housing. We add critically needed units to the starved housing market and we ensure that supports are on site and that partnerships with major healthcare providers are in place and that recovery is supported through housing, partnerships, and expertise.	Our approach is simple: 1. We finalize our building design and solidify our partnerships, clearly defining roles. Juneau Housing First Collaborative is uniquely qualified to do this. We developed 99 units of housing and built a shelter/care center facility in the last 8 years. We have an great an established partner relationship with both Bartlett Regional Hospital and with Southeast Alaska Regional Health Consortium. Both organizations work closely with us and understand that patients benefit immensely through housing and collaboration. 2. We construct Phase 1 of the project, 34 units and support offices. The more funding we can secure through this opportunity, the faster we can build without having to leverage additional funds. However, we understand that the need is great and are committed to leveraging other funds if necessary. Phase 1 (34 units) will cost approximately 11 million dollars to develop, subsequent Phases will be slightly less due to the design, site prep, and utilities to site, as well as permitting, achieved in Phase 1. 3. As Phase 1 is getting built, we will formalize the tenant selection process, the operational structure, and partner roles, creating a robust program for people in recovery. This program will rely on intensive case management and intensive collaboration with Bartlett Regional Hospital and SEARHC. 4. Simultaneously, we will establish an excellent evaluation plan to ensure that the project is truly meeting our objective of being a model of recovery housing success which contributes to health care cost reduction and can be replicated in other communities in Alaska. 5. We will secure operating resources, housing vouchers and other supports in order to operate the project. Other communities often partner with healthcare providers to receive operating subsidies in exchange for a place which can provide stability and appropriate level of care, thus limiting critical care readmissions.	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough)	Deferred or Not Advanced

The Greater Fairbanks Community Hospital Foundation	Advancing Specialty Access in Interior Alaska: Vascular, Cardiac & Wound Care Expansion	AK	Fairbanks is the sole provider of Vascular Surgery, Cardiology and Wound Care specialty services north of Anchorage. Fairbanks Memorial Hospital (FMH) serves as the regional hub for multiple rural and tribal communities. Approximately 8% of local patients have diabetes, a condition that contributes to poor wound healing and other comorbidities commonly managed within these specialty clinics. Cardiovascular demand in our region is growing faster than our system can keep pace. In 2024, the Center recorded 2,507 vascular encounters and by August 2025 had already reached 2,156, projecting a 29% annual increase, year over year. Cardiac needs are rising as well with 22,820 cardiac encounters in 2024 and continued growth expected. While these represent encounters rather than individuals, more than 4,000 unique heart patients required care last year. This rapid escalation highlights an urgent need for expanded capacity to ensure timely, high-quality cardiovascular care for our community. As a result, demand across all three specialty areas at FMH now exceeds available capacity, leading to long wait times, delayed diagnoses, preventable complications and frequent travel to Anchorage or out of state for essential care. Rural and tribal communities, many of which rely on Fairbanks as their closest specialty hub, face the greatest barriers due to long distances, limited transportation options, and higher burdens of chronic disease such as diabetes, heart failure, and vascular disease.	Foundation Health Partners (FHP) will address urgent specialty-care access gaps in Interior Alaska through a coordinated, multiyear strategy that expands clinical capacity, modernizes care delivery, and strengthens readiness for value-based care. The approach centers on three strategies: expanding clinic infrastructure, implementing redesigned team-based specialty care models, and deploying digital tools to reach rural, remote, and frontier communities. FHP is requesting \$8.5 million in first-year funding—\$8 million for clinic expansion and \$500,000 for care-model redesign and workforce development. These investments launch a multiyear transition toward value-based care by establishing the infrastructure, staffing, and technology required for long-term sustainability. 1. Expand and Modernize Clinical Infrastructure FHP will renovate and expand the Porter Heart & Vascular Clinic to increase capacity across Vascular Surgery, Cardiology, and Wound Care. Upgrades include redesigned patient flow, additional procedure and consult rooms, and integrated space for pharmacists, dietitians, and nurse navigators. Expansion will reduce wait times, support timely diagnoses, and ensure patients can access specialty care without leaving the region. 2. Implement Redesigned, Team-Based Specialty Care Models Integrated care teams will enhance chronic disease management, medication optimization, and adherence support. Pharmacists will provide disease-management programs and point-of-care testing; dietitians will expand wound care support, vascular risk counseling, and home-based services for older adults; and Nurse Navigators will strengthen follow-up and coordination for rural patients. A dedicated Heart Failure Clinic will support early intervention, reduce preventable complications, and decrease readmissions. 3. Expand Digital Health and Remote Monitoring Capabilities To improve access for distant communities, FHP will expand virtual specialty visits, remote monitoring tools, and AI-enabled diagnostic and point-of-care equipment. These technologies will support early detection, reduce unnecessary travel, and allow chronic-condition management closer to home. Prescription-delivery pilots will assist frontier communities, while enhanced analytics will strengthen real-time monitoring, risk stratification, and regional care coordination.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

The Greater Fairbanks Community Hospital Foundation	Fairbanks Addiction Medicine Inpatient Consultation Program	AK	The 2025 Fairbanks Community Health Needs Assessment identifies substance use disorder as a top community health priority. Excessive alcohol use affects 22% of adults, compared to 20% statewide. Drug overdose deaths in the Fairbanks North Star Borough rose sharply among American Indian and Alaska Native residents from 18 per 100K in 2019, 72 per 100K in 2021 and reaching 100 per 100K in 2025. This project addresses a documented gap in the continuum of care. Patients discharged from inpatient care at FMH often struggle to engage in outpatient treatment due to severity of illness, cognitive impairment, transportation barriers, limited internet access, and fragmented care systems. Although outpatient services are able to support these patients, many are still lost to follow-up after discharge. There is a need for an inpatient addiction medicine consultation program to assess hospitalized patients, provide timely intervention, and coordinate ongoing care after discharge to reduce the chance of being lost to follow-up. Currently, inpatient physicians at FMH request occasional consults from the Addiction Medicine Clinic; however, without a consistent process, many fall through the cracks during this transition. There is a need for case management support to ensure patients leave the hospital with a clear treatment plan, confirmed follow up appointments, and coordinated communication among care teams.	To address these challenges, Foundation Health Partners (FHP) is requesting \$500,000 in year one as the initial phase of a multi-year effort to establish a dedicated inpatient addiction-medicine consult service integrated with case management and care coordination. The program will stabilize patients during hospitalization, initiate evidence-based treatment such as medication-assisted treatment (MAT) and provide guided support through the high-risk post-discharge period. By proactively addressing barriers such as transportation, connectivity limitations, and fragmented systems, the program creates a reliable care pathway linking inpatient services, outpatient providers, and community supports. The model centers on a specialized team composed of two Addiction Medicine physicians, a full-time Advanced Practice Provider (APP), a case manager, and a care coordinator. This team will provide consistent daily bedside consultations at Fairbanks Memorial Hospital. A dedicated APP ensures reliable coverage, reduces demands on hospitalists, helps prevent burnout, and delivers focused patient support. This structure standardizes consult response times and ensures all eligible patients receive timely, evidence-based addiction-medicine evaluation. Integrating patient navigation and case management into the inpatient workflow allows the program to address common logistical and social-determinant barriers. Patient identification follows a structured dual-pathway process to ensure no eligible patient is missed. Screening criteria determine whether patients “screen in” for SUD services. Identification occurs through both passive and active pathways: inpatient providers apply screening criteria and place consult orders, while the SUD team proactively reviews new admissions and diagnoses to identify patients who may benefit. As systems evolve, EHR-based automation and alerts may further strengthen this process. Once a consult is ordered, the SUD provider meets the patient at bedside, conducts an assessment, discusses treatment options, and may initiate medication assisted treatment during hospitalization. Case management roles secure follow-up appointments before discharge, coordinate warm handoffs to Tribal Health Organizations and community providers, and ensure robust documentation of transition plans—reducing the risk that patients are lost during the vulnerable post-discharge period.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

The Greater Fairbanks Community Hospital Foundation	Launch PET-CT services in Interior Alaska	AK	Interior Alaska currently has no local access to PET-CT imaging, a critical diagnostic tool for accurate detection, staging, and monitoring of cancer and cardiac disease. Residents of the Interior region must travel to Anchorage or Seattle for these scans, creating significant barriers to timely care. Travel is especially burdensome for medically fragile patients who require multiple scans each year, often leading to delays, incomplete diagnostic workups, and higher overall costs to patients and payers. At the same time, demand for PET-CT imaging in the Interior is substantial and growing. Based on current estimates for Interior Alaska, there are 400 new cancer patients per year and 40% or 160 of those patients would benefit from PET-CT scans. As far as cardiac patients, Fairbanks Memorial Hospital’s Porter Heart Center sees about 4,170 patients per year and an estimated 37% or 1,542 patients would benefit from PET-CT scans. This project presents a critical opportunity to establish the region’s first PET-CT service line, improving access to advanced diagnostics, supporting earlier and more accurate treatment decisions, reducing travel burdens, and strengthening health equity for the 100,000 residents of Interior Alaska.	Foundation Health Partners will expand access to advanced diagnostic care by establishing Interior Alaska’s first PET-CT service line. The project focuses on bringing essential cardiac and oncology imaging closer to home for rural, remote, and frontier residents who currently must travel long distances for these services. Currently, this project has raised \$3.2 million in donations and is requesting \$4.2 million for the remainder of the funding needed to complete this project. The approach begins with completing the remaining project design, which is already 65% finished and scheduled for final approval by March 2026. Construction will begin once design is final and full funding is secured. The project reconfigures the existing Nuclear Medicine suite within the Fairbanks Imaging & Breast Center, avoiding the cost and delays of new construction. After remodeling, the Siemens Biograph Trinion EP PET-CT scanner and the necessary hot-lab equipment will be installed and tested. This phase includes vendor coordination, regulatory checks, and environmental preparation to ensure safe and compliant operations. Once the equipment is installed, staff training, radiation safety reviews, and workflow validation will prepare the team for clinical launch. The service will be supported through cross-training existing nuclear medicine personnel and by using established radiopharmaceutical supply chains. Within the first year, the project aims to reach steady operations of about 10 scans per day—five cardiac scans each morning and five oncology scans each afternoon—allowing rural patients to receive timely imaging without leaving the region. Strong regional partnerships will support referrals and care coordination, including Bassett Army Community Hospital, Chief Andrew Isaac Health Center, and local cardiology and oncology clinics. Overall, this approach provides a clear, phased path to bringing high-quality PET-CT imaging to Interior Alaska. By reducing travel burdens, improving diagnostic timeliness, and establishing a sustainable service model, the project will significantly enhance care for rural and medically vulnerable populations across the region.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

The Greater Fairbanks Community Hospital Foundation	Maternal Health Planning in Interior Alaska	AK	Fairbanks serves as the maternity care hub for Interior Alaska seeking to meet local maternity and pediatric needs without requiring transfers. This project seeks to conduct planning to address two maternal health needs. Families face significant barriers to accessing essential Maternal-Fetal Medicine (MFM) and pediatric subspecialty care. High-risk patients—including those with gestational diabetes, hypertension, complex fetal anomalies, and infections—frequently travel over 300 miles for specialized treatment. These trips often exceed \$1,000, causing immense financial, physical, and emotional strain on families due to travel costs, missed work, and childcare needs. Currently, the lack of local subspecialty care leads to delayed diagnoses and emergency air evacuations. Access to advanced diagnostics, such as MFM-level sonography and perinatal genetics, falls short of the standard of care. Out-of-state laboratory analysis adds additional financial burdens through inconsistent insurance coverage. The identification and care of pregnant people and newborns affected by substances during the perinatal period is a high priority in the region. By leveraging Alaska Perinatal Quality Collaborative (AKPQC) strategies and resources, this project will establish comprehensive, culturally responsive policies for universal screening and newborn toxicology testing. This approach ensures consistent, respectful care that honors community values and supports Alaska’s diverse families.	Foundation Health Partners is requesting \$300,000 for a collaborative planning project will fund a new dedicated maternal health planning position and provider time to develop the operational, clinical, and technological foundations needed to improve maternity care in the Interior region. The planning will focus on two specific needs: Develop a sustainable model for visiting and telemedicine subspecialty clinics to enhance high-risk pregnancy care at Fairbanks Memorial Hospital. Develop policies and processes to utilize the Alaska Perinatal Quality Collaborative Substance Affected Pregnancies Initiative (SAPI) tools and recommendations and the recommendations for newborn toxicology testing to improve prenatal and postpartum care in the setting of psychosocial perinatal risk. The planning project will coordinate with Tribal partners, statewide Maternal Fetal Medicine (MFM) teams, AKPQC, pediatric specialists, IT, imaging services, and community stakeholders to design a sustainable, culturally responsive model for delivering maternity subspecialty care and impacting perinatal substance use. The project will develop a formal partnership with the Alaska Native Medical Center to provide MFM physician access through a "shared model". This MFM specialist will provide a physical presence in Fairbanks and offer 24/7 remote consultation. This collaborative approach builds medical and cultural bridges between Anchorage and Fairbanks to serve a diverse population, including Tribal partners, military families, and rural residents. The project will develop plans for a telemedicine and IT system that will streamline communication and data transfer, improve clinical safety, and reduce travel. We will conduct a needs assessment for high-level fetal ultrasound equipment, sonographer training, and clinical space requirements to facilitate a multifunctional environment for pediatric and obstetrical specialists. This project will develop the policies and processes needed to implement a standardized approach to screening and brief intervention for perinatal substance use and for newborn toxicology screening. The planning process will seek agreement among providers on the tools, process, and training needs for universal screening during pregnancy. The planning will emphasis culturally responsive, high-quality care as the regional standard and ensure every pregnant person and newborn receives consistent care regardless of geography.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

The Greater Fairbanks Community Hospital Foundation	Purchase an Intuitive da Vinci robotic surgical system	AK	In October 2026, the current Intuitive da Vinci robotic system at Fairbanks Memorial Hospital will reach the end of its lifecycle and require replacement. The system is integral to providing minimally invasive surgery for patients across Interior Alaska, supporting employed and community general surgery, urology, and gynecology providers. Updating this equipment will ensure patients continue to receive innovative, high quality surgical care close to home. The technology also serves as both a recruitment asset and a retention tool for surgeons who rely on advanced platforms to deliver modern, evidence-based care. Without replacement, patients may face reduced service availability, delays in care, or the need for costly travel outside Alaska for complex procedures. This need is also closely tied to workforce stability. Robotic surgery is now a standard expectation in surgical practice, and FMH’s ability to recruit and retain high quality surgeons depends on maintaining up to date robotic capability. Replacing the current system preserves advanced surgical services, supports strong patient outcomes, and ensures Interior Alaska residents can continue receiving evidence-based care locally.	Fairbanks Memorial Hospital is requesting \$ 2.8 million for the Intuitive da Vinci robotic surgical system that needs replaced before it reaches end of life in October 2026 to ensure uninterrupted access to minimally invasive surgery for Interior Alaska. Early coordination with the vendor will secure timely production and delivery, so surgical services are not disrupted. As the purchase progresses, FMH’s facilities, biomedical engineering, and perioperative teams will prepare the operating room, complete infrastructure checks, and ensure the environment is ready for installation. After delivery, the system will be installed and tested to confirm it is safe and fully functional for clinical use. Training will be a key part of the transition. Surgeons and operating room staff will participate in vendor supported training, hands-on simulation, and familiarization sessions to adopt the upgraded technology safely and confidently. Once the system is in place, FMH will focus on stabilizing operations and supporting providers as they transition to the new platform. The upgraded system will help maintain surgical volumes, preserve clinical quality, and support recruitment and retention of high-quality surgical professionals. FMH will assume ongoing operational and maintenance costs after the RHTP grant period to ensure long term sustainability. The hospital will continue monitoring outcomes, access metrics, and workforce impacts to ensure the technology delivers lasting benefits to rural communities. This approach protects uninterrupted access to advanced surgical care, strengthens the local workforce, and supports long term alignment with evidence-based standards of care.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

The Greater Fairbanks Community Hospital Foundation	Team-Based, Value-Driven Primary Care Transformation in Interior Alaska	AK	The limited availability of primary care has been identified as one of the most pressing issues in the Community Health Needs Assessment for the Fairbanks region. Foundation Health Partners (FHP) is one of the few organizations in the region accepting Medicare, Medicaid, and uninsured patients without caps. FHP currently delivers primary care through its Internal Medicine & Senior Care Clinic and the TVC Family Medicine Clinic, but existing capacity is insufficient to meet community demand. Outdated clinic space, ongoing workforce shortages, and a lack of integrated technology contribute to inconsistent care quality, delayed diagnoses, and preventable complications. These challenges disproportionately affect rural residents who must travel long distances for even basic health services. FHP seeks to address limited primary care capacity available to serve rural and remote communities of Interior Alaska. Traditional reimbursement for primary care does not generate sufficient revenue to cover the investments needed to build the infrastructure and care teams to support a new model of care. Building a robust value-driven primary care model is the foundation for a phased adoption of an alternative payment model that will offer financial sustainability of primary care services. This project makes a significant investment in primary care by reconfiguring the clinic space, enhancing IT systems, and building the workforce to provide primary care for the future.	This is Foundation Health Partners (FHP) top transformation project. It is an ambitious, costly investment in an interdisciplinary, team-based primary care transformation. The project has been in the planning phase for many years and is ready to launch with funds from RHTP. FHP is requesting up to \$23.9 million during year one. FHP has the capacity to complete this project by Oct 2027 as the first phase of a multi-year effort to transition to value-based care. FHP will build the infrastructure to deliver proactive, technology-enabled care to 26,100 adults, strengthening chronic disease management and coordination for Interior Alaska. Year 1 investments focus on three pillars: 1. Clinic Reconfiguration (\$15M): Modifying existing 3rd-floor hospital space to support team-based care and expanded access. Upgrades to lighting, plumbing, and layout will convert underutilized areas into high-functioning clinical space with improved accessibility. 2. Digital Infrastructure & EHR (\$8.2M): Enhancing the EHR to unify health IT across care settings. This includes patient-facing tools, telehealth, HIE connectivity, and population health analytics. AI-enabled decision support will improve risk stratification for cancer, cardiovascular disease, and suicide, while ensuring medication safety and preventive care adherence. 3. Workforce Development (\$700K): Training and recruiting for redesigned roles, including medical assistants, pharmacy technicians, care navigators, and community health workers. FHP will also hire a dedicated Improvement Specialist to lead the transformation. The model emphasizes prevention and early intervention, including cancer screening, smoking cessation, weight management, behavioral health, diabetes education, and medication optimization. High utilizing patients will receive intensified services such as quarterly provider visits, annual wellness visits, semiannual pharmacy education, medication reconciliation, and care navigation. This project will allow FHP to partner with the Department of Health for a phased adoption of new primary care payment models that shift from volume-based reimbursement to value-based payment. Developing this clinic, IT, and workforce infrastructure will establish the core competencies necessary for long-term participation in value-based care arrangements.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

The Greater Fairbanks Community Hospital Foundation	Integrated Tele Nursing Support System	AK	Fairbanks Memorial Hospital (FMH), operated by Foundation Health Partners (FHP), is a Sole Community Hospital (SCH) serving a vast catchment area of over 100,000 individuals in Interior Alaska. As the primary provider of acute and emergency services for this region, FMH faces a critical intersection of geographic isolation and a tightening nursing labor market. FMH provides nursing services in every unit and every department across the hospital. The hospital faces ongoing nursing workforce challenges, including staffing shortages, rising patient acuity, high turnover, and burnout. Nurses are increasingly stretched thin by safety monitoring, documentation demands, and the need for constant observation of high-risk patients. This project seeks to address workforce demands while improving patient safety. Currently, nurses are burdened by high-acuity patient loads and a staggering administrative volume. Patient falls remain a persistent safety challenge; traditional 1:1 "sitter" monitoring is resource-intensive and often unscalable during staffing shortages. Virtual nursing solutions can help relieve these burdens by extending staff capacity and improving patient safety. This project presents an opportunity to address staffing constraints by implementing virtual options to augment clinical operations. AI-powered telesitter technology will allow for virtual patient monitoring and reduce the need for the hospital to assign a staff person to sit in a patient's room.	FMH is requesting \$288,000 in year one for an integrated Nursing Tele Support system to be deployed across inpatient units and the Emergency Department. The approach leverages a dual strategy—virtual sitter and virtual nursing solutions—to create a digital safety net that supports both patients and clinicians. CareView Remote Patient Monitoring is an AI-driven patient monitoring system designed to enhance patient safety in hospitals. It uses high-definition cameras, 2-way audio, and real-time analytics to allow staff to monitor up to 35 patients simultaneously from a central hub. It helps detect falls, prevent elopement, and reduces the need for in-person sitters. It utilizes mobile carts, portable, and ceiling mounted cameras with night vision and 360-degree views. This technology will reduce the need for traditional patient sitters that require a one-to-one staff-to-patient ratio for monitoring. The focus will be on high-risk patients such as those with delirium, dementia, or high fall risk and will allow one nurse to monitor multiple patients simultaneously. The AI features will identify subtle movements or patterns, such as a patient attempting to exit a bed, and trigger immediate alerts. This "predictive safety" model has been shown to reduce fall-related injuries by enabling staff to intervene before an adverse event occurs. This reduces the need to pull clinical staff away from high-acuity tasks for basic observation, ensuring bedside resources are deployed where they are most critical. To combat burnout and improve retention, the project will also introduce a Virtual Nursing Solution designed specifically to offload non-physical clinical tasks. These virtual nurses will handle time-consuming administrative burdens which allows bedside nurses to return their focus to "top-of-license" clinical care. This approach can create alternative work settings. For experienced nurses desiring a less physically demanding environment or flexible hours, virtual nursing offers a pathway to remain in the workforce, preserving institutional knowledge that might otherwise be lost to retirement or disability. Virtual nurses provide essential real-time support as a "second set of eyes" for high-stakes procedures, such as medication double-checks and sepsis bundle compliance audits, directly improving the hospital's overall quality metrics. This approach provides integrated methods for improving patient safety as well as increasing retention of staff.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

The Greater Fairbanks Community Hospital Foundation	Podiatry Services for Medicaid Patients in Interior Alaska	AK	Under federal Medicaid rules, podiatry services are optional for states to cover. Alaska recognizes podiatrists (DPMs) as licensed medical professionals. Alaska’s Medicaid program covers podiatry services for children, but does not cover podiatry services for adults. Because they will not be reimbursed, Alaskan podiatrists generally do not serve adult patients who have Medicaid as their primary insurance. Alaska is one of only four states with a restriction on adult use of Podiatry. This gap creates a critical access issue for adult enrollees who require specialized care for foot and ankle trauma and chronic diseases. The lack of coverage often results in untreated conditions that escalate into emergency department visits, inpatient stays, and significant morbidity, including avoidable amputations. This is particularly critical for diabetic patients; the Alaska Department of Health notes that uncontrolled diabetes can lead to disability and limb loss, yet the specialists best trained to treat these complications are excluded from Medicaid. Evidence from other states shows that integrating podiatry into Medicaid systems improves patient outcomes while reducing overall costs by shifting care from expensive emergency settings to cost-effective specialty clinics. By aligning with the 46 other jurisdictions that provide adult podiatry benefits, Alaska can support its medical community’s desire for better referral options and provide care to its most vulnerable residents.	In 2022, the Alaska Medical Care Advisory Committee (MCAC) made a recommendation to the Commissioner to add podiatric physicians as a covered provider for adults in the Alaska Medicaid system and outlined the regulatory language to allow adults on Medicaid to receive Podiatry services. The recommendation was not adopted, and the need to conduct a cost-benefit analysis was identified. This project requests \$200,000 to provide pilot podiatry services to adult Medicaid patients and complete a cost-benefit analysis to demonstrate the value of adding podiatry services to Alaska’s state Medicaid plan. Adults on Medicaid with foot and ankle issues often do not get the care they need, and their untreated conditions can result in emergency department visits and inpatient stays. Lack of podiatric coverage is resulting in significant morbidity (including below the knee amputations) and unnecessary deaths. Access to Podiatric expertise is an essential part of the multidisciplinary team involved in the amputation prevention efforts. FHP has added Dr. David Huntsman, DPM a board-certified podiatric physician with advanced surgical training to the orthopedic team at Fairbanks Memorial Hospital. (FMH) The hospital is committed to making podiatry services available to all patients including the Medicaid population despite the lack of payment by Medicaid for providing this care. FMH estimates 20% of the patients seen by the podiatrist will be covered by Medicaid and no payment will be received for their care. This project is requesting funding to pay 20% of the podiatric physician salary to cover the cost of caring for Medicaid patients. To evaluate the costs and benefits of adding podiatrist services to Medicaid, FHP will fund a contract to gather data in partnership with the Alaska Medicaid program. The project will conduct a formal cost-benefit analysis. This study will evaluate if providing preventative and specialized podiatric care to adult Medicaid patients improves health outcomes at a lower cost than the current reliance on emergency department triage and inpatient surgery. The consultant will survey Alaskan podiatrists to gauge support for the recommendation to add podiatrists to Medicaid. This ensures that the medical community is aligned and ready to serve this population. FHP will work with the M to ensure the necessary evidence is gathered to implement a sustainable cost-effective expansion.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

The Institute for Individual and Organizational Change (IFIOC)	Fidelity Based Motivational Interviewing as an Evidenced Based Practice	WA	Rural Alaska faces high rates of chronic disease, behavioral health needs, and substance use disorders alongside workforce shortages and geographic isolation. Even when services exist, disengagement, ambivalence, and treatment dropout limit effectiveness. Traditional workshop based training improves knowledge but rarely produces sustained clinical skill or measurable outcome change. Research demonstrates that without structured feedback and coaching, initial gains erode and performance plateaus. This creates a persistent gap between workforce education and system level outcomes. The opportunity is to close that gap by embedding fidelity based Motivational Interviewing implementation directly aligned with RHTP deliverables. Rather than adding new programs, this initiative strengthens the effectiveness of existing services by improving how providers engage patients in care. By measuring workforce proficiency and correlating it with engagement and retention metrics, Alaska can convert communication into a measurable lever for improving access, quality, and sustainability across rural systems.	This 12 month initiative implements a structured fidelity based Motivational Interviewing model across participating rural and frontier sites. Phase One establishes foundational and advanced skill through live interactive training that integrates contemporary neuroscience and trauma informed principles. Providers learn how chronic stress, historical trauma, and ambivalence influence executive functioning, adherence, and health decision making, particularly in Indigenous and frontier communities. Phase Two embeds structured fidelity measurement and individualized coaching using the MICA. Practitioners submit recorded sessions for confidential review and receive strengths based feedback focused on skill acquisition. Research consistently demonstrates that structured coaching produces significantly greater and more durable skill development than training alone. Participating agencies receive transparent proficiency reporting and guidance on correlating workforce skill metrics with operational indicators such as retention, medication adherence, treatment initiation, and patient satisfaction. The performance chain is explicit and measurable: as workforce proficiency increases, fidelity increases; as fidelity increases, engagement and adherence increase; as engagement and adherence increase, RHTP performance outcomes improve. The initiative also supports development of internal champions who can sustain fidelity processes within supervision and quality improvement structures. Tele coaching models ensure frontier communities can participate without geographic barriers, strengthening equitable access statewide.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

The Last Frontier Lodge	I AM SOMEBODY - Transitional Living Program for Youth Aging Out of Foster Care	AK	In Alaska, youth aged 14–24 aging out of foster care face a critical shortage of stable housing and access to essential life-skills coaching. Approximately 2,400–2,500 youth are in foster care at any time, with about 40 aging out each year. While the Office of Children’s Services provides Independent Living supports, it does not operate housing facilities. Existing transitional housing programs run by nonprofits like Covenant House, Youth Advocates of Sitka, Choosing Our Roots, VoA Alaska, and Bethel Housing and Homelessness Coalition serve broader populations and have extremely limited capacity, typically 10–25 beds per program. Statewide, fewer than 150 beds are available for youth exiting foster care, forcing many to rely on temporary solutions like college dorms, apartments with case management, or general youth homelessness programs. The I AM SOMEBODY Transitional Living Program for Youth will provide 5–10 dedicated transitional beds, combined with structured life-coaching and case management, mental/physical health care, giving young adults a supportive environment to build the skills/confidence needed for independent living. The programs focus on measurable outcomes, like housing stability, educational/employment engagement and independent-living readiness. By addressing this gap, the program reduces the risk of homelessness/instability, ensures participants have a clear pathway to self-sufficiency, and strengthens long-term outcomes for a population at high risk.	This project establishes a health-centered transitional living program for youth aging out of Alaska’s foster care system, addressing a critical gap in housing, health, and life-skills support. Youth exiting foster care face housing instability, limited access to health care, and social isolation, placing them at high risk for long-term physical, behavioral, and social health challenges. I AM SOMEBODY program combines safe, stable housing with health and supportive services to improve wellbeing, increase access to care, and strengthen pathways to independence. The Lodge has been identified as the location for the proposed transitional living program. All required permits and approvals will be explored and obtained as needed during the start-up period. The program will partner with child welfare agencies and local organizations to identify youth approaching age-out. Youth will participate in individualized assessments to determine housing needs and readiness for services. A review team will prioritize youth with the greatest need, enrolling 5–10 participants per cohort. Removing barriers to participation including transportation, documentation, and service navigation ensures equitable access for all eligible youth. Participants will live in safe, housing units with basic updates to meet living standards. Program funds will support housing stabilization services, transportation to health services, utilities, and other allowable housing-related supports that promote safe, stable, and independent living. Case management, life-skills coaching, transportation to health services, access to education and employment resources will further strengthen participants’ ability to thrive. Each youth will work with a trained community health worker to coordinate care, provide health education, and navigate preventive, primary, and behavioral health services. Housing stability will serve as the foundation for improved health outcomes. Measurable goals include 90% of participants maintaining stable housing for 12 months, 100% completing health screenings, 75% engaging in ongoing primary or preventive care, 50% reduction in emergency health utilization, and 80% participating in education, employment, or independent living programs. By integrating partnerships, evidence-based care, this program creates sustainable, outcome-driven model that addresses housing as a social determinant of health, and empowers Alaska’s youth to achieve long-term stability and self-sufficiency.	\$1M-\$5M	Statewide	Anchorage (Municipality)	Deferred or Not Advanced

The LeeShore Center	Child Enhanced Services	AK	Research has shown that children directly experiencing or witnessing domestic and sexual violence not only suffer from traumatic stress and ongoing emotional and behavioral problems they are at risk of suffering lifelong health issues as adults as well as using violence in later relationships themselves or entering into an abusive relationship. The rates of child sexual assault in Alaska are 6 times the national average and 1 in 3 youth experience teen dating violence. The Adverse Childhood Experiences (ACEs) study looked at childhood trauma and maltreatment, occurring between the ages of 0-17, and later-life health and well-being. Traumatic events included experiencing violence, abuse, neglect, witnessing violence and other traumas such as attempts of suicide by a family member, mental health problems, parental separation or incarceration of a parent, sibling or other family member. The more trauma a child experienced, the higher the risk of experiencing one or more behavioral, social, or physical problems later in life. ACEs can disrupt brain development, compromise immune systems, and lead to unhealthy behaviors, such as substance misuse. Chronic health issues later in life include diabetes and heart disease as well as depression, anxiety and suicidal tendencies. Early intervention is critical, providing mental health treatment and on-going support to children experiencing or witnessing violence can help build resiliency and better protect their health and well-being.	Children coming into LeeShore's emergency and transitional housing shelters have either witnessed or experienced domestic violence or sexual assault. They come with a variety of ills, including anxiety, sleeplessness, nightmares, stomachaches, high activity levels, aggression, worry, emotional detachment, depression; older youth may have issues with substance misuse, feel shame or guilt, are hypervigilant, or withdrawn and have poor concentration. The LeeShore Center proposes to contract out with a mental health clinician specializing in providing trauma-informed, evidenced-based treatment to traumatized children. The clinician would provide therapy services 1 x per week in-house (up to 8 hours per week) to children and youth up to age 18 residing in our emergency and transitional housing facilities. Services would include age-appropriate guided play therapy, therapeutic therapy, risk assessments, and individualized therapy to help address and lessen trauma symptoms. Mental health treatment can offer interventions that mitigate the negative effects of early adversity and trauma; interventions such as helping children feel safe, allowing them to talk about their fears, providing skills and strategies that can help them cope more effectively with stress, and mentoring parenting skills for the non-offending parent that can lead to healthy childhood development.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

The Raven Collective Thriving Community Initiative	Sustainable Tribal Health Systems in Alaska: Workforce Infrastructure and Technology-Enabled Care	IL	Rural and remote Alaska communities face persistent structural barriers to accessing timely, high-quality health care. Workforce shortages, provider turnover, transportation barriers, limited specialty care access, and infrastructure constraints create ongoing challenges for communities that are geographically isolated and weather-dependent. Tribal Health Organizations (THOs) serve as the backbone of health care delivery in many of these regions, yet they often operate within resource-constrained systems that must continuously adapt to maintain services. While many THOs have implemented innovative approaches—including telehealth expansion, community health worker models, and integrated care strategies—these efforts are often fragmented or difficult to sustain due to workforce instability, infrastructure limitations, and funding complexities. This project addresses an opportunity to strengthen Tribal health system infrastructure and sustainability through a collaborative initiative focused on workforce stabilization, telehealth expansion, and systems integration. By partnering with 1–2 Tribal Health Organization partners, the project will identify scalable solutions that improve access to care, enhance coordination across services, and build durable systems capable of supporting long-term rural health transformation in Alaska.	The Indigenous Rural Health Systems Strengthening Initiative will bring together The Raven Collective and 1–2 Tribal Health Organization partners to design and implement systems-level solutions that improve access, quality, and sustainability of rural health care. The project will begin with a structured systems assessment and strategic planning process with participating Tribal partners to identify priority workforce, technology, and service delivery challenges. This process will evaluate existing telehealth infrastructure, workforce capacity, care coordination pathways, and fiscal sustainability considerations to identify opportunities for improvement and scaling. Based on this assessment, the project will support three core areas of transformation: Workforce Infrastructure Strengthening: Participating partners will develop strategies to improve recruitment, retention, and support of rural health workers, including integration of community health workers, Community Health Aides, Behavioral Health Aides, and other frontline providers. Workforce stabilization planning will focus on improving continuity of care and reducing disruptions caused by high turnover. Technology and Telehealth Expansion: The project will strengthen telehealth capacity to improve access to specialty care, behavioral health services, and care coordination across geographically isolated communities. This may include telehealth workflow integration, infrastructure enhancements, and improved connectivity between local providers and regional referral systems. Systems Integration and Sustainability: The initiative will support Tribal partners in strengthening care coordination between primary care, behavioral health, and community-based services. Fiscal sustainability strategies—including reimbursement alignment, infrastructure planning, and operational efficiencies—will be explored to ensure improvements can persist beyond the project period. Throughout the initiative, The Raven Collective will provide facilitation, technical assistance, and project coordination support. Lessons learned from participating partners will be documented to inform scalable rural health system strategies that may benefit other Tribal and rural communities across Alaska.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Ketchikan Gateway Borough; Northwest Arctic Borough	Deferred or Not Advanced

The Recruiting Squad, LLC	Final Consolidated Draft: Alaska RHTP Letter of Interest	DE	Field 1: Project Title HiringOS™: A Decentralized Fulfillment Engine for Alaska’s Rural Clinical Workforce	Field 2: Project Description TRS will deploy HiringOS™ as the primary technical infrastructure for Alaska’s rural healthcare facilities. The platform functions as a direct Fulfillment Engine for local Hiring Managers at hospitals, FQHCs, and Tribal clinics, putting high-velocity recruitment capabilities directly into the hands of local facility leaders. Position Activation: Hiring Managers can activate a clinical vacancy in under two minutes via their dedicated dashboard. Instant Budgetary Estimates: Upon activation, the system generates an immediate Budgetary Estimate based on our usage-based model, providing facilities with instant cost-certainty for RHTP fund allocation. Direct Talent Delivery: Only "Interview-Ready" candidates—vetted for clinical credentials and the federal 5-year rural service mandate—are delivered directly to the facility dashboard for immediate review.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

The Rural Behavioral Health Institute	Screening Linked to Care: School-based Virtual Suicide Prevention for Alaska Youth	MT	Suicide is the second leading cause of death for rural youth in America, yet fewer than half of youth with treatable mental health conditions receive care. Alaska is the epicenter of this crisis. The state's overall suicide rate of 29.7 per 100,000 is the highest in the nation and has increased 34% over the last decade. Alaska Native young people bear a disproportionate burden, with the highest suicide death rates of any population nationally. With 57% of Alaskans living in designated mental health care shortage areas, most rural and remote youth have no pathway to support until they are in crisis. In remote regions, crisis care often does not exist. Untreated mental health conditions among youth are associated with increased school absences, poorer academic performance, lower graduation rates, and greater involvement in child welfare and juvenile justice systems—with lasting implications for entire communities. Early identification and care connection are essential to break this cycle. Alaska is uniquely positioned to be a pioneer in prevention. The state leads the nation in rural healthcare innovation, with dedicated state leadership, growing behavioral health infrastructure, and demonstrated success at designing care that works in the most remote and challenging conditions in the country. RBHI's Screening Linked to Care (SLTC) program is a scalable early identification program that can plug into and activate these existing networks, reaching youth before a crisis.	Alaska has an opportunity to set a national standard for rural youth mental health care through RHTP — and RBHI's Screening Linked to Care (SLTC) is a proven, technology-enabled piece of that puzzle. SLTC provides a ready solution that addresses the complete pathway from screening to appropriate intervention and ongoing care. Grounded in SAMHSA's evidence-based Screening, Brief Intervention, Referral to Treatment (SBIRT) framework, SLTC removes the barriers that prevent rural families from accessing care by bringing bi-annual universal mental health screenings, same-day care for high-risk students, and care navigation support directly to students in grades 3–12 at their schools. Our fully virtual model was built for the realities of rural and frontier communities. Since piloting in one Montana school in 2021, RBHI has delivered 66,000+ screenings in 150+ schools in four states and provided same-day care to more than 4,400 students with elevated suicide risk. Year-over-year, repeat students report more than three-fold reductions in suicidality and 29%+ decreases in severe depression and anxiety, proving that technology-enabled care can improve health equity via enhanced care access for youth in rural and underserved communities. SLTC is modular by design. Schools with existing clinical partnerships use our screening platform and manage follow-up themselves. Schools needing comprehensive support access our full suite of services. In every configuration, schools are in charge. They make all implementation decisions, adapt the program to their community's needs, and own their data. RBHI staff serve as facilitators and are available year-round. Every program component has been co-designed with schools and families: screener selection, real-time school dashboards, consent processes, same-day safety check-ins, and a care navigation platform that families and schools can access at any time. RBHI continuously collects and incorporates feedback from school and community partners to reduce implementation barriers and meet emerging needs. This approach has produced 95%+ school retention because partners genuinely own the work. SLTC is designed to strengthen Alaska's hub-and-spoke infrastructure, connecting schools, Tribal health organizations, local providers, and community organizations around a shared early identification system. SLTC is an early identification tool Alaska's behavioral health infrastructure can use to increase its impact on youth mental health.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

The TEARS Foundation	Amelia and Kannon’s Assistant	AK	Families in Alaska who experience the loss of a child often face immediate and overwhelming financial and logistical barriers, particularly in rural, remote, and frontier communities. Funeral and burial expenses can range from several thousand to tens of thousands of dollars, and costs are often significantly higher in Alaska due to transportation, limited service providers, and geographic isolation. Many families must also manage travel for medical care, the return of a child to their home community, or transportation of family members, creating additional financial strain during an already devastating time. For many families, there are few resources available to help with these urgent expenses. Assistance programs are limited, inconsistent, or difficult to access quickly, leaving families to rely on community fundraisers, loans, or personal savings while navigating intense grief. This gap in support can delay services, increase financial hardship, and add unnecessary stress during the earliest stages of bereavement. Amelia and Kannon’s Assistance was created to address this critical gap by providing immediate financial support to families after the loss of a child. The program helps cover funeral, burial, and related expenses so families can focus on honoring their child and beginning the grieving process rather than worrying about how to pay for essential services. By providing timely assistance and compassionate support, the program helps ensure families across Alaska	AK Afterglow addresses this gap through the Amelia and Kannon’s Assistance program by providing timely, compassionate financial support to families following the loss of a child. The program offers direct assistance for funeral, burial, cremation, and related memorial expenses, helping ensure that families can honor their child with dignity without facing overwhelming financial burden. The approach focuses on rapid response and accessibility. Families, hospitals, social workers, or community partners can submit requests for assistance, allowing the program to respond quickly during a time when decisions and arrangements must be made within days. Funds are distributed directly toward funeral homes or service providers whenever possible to ensure the support is used for its intended purpose and to streamline the process for grieving families. AK Afterglow also works collaboratively with hospitals, care providers, community organizations, and volunteers across Alaska to identify families in need and connect them with available resources. These partnerships help ensure that families in rural, remote, and underserved communities are aware of the program and can access support when it is needed most. In addition to financial assistance, AK Afterglow provides compassionate outreach and connections to grief support and remembrance opportunities, helping families feel supported beyond the immediate loss. This approach strengthens community networks of care while reducing financial and emotional barriers during one of the most difficult moments a family can face.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

THE WSDM NETWORK	WSDM Network: Artificial Intelligence (AI) Integrated Rural Behavioral Health Transformation	AK	In rural Alaska, the behavioral health crisis is compounded by a "technological and logistical desert." Current models of care are reactive and limited by the extreme scarcity of on-site clinicians. For Alaskans in remote or frontier communities, the wait time for intake often exceeds the window for effective crisis intervention. There is a critical lack of digital tools that allow for immediate self-regulation, triage, and trauma-informed screening at the point of need. To fulfill the RHTP mandate of system-level change, Alaska must move beyond traditional telehealth toward an integrated, AI-supported ecosystem that "sparks innovation" by bridging the gap between clinical demand and workforce capacity.	The WSDM Network, leveraging decades of clinical expertise from Wisdom Traditions Counseling Services (WTCS), proposes a transformative project designed specifically to align with RHTP Section 6 (Spark Technology and Innovation). We will test a new delivery modality: a novel Agentic AI-Supported Care Model that prioritizes the "ethical and appropriate use of AI" as a clinical assistant rather than a replacement. This initiative focuses on: • Enhancing Telehealth: Moving beyond simple video calls to interactive, AI-guided behavioral health exercises and supports. • Appropriate AI Use: Utilizing narrow AI models for intake automation and multi-perspective evaluation summaries to reduce provider burnout. This system would be created to flag specific items that a clinical oversight personnel would review and respond to. • Data Sharing & Interoperability: Designing the platform to facilitate seamless clinical documentation and data sharing between rural hubs and specialists. • Cybersecurity: Implementing a framework that secures sensitive behavioral health data in remote, low-bandwidth environments.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

THEMA Health, Inc	Rural & Tribal End-of-Life Access Expansion	AZ	Alaska can seize a scalable, home-based care opportunity that replaces long, costly travel with reliable services at home and earlier, culturally respectful end-of-life support. A hub-and-spoke footprint with mobile clinicians and RPM enables continuous management of chronic illness and smooth transitions into palliative and hospice care even where roads are seasonal or air travel is required. Because rural residents enroll in hospice less often and later, expanding home-based palliative and hospice closes a well-documented quality-of-life gap. The opportunity extends beyond clinical gains: local workforce development (full-time plus per-diem to cover low-density areas), formal referral pathways with rural hospitals, RHCs/FQHCs, tribal and IHS facilities, and reduced reliance on costly medevacs. The model is tailored to Alaska’s frontier context and directly aligns with RHTP initiative areas (Access, Workforce, Technology/Innovation, Pay for Value) to build durable community capacity and long-term system resilience.	We will deploy a regionalized hub-and-spoke clinical operations model built for Alaska’s frontier geography. Hubs in accessible population centers house clinical leadership, care coordination, and telehealth/remote patient monitoring (RPM). Interdisciplinary field teams composed of RNs, LPNs, CNAs/HHAs, therapists, medical social workers, and chaplains that are dispatched from hubs to rural and tribal communities, ensuring reliable coverage where many villages lack on-site physicians and depend on air transport. Care follows an evidence-based continuum: home health to stabilize chronic conditions and reduce acute episodes; palliative care for early symptom control and goals-of-care planning; and hospice for end-of-life management, caregiver training, and culturally aligned support. This directly targets known disparities in rural hospice use, patients entering later and less often than urban peers. Operational reliability is maintained through RPM for daily physiologic checks and rapid triage during weather-limited travel; route optimization and per-diem staffing pools preserve visit adherence across vast distances. Workforce development prioritizes clinicians residing within or near service regions, structured onboarding, and Alaska Native–specific cultural competency. Formal MOUs with rural hospitals, RHCs/FQHCs, and tribal/IHS facilities establish coordinated referral pathways, data sharing, and appropriate use of respite/GIP levels of care, aligning with RHTP’s access, workforce, and technology priorities.	\$1M-\$5M	Home- and communit y-based services provider	Multi- Community or Participating in Regional Hub-and- Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Therapeutic Health and Home LLC	The Arctic Rehabilitation & Telehealth Utility (ARTU)	AK	Rural Alaska currently relies on a costly medevac and charter model for rehab-preventable conditions, directly undermining community health and economic stability. Mothers with sepsis are flown to Anchorage; Elders with unaddressed fall risks suffer hip fractures requiring hospitalization; children with developmental delays are waitlisted for years, missing critical neuro-developmental windows. This reactive system is the main driver of excess healthcare costs and forces residents to leave their support networks for basic care. The opportunity is to operationalize a "Last-Mile" logistics utility that transitions the state to an evidence-based "Treat-in-Place" model. By deploying specialized physical, occupational, and speech therapists directly into villages, we shift the focus to prevention and functional recovery. A hybrid approach including telehealth and RTM fosters consistent presence and empowers individuals to take control of their health. This approach does more than save money; it keeps communities healthy and productive. Providing immediate, local lactation support allows mothers to remain in the workforce. Conducting home safety assessments allows elders to age in place as cultural anchors. Early intervention for pediatric delays ensures the next generation enters school ready to learn. ARTU replaces the breakage-and-repair model with a sustainable infrastructure of prevention, ensuring that health care strengthens the community rather than extracting its members.	Operational Logistics & Infrastructure: Success in rural Alaska is a logistics problem. ARTU utilizes a Year 1 Capitalization Strategy to secure the supply chain immediately: Housing: Utilizing Year 1 funds, we execute Master Leases on 60+ units (Hub Triplexes/Village 4-plexes), stabilizing housing for our workforce without waiting for new construction. Aviation: We secure dedicated Aviation Block-Space (3,000+ segments) on regional carriers, guaranteeing access regardless of freight backlogs. Digital Mesh: Deployment of 100 Starlink High-Performance terminals creates a "Digital Clinical Backbone" for Remote Therapeutic Monitoring (RTM). Train and employ village liasons for set up and ongoing operation of telehealth/RTM locations. Administrative Staffing: We will deploy a C-Suite Executive VP with deep healthcare logistics expertise. The team includes Regional Directors for local oversight, Logistics Coordinators, a Grant Compliance Officer, and a Medical Director. This support ensures clinicians focus solely on patient care. Workforce Ramp-Up & Retention: We deploy 60 specialized clinicians (PT/OT/SLP) in three strategic waves (Months 4, 8, 12). Recruitment is secured through national search firm partnerships with priority given to local candidates. Retention is engineered into the model: our "14-on/14-off" rotation prevents burnout, while a \$20k annual retention bonus incentivizes five-year commitments. Crucially, we fund specialist training pathways, training clinicians into Certified Breastfeeding Specialist (CBS) and Pelvic Rehabilitation Practitioners to directly address the RHTP "Healthy Beginnings" priority. Hybrid Clinical Model: We utilize a hybrid "Treat-in-Place" approach. High-intensity in-person visits address complex needs (manual therapy, neuromuscular re-education, functional training), while the Starlink mesh enables continuous Remote Therapeutic Monitoring (RTM) between visits. This ensures daily adherence to recovery plans, preventing the regression common in sporadic fly-in/fly-out models. Revenue Transition & Sustainability: The project is designed to wean off grant funding. Years 1-2 focus on "Capitalization" and non-billable prevention, training, and educational services (trust-building). Years 3-5 transition to high-volume Fee-for-Service billing and RTM revenue. By Year 6, the utility is fully self-sustaining through commercial revenue and Value-Based (APM) contracts with payers, requiring no further state subsidy.	Over \$5M	Private practitioner	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

thread	Alaska’s Child Care Expansion Program	AK	Alaska faces a significant shortage of quality early childhood education options, with a gap of needed services for over 23,000 Alaskan children. Communities, businesses, and individuals regularly seek thread’s guidance in child care start up support. However, comprehensive services are not available for navigating and supporting communities with child care solutions that fit their needs. Creating and starting a child care in rural communities is complex, expensive, and often involves important and specific facility, staff, and safety requirements, program design and materials, and risk and liability. Alaska’s Child Care Expansion Program will develop a line of business for services designed for communities interested in expanding child care spaces. Child care is an economic driver for rural communities across our state, but many communities are facing shortages of child care spaces or any available child care services at all. thread’s Child Care Expansion Project will create a facilitated community focused service that includes an innovative community engagement process designed to increase the supply of high quality affordable child care in rural communities. The purpose of the Child Care Expansion Project is to guide communities in identifying the scope and size of their child care challenges, and to empower and support communities to develop solutions to address these challenges.	thread seeks to expand the availability of quality child care by creating new and innovative community solutions. Alaska’s Child Care Expansion Program will help communities successfully navigate and plan for addressing child care needs through targeted supports and services. With a focus on rural Alaska, thread will partner with local community stakeholders to assess child care needs, design child care solutions, create community responsive supports and services, and create a user-friendly process designed to generate more child care for families across Alaska. The goal will be for communities to have ownership of their child care solutions including a plan for sustainability and support for long term success. thread will begin with planning to design, create and build agency capacity for this new line of business. This will include contracted expertise to ensure a strong and viable program design and model. The Child Care Expansion Program model will be designed to address the challenges of rural child care through the lens of economic development. thread will design and use a comprehensive, multi-month, community engagement process designed to identify right-sized solutions to increase the supply of high quality affordable child care in rural communities. By mobilizing community members and empowering the creation of community-based solutions, rural communities can preserve existing child care businesses and add new child care spaces designed with their preferences and needs. thread will aim to partner and serve up to five communities through this project period. Through the planning, thread will seek communities identified with RHTP partners and specific rural health challenges that would benefit from child care service expansion. Ready communities will identify with child care challenges impacting health and economic development. Child care shortages have a broad impact beyond the family/health care professionals, and communities will be supported to address these issues with right-sized solutions that meet the unique aspects of the community. Alaska’s Child Care Expansion Program will strengthen the state's early education infrastructure and foster health care economic growth through small business development and enabling more families to work and sustain their families to live, grow, stay, and thrive in Alaska.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

thread	Alaska Early Childhood Educator Wellness Project	AK	Alaska continues to face significant challenges in ensuring access to affordable, high-quality child care. Families statewide struggle to find licensed and regulated care, as the number of available slots does not meet community needs and costs remain prohibitive for many. A severe workforce shortage, driven by ongoing difficulty recruiting and retaining qualified early childhood educators, further limits access to child care. Educators earn low wages, often without paid leave, health coverage, or mental health benefits, contributing to stress, burnout, and turnover. Many early educators rely on public assistance to meet basic needs. These conditions weaken program stability and reduce the quality of care available to children and families. By increasing access to health and wellness supports, and program improvements that strengthen quality and best practices, the early childhood workforce will be better equipped to remain in the field. When educators have the tools and supports to maintain their physical and mental health, they are more likely to seek preventive care, manage stress effectively, and build long-term resilience. This leads to stronger job satisfaction, higher retention, and more stable child care programs. Ultimately, healthier educators contribute to healthier communities and a stronger early childhood system statewide.	The Alaska Early Childhood Educator Wellness Project will strengthen the health, wellbeing, and retention of Alaska’s early childhood workforce by expanding access to wellness and prevention supports and improving program environments statewide. thread will contract with an external evaluation partner to survey early educators and child care programs about the benefits they currently receive and those that most effectively support workforce stability. These findings will guide future strategies to improve recruitment and retention in the field. To promote preventive care and improve access to health services, thread will host 15 Health Fairs and Wellness trainings in identified communities in Alaska over the course of the grant. A prior pilot partnership with the Municipality of Anchorage (MOA) served approximately 35 educators at no cost, providing health screenings and a three-hour wellness training, followed by distribution of wellness items such as air purifiers, HEPA vacuums, electric toothbrushes, and Insta-pots. Thread plans to build onto this successful model and provide travel support so rural and remote educators can participate too. The project will also expand access to mental health and wellness tools by providing Calm app subscriptions to early educators. A previous pilot reached more than 1,500 educators and offered a wide range of meditations, movement activities, sleep supports, and classroom-appropriate resources. Subscriptions include two virtual wellness trainings and the ability for educators to share the resource with up to five family members or colleagues. To encourage physical activity, thread will also distribute pedometers to track, incentivize, and increase daily movement. Finally, thread will administer improvement funds to child care programs to strengthen health and safety conditions for staff, children, and families. Drawing on successful implementation of similar funding during COVID-19, these resources will help programs make meaningful upgrades that support workforce wellness, improve environments, and enhance long-term program sustainability.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

thread	Alaska Early Childhood Mental Health Project	AK	The mental health of young children, educators, and families is critical to positive, lifelong physical and mental health outcomes. Growing research suggests many educators may experience inequitably high levels of stress compared to other adults in the United States. This stress may lead to morbidity and mortality in educators, affects educator retention, and can lead to poor mental health in children, as well as increased expulsion and adverse childhood experiences. Young children are expelled at 3 times the rate of K-12 students from state-funded preschool; private and community childcare programs expel children at more than 13 times the rate of K-12. Children expelled or suspended are more likely to experience academic failure and face juvenile incarceration. Reasons linked to exclusionary practices include educator stress & wellbeing, implicit bias, & lack of skills & knowledge. To address this need, thread proposes expanding the access of early childhood programs, families, and behavioral/mental health professionals to the Pyramid Model, which is designed to support young children’s mental health & reduce exclusionary practices. This project also will promote access to GoNAPSACC (State of Alaska, Department of Health program) mental health training. Coaching is critical to the implementation of any training, and this project will increase access to trained coaches via the Relationship Based Professional Development Credentialing System and online coaching system.	To achieve long-term outcomes and goals, thread will promote the project to early childhood educators, behavioral/mental health professionals, and families, providing access to training and coaching supports. thread will provide a variety of asynchronous and conference trainings to educators, behavioral/mental health professions, and families, including a contract to Pyramid Model Consortium to expand access to emodules as well as travel and registration reimbursements to attend the NW Pyramid Early Learning Summit taking place in November 2026 in Anchorage. Early childhood educators will also have access to coaching to unpack and implement knowledge gained from training and thread will work to increase number of professionals with early childhood coaching certification (Relationship Based Professional Development (RBPD)) via training and mentor coaching thread will also evaluate the impact of educator and behavioral health professionals' knowledge and use of Pyramid Model practices in their work with families and young children to reduce exclusionary practices and increase healthy social emotional development. To further support educators, children, and families, thread will promote use of and completion of GoNAPSACC mental health modules. thread, in partnership with The Alaska Department of Health, Physical Activity and Nutrition Unit (DOH PAN), will offer early educators the Go Nutrition and Physical Activity Self-Assessment for Child Care (GoNAPSACC) program. Through this program, early educators receive technical assistance from thread to plan and support the health, nutrition, and physical activity of the children in their program. GoNAPSACC has released an additional module on social emotional development that thread will be promoting and providing to early educators.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

thread	Growing Professional Development for Alaska’s Early Childhood Educators	AK	Alaska’s early care and learning system is facing significant workforce recruitment and retention challenges that directly impact the wellbeing of children, families, and the broader rural health ecosystem. In many communities, particularly those that are remote or medically underserved, consistent staffing is essential to supporting healthy child development and reducing caregiver stress. National best practices demonstrate that stable educator child relationships contribute to improved developmental outcomes and strengthen protective factors within families. Despite this need, many early childhood programs across Alaska continue to operate with chronic understaffing, limiting their ability to provide high-quality onboarding, training, and ongoing professional support for new educators. These workforce shortages are especially pronounced in rural communities, where limited local training infrastructure and high turnover hinder continuity of care and place additional strains on families and community health systems.	To address these gaps, the proposed initiative seeks to establish a comprehensive professional development continuum designed to stabilize and strengthen the early childhood workforce statewide, with a focus on rural program needs. The project will deliver structured onboarding, coordinated year one training, stackable micro credentialing opportunities, and support for achieving the Child Development Associate (CDA) credential. Post CDA technical assistance will further promote workforce advancement and long-term retention, helping build a sustainable pipeline of qualified educators in areas where health and social services capacity is already stretched. To ensure accessibility for programs located in rural and remote communities, project implementation will utilize a multimodal delivery approach that includes in-person sessions, virtual instruction and coaching, and asynchronous learning opportunities. When necessary to support full participation and program effectiveness, the initiative will provide travel assistance, lodging, and program stipends—reducing common barriers faced by rural educators and ensuring that critical workforce development activities are available statewide. Through this initiative, thread aims to strengthen early learning capacity as a foundational component of rural community health, support family stability, and improve long-term wellbeing outcomes for Alaska’s youngest children.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

thread	Unified Child Care/Early Education Data System for Alaska	AK	Alaska’s child care and early education data systems operate in silos, with no secure or automated way to share information between thread and State of Alaska departments such as DEED and DOH. thread’s system maintains program data, SEED information, Learn & Grow levels, and family referral data, while the State’s Division of Public Assistance holds licensing and subsidy data. DEED maintains a separate database for Head Start, Early Head Start, and pre-elementary programs. Because these systems can’t communicate, families, providers, and staff must duplicate data entry, ask for data from each other, and wait longer to access the data needed to deliver or receive services. This also prevents the state from having a unified, accurate view of child care/early education in Alaska. *This proposal is for child care/early education it would be nice to do a project to have all early childhood data linked together (ie: WIC, ILP, behavioral health, etc.).	This project will use a structured, collaborative process to identify a secure and effective way for thread and the State of Alaska to share child care and early education data. This project will begin with a discovery phase to map how the SOA and thread databases currently collect and store information. This includes understanding thread’s Salesforce database on professional development, child care/early education programs, and family referrals; the Division of Public Assistance data on licensing and subsidies; and DEED data on Head Start, Early Head Start, and pre-elementary programs. Through interviews, workflow reviews, and data analysis, the project will identify where duplicate entry, inconsistent information, and gaps are creating challenges for families, providers, and agencies. Based on this assessment, thread and the SOA will research and identify technology that would close those gaps and silos in data, and ideally, then purchase technology(ies) to implement. Strengthening the child care/early education data system will also support and improve Alaska’s broader health care system. Reliable child care/early education is essential for health care workers, family stability, participation in the workforce, and children’s healthy development. When health care workers and families have accurate information about available child care/early education, they are better able to maintain employment, attend medical appointments, and access preventive care. Additionally, the project would help policymakers better understand the child care/early education sector.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Thriving Within, LLC	Alaska Clinical Supervision Access Project: Supporting LCSW and LPC Licensure in Rural Communities	AK	Alaska faces a persistent shortage of licensed behavioral health providers, especially in rural and remote communities. The state is federally designated as a Mental Health Professional Shortage Area, and workforce analyses estimate Alaska must recruit over 9,000 new health workers annually to meet demand and replace turnover. In rural areas, limited licensed clinicians contribute to long wait times, service gaps, and reliance on temporary or traveling providers. A key barrier to expanding the behavioral health workforce is limited access to the clinical supervision required for licensure. Early-career clinicians report difficulty obtaining supervision due to cost, limited supervisor availability, and scheduling constraints—barriers intensified in rural and isolated communities. Many clinicians experience delays completing licensure or leave Alaska to access supervision elsewhere, contributing to workforce instability. This project will pilot a stipend-supported individual and group clinical supervision program to expand access to licensure-quality supervision for mental health professionals across Alaska. In addition to supporting licensure, structured group supervision provides mentorship and peer connection for clinicians in isolated settings. These supports reduce professional isolation, strengthen clinical practice, and improve retention, helping providers remain in rural communities while completing full licensure.	This project will pilot a stipend-supported group clinical supervision program designed to increase access to supervision required for clinical licensure in Alaska. The pilot will operate over a thirty-month period and will be implemented in three phases: Foundation and Training, Implementation and Rolling Recruitment, and Evaluation and Sustainability. Phase 1: Foundation and Training (Months 1–3): The initial phase will focus on program development, supervisor preparation, and outreach. Contracts will be finalized with Alaska-based Licensed Clinical Social Workers who have post-licensure clinical experience in Alaska. Participating supervisors will complete required continuing education related to supervision standards under Alaska regulations and engage in additional coursework to support supervision of clinicians pursuing multiple forms of clinical licensure. Outreach and recruitment will begin through partnerships with behavioral health agencies, Tribal health organizations, rural clinics, school districts, and university social work and counseling programs. Phase 2: Implementation and Rolling Recruitment (Months 4–27) Following program launch, the project will provide two to three remote group supervision sessions per month, with each group serving approximately six to eight clinicians. Through a rolling recruitment model, new clinicians will be admitted as participants complete licensure requirements or openings become available. Supervision sessions will incorporate ethical practice consistent with the NASW Code of Ethics, trauma-informed care principles, reflective supervision, and culturally responsive approaches relevant to Alaska’s diverse communities. Sessions will include case consultation, ethical decision-making, professional development, legal and regulatory requirements and licensure preparation as required by Alaska. Phase 3: Evaluation and Sustainability (Months 28–30) The final phase will focus on program evaluation and sustainability planning. Supervision hours will be documented using standardized attendance logs and verification forms aligned with Alaska licensure requirements. Evaluation will monitor supervision hours delivered, participant progress toward licensure, and participant satisfaction. Findings will inform recommendations for sustaining and expanding the supervision model to strengthen Alaska’s behavioral health workforce, particularly in rural and underserved communities.	\$50,000-\$250,000	Private practitioner	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Thriving Within, LLC	Integrating Social Work and Public Health to Strengthen Rural Health Care Systems	AK	Alaska’s rural health system faces persistent workforce shortages that limit the ability of public health centers to address both clinical needs and the broader social determinants influencing health outcomes. Public health nurses frequently serve as frontline providers managing prevention services, care coordination, and population health initiatives, yet the complexity of community needs—particularly those related to social determinates of health—often requires additional workforce capacity and specialized knowledge of services. Master of Social Work (MSW) providers are well positioned to support these efforts. MSW clinicians receive extensive training and practicum experience prior to graduation, allowing them to deliver high-quality case management and community services in a cost-efficient manner, as salary for MSW providers are typically lower than those for public health nurses. At the same time, many recent MSW providers face limited access to structured supervision and early-career professional development in rural areas where licensed clinical supervisors are scarce. This gap can delay licensure progression and discourage long-term rural practice. This project proposes a proof-of-concept program integrating recent MSW providers, including those from the dual MSW/MPH program at the University of Alaska Anchorage, into public health centers across Alaska with structured supervision and training to support prevention-focused and community-based health interventions.	The proposed project would implement a supervised workforce development model placing MSW providers, including those from the MSW/MPH dual-degree program at the University of Alaska Anchorage, within public health centers across Alaska. In this role, social workers would collaborate with public health nursing teams to address social determinants of health, support care coordination, strengthen community partnerships, and assist with prevention-oriented initiatives. Participants would receive a cost-of-living salary stipend and additional training stipend in exchange for a one-year service commitment within participating public health centers. This structure is intended to support recruitment while improving workforce stability in communities that often experience high turnover. Clinical supervision and consultation would be provided by an experienced Licensed Clinical Social Worker with experience in behavioral health and community-based practice. Supervision would include telehealth-based individual supervision, group consultation, and interdisciplinary case collaboration with public health teams to support professional development and quality of care. MSW providers would contribute to public health activities including social needs screening, resource navigation, care coordination, prevention programming, and partnerships with local organizations. Providers with dual MSW/MPH degree would also contribute skills in population health analysis, program development, and evaluation. Technology-enabled supervision would allow participants in rural and remote communities to remain connected to professional support networks. The project would be implemented as a three-year pilot. Phase one focuses on program development, including establishing workflows, supervision structures, and collaboration with public health teams. Phase two places MSW providers in 2-3 public health centers to support prevention and community-based interventions. Phase three evaluates workforce feasibility, integration within public health teams, and improvements in care coordination and community health interventions.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Matanuska-Susitna Borough	Deferred or Not Advanced

TigerConnect, Inc.	Connecting Alaska: A Unified Clinical Communication Network from Village Clinics to Regional Hubs	CA	Alaska's healthcare landscape is defined by vast distances, isolated communities, and a fragmented network of regional hospitals, critical access hospitals, and tribal clinics spread across some of the most remote terrain in the US. For patients in rural and village settings, fragmented communication between providers is not a minor inefficiency, it is a barrier to timely, potentially life-saving care. When a village health aide needs to escalate a critically ill patient, or a rural clinician needs a specialist consult from Anchorage, the current reality is phone tag, fax machines, and disconnected systems with no shared visibility into patient status. These communication gaps have direct clinical consequences: delayed consults, slow care escalation, missed transfers, and an inability for leadership to identify where patients are falling through the cracks. Rural communities bear the highest burden of these delays, facing the greatest geographic barriers while also experiencing the highest rates of conditions where timely communication determines outcomes including stroke, trauma, cardiac events, and behavioral health crises. TigerConnect serves as ANTHC's enterprise clinical communication platform, yet communication across hospitals, independent health systems, and rural and tribal clinics remains inconsistent and fragmented. There is a opportunity to extend this proven platform statewide, creating Alaska's first unified clinical communication network.	TigerConnect proposes building a unified, statewide clinical communication network across Alaska, connecting every hospital and clinic on a single HIPAA-compliant platform so that care teams at any level can communicate securely, escalate patients rapidly, and coordinate transfers without switching systems. The goal is ensuring that no Alaskan patient's care is delayed because their provider lacked a reliable way to reach the right specialist at the right moment. The model is built around a hub-and-spoke structure. Each region's anchor hospital serves as the communication hub, with affiliated critical access hospitals and rural clinics connected as spokes. Regional tribal organizations including Yukon-Kuskokwim Health Corporation, Norton Sound Health Corporation, and SEARHC would each serve as regional hubs, alongside health systems such as Providence Alaska, Fairbanks Memorial, Bartlett Regional, and Mat-Su Regional. Connections are established based on clinical need transfer corridors, shared specialist networks, and referral pathways not blanket connectivity. Because all facilities operate on a single platform, care teams can securely message specialists in real time, escalate urgent cases, share clinical information, and coordinate transfers seamlessly. TigerConnect's workflow automation further streamlines care escalation by automatically routing urgent messages, triggering escalation protocols, and ensuring time-sensitive cases reach the right provider without manual intervention. Centralized analytics will capture communication volume, response times, and escalation patterns, giving leadership actionable data to improve care coordination statewide. ANTHC, as an existing TigerConnect partner, provides the proof of concept for this initiative. TigerConnect already serves over 7,000 healthcare organizations nationally, and its lightweight, cloud-based, mobile-first architecture is well-suited for Alaska's low-bandwidth, remote clinic environments.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

TigerConnect, Inc.	Transforming EMS-to-ED Communication Across Alaska with TigerConnect PreHospital	CA	Alaska's EMS landscape presents unique and persistent challenges. EMS providers including village health aides, regional ground crews, and air medical teams routinely transport high-acuity patients across some of the most remote and vast geography in the nation to regional critical access hospitals and major referral centers. Communication between EMS providers and receiving emergency departments relies heavily on radio and telephone calls that are frequently unreliable, unstructured, and inefficient. These limitations contribute to: • Prolonged EMS handoff times and delays at receiving facilities • Delayed clinical decision-making due to incomplete patient information • Unprepared ED teams, resulting in reactive rather than proactive care • Slower treatment for time-sensitive conditions including stroke, trauma, STEMI, and sepsis. Where patients travel hours by air or boat before arriving at an ED, even small communication delays can materially affect outcomes. A statewide solution is needed one that delivers structured, real-time clinical information from any EMS provider to any receiving facility, regardless of location or transport modality. TigerConnect Prehospital is proven nationwide, including in rural areas facing similar challenges. Deployments show improved handoff times, ED throughput, door-to-provider times, reduced staff workload, and gains in bed-days saved, transfer revenue, readmission rates, mortality index, LOS, and patient and provider satisfaction.	This initiative proposes deploying TigerConnect PreHospital as a unified, statewide EMS-to-ED communication platform connecting field providers, regional hospitals, and major referral centers across Alaska. Smaller scope deployments, like Anchorage area hospitals and local EMS, are also possible as project guidelines. The Alaska Native Tribal Health Consortium (ANTHC) is a current TigerConnect customer, utilizing the enterprise communication platform for care communication and collaboration across its network. The addition of TigerConnect PreHospital represents a complementary, easy to implement and enhancement to an existing enterprise relationship, with ANTHC/ANMC as the intended Phase 1 pilot site. The intuitive user interface (UI) of the platform, in addition to the very low IT and implementation resource requirements, makes it a very easy platform to scale between single implementations and state-wide initiatives, so that it can fit to whatever desired Phase 1 scope would work best. TigerConnect PreHospital is widely used around the country already as the main communication pathway for 911 prehospital communication for 120+ facilities and 500+ EMS agencies. It has currently powered over 2.5 million cases, showcasing deep levels of adoption by both EMS and hospitals for their daily communication needs. Users span all environments and organization types, from small rural critical access hospitals and their volunteer EMS partners to large urban hospitals and private and municipal EMS entities. TigerConnect Prehospital enables EMS providers to transmit HIPAA compliant, secure reports about incoming patients in seconds, and is agnostic to mobile devices commonly used in the field by EMS. Notifications include powerful clinical data like: • Clinical summaries and patient identification • Trauma scene images and stroke assessment videos • Real-time 12-lead ECG transmission • Telehealth consult integration. Receiving ED teams access secure, HIPAA-compliant case data via a centralized dashboard with real-time GPS tracking of inbound ambulances and aircraft, enabling early triage, proactive specialty activation, and optimized resource deployment before patient arrival. All case communications are automatically captured to support quality assurance, performance benchmarking, and continuous improvement, with the implications of statewide data capture leading to significant analysis that can help drive and support further initiatives and improvements.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Dillingham Census Area; Fairbanks North Star Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

TigerConnect, Inc.	Transforming Interfacility Patient Transfers Across Alaska with TigerConnect Transfer	CA	Alaska's extreme geography makes interfacility transfers uniquely high-stakes. Regional hospitals routinely transfer high-acuity patients to larger referral centers for specialty care, coordinating across vast distances with limited tools. Current workflows rely on excessive phone calls, manual coordination, and paperwork, with limited visibility into bed availability. These inefficiencies delay treatment, prolong bed occupancy, increase wait times, and contribute to major referral centers frequently reaching divert status limiting access to critical care for rural Alaska Native communities. When a remote village patient requires specialty care, every hour spent navigating a fragmented transfer process is an hour lost to treatment. For stroke, trauma, STEMI, and sepsis patients, that delay can mean the difference between recovery and permanent impairment. A unified, digitized transfer coordination platform purpose-built for Alaska's distributed health network would eliminate these inefficiencies, moving patients to the right level of care faster and with reduced administrative burden on stretched rural clinical teams. TigerConnect is ANTHC's enterprise clinical communication platform. That existing foundation, shared infrastructure, platform familiarity, trusted partnership makes ANMC the natural pilot site to prove this model before expanding statewide. ANMC is the intended pilot site, subject to capacity following RHTP grant awards.	TigerConnect Transfer is a cloud-based SaaS platform that unifies bed sourcing, transport scheduling, and real-time clinical communication into a single, intuitive solution. When a regional facility identifies a patient requiring transfer, care teams digitally share case information with receiving specialists and transfer centers in real time, enabling proactive preparation before the patient arrives. Transfer teams gain live visibility into available beds across facilities, order ambulance and medical transport services directly, and track transfer and discharge status in real time. Automated workflows reduce coordination burden on clinical staff, while built-in reporting and analytics track key metrics including transfer times, transport vendor performance, and throughput, providing leadership with actionable insights for quality assurance and continuous improvement. The platform requires no on-premises infrastructure and is optimized for low-bandwidth environments, making it well-suited for Alaska's remote regional facilities. TigerConnect intends to pilot this solution within the ANTHC network, connecting ANMC as the primary receiving facility with rural regional hospitals and village clinics that initiate transfers. A successful pilot demonstrating measurable reductions in transfer coordination time and divert events at ANMC is intended to build the evidence base for broader adoption across ANTHC's full regional network, though network-wide expansion will depend on ANTHC organizational prioritization following the pilot. Final implementation timing will be confirmed in coordination with ANMC and ANTHC leadership following grant award, as ANTHC may be managing a high volume of concurrent RHTP initiatives.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Tribal Health, LLC	Alaska Wellbeing Care Community: Digital Care Coordination & Community Health Infrastructure	AZ	Alaska’s healthcare system includes rural and Tribal clinics, hospitals, behavioral health providers, and community-based organizations that often operate across independent systems without shared operational infrastructure for coordinating referrals or tracking connections to community services. The state has made important investments in clinical data sharing through the statewide health information exchange operated by healthEconnect Alaska, and integrated care models such as the Nuka System of Care demonstrate the effectiveness of coordinated care within individual healthcare organizations. However, coordination challenges frequently occur between organizations, particularly when patients require services outside the healthcare system such as behavioral health treatment or community-based social services. The Alaska Wellbeing Care Community initiative addresses this gap by implementing an innovative technology platform that enables healthcare providers, Tribal health organizations, behavioral health agencies, and community-based organizations to coordinate services through shared workflows and closed-loop referral tracking. This approach complements Alaska’s existing health information exchange and care delivery systems by supporting operational collaboration across independent organizations while allowing each organization to maintain its own governance and care delivery models.	The Alaska Wellbeing Care Community (AWCC) initiative will establish a statewide digital care coordination infrastructure that enables hospitals, Tribal health organizations, community health centers, behavioral health providers, and community-based organizations to collaborate through shared referral and coordination workflows. The initiative will utilize the Wellbeing Care Community digital coordination platform as the core technology solution. Through this model, the State of Alaska would support deployment of a shared coordination infrastructure that allows participating organizations to access common tools for referrals, communication, and service tracking without requiring each organization to independently procure separate systems. This approach reduces implementation barriers while creating a consistent statewide coordination framework. Tribal Health will serve as the operational and program management partner responsible for implementation and adoption. Responsibilities include conducting readiness assessments, onboarding participating organizations, mapping care coordination workflows, and providing training and technical support. Tribal Health will also help develop local super-users within participating organizations to support long-term sustainability and adoption. The platform will support closed-loop referral management across healthcare and community organizations, documentation of social determinants of health needs, behavioral health referral coordination, and secure communication between providers and community partners. Population-level dashboards will provide insight into service utilization, referral outcomes, and unmet needs, helping organizations and state partners better understand community health challenges. Implementation will occur through a phased approach beginning with stakeholder engagement, readiness assessments, and onboarding of initial participants. Later phases will expand participation statewide while supporting ongoing performance monitoring and workflow refinement. By combining shared technology infrastructure with coordinated implementation support, the AWCC initiative will strengthen collaboration across Alaska’s healthcare and community service sectors and improve the ability of providers to connect patients to the services they need.	Over \$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Tribal Health, LLC	CARE Team + KATE AI: Strengthening Rural Emergency Triage & Workforce Stabilization	AZ	Emergency departments across rural & frontier Alaska face persistent workforce shortages, geographic isolation, limited specialty access, and significant behavioral health service gaps. Clinicians in these facilities must rapidly triage and stabilize complex patients with limited backup support and prolonged transfer timelines. Variation in Emergency Severity Index (ESI) triage assignment, delayed recognition of time-sensitive conditions, and limited behavioral health consultation can slow critical decision-making in these settings. Earlier identification of conditions such as sepsis, stroke, myocardial infarction, obstetric emergencies, and acute behavioral health crises is essential to safe stabilization when specialty care or rapid transfer is unavailable. This project addresses the opportunity to strengthen frontline emergency care through standardized triage support, workforce capacity building, and integrated decision support tools. CARE Team + KATE AI combines AI-enabled clinical triage assistance with embedded emergency medicine expertise to reduce clinical variability and improve early risk recognition. The model also creates a structured pathway for integrating telebehavioral health consultation into emergency department workflows, improving crisis evaluation and disposition planning where psychiatric coverage is limited.	The CARE Team + KATE AI initiative combines AI-enabled clinical decision support with embedded emergency medicine integration to strengthen stabilization capacity in rural & frontier emergency departments. The initiative incorporates KATE AI, a clinical risk intelligence platform that enables recognition of high risk presentations & supports objective ESI triage assignment through structured triage assessments & EHR data. The platform is deployed across U.S. health systems, including Adventist Health & UMass Memorial Health, & supports more than 4.6 million emergency visits annually across 40+ hospitals. Implementations demonstrate earlier identification of high-risk conditions & improved escalation of critically ill patients. In rural Alaska settings where specialty consultation & rapid transfer may be limited this capability strengthens recognition of time-sensitive medical & behavioral health conditions. Technology deployment is paired with Tribal Health’s CARE Team, which embeds emergency clinicians within participating facilities to translate decision support into sustainable practice change. The CARE Team conducts readiness assessments, maps triage workflows, integrates clinical protocols, & provides on-site nurse training, simulation-based reinforcement, & bedside coaching. This approach strengthens workforce confidence, reduces variability in triage decisions, & builds durable clinical capacity within local teams. Facilities may also integrate telebehavioral health consultation within emergency department workflows. Under this model, telebehavioral services may be delivered through FasPsych, a sister portfolio company to Tribal Health specializing in emergency telepsychiatry, with unified program oversight and clinical integration maintained by Tribal Health. The CARE Team supports participating facilities in embedding telebehavioral consult pathways directly into triage & stabilization processes, including development of activation criteria, staff training, documentation alignment, & structured evaluation & disposition pathways. Implementation follows a phased model including facility engagement, workflow mapping, EHR integration, clinical training, telebehavioral health integration where selected, & performance monitoring. Through coordinated technology deployment and workforce development, the initiative strengthens access to specialty-informed care while improving consistency & resilience within Alaska’s rural emergency departments.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Tribal Health, LLC	Moms & Minis Alaska: Rural and Indigenous Maternal Health & Workforce Transformation	AZ	Alaska Native mothers experience disproportionately high maternal morbidity and mortality, with many deaths considered preventable. Rural communities face severe geographic isolation, workforce shortages, and limited access to maternal and perinatal behavioral health providers. In many regions, pregnant individuals must travel long distances or temporarily relocate for prenatal care or delivery. These barriers contribute to delayed care, untreated perinatal mental health conditions, preventable complications, and costly emergency medical transport. The current system relies heavily on reactive hospital-based care rather than preventive, community-based maternal health services. This project addresses a critical opportunity to transform rural maternal care delivery by expanding locally accessible services, strengthening Indigenous workforce capacity, and leveraging telehealth-enabled care. By combining mobile maternal services with behavioral health screening, referral coordination, and community-based workforce development, Moms & Minis Alaska aims to improve maternal and infant outcomes while expanding access to care in remote communities.	Moms & Minis Alaska is a maternal health and workforce transformation initiative centered on a technology-enabled mobile maternity clinic model, complemented by pop-up and in-home outreach. The project includes four integrated components: 1. Mobile Maternity Clinics as Hub Extenders Fully equipped mobile maternal health units will be purchased or leased and will travel to rural and tribal communities in coordination with Tribal Health Organizations and rural/regional providers. Units will deliver prenatal and postpartum assessments, infant wellness checks, perinatal depression and substance use screening, basic ultrasound capability where appropriate, remote fetal monitoring, and care navigation. In communities with existing clinics, the mobile unit augments local capacity and specialty access. In communities without facilities, it functions as a temporary clinic, reducing travel burden and improving early risk detection. 2. Indigenous Workforce Development The mobile clinic serves as a training and mentorship platform for locally recruited tribal members. Tribal Health will provide structured learning modules, tele-mentorship with maternal and behavioral health specialists, and coordination with Alaska’s Community Health Aide Program referral systems. This “grow your own” model builds sustainable local capacity while strengthening cultural alignment and workforce retention. 3. Tele behavioral Health & Specialist Access Each mobile unit will be equipped with secure telehealth connectivity to enable real-time consultation with OB/GYN, CNM, and psychiatric providers. This expands access to perinatal mental health and substance use disorder services in regions without specialty care and reduces provider isolation. 4. Technology & Data Integration Mobile services will incorporate remote patient monitoring tools and AI-supported decision guidance to assist frontline staff in identifying high-risk pregnancies earlier. Clinical data will integrate with existing EHR systems to support continuity of care and regional planning. Together, this model shifts maternal care from reactive emergency transport to proactive, community-based prevention while strengthening Alaska’s Hub & Spoke framework.	\$1M-\$5M	Maternal health	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Tri-Valley Volunteer Fire Dept	Tri-Valley Volunteer Fire Department Emergency Medical Response Modernization	AK	TVVFD provides fire and EMS response to the Denali Borough, serving approximately 1,600 year-round residents with a fully volunteer workforce responding to fires, medical emergencies, trauma incidents, highway collisions, and seasonal tourism-related calls. TVVFD lacks modern emergency response equipment, reliable communications, and accessible training resources needed for a volunteer EMS and fire department to safely and effectively respond to emergencies in a remote region. This project seeks to address three core issues to increase health care access and strengthen the workforce: - Outdated and insufficient medical equipment: Aging cardiac monitors, lack of video laryngoscopes, and manual stretchers limit patient care capability and increase injury risk for volunteers. - Unreliable communications infrastructure: Radio coverage issues, aging handheld radios, and changing RF conditions reduce the reliability of emergency coordination and medevac activation. - Limited training access for a volunteer workforce: Geographic isolation and lack of training equipment make it difficult for volunteers to maintain critical emergency response skills. These critical gaps threaten the sustainability of the volunteer workforce serving a remote community.	Phase 1: Equipment Modernization: To improve the quality of care provided, TVVFD will modernize diagnostic equipment with three LIFEPAK 35 units at an estimated cost of \$80,000 per device. Upgrading to the LIFEPAK 35 will provide improved ECG clarity and diagnostic capability, enhanced cardiac arrest management tools, integrated CPR feedback, expanded data capture for quality improvement, greater durability and long-term lifecycle support. TVVFD will purchase two video laryngoscopes at an estimated cost of \$5,000 per unit. In a volunteer agency where intubation is infrequent but high risk, video laryngoscopy improves outcomes while strengthening provider confidence and competency. To protect and preserve the health of its workforce, TVVFD will purchase three powered self-loading cots from Stryker at an estimated cost of \$75,000 per unit. Powered cots will reduce lifting-related injuries, protect aging volunteers, allow safe patient loading with smaller crews, and improve patient stability during movement. To improve provider confidence and competency through repetitive, hands-on practice, TVVFD will purchase specialized task trainers (approximately \$50,000) for advanced airway placement, IV and IO access, difficult airway scenarios, and trauma procedure reinforcement. These tools will allow repetitive, hands-on practice within the TVVFD station, strengthening skill retention in a low-volume rural system and reinforcing training tied directly to the new clinical equipment. Phase 2: Communications Infrastructure Modernization: TVVFD proposes to purchase and install seven Pyramid SVR Vehicular Repeaters in frontline apparatus to improve signal strength, mitigate structural interference, and strengthen Alaska Land Mobile Radio (ALMR) interoperability. The estimated cost is \$30, 673. TVVFD will also purchase 15 ALMR-compatible handheld radios (estimated cost of \$75,000). Lastly, TVVFD will ensure seamless connectivity in remote response areas by purchasing six Starlink Mini systems with Satgear PM4 roof mounts and cabling for approximately \$4,250. Phase 3: Workforce Development and Training: To reduce the financial burden on its volunteer workforce, TVVFD is seeking to expand its capacity to host instructors in Healy. Hosting training locally allows TVVFD to significantly lower training costs, train multiple providers simultaneously, reduce time away from families and employment, and increase participation among volunteers who may otherwise be unable to travel.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough	Deferred or Not Advanced

True North Recovery, Inc.	Anchorage Launch Pad	AK	Behavioral health crises often escalate not because services do not exist, but because individuals cannot easily access or navigate them when needed. For Alaskans experiencing mental health or substance use crises, the default entry is emergency rooms, police, or no care at all. This gap is reinforced by Providence Alaska’s 2024 Community Health Needs Assessment, which identified increasing mental health and substance use access as top community priorities. True North Recovery (TNR), in partnership with the Anchorage Police Department HOPE Team, has gained direct insight into how some of the community’s most vulnerable members seek crisis services in Anchorage. Outreach consistently reveals untreated behavioral and substance use conditions among those experiencing houselessness. These interactions underscore the need for a low-barrier community access point offering immediate support and service connection. To address this gap, TNR proposes the development of the Anchorage Launchpad. This project establishes a low-barrier crisis and navigation access point in downtown Anchorage. Using a walk-in Peer Living Room model, individuals experiencing behavioral health crises can receive immediate peer-led engagement, stabilization, and connection to services in a welcoming, peer-led environment. Launchpad advances the RHTP initiative, Health Care Access, by expanding access to behavioral health services.	This project is currently in the Ready to Launch phase. The Anchorage Launchpad has secured \$750,000 in capital support from the Municipality of Anchorage, allowing the project to move forward while RHTP funding supports Year 1 operational costs and specialized training. The Anchorage Launchpad will operate as a peer-led crisis and navigation access center grounded in the Peer Living Room model. Certified Peer Support Specialists serve as the first point of engagement, providing crisis de-escalation and practical assistance while helping individuals identify immediate needs and next steps. This peer-led approach creates a welcoming environment where individuals feel respected and understood, reducing stigma that often prevents people from seeking help. To support this model, Launchpad integrates access to behavioral health clinicians for clinical evaluation and suicide risk assessment while offering behavioral health screening and walk-in integrated behavioral health assessments. Individuals can receive immediate peer support while also connecting to clinical evaluation when needed. True North Recovery operates a regional hub-and-spoke network with facilities in the Mat-Su, Fairbanks and Ketchikan, allowing individual service needs to be supported across the TNR continuum. This statewide access is especially relevant in Anchorage, which serves as a hub city and often receives individuals who arrive for specialty care or other services and later find themselves in crisis. Through peer engagement and rapport building, Launchpad can help individuals reconnect with appropriate services, often closer to home through the broader TNR network. Launchpad’s design aligns with the Crisis Now framework, reflecting nationally recognized crisis response best practices that emphasize rapid access to behavioral health support, stabilization in community settings, and coordinated care. As Anchorage continues developing its crisis continuum, Launchpad will function as a complementary access point supporting individuals who do not require high acuity crisis stabilization while also providing step-down support for those transitioning from higher levels of care. This approach creates opportunities for earlier intervention, shifting crisis response away from emergency departments and police, by establishing a local option for outpatient behavioral health crisis support and navigation services.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Advance to Implementation Application

True North Recovery, Inc.	Ketchikan Launch Pad	AK	Ketchikan faces significant gaps in behavioral health crisis response, often forcing residents to rely on law enforcement or the emergency department. In this geographically isolated island community, a lack of early intervention can exacerbate crises and result in traumatic off-island transports for stabilization. While the Fire Department’s Mobile Integrated Health team provides vital outreach, the community lacks a dedicated, voluntary access point for support outside of emergency systems. The Launchpad project addresses this by establishing a low-barrier crisis and navigation center in downtown Ketchikan. Utilizing a "Peer Living Room" model, it provides immediate peer-led engagement and stabilization in a welcoming, non-clinical setting. This approach shifts crisis response away from police and hospitals, providing a local alternative for early intervention. By connecting rural Alaskans to outpatient services and community resources, Launchpad expands access to timely, localized behavioral health support.	Launchpad addresses Ketchikan’s crisis response gap by establishing a community-based access point where individuals can receive immediate support, assessment, and navigation. Building on True North Recovery’s experience across Alaska, the model recognizes lived experience as a vital asset in crisis engagement. Located in downtown Ketchikan, the site uses peers as the first point of contact to provide trauma-informed support and de-escalation. When clinical intervention is required, licensed clinicians are available for suicide risk assessments and integrated behavioral health evaluations. This peer-led approach represents a meaningful transformation in how the community addresses behavioral health emergencies. Through a hub-and-spoke model, Launchpad utilizes telehealth to connect rural Alaskans with specialized clinical professionals while maintaining local stabilization. This ensures that even in isolated frontier areas, residents can access high-level care without leaving their community. By offering a voluntary alternative to police-led or emergency department responses, peers help individuals identify immediate needs and coordinate "warm handoffs" to outpatient treatment, detox, housing, and recovery supports. The model aligns with "Crisis Now" principles and Alaska Department of Health recommendations by providing timely engagement close to home. This continuum of care—from initial stabilization to ongoing follow-up—reduces the likelihood of repeated crisis cycles. Ultimately, this project fulfills the Rural Health Transformation Program’s goal of expanding behavioral health access and ensuring essential crisis support is available in remote Alaskans' own backyards.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Single Community	Ketchikan Gateway Borough	Advance to Implementation Application

True North Recovery, Inc.	Palmer Women's Trauma Residential	AK	Mat-Su Borough is experiencing rapid population growth, but available services have failed to keep pace with rising population needs. The 2025 Mat-Su Health Foundation Community Needs Assessment describes an urgent demand for comprehensive behavioral health care. System barriers such as limited access to services, a shortage of Medicaid providers, and a lack of specialty treatment options make early engagement difficult, causing people to seek help only when their needs are most severe. These service challenges affect the community, with women particularly those with both substance use and mental health issues facing greater barriers to treatment. As a peer-led organization serving the community for a decade, True North Recovery (TNR) brings direct experience and insight into the needs of the local population and operates a hub-and-spoke network that provides regional perspective on service needs. This experience has shown the increasing demand for specialized residential treatment services for women with trauma histories and co-occurring mental health and substance use disorders. True North Recovery proposes development of a 16-bed residential substance use treatment program located in Mat-Su providing gender-responsive care for adults with co-occurring disorders. The program integrates trauma-focused approaches including Brainspotting alongside evidence-based programming delivered by clinicians and peers trained in trauma specialization.	This project is currently in the Ready to Launch phase. Funding will support first-year operations, including specialized workforce training. TNR has secured a 7,000-square-foot house on 16 acres. The property is nestled among trees with private walking trails, creating a calm environment that supports recovery. This program is Alaska’s first statewide residential substance use treatment initiative that integrates trauma treatment as a central component specifically addressing the needs of women through a peer-led model. The program serves adults aged 18 and older experiencing substance use disorders, trauma, and co-occurring mental health challenges. Because substance use, trauma, and parenting often intersect, women enter treatment while navigating Office of Children’s Services (OCS) involvement, intimate partner violence (IPV), housing instability, and intergenerational trauma. In frontier Alaska, specialized treatment services for women are scarce or nonexistent. This makes these challenges even greater, particularly for those experiencing IPV and substance use in areas lacking domestic violence shelters or safe places to stabilize. The program is designed to acknowledge the complex roles and circumstances women shoulder while pursuing recovery. Services integrate gender-responsive, trauma-specific, and co-occurring capable care within a structured residential environment. Programming supports women who have experienced trauma, including IPV and other complex circumstances that intersect with addiction. Weekly programming emphasizes emotional safety, inclusion, and culturally responsive practices that build on each participant’s strengths and lived experiences. Staff are trained to recognize how trauma, stigma, and caregiving responsibilities shape treatment engagement and recovery pathways. Clinical services further integrate evidence-based treatments such as Hazelden’s Co-Occurring Disorders curriculum, Seeking Safety, and Brainspotting, a specialized trauma-processing technique. These approaches assist with addiction recovery, safe trauma processing, emotional regulation, parenting skills, and resilience. Participants also access wraparound supports through the TNR continuum, including primary care, MOUD, and housing and recovery supports. This integrated, trauma-responsive model creates a healing environment closer to home where women can stabilize, reconnect with their strengths, and build pathways to long-term recovery.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Ketchikan Gateway Borough; Matanuska-Susitna Borough	Advance to Implementation Application

True North Recovery, Inc.	TNR Technology Suite	AK	True North Recovery is implementing a coordinated suite of technology upgrades to strengthen behavioral health services and data management across its rural and regional service locations. This modernization initiative includes the customization of a new Electronic Health Record (EHR), a transition to Hazelden’s upgraded Learning and Resource Center to expand telehealth-enabled SUD and adult mental health services, the development of AI-enhanced data analytics infrastructure, and the deployment of an in-house Voice-over-IP (VoIP) communication system. TNR has strategically transitioned away from the State-supported EHR (AKAIMS) to implement a self-managed clinical documentation infrastructure that aligns with its specific hub-and-spoke service model. While core platforms have been selected and implementation planning is underway, specialized technical expertise is required to ensure systems are interoperable and configured effectively. Rather than utilizing state-provided assistance, TNR will contract a private systems engineer to develop the data analytics framework and a dedicated contractor for cybersecurity IT system upgrades. This expertise ensures that EHR data is translated into meaningful operational and outcomes reporting while meeting rigorous cybersecurity standards. RHTP funding will support the deployment and specialized engineering required to establish this coordinated infrastructure, ultimately increasing evidence-based service delivery and program monitoring	The data modernization initiative at True North Recovery is positioned at a Ready to Launch stage, with core platforms already selected and the organization fully prepared for activation. The execution focus is on a coordinated, sequenced implementation rather than adopting systems independently, ensuring they function as a unified, integrated environment. The requested funding covers the full roll-out and customization of a new EHR, the transition from a legacy Hazelden platform to an upgraded learning platform to expand telehealth SUD and adult mental health services, the development of AI-enhanced data analytics infrastructure, and the implementation of an in-house managed VoIP phone system. To ensure comprehensive data continuity, the new EHR will be configured to communicate with AKAIMS, maintaining strict alignment with the State’s minimum data set requirements. This integration allows TNR to move away from the State-supported clinical infrastructure while remaining compliant with mandatory reporting standards. Execution will require funding for deployment and subscription fees within a 12-month period. Instead of state-provided technical assistance, TNR will contract specialized experts including a systems engineer for data architecture and a cybersecurity contractor—to guide configuration, reporting, and system reliability. These experts will manage the coordinated rollout, troubleshooting, and staff adoption while providing necessary knowledge transfer to TNR’s internal IT staff. This approach is critical to TNR’s hub-and-spoke service model, which relies on consistent communication and shared clinical data between rural sites. By activating tools in a deliberate sequence, TNR maintains operational continuity and avoids fragmented systems. Ultimately, this strategy focuses on making data highly usable by linking the EHR with AI-enhanced analytics and building automated reporting capacity. This approach directly aligns with Alaska’s Rural Health Transformation Program Initiative 6, which emphasizes leveraging technology to strengthen health system performance and support data-informed decision-making.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

True North Recovery, Inc.	Wasilla Crisis Stabilization Center	AK	Behavioral health crisis systems work best when Alaskans can access the right support at the right time. However, community-based alternatives are limited, and those in crisis often encounter police or hospitals as their first contact. While necessary, these contacts can be jarring, stigmatizing, and can escalate situations. Creating safe alternatives to divert individuals from police or hospital intervention is crucial to meeting the rising demand for community-based services in the Mat-Su Region. To meet this need, True North Recovery (TNR) proposes an innovative peer crisis residential respite pilot, the first 24/7 peer-led respite in the state. Peers serve as core staff, providing de-escalation, safety planning, and recovery connections for those needing stabilization who do not meet inpatient criteria. TNR, a peer-led organization, has expanded since 2016 to offer a full array of residential and detox services through an extensive hub-and-spoke network. At the center is our integrated campus housing the Day One Center and Dylan’s Place, serving as the primary hub for seamless service delivery. This model allows for immediate changes in Level of Care (LOC), moving fluidly between the Day One Center's walk-in "living-room" crisis services and the 3.7/4.0 detox services at Dylan’s Place. Alongside our mobile outreach team and Wasilla Launchpad, these integrated services ensure the new pilot is perfectly positioned for maximum impact.	The pilot represents the defined approach stage of planning and development for a peer crisis residential respite in Mat-Su Valley. Funding will support phased planning, development, and implementation. Phase one focus includes operational modeling, service flow, staffing, and facility safety design aligned with accreditation standards. Phase two supports service activation and full operational support for years one through three, allowing the model to be tested within the crisis continuum. A strong focus includes data collection on operations and utilization to guide future funding strategies for services that currently lack reimbursement options. This phased pilot supports the evolving rural crisis response system by introducing a local, low-acuity, short-term option. It enables early intervention that complements current and planned services—including Mobile Crisis, stabilization centers, and hospital expansion—without duplicating efforts. The model aligns with the Crisis Now framework by providing a safe place to go during a behavioral health crisis. This pilot introduces Alaska’s first peer-led crisis respite. Services are person-centered, trauma-informed, and recovery-oriented, utilizing lived experience as a therapeutic asset. Staffing includes onsite access to mental health clinicians for assessment and intervention. TNR has secured a facility connected to its current campus that houses the Day One Center and Dylan’s Place Detox for seamless service integration. To ensure project readiness, TNR has made a \$600,000 cash investment in the facility, plus an additional \$1.3 million in guaranteed financing for the building purchase. The site is strategically positioned to support: • Step-up and step-down care within the regional hub-and-spoke system. • Hospital transitions and emergency department diversion. • Day One Center (Launchpad) clients who require more support than outpatient crisis access. • Mobile Crisis Team resources when stabilization in the community isn't possible. The four-year pilot focuses on launching in Year 1, adjusting staffing based on trends in Year 2, and evaluating usage and costs in Year 3 to assess Medicaid feasibility. By Year 4, services will transition to an approved Medicaid reimbursement model or another billable level of care.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

True North Recovery, Inc.	TNR Workforce Development Programs	AK	The True North Recovery (TNR) Workforce Development Project is a multi-tiered initiative designed to bridge the gap between clinical treatment and long-term economic stability for Alaskans with behavioral health and substance use disorders. The project addresses two critical needs: the severe shortage of entry-level behavioral health providers in rural Alaska and the lack of supportive employment opportunities for individuals reentering the workforce during recovery. To achieve this, the project utilizes three integrated pathways that offer "grace to work out the kinks" in a supportive environment: Clinical Internship Pathway: Provides 20 paid positions (\$20.00/hr) for a minimum of 90 days to equip soon-to-be graduates with essential competencies like ethics, boundaries, and clinical documentation. Interns are paired with mentors in residential settings to ensure they are field-ready. Job Training Program (TNR Enterprises): Offers 20 paid positions (\$20.00/hr) within internal micro-businesses—including maintenance, janitorial, administrative, and vehicle repair shops. This pathway allows participants who may not yet be ready for clinical roles to gain trades and documented references. TNR Training Academy: A curriculum-based hub developed in partnership with NAADAC to provide virtual and in-person CEUs specifically aligned with the Alaska framework for Chemical Dependency Counselor (CDC) and Peer Support certifications.	1. Clinical Internship Pathway This track focuses on a "mentor-first" model for soon-to-be graduates. Structured Mentorship: Interns are placed within a True North Recovery (TNR) residential program for 12 weeks, working alongside mentors who model core competencies in ethics, boundaries, safety, and clinical documentation. Professional Readiness: After 90 days of paid training at \$20.00/hour, each participant undergoes a formal evaluation to certify their readiness for entry-level behavioral health positions. Holistic Support: TNR assists candidates with resume building, background check variance applications, and obtaining letters of recommendation from clinical teams. 2. Vocational Training (TNR Enterprises) This pathway provides a supportive "micro-business" environment where participants can gain technical skills without the immediate pressure of external employment. Diverse Trade Exposure: Participants engage in paid roles (\$20.00/hour) across various sectors, including janitorial, maintenance, administration, and vehicle repair. Future plans include expanding into specialized fields like IT and medical billing. Strategic Independence: To bypass the delays caused by background check variances for non-clinical roles, TNR is contracting legal and financial advisors to establish these enterprises under a separate EIN. This allows participants to build documented job history and technical skills independently. Work-Force Bridge: TNR partners with local businesses to conduct interviews for participants, facilitating a smooth transition into the broader Alaska workforce. 3. TNR Training Academy & Holistic Stability The approach extends beyond immediate jobs to long-term career and life stability. Certification Access: Through a partnership with NAADAC, the Academy provides an array of virtual and in-person classes specifically aligned with Alaska-specific requirements for Chemical Dependency Counselor (CDC) and Peer Support certifications. This fills a critical gap left by the closure of previous state training programs. Integrated Stability: Recognizing that housing is a "vital component" of success, participants can utilize SOR-funded workforce housing. This allows them to build a documented rental history, preparing them for independent living. True North Recovery Has invested to date approximately 1.2million dollars into the development of this multifaceted project.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Ketchikan Gateway Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

TrueNorth Medical Staffing LLC	Southeast Alaska Specialty Care Access Initiative	AK	Southeast Alaska's approximately 60,000 residents are distributed across a 500-mile island archipelago with no road connections between communities. The region has no permanent, independent ophthalmology practice. Residents requiring specialty eye care — including treatment for diabetic retinopathy, glaucoma, age-related macular degeneration, and other sight-threatening conditions — must travel by float plane or ferry to Juneau or leave Southeast Alaska entirely, creating delays that frequently result in preventable vision loss. Diabetes prevalence among Alaska Native populations in the region is significantly above the national average, driving elevated rates of diabetic retinopathy — a leading cause of blindness that is highly treatable when caught early and managed consistently. Geographic isolation makes that consistency nearly impossible under the current model of care. This project addresses that gap by establishing a permanent ophthalmology hub in Juneau with the infrastructure to extend care regionwide through tele-ophthalmology and mobile clinic deployments — converting a fragmented, travel-dependent system into a coordinated, accessible regional network.	This project establishes a permanent ophthalmology clinic in Juneau as the hub of a regionwide specialty eye care network serving all of Southeast Alaska. The approach operates through three integrated components. Brick-and-Mortar Hub: A dedicated ophthalmology clinic in Juneau will provide comprehensive eye care including medical and surgical management of cataracts, glaucoma, diabetic retinopathy, age-related macular degeneration, and retinal disease. The clinic builds on an established patient base and referral network developed through years of practice at Bartlett Regional Hospital, ensuring immediate community impact from day one. The hub serves Juneau's 30,000 residents directly while functioning as the coordination center for regional outreach. Tele-Ophthalmology Network: The clinic will establish remote screening and consultation partnerships with rural clinics, tribal health organizations, and community health aides across the archipelago. AI-assisted diagnostic imaging analysis will be integrated into the screening workflow, enabling automated detection of early diabetic retinopathy, glaucoma, and macular degeneration from retinal photographs taken at remote sites — flagging high-risk patients for priority specialist review and dramatically expanding the volume of screenings the network can support. Mobile Ophthalmology Clinics: Periodic deployments to regional communities will bring comprehensive eye care — including dilated exams, disease monitoring, laser treatments, and intravitreal injections — directly to patients who cannot reliably travel. Communities served will include Haines, Hoonah, Ketchikan, Petersburg, Sitka, Skagway, and Wrangell. Together these three components transform the current fragmented, travel-dependent model into a coordinated, technology-enabled regional network built on permanent infrastructure and a long-term commitment to Southeast Alaska.	\$1M-\$5M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough)	Deferred or Not Advanced

Truentity	Advancing Networked Care for Health Outcomes in Rural Communities (ANCHOR) in Alaska	NC	Rural and frontier communities across Alaska face significant barriers to consistent healthcare access. Long travel distances, limited provider availability, and infrequent clinical visits make it difficult for residents to receive ongoing support for chronic conditions such as hypertension and diabetes. As a result, many patients go long periods without monitoring or care coordination between visits, increasing the risk of complications and avoidable hospital utilization. At the same time, community pharmacies are often among the most accessible and trusted healthcare locations in rural communities. Patients interact with their pharmacist far more frequently than with other healthcare providers, yet pharmacies are rarely equipped with the digital infrastructure or care frameworks needed to support ongoing clinical engagement. This project addresses that gap by enabling community pharmacies to serve as technology-enabled access points for continuous monitoring, early risk identification, and care coordination. Through the ANCHOR model, pharmacies are equipped with connected devices, digital workflows, and clinical protocols that allow them to support patients between traditional clinic visits. By strengthening the role of pharmacies as accessible community care hubs, this approach expands access to chronic disease support while helping rural residents remain connected to care closer to home.	This project will be implemented through Truentity’s ANCHOR (Advancing Networked Care for Health Outcomes in Rural Communities) model, a pharmacy-centered care framework designed to expand access to healthcare services in rural, remote, and frontier communities. The approach activates Alaska-based community pharmacies as local care delivery hubs. Participating pharmacies provide technology-enabled clinical services that support continuous monitoring, early risk identification, medication optimization, and care coordination for patients with chronic conditions such as hypertension, diabetes, and heart failure. Patients enroll through participating pharmacies and use connected monitoring devices and structured digital workflows to capture key health indicators such as blood pressure, glucose readings, medication adherence, and symptom data. This information is securely transmitted to the ANCHOR platform, where analytics identify trends and potential risks. When readings exceed established clinical thresholds, alerts are generated and reviewed through physician-governed clinical protocols. Pharmacy teams conduct patient outreach, reinforce treatment plans, and coordinate with primary care providers or other healthcare partners when escalation is required. This enables earlier intervention and more consistent follow-up between traditional healthcare visits. The model is designed to deploy quickly using existing community infrastructure. Because services are integrated into pharmacy operations, sites can typically be onboarded and operational within weeks. Truentity provides the digital platform, standardized care workflows, training, and operational support needed for pharmacies to integrate these services into their daily practice. This approach expands the effective rural healthcare workforce by enabling pharmacists and pharmacy teams to operate at the top of their license while maintaining coordination with physicians and other providers. By embedding continuous care and monitoring within trusted community pharmacies, the model improves access to care, strengthens care coordination, and supports better management of chronic disease across Alaska’s rural and frontier communities.	\$1M-\$5M	Statewide	Denali Borough; Fairbanks North Star Borough; Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Southeast Fairbanks Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

Trusted Connections	Trusted Connections: Healing Trauma — Together	AK	Multigenerational trauma in Alaska damages family structures and leads to internalized oppression, boarding-school informed parenting, and unhealthy coping through addiction. Systemic racism continues today. Tens of thousands of Alaska Natives have lost vital connection with home and culture. We see the trauma of people living cold on the street, addicted to substances, and dying by suicide at three times the national average. Many end up in prison, are trapped in domestic violence, or become our Missing and Murdered Indigenous Relatives. Support from within Native community is the single strongest protection against these catastrophic outcomes. Establishing trusted relationships helps people feel safe to identify problems and heal in community. Our primary tool is Trauma Healing Circles. We do not treat trauma — instead we help people walk through trauma so they can experience their own healing. We prevent new trauma and support hurting people on their path to hope with holistic, Indigenous-centered Trauma Healing Circles led by local community peers throughout the state. People choosing a healing path and a life respectful of self, family, and culture leads to reduced isolation, increased identity awareness, expanded peer access, shared advocacy, and self-care.	When a friend cares enough to walk with us as we face our deepest challenges, many things that have been overwhelming—even paralyzing—become possible. Trusted Connections is a grassroots effort led by people whose families, communities, lives, and culture were greatly harmed by intergenerational trauma. We have walked with pain. We are committed to building a network of Indigenous Trauma Healing Circle peer facilitators who serve in their Alaskan communities. We have seen dramatic positive outcomes for dozens of clients—on the streets of Anchorage, in Trauma Healing Circles, and through village connections—by providing high engagement, culturally sensitive, trauma-responsive peer support services. Our team builds trust and connection during Trauma Healing Circles and with people we support in the community. These relationships create a path for healing. We care enough to take time. To be present. To sit in quiet support when someone shares their pain. To listen to voices that have been brushed aside. To acknowledge each person's immense value. We address healing now in ways that help prevent future trauma. Logistics — we will implement our approach through building capacity, direct service, Indigenous-centered curriculum, and supporting healthy resilience in staff. Build Capacity Establish administrative and evaluation infrastructure capacity, set up website/social media presence, and grow contributor pool. Lease and set up a dedicated drop-in space in Anchorage. Acquire and equip a vehicle to bring pop-up mobile services to the community. Train Indigenous peers to facilitate Trauma Healing Circles and support connections in their communities (create a statewide network). Relational work w/partner orgs. Share facilitator training with communities as we are invited. Direct Service Address immediate individual needs arising from multigenerational trauma. Develop culturally sensitive care protocol that can be adapted for use in rural, remote, and frontier communities. Curriculum Design, create, test, and refine holistic customizable Alaska Native / Indigenous-centered Trauma Healing Circle facilitator training curriculum for online and in-person delivery. Support Healthy Resilience Provide training and holistic supports for healthy resilience of staff	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Sitka (City and Borough)	Deferred or Not Advanced

(including community-based peer facilitators) to sustain organic growth. Mutual support networking/gatherings.

Tundra Womens Coalition	Tundra Women's Coalition Multidisciplinary Expansion	AK	Western Alaska has the highest rates of domestic and sexual violence in the country. Half of adult women in the Yukon-Kuskokwim Delta have experienced intimate partner violence, sexual violence or both, in their lifetime. The true rates are likely higher than what is reported because of the limited access to law enforcement and medical forensic services available to people in the YK Delta. The area is rural, remote, and off the road system. Interpersonal violence can impact every system in the body, sometimes for a lifetime, so the need for forensic examinations, medical treatment, follow-up medical treatment, and routine medical care for survivors of violence is critical. SART call-outs can take up to six hours depending on the case, the number and extent of injuries, and what sort of impact the trauma has on the survivor. This region’s MDT sees 75-100 adult sexual assault responses and 100-150 child sexual assault responses each year. The lack of an adequate response to contributes to cycles of continued harm on the Alaska Native population and the communities in which they, and their children, live. A poor response or absent response prevents healing and oftentimes leaves people vulnerable to additional victimization. Beyond looking at the high rates of sexual and domestic violence the impact of sexual violence can be inferred in the high rate of death by suicide, substance misuse, economic poverty, and mental health issues.	Tundra Women's Coalition hosts the multidisciplinary response to violence for the region in partnership with law enforcement and the Yukon Kuskokwim Health Corporation. YKHC has make-shift office space at TWC to provide forensic examinations, medical treatment, follow up medical, and regular medical checks for families and people impacted by violence. The increased collaboration between YKHC and TWC through the years has greatly increased this region's access to medical and forensic services after violence and almost entirely stopped people from having to fly to Anchorage to be seen. Only medically complicated cases have to be seen in Anchorage now. The Team wishes to design a new wing of Tundra Women's Coalition that would allow for MDT members to work in the same space. This wing would allow for medical services, interview space for law enforcement, and a space to conduct telehealth services for people stranded in village communities, unable to get to Bethel because of inclement weather. In those cases the opportunity to collect evidence is lost and many people opt not to report because of the length of wait time. Many sexual assaults are not reported because of the hassle of having to fly into Bethel when weather could leave you stuck in your village community, and then later stuck in Bethel. People's access to medical after violence would greatly increase if the MDT could work closer together, and also create a space that telehealth consults could happen. Currently when a telehealth appointment is happening the provider has to go to their home for better internet connectivity. Besides the response to crime that includes forensic medical services, YKHC has begun offering medical services to residents living at TWC. This is greatly increases victims of violence access to medical care like women's health check ups, general check ups, TB screening (for when people are seeking treatment), vaccinations, and follow up for things like head trauma and injury checks. YKHC is working out of make shift space for this currently and would greatly benefit from specifically designed space. TWC office space has been maxed out due to YKHC's presence. Additional space would take the pressure off of everyone and ensure more confidentiality for medical services.	\$250K-\$1M	Single Community	Bethel Census Area	Deferred or Not Advanced

Turnagain Social Club	Home and Community Based Waiver Association	AK	Alaska’s Home and Community-Based Services (HCBS) system plays a critical role in allowing older adults and individuals with disabilities to remain in their homes and communities rather than entering costly institutional care. However, HCBS providers across Alaska often operate independently with limited coordination, shared resources, or structured communication with state agencies and health systems. This fragmentation creates challenges for providers—particularly in rural, remote, and frontier communities—where workforce shortages, geographic barriers, and limited access to training or technical assistance already strain the system. Without a coordinated structure to support HCBS providers, opportunities to improve care coordination, share best practices, strengthen workforce capacity, and address system gaps are often missed. These challenges can affect the stability of community-based services that many rural Alaskans rely on to maintain their health and independence. This project presents an opportunity to establish a Home and Community-Based Waiver Provider Association that strengthens collaboration, communication, and system support for HCBS providers across Alaska. By creating a coordinated network focused on training, technical assistance, and provider engagement, the association will help strengthen community-based care delivery, support rural providers, and improve the stability and effectiveness of services that allow Alaskans to receive care closer to home.	The proposed project will establish a Home and Community-Based Services (HCBS) Waiver Provider Association to strengthen coordination, communication, and support for providers serving older adults and individuals with disabilities across Alaska, including rural, remote, and frontier communities. The association will create a structured network that connects HCBS providers, allowing them to collaborate, share best practices, and access training and technical assistance that support consistent, high-quality service delivery. The association will focus on several key strategies. First, it will provide education and workforce development opportunities to strengthen provider capacity, particularly for rural providers who often have limited access to training, technical assistance, and professional support. Second, it will facilitate information sharing and collaboration among providers, care coordinators, hospitals, and health system partners to improve care coordination and continuity of services for individuals receiving HCBS supports. Third, the association will serve as a central resource and communication hub, helping providers navigate regulatory requirements, implement best practices, and address operational challenges that affect service delivery in rural areas. This will include sharing tools, guidance, and resources that help providers strengthen services while maintaining compliance with state and federal requirements. Finally, the association will support data sharing and collaborative problem solving, enabling providers to identify trends, workforce challenges, and service gaps that affect rural communities. By strengthening communication and collaboration across the HCBS system, the association will help stabilize the provider network and improve the delivery of community-based services. Through training, collaboration, and improved system coordination, this approach will strengthen the long-term sustainability and effectiveness of community-based care services that allow rural Alaskans to receive needed care closer to home.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Turnagain Social Club	Medical Model Adult Day Care	AK	Alaska’s long-term care system has a critical gap for older adults and individuals with complex chronic medical conditions who need ongoing clinical monitoring but do not qualify for skilled nursing facility placement and cannot be adequately supported through fragmented community services. Many individuals living at home or in assisted living homes experience worsening chronic diseases—such as diabetes, heart failure, COPD, and dementia—because routine medical oversight and care coordination are limited in community settings. While services such as home health, therapy, meals, case management, and transportation exist, they are often delivered by separate providers with little integration, leading to communication gaps, inconsistent disease management, and delayed recognition of health changes. These gaps frequently result in preventable emergency department visits, hospitalizations, and rising healthcare costs for the State of Alaska. This project proposes piloting a medical model adult day care that integrates nursing oversight, chronic disease management, therapy services, case management, meals, and transportation in one coordinated setting. Through regular monitoring, early intervention, and continuity of care, this model shifts care from costly crisis response to proactive disease management, improving outcomes while reducing avoidable hospital utilization and generating long-term cost savings.	The proposed project will pilot a medical model adult day care program designed to improve chronic disease management and continuity of care for older adults and medically complex individuals living in the community. The program will integrate clinical oversight, nursing assessments, care coordination, therapy services, meals, and transportation into a single coordinated setting. Participants will attend the program regularly, allowing licensed nursing staff to monitor chronic conditions, manage medications, identify early changes in health status, and coordinate care with primary care providers, specialists, and care coordinators. By bringing multiple services together under one roof, the program reduces fragmentation and ensures consistent communication between providers involved in a participant’s care. The model emphasizes preventive care and early intervention, enabling health issues to be addressed before they escalate into emergency department visits or hospitalizations. In addition to clinical monitoring, participants will receive structured therapeutic activities, nutrition support, and social engagement that contribute to overall health and stability. By shifting care from episodic crisis response to ongoing disease management and coordinated community-based support, the program aims to improve health outcomes, reduce avoidable hospital utilization, and demonstrate a more cost-effective model of care for the State of Alaska.	\$1M-\$5M	Home- and community-based services provider	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Turnagain Social Club	Transportation Fleet & Brokerage	AK	Alaska’s health care system faces significant challenges related to transportation barriers, particularly for patients traveling to Anchorage for medical care. Many individuals from rural and remote communities must travel to Anchorage to access specialty care, hospital services, dialysis, and other treatments that are not available locally. Once in Anchorage, reliable transportation between the airport, lodging, medical facilities, pharmacies, and follow-up appointments is often difficult to coordinate. These gaps frequently result in missed appointments, delayed care, and disruptions in treatment. When patients are unable to attend scheduled appointments or access follow-up care, chronic conditions can worsen, leading to preventable emergency department visits and hospitalizations. Hospitals in Anchorage are already experiencing capacity challenges, and avoidable emergency visits place additional strain on the health care system. This project addresses the opportunity to create a coordinated health care transportation brokerage and fleet service that improves transportation access for patients receiving care in Anchorage. By improving transportation coordination, the project aims to reduce missed appointments, improve continuity of care, and reduce avoidable emergency department utilization.	The proposed project will establish a health care transportation brokerage and fleet service based in Anchorage to improve coordination and reliability of transportation for patients traveling to Anchorage for medical care. The brokerage will work with hospitals, health systems, tribal health organizations, assisted living homes, and home and community-based service providers to coordinate transportation for individuals traveling between airports, lodging, medical facilities, pharmacies, and follow-up appointments. The project will develop a centralized scheduling and coordination system that allows providers and care coordinators to arrange transportation more efficiently. A dedicated fleet will support scheduled medical transportation and help ensure patients can attend appointments, receive follow-up care, and access community-based services while in Anchorage. By improving coordination of transportation resources and reducing missed appointments, the project will support better continuity of care and chronic disease management. Over time, improved transportation access is expected to reduce preventable emergency department utilization and hospitalizations while supporting more efficient use of health care services for rural patients receiving care in Anchorage.	\$250K-\$1M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Tyonek Tribal Conservation District	“Tyonek Grown” Restoration and Readiness for Site-Based Wellness Outcomes	AK	Tyonek is a rural village community without a grocery store. To supplement diminishing subsistence foods, households order foods online and fly them in by plane. The cargo rate of \$0.70/pound, as well as high rates of un/underemployment, incentivizes the purchase of processed food items. As a result, residents experience higher rates of diabetes, heart disease, and other chronic illnesses. These challenges also contribute to mental health concerns, especially among youth and elders. Our 1.25-acre community produces over 2,500 pounds of produce and provides garden plots for 12 households, but aging infrastructure has become both a human safety concern and barrier to increasing production. Once the growing season is over, Tyonek has lacked the storage facilities to maintain vegetable inventory into the winter as well as a consistent method for community members to preserve more than a minimal amount of foods as shelf-stable or frozen items. Tyonek shareholders living primarily outside of the village are also experiencing high rates of health concerns and food insecurity. While those in urban areas have closer access to a variety of retail food products, many express food insecurity through a lack of access to traditional subsistence foods from the village. Expressions of well-being are often related to the ability to access opportunities for growing, harvesting, and creating these food items.	The Tyonek Grown community garden is a site-based wellness center, contributing to preventative health care in the summer and fall by providing both fresh vegetables and opportunities to gather, learn, and participate in the production of fresh foods. We propose to amplify our impact on human health in the community of Tyonek, Anchorage, Mat-Su, and the Kenai Peninsula through the following activities: • Restoration of infrastructure at the Tyonek Grown community garden: wash shed, plumbing and irrigation, solar panel and battery shed, high tunnels, compost bin, cold storage, accessible pathways, gathering space, fence line, and food processing work spaces. These repairs will increase participation by providing safe accessibility to production, education, processing, and storage activities for community members. These restorations will also provide “site readiness” for TTCD to provide healthy food production technical trainings and outreach at the farm. Audiences would include the Tyonek community and school, our local summer interns, Kenai Peninsula School District students and teachers, Shareholder primarily residing in Anchorage and the Mat-Su, and Tribal Conservation District staff from around the state. • Connecting Tyonek Grown resources to outcomes measured by the Indian Creek Health Department: The garden is across the road from the health department and clinic in the village. Creating accessible pathways and gathering spaces in the garden, as well as providing direct outreach on how outdoor gardening activities and making healthy food choices contribute to specific health goals, are anticipated to have a positive impact on ICHD’s community health objectives. We propose to create an MOU with ICHD to co-create these pathways and metrics. • Increasing native plants and “food forest” production to increase diversification of healthy foods as well as provide culturally relevant harvesting opportunities. • Conduct a Tyonek Shareholder Food Assessment for shareholders primarily residing in Anchorage and the Mat-Su. This will be supplemental to the Tyonek Community Food Assessment that we are completing in 2026. The Shareholder Assessment will inform the inclusion of initiatives that connect shareholders to the Tyonek Grown program through on-site outreach and harvest opportunities, fresh produce deliveries, and the preservation of subsistence foods for winter and spring pantries.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

U.S. Renal Care Inc., DBA Alaska Dialysis	Comprehensive Kidney Care for Alaskans	TX	Alaska’s rural kidney disease population faces significant geographic, socioeconomic, and access barriers. Many patients must travel long distances for specialty care, often without reliable transportation or predictable weather conditions. Specialty resources are unevenly distributed, and many communities do not have consistent primary or specialty care support. These realities contribute to delayed diagnosis, faster disease progression, avoidable hospitalizations, and limited access to dialysis options, including home therapies that could allow people to remain in their communities. The program aligns with the State of Alaska’s Rural Health Transformation Program (RHTP) and seeks to address long standing structural barriers in the State’s kidney care ecosystem, particularly those affecting rural, remote, and frontier communities. U.S. Renal Care, Inc. dba Alaska Dialysis and its nephrology partners bring decades of kidney care experience delivering high quality kidney care across the state, serving more than 600 ESKD patients at seven dialysis centers and thousands of CKD patients statewide. The proposal builds on proven outcomes from participation in Medicare’s Kidney Care Choices (KCC) advanced payment model, which has shown measurable improvements in mid-to-late-stage kidney disease progression, reduced hospitalizations, and quality indicators including home dialysis, optimal starts, permanent access, outpatient starts, as well as transplant related metrics.	Our approach has been tested and validated over the last four years in the Kidney Care Choices (KCC) program, a model administered by the Centers for Medicare and Medicaid Innovation (CMMI), including patients across Alaska. Analysis from NIH United States Renal Data System (USRDS) shows improvements in all relevant quality measures across 2022-2023 performance years. These improvements represent lower morbidity, mortality, improved quality of life, and lower cost of care for the patients we serve. Here's how our model achieves this: The model focuses on four approaches: 1. Early Identification 2. Cessation or Delay of Disease Progression – including Rural Interdisciplinary Teams (IDTs), Complex Chronic Disease Management and Specialized Technology 3. Smooth Transitions to ESKD Care 4. Improved Outcomes and Quality of Life with Lower Resource Utilization Partnerships with Communities, NGOs and Critical Access Hospitals (CAHs) Alaska Dialysis will partner with communities, NGOs and CAHs to evaluate and support the expansion of locally delivered dialysis in communities that have traditionally lacked the infrastructure or population to support in-center or home dialysis care, such as Kodiak, Bethel, Nome, Stika, Ketchikan and other communities across the state. This prevents care delays and eliminates the need for patients to travel long distances to receive life sustaining treatment. It also expands access to home dialysis, allowing patients to remain in their local communities. Within each of these four areas, the initiative includes investments to support recruitment, training, and retention of the rural healthcare workforce. Using US Renal Care’s GROW, SUPPORT, and RETAIN framework, the program creates advancement pathways and career opportunities for rural residents. These skilled providers are an important element of ensuring effective care can be delivered to residents in rural areas in a sustainable manner. U.S. Renal Care Inc., DBA Alaska Dialysis	Improving Access & Quality of Dialysis Treatment for Alaskans	TX	End-stage kidney disease presents a significant and growing healthcare challenge in Alaska. Dialysis is a life-sustaining treatment that must be delivered consistently several times per week. However, rural communities face structural barriers that make delivering reliable dialysis care more difficult. Workforce shortages are one of the most pressing challenges. Recruiting and retaining dialysis nurses, technicians, and support staff in rural areas is increasingly difficult due to workforce competition, geographic isolation, and limited local training pipelines. Staffing shortages can limit treatment availability and increase operational strain on existing teams. Dialysis delivery requires specialized infrastructure including dialysis machines, water purification systems, infection control environments, emergency power capabilities, and IT / cybersecurity infrastructure. Facilities require ongoing modernization to maintain reliability and support safe care delivery. By addressing both workforce capacity and facility resilience, this project can improve treatment access, reduce avoidable hospitalizations, and support sustainable kidney care services across rural Alaska.	Alaska Dialysis is the leading provider of chronic kidney disease and end-stage kidney disease (ESKD) in the state of Alaska, with two decades of experience serving citizens of the state. Alaska Dialysis and its nephrologist partners treat more than 600 ESKD patients across seven dialysis facilities, including Juneau, Soldotna, Fairbanks and Wasilla and state wide home dialysis programs and thousands of CKD patients in communities across the state. First, Alaska Dialysis will expand workforce development initiatives designed to build a sustainable rural kidney care workforce. These efforts will strengthen recruitment, training, and retention of dialysis clinicians and support staff, including nurses, Patient Care Technicians (PCTs), pharmacists, care navigators, and community health workers. Through partnerships with local training institutions and community organizations, Alaska Dialysis will expand apprenticeship and training-to-employment pathways, including paid PCT apprenticeship programs that allow rural residents to enter the healthcare workforce while remaining in their communities. These programs will also create advancement pathways for existing staff and support providers practicing at the top of their license. Second, the project will modernize dialysis infrastructure across Alaska Dialysis facilities. Dialysis delivery requires advanced treatment equipment, specialized water purification systems, temperature-controlled environments, and reliable emergency power systems. Targeted investments will upgrade dialysis machines, water treatment systems, isolation rooms, and facility infrastructure to support patient safety, infection control, and treatment reliability. Together, these efforts will strengthen Alaska’s rural dialysis care delivery system, expand treatment capacity, and improve the reliability and quality of dialysis services statewide.	\$1M-\$5M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Umoja Coworking & Incubator	Rural Alaska Health Provider Hub & Community Innovation and Housing Center	AK	We are writing to express our interest in partnership with the Alaska Community Foundation to develop the Rural Alaska Health Provider Hub & Community Innovation and Housing Center, a collaborative initiative designed to strengthen the rural health workforce, expand telehealth infrastructure, and improve access to care for communities across rural Alaska. Rural Alaska faces persistent barriers to health care access due to geographic isolation, workforce shortages, and limited training infrastructure. Providers traveling to rural villages often lack centralized support systems, while community health workers and new providers entering Alaska frequently struggle to find training opportunities, housing, and collaborative networks that help them succeed and remain in rural communities. To address these challenges, Umoja Coworking and Incubator and Umoja Cultural School propose establishing a central hub where health providers, community health workers, nonprofits, and telehealth specialists can collaborate, train, and deliver services that reach rural communities across the state. This initiative would advance two key priorities for Alaska’s health systems: strengthening the rural health workforce and sparking technology and innovation in health delivery.	establishing a hub where health providers, community health workers, nonprofits, and telehealth specialists can collaborate, train, and deliver services that reach rural communities across the state. Components of the Hub Provider Coworking and Collaboration Space The hub will provide shared workspace for visiting professionals including physicians, nurses, behavioral health providers, veterinarians, social workers, and public health specialists. Providers traveling through regional hubs such as Anchorage or Fairbanks will be able to use the space between rural deployments to coordinate services and collaborate with other organizations. Features will include: • shared and solo offices • meeting/training rooms • telehealth stations • secure patient consultation rooms • childcare access for providers and trainees Training/Workforce Development Center A dedicated training center will support the development of rural health workers and community health leaders. Training programs may include: • Community Health Aide training • behavioral health support training • telehealth technology use • maternal and child health support • emergency response training • veterinary and animal care services Telehealth & Digital Health Innovation Center A technology hub within the facility will expand digital health capacity for rural providers. Capabilities will include: • telemedicine consultation rooms • digital diagnostic equipment • remote patient monitoring systems • wearable health device training • secure data-sharing infrastructure These tools will support emerging approaches to care delivery and align with statewide priorities to expand telehealth and digital health services. Community Education & Wellness Space The hub will also serve as a flexible community education space offering prevention and wellness programming such as: • parenting classes • mental health support groups • nutrition and healthy living education • community health workshops • cultural wellness programs These programs will help support healthy communities and preventative care across Alaska.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Fairbanks North Star Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kodiak Island Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Sitka (City and Borough); Southeast Fairbanks Census Area	Deferred or Not Advanced

Rural Provider Housing and Support Services

Housing remains one of the largest barriers to recruiting and retaining providers who travel to rural Alaska. The hub will provide short-term overnight accommodations and logistical support for providers rotating through rural communities.

- temporary housing
- childcare partnerships
- workspace and training access
- travel coordination

United Way of Anchorage	Alaska Employer Child Care Cost Share: Statewide Model Design & Regional Hub Development	AK	Alaska loses \$305 million annually due to child care challenges. Fifty-one percent of Alaska families — up from 25% in 2019 — cannot fully participate in the workforce because of child care. Over 61% of Alaskans live in child care deserts. In hub communities like Kotzebue, Dillingham, and Bethel, licensed child care centers have closed or never existed. Alaska employers lose an estimated \$152 million annually in productivity due to child care-related absenteeism and turnover. In 2025, United Way of Anchorage commissioned what we believe is the nation's first community-specific pre-implementation feasibility study of an employer cost share model prior to program launch — focused on Anchorage. Eighty-four Anchorage employers were surveyed and administrators from six states with operating programs were interviewed. A February 2026 peer review with national experts from five states validated the concept. The Governor's Task Force on Child Care formally recommended this model in December 2024, and SB 95 (2025) established a legislative framework supporting employer child care incentives statewide. No employer cost-sharing model exists anywhere in Alaska. The opportunity: translate a validated Anchorage concept into a statewide, regionally-differentiated design — built honestly around Alaska's provider landscape, employer density, and the distinct realities of regional centers and hub communities.	United Way of Anchorage proposes a Year 1 planning and design initiative to develop a statewide Alaska Employer Child Care Cost Share model — organized around Alaska's geographic reality of regional centers and hub communities — moving from a validated Anchorage concept to a statewide implementation-ready design. Year 1 includes four workstreams: 1. Statewide employer and provider landscape study: Commission an independent contractor to extend the Anchorage feasibility methodology statewide. Survey employers and assess licensed child care provider capacity across regional centers (Fairbanks, Juneau, Sitka, Kodiak, Kenai, Ketchikan, Mat-Su) and hub communities (Bethel, Nome, Kotzebue, Dillingham, Utqiagvik). Assess which communities have sufficient provider infrastructure now and which require parallel supply-side investment first. The Anchorage feasibility study cost approximately \$70,000 — this statewide effort will be appropriately scoped. 2. Tiered readiness architecture: Using study findings, tier communities into: Tier 1 — regional centers ready for Year 2 implementation; Tier 2 — communities viable with provider development support; Tier 3 — hub and remote communities where alternative models are needed first. 3. Model design and policy alignment: Convene a statewide design team to finalize program parameters — contribution structure, no-income-restriction eligibility, payroll deduction mechanics, third-party administrator requirements, and facilitator criteria. Align with SB 95, CCAP, and ACCEE Fund structures. 4. Implementation playbook: Produce a replicable facilitator guide as the operational foundation for Year 2+ launches. UWA's role is statewide convener and model architect throughout.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

United Way of Anchorage	Strengthening Alaska 211: Community-Led Care Coordination for Rural Health Transformation	AK	Alaska's rural and frontier communities face a structural gap: Alaskans with the greatest health needs have the fewest pathways to coordinated care. Primary care, behavioral health, social services, and tribal health organizations operate in parallel — referrals disappear, people retell their stories at every door, and providers cannot see whether help was received. Providers across Alaska have begun building coordination capabilities, but siloed efforts duplicate cost and effort without creating the shared infrastructure needed for true system-level change. A Community Information Exchange (CIE) is a shared infrastructure that connects health care, social services, tribal organizations, and community providers so that care follows the person—not the system boundary. For a mother in a remote community navigating prenatal care, a CIE means her tribal clinic, regional hospital, and community supports share a single care record. A CIE also generates the closed-loop outcome data that value-based payment models require—making it foundational to Alaska's health system transformation, not just a coordination tool. Alaska 211 is the natural backbone for a statewide CIE. With 19 years of operation, 8,000+ resources across 1,000+ agencies, 30,000+ annual requests, it already has the reach and relationships a CIE requires.	Phase 1 - Build Foundation: Rather than deploying technology prematurely, we carefully design a CIE that communities will adopt and sustain, doing the following: Governance/Engagement: Create a steering committee of UWA, tribal health organizations, hospitals, behavioral health providers, and community leaders. Develop data agreements and co-governance frameworks grounded in CARE principles. Conduct a statewide needs assessment to document service gaps, connectivity constraints, and provider readiness. Identify initial pilot communities and providers in a community-led selection process. Sustainability: Treat sustainability as a design decision that must be made at the beginning of the project. Establish the economic foundation for sustainability. Quantify with a statewide value/needs assessment where today’s fragmentation creates financial loss, operational burden, and missed performance incentives. Explore economies of scale, partnerships and value-based models to fund the CIE beyond RHTP. Define Operating Model: Establish (1) shared governance across health, social services, tribal, and community partners; (2) shared language for care coordination and health/social integration; (3) secure information exchange connecting critical systems without replacing existing platforms; (4) mapped service gaps with measurable improvement targets; (5) data governance frameworks for community-level equity insights. Assess interoperability with EMRs, Alaska HIE, Medicaid, and tribal health records. Document requirements for low-connectivity environments. Phase 2 – Launch Pilots: Phase 1 findings confirm sustainability of the CIE and create a solid foundation for governance and operating model. Based on this framework, implement 2 Pilots, bringing the CIE to life and impacting real health outcomes. We configure tools for Alaska's operating context; enact data governance policies and consent workflows; baseline metrics for pilots; finalize pilot site agreements, provider onboarding plans, and workforce training frameworks for care navigators and community health workers; produce playbook for deployment; and launch the pilots. Phase 3 - Expand: Launch Pilot 3 and expand. Scaling requires intensive change management and technical expansion. We apply structured adoption principles to build desire and knowledge across new partner communities. As the model grows, continuous plan-do-check-act cycles refine training, partner recruitment, communications, and outcome measurement.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

United Way of Anchorage	ALICE in Action: Building Financial Stability Resources for Alaska’s Regional Communities	AK	Alaska is different. Residents navigating fragmented systems for housing, food, health care, and employment face the compounding challenges of limited infrastructure, geographic isolation, and capacity gaps that urban models cannot solve. At United Way of Anchorage (UWA), we know that economic instability creates barriers linked to poorer health outcomes, increased stress, and higher use of emergency and crisis services. UWA and Alaska 211 have spent more than a decade building programs that treat financial security as a core social determinant of health — Eviction Diversion, Landlord Housing Partnerships, and closed-loop referral services that connect Alaskans to housing, health insurance, and federal benefits before financial stress becomes a health crisis. These approaches work in Anchorage. But the families who need them most — in regional hub communities across the state — often have no equivalent local resource to be referred to. In fall 2026, UWA will release United for ALICE: the first statewide dataset on financial insecurity in Alaska, more actionable than the Federal Poverty Level and specific enough to guide targeted community investment. This project uses that data to answer what data alone cannot: what financial stability resources are missing in Alaska’s regional communities, what interventions fit each community’s context, and who are the right local partners to build and sustain them?	Financial stability resources work best when they are designed with communities, not delivered to them. In Anchorage, UWA’s combination of community trust, provider relationships, and a resource backbone — supported by Alaska 211’s closed-loop referral infrastructure — enabled programs like Eviction Diversion and the Landlord Housing Partnership to stabilize hundreds of households. The experience showed what works. It also showed what’s missing elsewhere: in many regional hub communities, there is no equivalent resource for Alaska 211 to refer families to, no local program to activate, no community partner equipped to address financial instability before it becomes a health crisis. This project stands on its own: Alaska 211’s existing referral infrastructure, UWA’s operating programs, and the United for ALICE data provide everything needed to identify resource gaps, design community-level interventions, and connect families to help. This project stands on its own. In the planning year, UWA will cross-reference United for ALICE data with Alaska 211’s statewide resource database to map where financial insecurity is concentrated and where resource gaps are most acute. UWA will then work directly with providers, community organizations, and local partners in regional hub communities to understand what interventions are feasible given local infrastructure, workforce capacity, and community readiness. Solutions may include community-based personnel, technology-enabled navigation tools, peer networks, adapted versions of UWA’s existing program models, or collaborative partnerships — the planning process determines what fits each community, rather than assuming a single model statewide. The result of the planning year will be a differentiated implementation plan for multiple hub communities: what financial stability resource or intervention each community will develop, who the local host or partner will be, how it connects to Alaska 211’s referral network, and what a sustainable funding model looks like beyond RHTP. This approach reflects UWA’s founding role as Alaska’s trusted convener — providing the data, program expertise, and resource backbone while communities lead the design of solutions that fit their own context.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

United Way of Anchorage	Home for Good - Permanent Supportive Housing expansion	AK	Alaska has an opportunity to build on the proven success of the Home for Good project to address persistent homelessness for residents with the most complex needs. Many of these individuals cycle repeatedly through crisis and emergency systems—including jails, hospitals, and emergency shelters —while remaining unhoused. For the past five years, Home for Good has worked with more than 20 system partners to provide intensive case management and stable housing to residents in Anchorage experiencing long-term homelessness and are cycling through emergency services. In preliminary data from the project’s final evaluation, Home for Good participants spent a substantial amount of time stably housed and remained in a lease over 90% of the maximum number of days at 18 months after HFG enrollment. Use of emergency services declined significantly – when comparing 12 months before and 12 months after participants’ first lease date, participants had an 84% reduction in shelter stays, 71% reduction in intakes to the Anchorage Safety Center, 54% reduction in arrests, and 18% reduction in calls to the Anchorage Fire Department for EMS transport. United Way of Anchorage is now seeking support to expand this proven model and house an additional 100 participants over five years. With a strong focus on outcomes and an investment in permanent supportive housing, people in Anchorage with the most complex barriers to housing can achieve housing stability.	Home for Good (HFG) provides supportive housing to Anchorage residents experiencing persistent homelessness with complex needs, often including multiple disabling conditions. Building on five years of proven success, HFG seeks to expand its reach to house an additional 100 participants over the next five years. The project uses an evidence-based approach, combining housing assistance with intensive case management and behavioral health services to stabilize participants and connect them to long-term supports.	\$1M-\$5M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

United Way of Mat Su	Building a Healthier Mat-Su	AK	Residents of the Mat-Su Borough face significant health disparities driven by geographic isolation, limited access to preventive services, and growing population pressures on health infrastructure. Many communities lack accessible public spaces that promote physical activity, social connection, and healthy development for children and families. At the same time, families with young children and older adults often struggle to navigate available services or access programs that support long-term health and well-being. These challenges contribute to higher risks of chronic disease, developmental delays in early childhood, and increased social isolation among teens, adults, and older adults. Without coordinated community-based solutions, health and wellness systems in Mat-Su face increasing demand for costly reactive care rather than preventive support. However, the Mat-Su region also has a strong network of community organizations, local governments, and health partners working collaboratively to address these challenges. This project presents an opportunity to strengthen and coordinate these efforts to build healthier environments, improve early childhood outcomes, improve teen health and wellbeing, and support aging populations in rural communities.	United Way of Mat-Su will implement a coordinated community health and wellbeing approach focused on prevention, connection, and community infrastructure through initiatives aligned with Healthy Beginnings and Healthy Communities. Key components include: Early Childhood: Strengthening early childhood initiatives that support families, promote developmental screening, increase space spaces for play time and for parents/caregivers to socially connect with other parents/caregivers, and connect parents with resources that foster healthy child development. Parks and Playgrounds: Expanding access to safe, inclusive outdoor spaces that promote physical activity, social engagement, and healthy childhood development across Mat-Su rural communities. Healthy Aging Initiatives: Supporting programs that reduce social isolation and increase social engagement among older adults, increase opportunities for physical activity and engagement, and connect seniors with services that support independence and well-being; Bolster senior supports through fall prevention education and outreach. Thrive Mat-Su: Leverage the coalition's youth substance abuse primary prevention work to align partners across sectors, share data, and coordinate strategies that improve community health outcomes; build on community engagement and readiness to build protective factors and positive youth development approaches and practices in the community; integrate resilience and mental health supports into all programming; increase youth events and youth activities to increase overall opportunities for youth. Youth 360: Launch a new afterschool teen club at Palmer Junior Middle School building upon the success and implementation of the Icelandic Prevention Model; Currently operate four teen afterschool clubs and an out of school summer camp focused on social connections, building life skills and resilience skills, refusal skills, youth voice and youth leadership development; program addresses equity and barriers by providing food, basic needs assistance, and transportation for participants. Community Collaboration: Strengthening partnerships with health providers, local governments, tribal partners, and community organizations to build sustainable systems that address social determinants of health. This approach integrates prevention, community engagement, and cross-sector collaboration to create lasting improvements in community health infrastructure.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

University of South Florida	DISTA: Modernizing Workforce Through Strategic Training in Applied Public Health	FL	Strengthening the rural public health workforce is essential for improving disease prevention and response across Alaska’s geographically dispersed communities. The University of South Florida (USF) seeks to partner with Alaska public health stakeholders to strengthen training for Disease Intervention Specialists (DIS) and other frontline healthcare and public health professionals serving rural and geographically dispersed communities. Through Driving Impact through Strategic Training in Applied Public Health (DISTA), USF proposes to work with Alaska partners to adapt and implement a competency-based training model that strengthens workforce readiness, supports rural public health practice, and builds sustainable training capacity across the state. Established in 2022 as a collaboration between USF and the Florida Department of Health, DISTA addresses critical workforce training gaps identified through statewide assessments of Disease Intervention Specialists and other frontline public health professionals. The program integrates academic expertise with real-world public health practice to build a scalable workforce training infrastructure focused on competency development, applied skills, and career progression. DISTA currently offers a large selection of online modules in public health, interview skills and counseling, infection-specific content, social behavioral health, and leadership and management as well as online synchronous and in-person training opportunities.	The proposal would begin with a workforce training needs assessment conducted in partnership with Alaska public health stakeholders, including state and local agencies and community partners. Particular attention would be given to Alaska’s geographic barriers, rural workforce distribution, and travel constraints that influence access to training opportunities. Based on these findings, DISTA would work with Alaska partners to adapt the training curriculum and implement a hybrid training model that may include self-paced online learning modules, live virtual training sessions, in-person experiential workshops, mentorship opportunities, and a Train-the-Trainer component designed to build sustainable local training capacity. By strengthening workforce readiness, expanding access to training across geographically dispersed regions, and establishing local instructor capacity, this initiative would support Alaska’s efforts to strengthen disease investigation capacity and public health response systems in rural communities. Since its launch, DISTA has trained over 258 frontline public health professionals throughout Florida, including a significant proportion of early-career staff engaged in disease investigation and community outreach, underscoring the necessity for structured onboarding and applied skills training. Participants’ knowledge assessment scores statistically significantly increased from 69% to 95%, and confidence improved across essential investigation skills. Experiential learning activities, such as simulations, mock interviews, and case scenarios, reinforced practical competencies, including case management and field safety. Workforce outcomes also improved: 80% of DISTA-trained staff remained employed compared to 42% under previous training models, and there was a 10.2 percentage-point reduction in first-year separation, suggesting enhanced workforce readiness and retention. DISTA’s curriculum is organized as a tiered learning pathway combining self-paced online modules with experiential training. This hybrid structure allows learners to progress from foundational skills to advanced leadership competencies while accommodating workforce schedules and geographic constraints. DISTA competencies align with national public health certification frameworks, including Certified in Public Health (CPH), Community Health Worker (CHW), and Certified Health Education Specialist (CHES), ensuring alignment with broader workforce development standards.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

University of Washington	Rural Point of Care Ultrasound Initiative-Bringing Healthcare to Alaska’s Most Remote Communities	WA	Rural regions of Alaska suffer from increased morbidity and mortality, in part due to challenging distribution of higher-level resources and specialists. Spoke and hub models like ANTHC have addressed these odds with easy escalation to critical access hospitals and specialty care. However, persistent gaps in imaging lead to unnecessary transfers, delayed care, and missed diagnoses creating substantial costs. X-ray, computed tomography and standard ultrasound are not feasible in most rural Alaskan communities given the expense of transporting, maintaining, and training providers to operate complex machinery. POCUS at scale can drastically improve care with a rapid, low-cost and evidence-backed solution where access to advanced diagnostics is limited. Providers from community health workers to physicians have successfully used the technology and research has shown that competency attainment for the most basic POCUS scans can be as low as 10 studies. However, a major component of expanding capacity to rural sites is linking the images to a robust network. It can only be achieved with solutions that scale across settings and priorities, not single departments. This requires deployment of probes, software integration, and clinical education. The funding required to establish high quality POCUS deployment is not feasible for a healthcare network serving patient populations that largely rely on tribal assistance and Medicaid. RHTP funding can bridge this implementation gap.	We plan to expand ultrasound diagnostic capabilities to rural sites with delivery of portable probes, curated curriculum, longitudinal education, technological support and integration into already existing electronic medical records. This will start with initiatives in already identified tribal health organizations (THOs) with the eventual goal of widespread adoption throughout ANTHC. Over the past three years we have been running a small pilot program in partnership with SouthEast Alaska Regional Health Consortium (SEARHC). We will use this experience to expand into Southcentral Foundation (SCF) and Maniilaq Health Center (MHC). Both THOs have on site staff facilitating POCUS expansion. First steps involve creation of a central image repository integrated into each location’s electronic medical record (EMR) and picture archiving and communication system (PACS). This integration as well as probe delivery will be accomplished through partnership with Butterfly Network, Inc - an American health technology company that manufactures chip-based ultrasounds alongside a comprehensive, cloud-based software system. In parallel we will begin educational sessions for rural providers with already established credentialing guidelines trialed in SEARHC. A combination of UW emergency medicine and Alaska Native Medical Center (ANMC) ultrasound faculty and fellows will provide on site and telehealth guided training sessions. We will employ additional ultrasound teachers through programs like the global ultrasound institute (GUSI) should the training sessions exceed the capacity of these educators. UW ultrasound faculty and fellows will oversee image review for quality assurance and improvement. Collaborators from Butterfly will aid in informatics to continually reassess usage and reorient education to match need and utilization. Next steps of the project will include expansion to additional THOs as well as more providers within each site. We will also grow partnerships on a more structural level within the larger ANTHC network with the goal of improved interoperability between sites using cloud imaging software as well as a centralized learning center within ANMC. This stage will involve equipping educators with probes and phantom models. It will also involve partnering with ultrasound trained faculty, community health aide (CHA/P) directors, and administrators within the network to establish formalized clinical guidelines and advanced local resources.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Kuskilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

University of Washington dba Airlift Northwest	Airlift Northwest Air Medical-Expand Access to Essential Health Services in Rural Communities	WA	Alaska’s geography, severe weather patterns, and vast distances create some of the most complex health care access challenges in the nation. Many communities lack road connectivity and rely entirely on aviation to access advanced medical care. Patients requiring trauma services, burn care, advanced cardiac intervention, neurosurgery, high-risk obstetrics, complex pediatric services, transplant evaluation, or other quaternary-level care must be transported rapidly and safely to higher levels of care. Demand for interfacility critical care transport from Southeast Alaska continues to grow. Weather variability, limited aircraft availability, and increasing clinical acuity create capacity constraints that can delay access to definitive care. A third Learjet based in Juneau will directly address these access gaps and ensure reliable system capacity. The addition of this aircraft will: • Expand reliable access to tertiary and quaternary care for rural and frontier communities. • Reduce time to definitive care for trauma, stroke, STEMI, sepsis, high-risk maternal, pediatric, and other complex patients. • Improve system redundancy during weather disruptions and peak demand periods. • Support small rural hospitals and critical access facilities in stabilizing and transferring patients safely. • Strengthen Alaska’s statewide referral network and continuity of care.	We propose the placement and operation of a third Learjet based in Juneau, Alaska, dedicated to expanding access to tertiary and quaternary health care services for patients across Southeast Alaska and surrounding rural and frontier communities. Funding from the Rural Health Care Transformation Fund will support: • Acquisition and operational deployment of a third Learjet dedicated to the Juneau base. • Staffing with specialized critical care transport clinicians. • Expanded 24/7 coverage capacity to reduce transport delays. • Increased throughput to tertiary and quaternary care centers. This aircraft will serve 200 or more patients annually, representing critically ill or injured Alaskans who require services not available in their home communities. These funds will support aircraft readiness, clinical staffing, aviation operations, maintenance, and rural access stabilization necessary to maintain consistent 24/7 service to Southeast Alaska and surrounding frontier communities. The addition of this aircraft will: • Expand reliable access to tertiary and quaternary care for rural and frontier communities. • Reduce time to definitive care for trauma, stroke, STEMI, sepsis, high-risk maternal, pediatric, and other complex patients. • Improve system redundancy during weather disruptions and peak demand periods. • Support small rural hospitals and critical access facilities in stabilizing and transferring patients safely. • Strengthen Alaska’s statewide referral network and continuity of care. This investment directly advances the Fund’s goal of expanding and maintaining essential health services in remote communities by ensuring patients can reach the care they need, when they need it.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Sitka (City and Borough); Wrangell (City and Borough)	Deferred or Not Advanced

Upper Susitna Fitness Center	Upper Susitna Valley Wellness Center (USVWC): Readiness and Planning Project	AK	The approximately 6,000 residents of the Upper Susitna Valley have no access to a year-round indoor fitness and wellness facility. This is not a gap in convenience - it is a gap in preventive health infrastructure; one that affects residents of all ages, from youth facing higher obesity risk to working adults managing chronic conditions to elders who need structured programming to maintain independence. The nearest public gym is over 70 miles away in Wasilla, and Alaska's extended winters make outdoor exercise difficult for much of the year. A 2025 community survey received 224 responses across the service area and confirmed strong, cross-generational demand. Top health goals were general health improvement (65%), stress reduction (54%), and weight loss (51%). Top requested amenities included strength training equipment (65%), cardio machines (51%), and group fitness classes (49%). The opportunity is clear: documented community demand, a facility committed for future use by a local partner organization, and engaged clinical and community partners together create the conditions to establish the region's first fitness and wellness center - directly aligned with RHTP's Healthy Communities initiative and its emphasis on evidence-based prevention and chronic disease management.	This Letter of Interest requests readiness funding to build the organizational, planning, and partnership foundations necessary to bring a community wellness center in the Upper Susitna Valley from concept to implementation-ready status. The first priority is establishing the organization itself. We will formally incorporate the USVWC as a registered Alaska nonprofit corporation with 501(c)(3) tax-exempt status, establish a governance board, adopt bylaws, and build the financial management and administrative infrastructure required to responsibly manage federal grant funds. A part-time project coordinator will be hired to manage readiness activities, coordinate with partners, and maintain community engagement throughout this phase. Equally critical is securing the facility. The Sunshine Station Childcare Center Board has committed to making their current building available for use as a community wellness center once construction of their new facility is complete, projected for 2028. While that commitment is clear, the terms have not yet been formalized in writing. Putting a written facility agreement in place is a key deliverable of this readiness phase and essential before any capital planning can proceed. Once secured, we will commission a licensed structural engineer to assess the building's capacity to support fitness equipment and programming use, identify code compliance requirements, and provide renovation cost estimates. Simultaneously, we will formalize partnerships with Sunshine Community Health Center (SCHC), the Northern Valley Health Coalition (NVHC), Wasilla Physical Therapy, Sunshine Transit, and area community councils through written memoranda of understanding that define roles, shared wellness goals, and coordinated programming. These readiness activities will produce concrete, foundational outcomes: a legally incorporated nonprofit, a formalized facility agreement with the Sunshine Station Childcare Center Board, and a professional structural assessment with cost estimates that define the scope of renovation. Together with signed partnership memoranda of understanding and a project plan identifying the health outcomes the center will track once operational, these deliverables will position the USVWC as a shovel-ready project prepared to pursue implementation funding. We welcome RHTP technical assistance in project management and reporting as we build this foundation.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Upskilled Evolution LLC	Building Alaska's Rural Health Future: Workforce Development and Technology Innovation	AK	Alaska's rural and tribal healthcare organizations face a workforce crisis threatening the survival of essential community health infrastructure. Hundreds of clinical and support positions sit vacant across rural Alaska, not because qualified candidates don't exist, but because small organizations lack the administrative capacity, recruitment expertise, and financial resources to compete for talent against large urban health systems. The consequences are severe. Patients in remote communities lose access to consistent care. Overworked staff burn out and leave. Organizations resort to expensive temporary staffing contracts that extract value from communities without building them. Upskilled Evolution exists to close this gap. By providing completely free, professional recruitment services exclusively to rural and tribal healthcare organizations, we level a playing field that has long been tilted against Alaska's most underserved communities. Every placement is a permanent direct hire, a new Alaskan who becomes an organizational employee and community member from day one. This project seizes a critical opportunity created by the RHTP to scale this model statewide, reaching tribal health corporations, Critical Access Hospitals, FQHCs, and rural clinics that would otherwise have no access to professional workforce support, and delivering that support at zero cost to the organizations that need it most.	Upskilled Evolution addresses Alaska's rural healthcare workforce crisis through a three-part approach: permanent direct-hire recruitment, organizational capacity building, and technology-enabled service delivery. Recruitment Services form the core of our model. We provide end-to-end recruitment at no cost to partner organizations, including candidate sourcing, screening, interview coordination, background checks, moving expense support, and onboarding assistance. Our tiered incentive structure prioritizes the most remote and underserved placements, with enhanced relocation support and retention bonuses for Tier 1 communities. Every candidate placed becomes a permanent employee of the hiring organization from day one, not a temporary contractor, not an agency employee, but a committed new Alaskan invested in organizational and community success. Organizational Capacity Building ensures our impact outlasts the grant period. We provide hiring manager training to 100 or more healthcare leaders across partner organizations, building internal recruitment and retention expertise that strengthens workforce infrastructure permanently. Organizations we serve will continue attracting and retaining quality permanent staff long after our direct engagement ends. Technology Integrationthrough our consortium partner Remote Hands Alaska equips rural organizations with the IT infrastructure, telehealth capabilities, and cybersecurity foundations needed to operate efficiently and extend their reach across Alaska's challenging geography. Our tribal outreach partner, Far North Strategies, ensures that Alaska Native communities and tribal health organizations receive culturally competent, prioritized access to all services, with dedicated statewide engagement across Alaska's 229 federally recognized tribes. Together, these three service lines create a comprehensive, sustainable workforce solution that transforms how rural and tribal Alaska recruits, retains, and builds the permanent healthcare teams their communities depend on. Rural Alaska does not need more temporary fixes. It needs permanent people, permanent teams, and permanent investment. Upskilled Evolution is not a staffing agency passing through. We are an Alaska woman-owned small business building the workforce infrastructure this state has needed for decades, one permanent placement, one empowered organization, and one thriving rural community at a time. This is a commitment to Alaska's future.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Upstream Family Medicine Inc	Upstream Family Medicine OB Capacity Building Initiative	AK	The Central Kenai Peninsula faces an imminent obstetric care crisis. The region’s two OBGYNs are at retirement age and a third is approaching retirement. When they leave, specialist OB backup disappears, and full responsibility for obstetric access falls to the Soldotna Physician Collaborative, the area’s only remaining OB-capable primary care group. The SPC physician group delivers approximately 200 babies annually, holds a formal tribal OB contract with the Kenaitze Indian Tribe, and shares call coverage among its physicians. That model works today. It will not hold without specialist backup. Rural physicians develop critical obstetric and newborn skills through scattered, infrequent exposure, not the structured repetition that sustains competency. Last year, Upstream providers attended 6 resuscitations at delivery and 9 critical care infants. An additional 54 deliveries involved low Apgar scores: 33 with a 1-minute Apgar of 6 or below and 21 with a 5-minute Apgar of 7 or below. Across multiple physicians sharing call, each individual encounters these events rarely. When they occur, there is no specialist to defer to. Structured advanced training replaces scattered exposure with deliberate, supervised repetition. The Kenai Peninsula’s 2022 CHNA identifies maternal health as a top unmet priority, and 23.9% of Kenai Peninsula women are not receiving first-trimester prenatal care. This grant directly addresses both gaps.	Upstream will implement a OB Capacity Building Initiative: recruiting a fellowship-trained FMOB physician and providing advanced clinical training to 2 to 3 existing SPC physicians in Year 1, with training continuing in Year 2. Year 1: FMOB Recruitment and Advanced Clinical Training USFM will recruit a Family Medicine Obstetrics fellowship-trained physician through the American Board of Physician Specialties. The ABPS FMOB fellowship produces family physicians with advanced training in obstetrics, labor and delivery, and newborn care, exactly the clinical profile the Central Kenai Peninsula needs as specialist OB backup retires from the region. The recruitment package will include a sign-on bonus, a housing incentive, and a childcare incentive where applicable. Recruitment will be active immediately upon award with a target start date within 12 months. Year 2: Continued Advanced Clinical Training Two to three existing SPC physicians will travel to an out-of-state facility, likely in Washington state, for advanced L&D and newborn specialty training in weekly rotations over several months. Physicians will obtain licensure and credentialing prior to rotations. Grant funding covers travel, lodging, licensure, credentialing, and training costs. Upstream will confirm fellow coverage through UW connections to maintain practice continuity during absences. Year 2 funding will support continued advanced training rotations for the same physicians, deepening clinical competency through additional supervised weeks at the same facility. Continuation builds on Year 1 credentialing and faculty relationships, maximizing the investment. This initiative directly advances three RHTP priority areas. Strengthen Workforce: Recruiting a fellowship-trained FMOB physician through ABPS and providing advanced L&D and newborn specialty training to 2 to 3 existing SPC physicians builds the rural physician capacity and clinical depth the Central Kenai Peninsula will need as specialist OB backup retires. Healthy Beginnings: sustaining obstetric access for Alaska Native women under tribal contracts and protecting first-trimester prenatal care access for rural women who have no alternative provider. Healthy Communities: A stable rural OB safety net directly supports maternal and newborn health outcomes for the Central Kenai Peninsula. Physician recruitment incentives and clinical training costs are permissible RHTP uses under CMS guidelines to support rural workforce development.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Upstream Family Medicine Inc	Healthy Beginnings and Communities Immunization Infrastructure Project	AK	Rural clinics on the Peninsula face frequent power disruptions and limited infrastructure capacity that create ongoing risk to vaccine storage integrity. In 2025, the region experienced 75 power outages, a frequency that exposes cold-chain systems to repeated temperature excursion risk. USFM administered 1,601 vaccine injections in 2025. Without adequate cold-chain protection, a single prolonged outage could compromise inventory, disrupt immunizations, and require costly vaccine replacement. The urgency of this investment is reinforced by regional immunization coverage data from the AK Childhood and Adolescent Immunization Report. Across the Gulf Coast region, only 34% of adolescents aged 13–17 are vaccinated for HPV, only 47% of kindergartners have completed the recommended kindergarten series, and only 52% of children aged 19–35 months have completed the recommended childhood series. These rates fall well below national targets and reflect the compounding effect of rural access barriers and service disruption risk. Protecting maternal immunization infrastructure is also critical to infant health outcomes. The RSVpreF vaccine, administered during pregnancy, provides passive immunity to newborns and reduces the risk of severe RSV disease in infants by approximately 50–60%. Cold-chain compromise directly translates to preventable infant illness a particularly high-stakes consequence in a rural region where neonatal and pediatric specialty care is geographically distant.	The proposed approach strengthens rural vaccine cold-chain reliability through coordinated infrastructure investment, real-time risk monitoring, updated operational protocols, and formalized regional collaboration. First, the project will procure and install one CDC-compliant, technology-enabled medical-grade vaccine refrigerator/freezer unit equipped with continuous digital temperature monitoring and automated alarm capability. A dedicated backup power system will be installed to ensure uninterrupted refrigeration during outages. These capital improvements directly address the region’s documented frequency of power disruptions and the current absence of reliable backup storage protection. Second, the clinic will implement real-time remote temperature monitoring with automated alert notifications to designated staff. This system enables rapid identification and response to temperature excursions before vaccine integrity is compromised. Updated written vaccine storage and handling policies will be aligned with CDC guidelines to standardize procedures, documentation, and corrective action protocols. Third, the project will formalize Memorandums of Understanding (MOUs) with neighboring clinics to establish a coordinated vaccine storage and emergency transfer network. These agreements will define activation triggers, response timelines, contact protocols, and documentation standards to ensure rapid redistribution when primary storage is compromised. A validated portable vaccine transport carrier will support safe emergency transfers. This structured coordination transforms isolated clinic response into a regional continuity strategy, fostering collaboration. Fourth, staff training will ensure consistent operational readiness. Training will cover equipment use, emergency response procedures, documentation requirements, and communication protocols. By combining durable infrastructure investment, real-time monitoring, defined response procedures, and regional partnership agreements, this approach creates a layered protection model that reduces vaccine loss risk, strengthens quality oversight, and ensures uninterrupted immunization access for rural communities.	\$50,000- \$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Upstream Family Medicine Inc	Upstream Family Medicine Rural Diagnostic Modernization Initiative	AK	The Central Kenai Peninsula faces a well-documented diagnostic access crisis. The 2022 Central Kenai Peninsula Community Health Needs Assessment found that 45% of local households left the area for medical care in the past year. Among those who left, 53.4% said the service was not available locally, and 19.5% cited outdated equipment or technology as the reason. Pulmonology and radiology appear among the top services sought outside the region. The Peninsula has only 107 primary care physicians per 100,000 residents, below Alaska’s rate of 133.6. With 4 residents per square mile, patients in communities like Sterling, Kasilof, Nikiski, Ninilchik, and Seward already travel significant distances to reach primary care. When a referral pushes them further out of the region, that burden compounds. Chronic disease rates make proactive in-clinic monitoring urgent. Diabetes affects 11.6% of residents, compared to 7.6% statewide. Obesity is 42.9%, exceeding state and national benchmarks. Lung cancer incidence is higher than both state and national rates. High blood pressure affects 37.2% of the population. These are the conditions where earlier detection and continuous monitoring produce measurable clinical impact. Without expanded diagnostic infrastructure within primary care, rural patients remain dependent on out-of-region specialty access, increasing delays, fragmenting care, and driving preventable deterioration in outcomes.	Through the Upstream Family Medicine Rural Diagnostic Modernization Initiative, the clinic will expand in-clinic diagnostic capacity and implement remote monitoring technologies to strengthen proactive management of chronic and high-risk conditions in rural primary care. In collaboration with Katy Sheridan, MD, and Jennifer Wooley, MD, Upstream will deploy advanced diagnostic and monitoring equipment through a shared utilization model across participating clinics. This coordinated equipment-sharing structure will maximize access to specialized tools while reducing unnecessary duplication of investment across rural sites. The Initiative will focus on technologies that support early identification and monitoring of respiratory disease, dermatologic abnormalities, maternal and neonatal risk factors, pediatric developmental and preventive screening needs, and metabolic health indicators. Remote monitoring tools will enable ongoing assessment between visits, allowing providers to identify concerning trends earlier and intervene more promptly. All equipment will integrate with each clinic’s existing EMR system to ensure secure data transfer, continuity of documentation, and interoperability without requiring a full system replacement. Structured workflow integration and staff training will support seamless adoption within routine primary care operations. By expanding in-clinic diagnostic capabilities and implementing coordinated, shared access to equipment, the Initiative shifts care from episodic, referral-dependent assessments to earlier detection and ongoing monitoring within the rural primary care setting. If this model demonstrates that independent rural primary care practices can share diagnostic infrastructure without duplicating investment, Upstream will document and share the framework through RHTP networks as a replicable model for other rural primary care networks across Alaska.	Under \$50,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Upstream Family Medicine Inc	Upstream Family Medicine Rural Technology Modernization Initiative	AK	Upstream Family Medicine operates in a rural healthcare environment where aging technology infrastructure, cybersecurity vulnerabilities, and inefficient administrative workflows threaten operational stability and patient data security. Rural clinics are increasingly targeted by cyber threats but often lack modern cloud-based infrastructure and advanced endpoint protection. Legacy server systems and outdated hardware increase risk exposure, create maintenance burdens, and strain limited workforce capacity. In 2025, the clinic delivered 34 telehealth appointments representing less than 1% of total visit volume. This significantly underrepresents the telehealth demand in a geographically dispersed rural region and reflects technology infrastructure limitations rather than patient preference. Manual intake processes, paper-based screening forms, and manual entry of screening data into the EMR consume patient, clinical, and administrative time. Staff must scan, upload, and re-enter information, increasing the risk of documentation errors and workflow delays. These inefficiencies extend check-in times, contribute to longer patient wait times, and reduce screening compliance. Limited telehealth infrastructure further restricts access in a geographically dispersed region. These technology gaps increase operational risk, contribute to staff burnout, and limit the clinic's ability to deliver secure, efficient, and technology-enabled rural primary care services.	Through the Upstream Family Medicine Rural Technology Modernization Initiative, Upstream Family Medicine will implement a comprehensive infrastructure modernization and cybersecurity enhancement project in partnership with PNC IT, which will provide secure implementation and ongoing technical support. The initiative will begin with the deployment of advanced cybersecurity protections, including ThreatLocker application control and enhanced endpoint security tools, followed by the removal of legacy on-site server infrastructure and the transition to secure cloud-based systems. Cloud migration will reduce vulnerability, strengthen data redundancy, and improve disaster recovery capacity for rural operations. Twelve workstations (computer not included) will be equipped with upgraded monitors and secure docking stations to improve display quality, ergonomics, and workflow flexibility. High-resolution monitors with blue-light reduction features will protect staff vision and reduce fatigue during prolonged EMR use. Privacy screen technology will be incorporated to safeguard patient information and reinforce HIPAA compliance in clinical and administrative spaces. The telehealth suite will be modernized with upgraded video and audio equipment to improve the quality of visits and expand reliable access for patients in geographically dispersed communities. AI integration will include both equipment and structured training for all staff. Training will provide in-depth education on medical AI use, beginning with foundational AI literacy and progressing to advanced tools such as AI-supported documentation and dictation. Equipment and software necessary for secure AI utilization will be deployed across clinical workstations. The program will emphasize safe implementation, human oversight, data security, and appropriate clinical application to ensure AI enhances efficiency without compromising quality or compliance. Digital intake and screening forms will be developed and integrated directly into the EMR, eliminating manual scanning and re-entry. This integration improves workflow efficiency, reduces wait times, and increases preventive screening compliance while avoiding recurring subscription fees.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Upstream Family Medicine Inc	Upstream Family Medicine Rural Workforce Stability Program	AK	Upstream Family Medicine has served the Central Kenai Peninsula since 2013, building a clinical and administrative team that delivers 6,755 patient visits annually in a region where healthcare access is limited and the cost of losing experienced staff is high. The Central Kenai Peninsula currently has 22 open medical assistant positions. In a labor market this competitive, retaining experienced rural healthcare workers requires active, meaningful investment beyond competitive base wages. Upstream already provides an annual compensation bonus as part of its standard staff package. This grant supports an additional retention incentive on top of that existing commitment, sending a clear signal to every member of the team that their experience, their relationships with patients, and their dedication to rural practice are recognized and valued. Beyond retention, this grant supports professional development through APCA no-cost certified programs and approved programs of each staff member's choosing, and AI-in-healthcare training for all staff and providers through PNC. Investing in staff growth builds engagement, strengthens competency, and creates long-term rural healthcare careers beyond individual grant cycles. Upstream has built something rare on the Central Kenai Peninsula: a stable, trusted, high-functioning rural primary care team. This grant protects it.	Upstream Family Medicine will implement a two-component Staff Retention and Development Initiative across all clinical and administrative positions. Staff Retention Incentives Upstream currently provides an annual compensation bonus as part of its standard staff package. This grant supports an additional retention bonus on top of that existing commitment for all current clinical and administrative staff: 5 providers, 3 medical assistants, 3 receptionists, 1 clinic manager, and 1 medical biller. In a labor market with 22 open medical assistant positions on the Central Kenai Peninsula, this additional investment directly addresses the competitive pressure that puts experienced rural healthcare workers at risk of departure. Retention bonuses will be distributed upon award, with a second distribution at the grant midpoint to reinforce continuity throughout the full grant period. Professional Development and AI Training All staff will have access to professional development opportunities through the Alaska Primary Care Association and other approved educational programs of their choosing. APCA offers rural-focused training at no direct cost to the clinic; grant funds will support wage adjustments at program midpoints and completion milestones, and tuition for approved programs outside APCA's no-cost offerings. Staff will select programs aligned with their individual roles and career goals. Giving staff a meaningful voice in their own development strengthens engagement and long-term commitment to rural practice. Grant funding supports AI-in-healthcare training for all staff and Upstream physicians through PNC, building full organizational readiness for AI-assisted rural practice. Together these two components address both the financial and professional drivers of retention, creating a workplace where experienced rural healthcare workers choose to build careers. This initiative directly advances two RHTP priority areas. Strengthen Workforce: retention incentives and professional development address the financial and career drivers that cause rural healthcare workers to leave, building the long-term workforce stability the Central Kenai Peninsula depends on. Health Care Access: retaining the experienced team that delivers 6,755 patient visits annually is a direct protection of access for rural patients with chronic disease, complex care needs, and limited alternatives.	\$50,000-\$250,000	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Uwill, Inc.	Expanding Access to Behavioral Health Care for Youth and Young Adults in Rural Alaska	MA	Many youth and young adults living in rural, remote, and frontier communities across Alaska face significant barriers to accessing timely behavioral health care. Limited local provider availability, geographic isolation, transportation challenges, and long wait times often delay or prevent individuals from receiving the mental health support they need. These challenges are particularly pronounced for adolescents and young adults, a population that is experiencing rising rates of anxiety, depression, and suicide risk nationwide. At the same time, many communities are actively working to strengthen local behavioral health systems but continue to face persistent workforce shortages and gaps in specialty services. This creates an opportunity to expand access to care through telehealth-enabled services that can supplement existing providers and extend the reach of licensed clinicians. By leveraging telehealth and partnering with Tribal health organizations and community behavioral health providers, this project seeks to reduce barriers to care, connect youth with licensed clinicians more quickly, and support a more coordinated and sustainable behavioral health system for young people across Alaska.	Uwill proposes to expand access to behavioral health services for Alaskans ages 13–24 by delivering telehealth-based counseling, telepsychiatry, and 24/7 crisis support through a secure, accessible platform. This approach is designed to supplement existing behavioral health resources and help address workforce shortages that can limit timely access to care in rural, remote, and frontier communities. Through Uwill’s platform, youth and young adults will be able to quickly connect with independently licensed clinicians for video or phone appointments, allowing them to receive care from home, school, or other safe locations. By reducing geographic and scheduling barriers, telehealth enables individuals in underserved areas to access licensed behavioral health providers without requiring travel or long wait times. To ensure services are integrated within Alaska’s existing care system, Uwill intends to partner with a Tribal health consortium and/or a Certified Community Behavioral Health Clinic (CCBHC). These partnerships will support culturally responsive care and enable coordinated referrals when individuals require additional or ongoing services. Telehealth services would function as an extension of local behavioral health infrastructure, helping expand capacity while maintaining continuity of care. Uwill’s integrated model includes teletherapy (Umatch), telepsychiatry (Upsych), and 24/7/365 crisis support (Uhelp), allowing individuals to access different levels of support through a single platform. This coordinated structure helps reduce fragmentation across services while ensuring individuals can receive appropriate care as their needs change. In addition to direct services, Uwill provides realtime data reporting through its Ucollaborate platform, enabling partners to monitor utilization, identify emerging trends, and better understand community needs. These insights can help inform planning and support ongoing program improvement. By leveraging telehealth technology, expanding clinician reach, and coordinating with local partners, this project aims to improve timely access to behavioral health care while supporting a more sustainable and connected behavioral health system for young people across Alaska.	\$250K-\$1M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

V Fit & Wellness	Community health education & prevention	AK	Alaska faces many barriers to healthcare access, particularly in rural communities where specialty services are limited or unavailable. Even in Fairbanks, access to specialty care for chronic conditions such as diabetes, cardiovascular disease, and stroke can be delayed or fragmented during acute health crises. As a result, preventable complications, avoidable hospitalizations, and long-term functional decline are common. The opportunity exists to intervene earlier, before chronic conditions escalate into emergencies. Prevention, education, and sustained community-based support are largely absent in the current rural healthcare infrastructure, which is heavily focused on acute care rather than long-term wellness and disease management. This project addresses that gap by establishing a community-centered preventive health model focused on chronic disease education, wellness education, nutrition access, and year-round physical activity. By engaging youth, families, adults, elders, and individuals with disabilities through individualized goal setting, family support systems, and structured group programming, this initiative shifts the focus from reactive care to proactive health care. Strengthening our community preventive services will reduce adverse outcomes, improve functional independence, and enhance long-term health resilience in Interior Alaska.	My approach will be a phased approach to build a community preventative health and wellness center. This center would incorporate an indoor field house facility for youth (and/or adult) sports to play year round, an adaptive gym for patients recovering from injury, illness, and/or unable to attend typical gyms, education classroom and kitchen for nutrition classes, heated greenhouse/high tunnels to support year round fresh food access, and clinical/specialty care wing. Phase 1 (year 1) - Secure property, design and start building center working with an engineer and design team. Goal would be field house development first, adaptive gym, classroom and kitchen, greenhouse, and clinic. Develop community partnerships and outreach to local resources (University of Alaska, FMH, TCC, Youth Sports, specialty providers, primary care practices). Recruit for soft launch of preventative outreach programs as structure and staffing are coming together. Mobile outreach trailer to be able to bring preventative services to people's homes (physical fitness equipment for people with disabilities, ability to have small groups for physical fitness and wellness education, wheelchair accessible). Phase 2 (year 2-3) - Begin to launch more preventative programs; health screenings, chronic disease prevention programs, nursing-led wellness coaching, care coordination services, prevention classes, senior restorative programs, youth physical activity programs, nutrition classes, CPR classes. Start working with insurance companies/CMS to become an approved provider, develop MOA's for fee scale with options for sliding scale as income/non-profit status is reviewed, begin high tunnel and indoor farming for year round access to fresh food. Partner with FFA, 4-H, local farmers, farmers market, UAF agriculture department. Phase 3 (year 4) - Review sustainability and revenue streams. Refine processes to continue to make physical fitness and healthy food accessible but sustainable long term. Focus on community and partnerships to continue to grow. Start local produce production for use in stores, farmers markets, nutrition classes. Phase 4 (ongoing) - Continuous improvement process on sustainability (PDCA), develop relationships with the community and outreach providers to potentially offer options of specialty care options.	Over \$5M	Home- and community-based services provider	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced

Valley Allergy and Asthma, LLC	Allergy & Asthma Outreach, Awareness and Treatment	AK	Timely diagnosis of allergies and asthma is often delayed by non-specific symptoms that mimic common colds, the intermittent nature of flare-ups, and limited access to specialized testing like spirometry in primary care. Addressing this requires a shift from reactive to proactive management through technology and integrated clinical pathways. Improving diagnostic timelines also depends on systemic changes in how healthcare providers and patients interact. Identifying at-risk children through birth cohort data and early-life risk factors (e.g., wheezing frequency, FeNO levels) allows for primary prevention before asthma becomes chronic. In Alaska, approximately 6% to 8% of the population has asthma, and about 20% suffer from allergies. Food sensitization in infants significantly increases the risk of developing asthma later in childhood*. 42% Alaska Native children and 19% of adults are more likely to have asthma than the general U.S. adult population**. Allergies among Alaskans are also widespread, with environmental and food-related triggers being common. Approximately 20% of Alaskans have some form of allergy and about 65.9% of children with asthma in Alaska also have a co-occurring allergy***. We would like to improve the health of Alaskan's by raising awareness and facilitating early interventions and management of these diagnoses. * (aafaalaska); ** (American Lung Assoc); *** CDC	There are several ways to improve awareness and create pathways to early intervention, preventative and continued care. *We would like to integrate with Health e-Connect Alaska (AK HIE) so that important patient clinical data regarding asthma and allergy diagnoses, as well as treatment plan and recommendations, are available in real time to our patients' other health care providers. *Utilize Telehealth in a greater capacity: Integrate e-Consults with urban specialists to support local PCPs in managing complex cases and expediting patients to greater care when clinically indicated. We propose making changes to our patient portal to allow secure and encrypted access to follow-up visit via telemedicine. *Implement Autoimmune Therapy at Extender Sites: This is a service we have done infrequently and have had success with it. As a new service, we would like to collaborate with rural clinics who have expressed interest in providing therapeutic injections and perform monitoring during hours when we are available for immediate consultation. We would like to define how this service delivery will work to build a sustainable model, which initially will require resources that we hope to access through this grant. *Create Informational Videos for Distribution: We would like to have professionally created videos for distribution to the public through social media platforms, to school nurse programs and to tribal and rural health clinics. These videos are intended to raise awareness on symptoms that may require immediate attention to avert serious and potentially life-threatening emergencies. *Track Outcomes: Employ data tracking for asthma-related emergency department visits and hospital readmission rates. This will allow us to define our collaboration efforts, ensuring measurable impact. *We will need to hire additional staff to assist with implementing infrastructure for these initiatives as we work toward building sustainability beyond the life of the RHTP project.	\$250K-\$1M	Private practitioner	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

Valley Charities	Reentry Coalition Capacity Development - Mat-Su Borough, Juneau, Ketchikan, and Kodiak	AK	Alaska’s local reentry coalitions play a pivotal role in supporting individuals returning to their communities after incarceration. These coalitions—made up of nonprofits, tribal organizations, state agencies, faith groups, and community volunteers—work together to reduce recidivism and promote long term stability for returning citizens. Their impact reaches far beyond individual success stories; they strengthen public safety, support economic growth, and advance federal reentry objectives. At the heart of their mission is collaboration. Alaska’s vast geography and unique cultural landscape make coordinated support essential. Local coalitions help bridge gaps in housing, employment, behavioral health services, transportation, and identification—barriers that often determine whether someone successfully reintegrates or cycles back into the justice system. By tailoring solutions to local needs, these coalitions ensure that reentry support is culturally responsive and accessible, especially in rural and Indigenous communities.	The Reentry Coalition’s work directly aligns with federal priorities outlined by agencies such as the U.S. Department of Justice and the Federal Interagency Reentry Council. Federal policy emphasizes reducing recidivism, improving access to treatment, expanding employment opportunities, and strengthening community based partnerships. Alaska’s coalitions operationalize these goals on the ground. They help implement evidence based practices, coordinate grant funded programs, and ensure federal resources reach the people who need them most. The benefits ripple outward. When returning citizens secure stable housing, find meaningful work, and access treatment, communities experience lower crime rates and reduced correctional costs. Families remain intact. Employers gain reliable workers. Rural communities—often disproportionately affected by incarceration—see improved social and economic stability. In a state where vast distances, limited infrastructure, and rich cultural diversity create unique challenges, Alaska’s local reentry coalitions serve as a critical bridge between federal policy and real-world outcomes. Their work not only transforms individual lives but also strengthens communities across Alaska and advances national reentry goals—reducing recidivism, enhancing public safety, and empowering individuals to successfully rebuild their lives.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Juneau (City and Borough); Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Valley Medical Care PC	Improving Southeast Alaska’s Diagnostic Infrastructure to Improve Rural Access and Care Coordination	AK	Our organization serves as a regional access point for patients from smaller Southeast Alaska communities and functions within Alaska’s broader referral network to Anchorage and other tertiary care centers. Patients frequently travel significant distances for diagnostic imaging and specialty evaluation, making timely interpretation critical to reducing delays and unnecessary travel. Our physician-owned family practice provides full-spectrum care including primary care, inpatient hospital services, obstetric care and deliveries, and procedural services such as colonoscopy and upper endoscopy. As one of the few independent practices in the region offering this breadth of services, we play an essential role in sustaining local and regional access to comprehensive care. Reliable diagnostic imaging infrastructure is necessary to safely maintain these services and reduce the need for patients to leave Southeast Alaska for care that can be provided locally. Our organization provides approximately 1500 imaging services annually. Our current PACS is outdated and approaching end-of-life support, limiting interoperability and timely sharing of studies with consulting radiologists and care partners. Even in Juneau, specialty availability is limited, and many patients ultimately require referral to Anchorage. Modernizing our PACS will strengthen regional and statewide diagnostic coordination, reduce delays to treatment, and improve efficient use of Alaska’s limited healthcare resources.	We propose implementation of a modern, secure, and interoperable PACS platform that will strengthen diagnostic imaging infrastructure and support coordinated care across Southeast Alaska and the statewide referral network. Project activities will include: • Selection and procurement of a PACS system designed for high reliability, interoperability, and secure digital image exchange • Integration with existing imaging equipment and the electronic health record • Development of secure, digital, image-sharing capabilities with referring providers in smaller Southeast communities and tertiary care centers, including Anchorage-based specialists. • Vendor-supported installation, testing, and phased implementation to minimize disruption to patient care • Comprehensive staff training to ensure efficient adoption and optimized workflows • Establishment of ongoing maintenance and support agreements to ensure long-term system stability The new PACS will allow imaging studies to be rapidly transmitted for specialist interpretation and shared seamlessly with referral partners. This will improve diagnostic turnaround time and allow treatment planning to occur more efficiently before patients return to their home communities or travel for higher levels of care. Enhanced interoperability will strengthen coordination between rural clinics, our organization, and tertiary care centers by ensuring imaging is immediately accessible across care settings. This will reduce repeat imaging, prevent delays in referral processing, and support more timely specialty intervention when needed. By modernizing core diagnostic infrastructure, this project strengthens regional capacity while also improving connectivity across Alaska’s healthcare system. It ensures that patients traveling within Southeast Alaska and onward to Anchorage receive coordinated, timely, and high-quality diagnostic services that support improved clinical outcomes.	\$50,000-\$250,000	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Juneau (City and Borough)	Deferred or Not Advanced

Valley Medical Care PC	Improving Timely Diagnosis and Rural Care Access Through Portable Ultrasound Modernization	AK	Our organization serves as a regional access point for patients from smaller Southeast Alaska communities who often travel significant distances for care. Timely diagnosis during these visits is essential to ensuring patients can complete evaluation and treatment planning without unnecessary repeat travel or delays. Our physician-owned family practice provides full-spectrum care including primary care, pediatrics, inpatient hospital services, obstetric care and deliveries, and procedural services such as colonoscopy and upper endoscopy. Many clinical evaluations benefit from immediate ultrasound imaging to support diagnosis and treatment decisions at the time of visit. Modern portable ultrasound units will allow providers to obtain high-quality imaging at the bedside during examinations, enabling immediate diagnosis and treatment planning. Point-of-care imaging can reduce delays in diagnosis, minimize repeat visits, and support completion of care in a single visit. This is of particular value for patients traveling from smaller Southeast communities outside of Juneau. Upgrading to modern portable units will reduce delays, allow for expanded local services, improve patient experience, and support more efficient use of Alaska’s limited healthcare resources.	We propose acquisition and implementation of two modern portable ultrasound units to improve bedside diagnostic capability and support timely clinical decision-making across clinic and inpatient settings. Project activities will include: • Procurement of two portable ultrasound units designed for high-quality point-of-care imaging • Integration into clinic, obstetric, and procedural workflows • Provider training and competency development for optimal use • Integration with documentation and imaging systems as appropriate • Establishment of maintenance and lifecycle planning Portable ultrasound will be used by providers during patient encounters to support real-time diagnostic assessment and procedural guidance. Improved image quality and portability will enhance evaluation of obstetric concerns, abdominal pain, soft tissue conditions, vascular concerns, and other clinical needs where immediate visualization supports timely care decisions. Point-of-care imaging will allow many patients traveling from smaller Southeast communities to complete evaluation and treatment planning in a single visit whenever clinically appropriate. Immediate access to high-quality imaging will also support more efficient coordination with referral partners and tertiary care centers when higher-level care is required. By modernizing bedside imaging capability, this project will strengthen our ability to deliver timely, efficient, and coordinated care while reducing delays and unnecessary repeat travel for patients across Southeast Alaska.	\$50,000-\$250,000	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Juneau (City and Borough)	Deferred or Not Advanced

Valley Medical Care PC	Protecting Clinical Operations Through Core Server Infrastructure Replacement	AK	Our organization serves as a key regional access point for patients from smaller Southeast Alaska communities and operates within Alaska’s broader referral network to Anchorage and other tertiary care centers. Reliable access to secure clinical systems is essential for coordinating care across this system, particularly for patients who must travel significant distances for services. Our physician-owned family practice provides full-spectrum care including primary care, pediatrics, inpatient hospital services, obstetric care and deliveries, and procedural services such as colonoscopy and upper endoscopy. Sustaining this breadth of services requires dependable server infrastructure capable of supporting electronic health records, diagnostic data, and secure communication across care teams. Our current server environment is aging and approaching end-of-life support, creating increased risk of system instability, downtime, and reduced performance. Without replacement, these limitations could impact timely access to patient records, diagnostic results, and care coordination across organizations. Even in Juneau, specialty access is limited and patients require referral to Anchorage for specialized services. Reliable core infrastructure is essential to ensuring patient information moves efficiently across care settings. Replacing aging servers will strengthen system stability, protect continuity of care, and support more efficient use of Alaska’s limited healthcare resources.	We propose to modernize core server infrastructure to ensure secure, reliable, and scalable support for clinical operations and coordinated care across Southeast Alaska and the statewide referral network. Project activities will include: • Procurement and installation of updated server hardware and secure data storage systems • Migration of existing clinical and operational systems to modern server infrastructure • Strengthening cybersecurity protections and backup capabilities • Integration with electronic health record, imaging, and billing systems • Testing and phased implementation to prevent disruption to patient care • Establishment of maintenance and support agreements for long-term stability Modernized servers will improve speed, reliability, and security of clinical systems that support daily patient care. Providers will have more consistent access to patient records, diagnostic results, and communication tools necessary to coordinate care across locations. Improved system performance will reduce downtime risk and ensure continuity of operations for both in-person and remote coordination. Enhanced infrastructure will also strengthen secure information exchange with referring providers and tertiary care centers, including Anchorage-based specialists. Reliable data access will support more efficient referral processing, reduce duplication of services, and improve continuity of care when patients transition between communities and levels of care. By investing in foundational technology infrastructure, this project strengthens regional capacity while supporting more coordinated, efficient healthcare delivery across Alaska.	\$50,000-\$250,000	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Juneau (City and Borough)	Deferred or Not Advanced

Valley Neighborhood Dental Center	Bridges to Care: Rural Alaska Comprehensive Dental Access Initiative	AK	Rural communities in the Matanuska-Susitna Borough face persistent barriers to essential dental services, even though providers are present in the region. For many residents—especially seniors, individuals with chronic disease, people with disabilities, and low-income households—transportation is the primary obstacle to obtaining routine and preventive dental care. Long travel distances, limited demand-response transit, unreliable or unavailable vehicles, and difficulty using app-based transportation result in missed appointments, delayed treatment, and avoidable progression of dental conditions. These challenges are most pronounced in outlying communities such as Willow, Talkeetna, Glennallen and other communities where residents travel significant distances to reach care. Needs that could be addressed through preventive or early restorative services often go untreated until they require urgent or emergency intervention, driving poorer outcomes, higher costs, and inefficient use of acute care resources. This project addresses a clear Health Care Access gap by integrating transportation into the dental care delivery model. Through partnerships with community-based and on-demand transportation providers, it will coordinate no- or low-cost rides for high-need rural patients. By reducing non-medical barriers, the project will improve appointment adherence, expand access for underserved residents, and strengthen the sustainability of dental services in the Mat-Su.	This project will address persistent barriers to dental care access in rural Matanuska-Susitna communities through a coordinated, transportation-enabled dental care model that strengthens workforce capacity and improves care efficiency. It recognizes that limited access in rural areas is driven not only by provider availability but also by transportation challenges, workforce shortages, and the burden of multi-visit treatment for patients traveling long distances. The first component is integrating transportation into the dental care delivery model. The project will establish partnerships with community-based and on-demand transportation providers to ensure reliable rides for patients. Transportation coordination will be embedded into clinic workflows, aligning scheduling with available transportation. Priority will be given to rural residents and high-need populations, including seniors, individuals with chronic disease, people with disabilities, and low-income households in outlying Mat-Su communities. This reduces missed appointments, improves continuity of care, and expands the effective service area of existing providers. The second component focuses on strengthening local workforce capacity. Funding will support recruitment and onboarding of a new dentist in the Mat-Su, increasing service availability and reducing wait times. The project supports long-term retention by improving practice sustainability, stabilizing patient flow through reduced no-shows, and investing in modern clinical infrastructure, ensuring that access gains from transportation support are matched by sufficient provider capacity. The third component is targeted investment in modern dental equipment and technology to improve efficiency and reduce the need of multi-day visits. Advanced diagnostic and treatment tools allows more comprehensive care to be delivered in a single visit when appropriate. This is especially important for rural patients who face significant travel burdens and depend on coordinated transportation. Fewer visits improve treatment completion, reduce hardship, and lower system costs. Together, these components shift care from crisis-driven, episodic visits toward routine, preventive, and planned care. By addressing transportation barriers, workforce capacity, and care efficiency simultaneously, the project improves access, strengthens sustainability, and advances equity for rural Mat-Su residents while aligning with the RHTP Health Care Access initiative.	\$250K-\$1M	Dental	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

Valley Upright Imaging LLC	Establishing Alaska’s First Medical Cyclotron to Improve Access to PET Imaging Isotopes	AK	Alaska faces significant challenges in accessing PET imaging radiopharmaceuticals due to its geographic isolation and the short half-life of many diagnostic isotopes. Currently, most PET tracers must be transported from facilities outside the state, often requiring long-distance flights that are vulnerable to weather delays and logistical disruptions. These limitations can result in cancelled scans, delayed diagnoses, and reduced access to advanced imaging for patients, particularly those living in rural and frontier communities. The opportunity addressed by this project is the establishment of a local cyclotron facility capable of producing PET radiopharmaceuticals within Alaska. Local production would create a reliable and sustainable supply of diagnostic isotopes, reduce dependence on out-of-state shipments, and significantly improve access to timely PET imaging services. This would allow healthcare providers to diagnose and manage serious conditions such as cancer, neurological disorders, and cardiovascular disease more effectively for patients across the state, including those in remote regions.	Once operational, the facility will produce commonly used PET isotopes such as fluorine-18 (F-18), which is used in PET imaging for cancer detection, neurological disorders, and cardiovascular disease. Local production will eliminate reliance on long-distance transport of short-lived isotopes, ensuring a more reliable and consistent supply for healthcare providers across the state. The project will also establish distribution and coordination systems with hospitals, imaging centers, and rural healthcare providers throughout Alaska to ensure timely access to PET imaging services. By integrating with existing healthcare networks and imaging providers, the cyclotron facility will support improved diagnostic capabilities while reducing delays caused by weather, transportation barriers, and supply interruptions.	Over \$5M	Clinic	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Sitka (City and Borough); Southeast Fairbanks Census Area	Deferred or Not Advanced

Valley Upright Imaging LLC	Upgrade our existing GE Logiq E10 ultrasound system.	AK	Currently, no providers in our region offer bone density screening using non-ionizing radiation. Most bone density testing relies on DEXA technology, which uses ionizing radiation and is typically only available at larger medical centers. This creates a barrier for many rural Alaska residents who must travel long distances to receive bone health screening, and some patients may avoid testing due to concerns about radiation exposure. This project creates an opportunity to introduce ultrasound-based bone densitometry, which provides bone density assessment without ionizing radiation. By upgrading our existing GE Logiq E10 ultrasound system, Valley Imaging Center will be able to offer a safe, convenient, and locally available bone density screening option for patients in Wasilla and surrounding rural communities, improving early detection of osteoporosis and other bone health conditions.	Valley Imaging Center will address this opportunity by upgrading our existing GE Logiq E10 ultrasound system to enable ultrasound-based bone densitometry. This upgrade will allow our clinic to provide bone density screening that does not use ionizing radiation, making testing safer and more accessible for patients in rural Alaska. Grant funding will be used to purchase the required software upgrade, hardware components, installation, and staff training necessary to implement this capability. Once installed, our clinical staff will integrate ultrasound-based bone density testing into routine imaging services and make it available through referrals from local primary care providers and rural clinics. By utilizing existing equipment and infrastructure, Valley Imaging Center will be able to quickly implement this service and provide a convenient, radiation-free bone health screening option for residents of Wasilla and surrounding rural communities. This approach will expand preventive screening and improve early detection of osteoporosis and low bone density in our region.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Valley Upright Imaging LLC	Upgrade our PACS and develop HL7 connectivity with remote clinics	AK	Many rural healthcare providers in Alaska face challenges accessing diagnostic imaging results quickly and efficiently due to limited interoperability between imaging systems and electronic health records (EHRs). Our current PACS system has limited ability to share imaging data seamlessly with the EHR systems and patient portals used by rural clinics. This can create delays in transferring medical information, which slows care coordination and clinical decision-making for patients who often travel long distances for imaging services. This project presents an opportunity to modernize our imaging data infrastructure by upgrading our PACS system and implementing HL7 connectivity. Doing so will improve the secure exchange of imaging reports and clinical data with rural healthcare providers and patient portals, improving access to information, reducing delays in care, and strengthening healthcare coordination for rural and frontier communities in Alaska.	Valley Imaging Center will upgrade its existing PACS system by implementing modern hardware, software, and secure cloud-enabled infrastructure designed to support interoperability with regional healthcare systems. As part of this upgrade, we will develop and implement HL7 interfaces that allow imaging reports and related clinical data to be automatically transmitted to electronic health record (EHR) systems and patient portals used by referring providers and rural clinics. The project will include vendor selection, system installation, HL7 interface development, cybersecurity configuration, and testing with partner healthcare organizations to ensure reliable and secure data exchange. Once implemented, the system will allow imaging reports and results to be delivered electronically and in near real-time to referring providers and patients. This approach will significantly improve communication between Valley Imaging Center and rural healthcare providers, reduce delays in information transfer, and enhance care coordination for patients in rural and frontier communities across Alaska.	\$250K-\$1M	Clinic	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Valley Women and Children Clinic	Valley Women and Children Clinic	AK	Alaskan families in the Mat-Su region and beyond have to navigate fragmented services across multiple locations to access prenatal care, postpartum support, behavioral health services, and preventative care. Transportation barriers, workforce shortages, and limited coordination between providers can make it difficult for families to access timely care.	Repurpose the former urgent care facility on KGB into a collaborative health hub focused on women’s and children’s healthcare. The model would provide shared clinical space and infrastructure that allows independent providers to operate their own practices while benefiting from coordination and shared services. Services could include prenatal and postpartum care, a community birth center operated by independent midwives, behavioral health therapy, pelvic floor therapy, lactation support, family medicine, nutrition services, lab services, telehealth, and community education classes. The facility could also provide shared resources such as nurse support services, transportation assistance for patients, and connections to community support services.	\$1M-\$5M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced
Vantage Technology Holdings, Inc	Rural Mobile Surgical Access Initiative for Cataract and GI Preventive Services	IL	Many rural Alaska hospitals lack the capital resources and workforce capacity to offer specialty procedures such as cataract and gastrointestinal ("GI") procedures. The cost of purchasing endoscopy towers, ophthalmologic surgical equipment, and maintaining specialized technical staff makes local delivery economically infeasible in low-volume frontier settings. As a result, patients must travel out of region for routine preventive and diagnostic care. This leads to delays in colorectal cancer screening, untreated cataracts, increased fall risk among elders, and higher long-term system costs. The opportunity is to establish a shared, mobile surgical infrastructure model that allows multiple rural hospitals to access specialty services without individually bearing the full cost of ownership and staffing.	Vantage will implement a Rural Mobile Surgical Access Initiative that expands cataract and GI diagnostic capacity across participating rural Alaska hospitals. The approach includes: Capital Infrastructure Deployment Vantage will purchase and maintain ophthalmology and GI procedural equipment, including endoscopy towers, scopes, sterilization systems, cataract instrumentation, and related supplies. Mobile Deployment Model Equipment will be transported between hospitals using customized transport systems. Resources are centrally staged and deployed on scheduled service days across participating facilities. Specialized Workforce Retention Vantage employs and retains certified surgical technologists and operations managers who travel with the equipment. This removes the burden on rural hospitals to recruit and retain full-time specialty staff. Shared Resource Scheduling Service days will be coordinated across hospitals to optimize utilization and ensure consistent access. Hospitals commit to minimum procedure volumes per visit. Preventive Focus GI services will prioritize colorectal cancer screening and diagnostic follow-up. Ophthalmology services will focus on cataract evaluation and surgery to restore vision and reduce fall risk among elders. Operational Integration	\$1M-\$5M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Vantage will integrate scheduling, inventory management, quality assurance, and reporting systems to ensure compliance and performance monitoring.

This model transforms fixed-cost capital burdens into scalable shared infrastructure, making specialty preventive services economically viable in rural Alaska.

Veridian Strategies	Alaska Rural Health Care Integrity and Oversight Initiative	AK	Alaska's Rural Health Transformation Program represents a five year, 1.36 billion dollar investment flowing through a subrecipient administrator to hundreds of organizations of varying administrative maturity, creating significant risk from fraud, waste, abuse, and noncompliance. Documented weaknesses reinforce this concern: a 2023 HHS OIG inspection identified serious deficiencies in Alaska's Medicaid Fraud Control Unit, and a 2024 CMS Program Integrity Review found inconsistent state oversight practices. CMS is simultaneously expanding AI enabled program integrity initiatives, signaling heightened federal expectations for proactive detection and deterrence. Veridian's proposal fills a precise structural gap that no existing entity addresses. The ACF performs no fraud investigations, risk assessments, or compliance training. The Alaska DOH holds oversight authority but operates no dedicated investigative or analytical FWA function within RHTP as yet known. The Alaska MFCU's statutory mandate under 42 CFR Part 1007 is limited to Medicaid provider fraud and does not extend to federal grant compliance, RHTP subrecipient monitoring, or proactive integrity functions. No existing entity performs the integrated combination of pre award due diligence, AI driven analytics, investigative services, compliance training, and value based care integrity assurance this initiative delivers — ensuring every RHTP dollar reaches rural Alaska's communities.	Our proposed approach is to establish a dedicated, statewide Alaska Rural Health Care Integrity and Oversight Initiative that embeds program-integrity infrastructure alongside RHTP investments from the outset, rather than relying on after-the-fact audits or overextended enforcement bodies. We will deploy a 28-FTE multidisciplinary team in four integrated programs—Investigations, Analytics, AI & Machine Learning, and Provider Support—supported by specialized contractors in value-based payment, forensic accounting, coding and billing audit, IT security, tribal governance, and independent evaluation. This gives each RHTP initiative tailored integrity capabilities that are provider-facing, preventive, and capacity-building rather than punitive. The Investigations Program will be the field engine of the initiative, turning analytic signals, complaints, and referrals into structured casework that protects RHTP funds and strengthens internal controls. Senior and mid-level investigators will conduct complex investigations into alleged fraud, waste, abuse, and noncompliance through interviews, site visits, and targeted record reviews, while entry-level investigators support with research and documentation. A Health Care Coding and Billing Audit Specialist and a Forensic Accounting and Complex Financial Analysis Consultant will deepen casework by identifying improper billing, quantifying potential overpayments, and detecting schemes such as self-dealing and procurement irregularities. Operational Support Technicians will serve as case coordinators, keeping files complete, organized, and compliant. In parallel, the Provider Support Program will deliver training that explains, in practical terms, what can and cannot be done with RHTP funds, billing rules, and required internal controls, using in-person and remote formats to reach rural, remote, and frontier providers. Each session will be documented (who attended, where, when, duration, key interactions), creating a clear record of expectations if a participant later engages in FWA. Trainings will also function as a discreet tip line: participants often approach trainers privately to share concerns, and we will convert credible disclosures into formal leads for the Investigations and Analytics teams. This creates a continuous loop from data to investigation to corrective action, training, and new tips, building durable program-integrity infrastructure that can be sustained beyond the grant period. Via Vita Health Project, Inc.	AI-Enabled Rural Diagnostic Imaging and Women’s Health Access Expansion for Interior Alaska	AK	Rural and frontier communities across Interior Alaska face persistent barriers to accessing timely diagnostic imaging services. Patients frequently travel long distances for specialty ultrasound and women’s imaging services, often requiring flights, weather-dependent transportation, time away from work, and additional financial burden. These barriers contribute to delayed diagnostic evaluation, later detection of disease, and fragmented follow-up care. Diagnostic ultrasound plays a critical role in early disease detection, prenatal monitoring, and management of chronic health conditions. However, many rural health systems rely on aging imaging equipment that limits diagnostic quality, reduces workflow efficiency, and constrains service capacity. Workforce shortages further strain rural diagnostic infrastructure and contribute to delays in care. This project represents an opportunity to modernize regional diagnostic infrastructure by expanding AI-enabled ultrasound systems, Automated Breast Ultrasound (ABUS), portable ultrasound technology, and integrated digital imaging workflows. These upgrades will increase local diagnostic capacity, improve care coordination with referring providers, reduce costly medical travel and delayed diagnosis, and support earlier detection of disease.	This project will establish a modernized diagnostic imaging model designed to strengthen access to high-quality imaging services for rural and frontier communities in Interior Alaska. The project will invest in advanced imaging infrastructure including next-generation AI-enabled ultrasound platforms, an Automated Breast Ultrasound (ABUS) system to enhance breast imaging capability, a portable ultrasound system to support flexible service delivery, and Trophon high-level probe disinfection systems for infection control. These technologies will replace aging imaging equipment and expand diagnostic imaging capacity. AI-enabled ultrasound technology improves image acquisition consistency, supports standardized scanning protocols, and increases workflow efficiency. Improved imaging capability allows sonographers to complete examinations more efficiently while maintaining diagnostic quality and clinical accuracy. Automated Breast Ultrasound improves evaluation of dense breast tissue and expands access to supplemental breast imaging for patients who may benefit from additional screening beyond traditional mammography. The project will also implement information technology upgrades including imaging workstations, secure image transfer systems, laptops, and scheduling integration tools that improve workflow efficiency and communication with providers. Equipment installation will occur within existing clinical space already configured for diagnostic imaging, allowing rapid deployment without construction delays while ensuring compliance with electrical, infection-control, and imaging workflow requirements. Portable ultrasound capability will allow flexible imaging deployment for patients who cannot easily travel to centralized imaging locations, improving access for rural referrals and high-risk patients requiring timely diagnostic evaluation. Workforce sustainability is also a key component. Recruiting and retaining imaging professionals in rural Alaska requires modern equipment, efficient workflows, and opportunities for professional development. Updated technology and training reduce burnout, improve efficiency, and support long-term workforce retention. Implementation will occur in phases including procurement, installation, training, workflow integration, and performance monitoring. Outcomes will be measured through increased diagnostic throughput, reduced referral-to-imaging wait times, decreased costly medical travel, and improved workforce stability.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Via Vita Health Project, Inc.	Arctic Advancement: EMR for Rural Alaska Ultrasound Clinic with Epic-Integrated with AI-Enabled EHR	AK	Rural and Interior Alaska face significant barriers to timely diagnostic imaging and coordinated health records. Fairbanks Ultrasound Clinic lacks certified HITECH-compliant electronic medical record (EMR) systems and integrated imaging platforms. Our ultrasound clinic operates without a fully integrated EMR, limiting the ability to share records electronically with referring providers, coordinate care efficiently, and provide patients secure access to their health information. These gaps can delay diagnosis, require duplicate testing, and increase patient travel to larger hospitals for services that could be provided locally. This project will purchase and implement a HITECH-compliant EMR for Via Vita Health Project dba Fairbanks Ultrasound and connect it to a shared Community Epic environment hosted in partnership with Providence Medical Center. This integration will allow the clinic and participating providers to access unified patient records, MyChart, and structured imaging reports, improving care coordination and timely diagnosis. The project will also upgrade the clinic’s infrastructure—including network capacity, hardware, and secure communication systems—to support cloud-based imaging, AI-assisted ultrasound workflows, and telehealth. These upgrades align with Alaska Rural Health Transformation Program and CMS goals to expand access, improve care coordination, and strengthen sustainable health technology infrastructure for rural communities.	This project addresses critical barriers to diagnostic care by establishing Via Vita Health Project dba Fairbanks Ultrasound as a community Epic-hosted diagnostic hub. By integrating Inteleraad’s cloud-based PACS with Community Epic, along with AI-assisted ultrasound, secure VoIP, and HIPAA-compliant Zoom telehealth, clinicians will have faster imaging access, automated measurements, and immediate access to patient records for rural providers and patients. Via Vita Health Project dba Fairbanks Ultrasound will partner with Providence Medical Center’s Community Epic hub and integrate with Inteleraad’s cloud PACS to expand access to high-quality imaging and electronic health records in rural and Interior Alaska. This approach combines advanced ultrasound technology, AI-assisted imaging, secure communication tools, and a shared EHR model to improve access, quality, and sustainability. Centralized Epic Access for Rural Clinics: The clinic will serve as a Community Epic partner, enabling small clinics and health centers to connect through a shared model. This expands access to MyChart, unified patient records, and structured reporting without requiring each clinic to maintain costly infrastructure. Cloud-Based Imaging and AI Integration: Ultrasound studies will use AI-assisted measurements for OB, vascular, and general imaging. Images are automatically routed through Inteleraad to Epic, enabling faster reporting, quality assurance, and secure access for clinicians and patients. Telehealth and Communication Systems: HIPAA-compliant Zoom and secure VoIP will support remote consultations, real-time image review, and improved patient-provider communication, reducing travel for rural patients. Workflow Optimization and Training: Staff will receive training on Epic, Inteleraad, and AI-assisted imaging to standardize protocols, reduce errors, and improve efficiency. Continuous quality monitoring and remote support will ensure reliable operations. Sustainability and Scalability: Cloud-based systems allow remote radiologists to interpret studies, support disaster recovery, and enable regional expansion. Partnerships with surrounding clinics, tribal health centers, and primary care providers will strengthen care coordination and expand access across Interior and rural Alaska.	\$1M-\$5M	Maternal health	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough	Deferred or Not Advanced

Via Vita Health Project, Inc.	Interior Alaska Diagnostic Imaging Workforce Stabilization and Access Initiative	AK	Interior Alaska faces diagnostic access instability driven by sonographer shortages, geographic isolation, and limited staffing. Diagnostic ultrasound supports prenatal monitoring, vascular assessment, and abdominal and pelvic diagnostics. Alaska’s workforce pipeline is limited, with only one accredited diagnostic medical sonography training program and ongoing difficulty recruiting sonographers to rural regions. Fairbanks Ultrasound serves as a diagnostic imaging hub for Interior Alaska, supporting a hub-and-spoke referral network linking rural clinics across the Fairbanks North Star Borough and surrounding communities. The clinic completed 1,834 diagnostic ultrasound examinations in the past year with two sonographers, serving approximately 1,800–2,200 unique patients annually. Routine referral-to-imaging wait times average 3–4 weeks due to strong demand and limited capacity. Urgent obstetric referrals are prioritized and completed within 24–72 hours, with most reports returned within 24 hours. When access is disrupted, patients face delayed diagnosis, fragmented care coordination, or costly travel to Anchorage. This project will strengthen rural diagnostic infrastructure through workforce stabilization, a grow-our-own sonographer pipeline, ergonomic injury prevention, and technology-enabled workflow improvements. Expanding capacity will reduce wait times and allow patients to receive timely ultrasound services within Interior Alaska rather than traveling out of state.	This project strengthens diagnostic imaging access for rural Interior Alaska through coordinated workforce stabilization, technology-enabled workflow improvements, and regional care coordination centered at an established diagnostic referral hub. The approach focuses on improving timely access to ultrasound services for patients from rural and frontier communities while stabilizing the regional imaging workforce and strengthening rural diagnostic infrastructure. Fairbanks Ultrasound functions as a regional imaging hub within a hub-and-spoke referral network supporting providers and clinics across the Fairbanks North Star Borough and surrounding rural communities. The project will increase stable diagnostic capacity, improve scheduling throughput, and strengthen coordination between referring providers and imaging services. Workforce stabilization will be achieved through structured service agreements and retention incentives supporting core sonographer roles, reducing reliance on temporary staffing and improving continuity of care. A grow-our-own workforce pipeline will sponsor a trainee through an accredited sonography training program with defined milestones including coursework completion, supervised clinical competencies, and certification preparation under clinical preceptor oversight. Operational improvements will focus on technology-enabled care and workflow modernization. AI-assisted documentation tools, digital referral and scheduling systems, and performance dashboards will reduce administrative burden, improve room utilization, and support faster diagnostic turnaround for referring providers. Ergonomic equipment upgrades and training will reduce repetitive strain injuries that contribute to workforce attrition and workforce shortages. Together, these strategies will increase imaging throughput, reduce referral-to-scan delays, improve regional care coordination, and allow more patients to receive diagnostic ultrasound services within Interior Alaska rather than traveling out of region for imaging. By strengthening workforce stability and operational efficiency, the project advances rural health system sustainability and supports timely diagnostic services for communities across Interior Alaska.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Via Vita Health Project, Inc.	MOBILE IMAGING CLINIC PROJECT	AK	The vast geographic distances which define Alaska constitute a real barrier to care for patients. This only becomes more formidable for those with health conditions, disabilities, and other challenges. As the medical services many seek are hard to establish, fund, and staff in Alaska, the best options for care for many patients involve financially costly transportation and lodging. Journeying to one of a few distant cities, patients not only suffer from whatever primary medical condition drove them to initially seek care, and the financial burden associated with receiving such, but worse still, must endure said journey itself. These expeditions in search of health care commonly press beyond simple inconvenience, to the very point of agony itself. Consequently, many simply abandon their pursuit of health care, before it even begins. Early detection of a broad range of maladies, paired with oft-modest medical interventions, can result in miraculously positive outcomes for patients; miracles denied to those who have been abandoned to the fringe of medical access. A medical industry which clings too rigidly to conventional brick-and-mortar models of healthcare is simply not viable for all Alaskans. These obstacles compound to create a strife-laden medical experience so adverse, many seek care all-to-late, or, even more tragically, not at all. The heart-breaking truth is this; many Alaskans suffer more, and perish sooner, than they ought, from simple lack of logistical efficiency.	The Mobile Imaging Clinic Project will deliver diagnostic imaging services directly to rural communities using a mobile service model supported by the clinical expertise and operational infrastructure of FAIRBANKS ULTRASOUND LLC. Mobile clinics will travel to rural communities on scheduled service days, allowing patients to receive diagnostic imaging services closer to where they live. Imaging studies will be performed by qualified imaging professionals using portable diagnostic equipment. Imaging orders will continue to be submitted electronically by referring providers, consistent with current healthcare workflows. Completed imaging studies will be securely transmitted to radiologists for interpretation. Final reports will then be delivered electronically to the referring provider, allowing continuity of care and timely clinical decision making. This model reduces the final barrier to diagnosis for many rural patients. Ordering and reporting of imaging studies already occur digitally; therefore, providing local imaging appointments allows patients to complete the diagnostic process without traveling to urban centers.	\$250K-\$1M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Village of Solomon	Solomon Tribal Wellness	AK	Our rural tribal community faces significant health disparities driven by geographic isolation, limited access to preventive services, workforce shortages, transportation barriers, and high rates of chronic conditions such as diabetes, hypertension, and obesity. Many residents must travel long distances for care, resulting in delayed treatment and avoidable emergency visits. Youth have limited access to structured physical activity opportunities, and substandard housing conditions contribute to respiratory and cardiovascular health issues. Additionally, there is a shortage of locally trained healthcare professionals, limiting continuity and culturally responsive care. This project addresses the opportunity to shift from a reactive, crisis-driven system to a proactive, community-based model that strengthens prevention, builds local workforce capacity, improves home environments, and expands access to healthy lifestyle supports—ultimately improving long-term health outcomes and system sustainability in our rural community. The Tribe has offered small financial support to such activities proposed under this opportunity; the Traditional Council understands the need and the desire from receiving more and more applications for tribal wellness activities although the tribe has had limited funding resources to support all requests. Preventative approaches are one of the best ways to educate and encourage life long healthy and safe lifestyles	Our proposed approach is a holistic, community-driven rural health transformation model that integrates prevention, early intervention, workforce development, youth engagement, and environmental health improvements. Rather than relying solely on facility-based care, the project brings health supports directly into homes, schools, and community spaces. The approach includes removing financial barriers to physical activity through extracurricular and sport-related scholarships; deploying portable diagnostic tools to support home-based monitoring of chronic conditions; and offering culturally grounded whole-health education such as nutrition, food sovereignty, CPR, and first aid training. Youth programming for children under age 10 emphasizes early physical activity and healthy habits to reduce long-term chronic disease risk. To ensure sustainability, the project invests in medical certificate training scholarships to build a local healthcare workforce and partners with the Residential Weatherization Program to improve home environments that directly impact respiratory and cardiovascular health. Together, these coordinated strategies create an integrated, preventive, and sustainable health system tailored to the realities of rural and frontier tribal communities.	\$50,000-\$250,000	Single Community	Nome Census Area	Deferred or Not Advanced

Virta Medical PC	Reversing metabolic disease- type 2 diabetes, pre diabetes, obesity and overweight in rural areas	CO	Virta directly addresses chronic diseases: type 2 diabetes, pre diabetes, obesity and overweight members (metabolic disease). Virta indirectly addresses: inflammation, cardiovascular disease, liver disease, kidney disease, muscle skeletal issues, mental health and sleep. Through Virta's approach, we're able to help members that face barriers to care have access to doctors and endocrinologists in their pocket 24/7. Given the size of Alaska and the rural nature of the State, Virta will enable members that traditionally have challenges accessing care have the care they need at their fingertips. Virta's approach will enable Alaskans to take charge of their health with medical supervision and as member's health improves- when clinically appropriate- their Virta doctors will start to titrate down and deprescribe medications including Insulin and GLP-1s. Not only can we improve the health of Alaskans, Virta can also improve their access to care, will leave them feeling better (less medications- many of our members have a new outlook on life due to the health improvements they experience) and help the State spend less on expensive medications (members will no longer need these drugs) and medical claims as members improve no only their metabolic health, but their overall health.	Virta's proposed approach is simple- offer Virta as a covered benefit to anyone with metabolic disease- members who have type 2 diabetes, pre diabetes, obesity or are overweight (BMI of 25 or greater). Virta would collaborate with the State on an engagement approach designed to engage all members. Virta is always an opt in program- we would then provide our medically supervised nutrition therapy to members who opt in and complete their clinical intake call. There is no artificial graduation date or time limit. Members who remain engaged with Virta stay in the program as long as they need. If a member becomes disengaged or self-graduates Virta then discharges that member from our care and transitions care back to the member's previous provider. Virta's approach is medically supervised personalized nutrition therapy tailored to each member. Our approach is based on getting the nutrition right for each member's metabolism. Our approach is based in decades of research and outcomes and based on low carbohydrates, moderate protein and high healthy fats. Virta can launch in just 90 days from contract completion and all that is needed to implement Virta is eligibility information, billing setup and member marketing and communications alignment. Most of our public sector contracts have a term of between 3 to 7 years.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Virtual Telemedicine, LLC	Expanding Telemedicine Access for Primary Care and Cancer Prevention in Rural Alaska	AK	Rural communities in Alaska face significant barriers to accessing primary care and preventive health services. Long travel distances, geographic isolation, severe weather conditions, and provider shortages often make it difficult for residents to receive routine care and recommended cancer screenings. Many patients must travel long distances by road or air to access services, which can delay care and reduce participation in preventive health programs. Improving access to primary care, cancer prevention, and chronic disease management through telemedicine can help reduce these barriers and improve health outcomes for rural populations.	This project will expand telemedicine services led by a nurse practitioner to improve access to primary care, cancer prevention, and healthy weight counseling for rural Alaska residents. Funding will support the hiring of a medical biller and a nurse case manager to improve care coordination, patient follow-up, and insurance billing processes. The nurse case manager will assist patients with chronic disease management, preventive care education, and coordination of recommended cancer screenings. Funding will also support essential office operations, development of a patient-accessible website, and outreach efforts to inform rural residents about telemedicine services. In addition, the project will implement a HIPAA-compliant electronic medical record system to support secure telehealth services, documentation, scheduling, and billing. These improvements will allow the practice to expand telemedicine capacity and serve more rural patients who currently face barriers to accessing care.	\$50,000-\$250,000	Private practitioner	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

VOA Alaska	Value Based Care: Back Office Improvement, IT Modernization, Analytics, Workflow Transformation	AK	Rural, remote, and frontier Alaska families face a persistent gap in access to safe, high-quality youth and young adult behavioral health services because options are limited or unavailable. Alaska’s behavioral health landscape for youth and adolescents is profoundly defined by a huge need for services, lack of crisis response, and not enough capacity creating a mental health crisis for the most vulnerable population. This project is an opportunity to modernize and strengthen internal back-office infrastructure including billing, claims management, scheduling, eligibility verification, compliance, and reporting to more effectively manage Medicaid and commercial payors, stabilize cash flow, and sustain access to care in underserved communities. Improved back-office capacity is foundational to VOA’s ability to expand services, participate in value-based care models, and remain financially viable in rural and frontier settings. These investments enable deeper integration of physical health, behavioral health, and social services particularly in rural and frontier communities. Strengthening this infrastructure will allow VOA Alaska to improve care coordination, enhance quality and outcomes, reduce avoidable costs, and shift care to more appropriate, lower-cost settings, while positioning the organization for long-term financial sustainability under evolving payment models.	Funds proposed would be used for a capacity building analysis to enhance VOA Alaska operationally and ensure the agency is technologically ready for a value-based care and/or alternative payment model, along with centralized and streamed back-office functions, all of which improve outcomes for rural Alaskans. As it stands, VOA Alaska has outdated IT infrastructure, limited interoperability, manual spreadsheet reporting which create delays in access, care coordination, claims management workflow gaps, operational deficiencies, and need to strengthen performance benchmarks. RHTP funds will support a consultant to lead modernization efforts to identify and implement ways to strengthen data governance, analytics, workflow efficiency, and reporting capability, so we can reliably track outcomes, manage populations, and meet payer and state performance requirements. Outcomes include: -Enhanced quality and outcomes: Data-driven population health tools allow proactive care management. -Improved care coordination: Seamless integration of physical, behavioral, and social services. -Increased access to appropriate care settings: Reduces avoidable hospitalizations and shifts care to lower-cost, community-based settings. -Improved financial sustainability of essential behavioral health services, reducing risk of service disruption or program closures -Enables more reliable and timely access to care by supporting stable staffing and operations -Reduces administrative burden on clinical staff, allowing providers to focus more time on patient care -Supports expansion of services to rural and frontier communities by ensuring reimbursement systems can scale effectively -Strengthens long-term capacity to participate in innovative payment models that benefit rural populations -Workforce efficiency: Staff can work at the top of their license, improving responsiveness and patient satisfaction. -Long-term sustainability: Strengthened infrastructure ensures continued delivery of high-quality care under evolving payment models.	\$250K-\$1M	Behavioral health/su bstance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

VOA Alaska	Adolescent Residential Center for Help SUD Residential Safety, Workforce, and Family Connection	AK	Rural, remote, and frontier Alaska families face a persistent gap in access to safe, high-quality adolescent residential substance use treatment because options are limited or unavailable. Substance use disorder continues to plague Alaska youth, with Alaska ranking as one of the top states facing this particular crisis. The 2023 YRBS indicated that 17.3% of Alaska high school students reported vaping, and 16.9% reported drinking in the past 30 days. Complicating matters more, sadly Alaska’s youth sit in the shadow of a fentanyl overdose epidemic with 6.1% of Alaskan youth reporting misuse of prescription pain medication in the last 30 days. Outdated or constrained facility safety features restrict residential facilities from consistently meeting high acuity needs, while limited resources for ongoing staff training can contribute to variability in care quality. VOA Alaska is positioned to sustain and strengthen ARCH's role within Alaska's behavioral health system by further engaging in safety updates and enhancing clinical expertise. ARCH plays a critical role in reducing out-of-state placements and supporting long-term stability for youth and family across Alaska as ARCH is the only in-state residential options for adolescents with complex substance use and mental health needs.	Funds will be used to complete critical safety upgrades and care-environment enhancements at Alaska’s only adolescent co-occurring residential program that is non-tribally funded. ARCH meets the critical statewide need by serving youth from rural communities and Tribes across Alaska. ARCH serves over 30% of clients from high need rural regions statewide. The facility functions as a statewide resource when local options are limited or unavailable. Funding would support targeted safety renovations and operational enhancements, to include: -Pharmacy consultant to strengthen medication management practices; -Renovation of the medication room to improve security and compliance; -Training dollars to ensure staff maintain the skills needed for high acuity adolescent care through curriculum for: The Seven Challenges, Eye Movement Desensitization and Reprocessing (EMDR), and Internal Family Systems; -Use technology to implement Caring Contacts to reduce suicide risk for adolescents who discharge from ARCH; -Configuration study of ARCH to better address client safety and trauma informed environmental setting; and - Fund for safety improvements across the facility: access control, acoustic tiling, anti-ligature hair dryers, walking loop improvement, basketball fence, anti-shatter windows. All together this investment lowers risk, improves quality, and strengthens a reliable pathway to treatment for rural youth and families who must travel long distances to access residential care.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

VOA Alaska	Rural Behavioral Health Outpatient Program	AK	Rural, remote, and frontier Alaska families face a persistent gap in access to safe, high-quality youth and young adult behavioral health services because options are limited or unavailable. Alaska’s behavioral health landscape for youth and adolescents is profoundly defined by a huge need for services, lack of crisis response, and not enough capacity creating a mental health crisis for the most vulnerable population. Recent statewide Youth Risk Behavioral Survey (YRBS) trends show that 43.2% of Alaska high school students reported feeling so sad or hopeless for a least two weeks resulting in stopping usual activities, 22.6% seriously considered attempting suicide, with 19% attempting suicide in the last year. This project addresses a clear opportunity to close persistent rural access gaps by delivering a scalable outpatient behavioral health model, telehealth paired with planned on site care to communities where local psychiatric and clinical capacity is limited and when travel is not possible. By developing a team dedicated to rural Alaska for outreach and care coordination, the agency can identify needs earlier, sustain engagement with rural populations, and strengthen continuity of care close to home.	Funds will be used to establish a team to deliver consistent, culturally responsive care primarily to rural communities across Alaska, with a focused emphasis on Tribal partners and Alaska Native and American Indian peoples. The program will be staffed with a: - Medical Care Team Coordinator to manage health needs and continuity across systems for improved outcomes; - Psychiatrist to provide psychiatric evaluation, psychotherapy, medication management, and clinical consultation, including regular in-person supports to the Mat-Su region and the Lake and Peninsula School District; - Rural Health Outreach Manager / Tribal Liaison dedicated to rural outreach, and partnership-building -2 rural mental health clinicians who will provide a blend of telehealth and on-site services, including regular in-person supports to the Mat-Su region and the Lake and Peninsula School District; and -Contractor to support evaluation and assist with long-term sustainability when RHTP funds end. By meeting communities where they are – through school linked access points, coordinated referrals, and telehealth options – this program will reduce barriers created by geographic distance, improve continuity of care after crisis or hospitalization, and strengthen early identification and treatment of youth and families. The expected impact includes increased outpatient access and care coordination, improving symptom stability, and ensuring rural communities and systems have long-term supports.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Walgreens	Pharmacist-Led Hypertension & Chronic Disease Management	IL	Alaska's rural chronic disease crisis faces high cardiovascular mortality rates, disproportionate diabetes burden in Alaska Native populations, and severe medication access gaps which demands a pharmacist-led solution that meets patients where they are. Alaska's RHTP explicitly funds pharmacist test-and-treat, alternative payment models for pharmacists, medication management, and adherence support. Walgreens brings a documented, implementation-ready Hypertension Management Program with AI-driven patient stratification, multi-modal engagement (in-person, telephonic, digital), and a remote pharmacist team achieving 65%+ engagement rates. This is not a theoretical proposal; Walgreens operates outcomes-based payment models with payers today. Walgreens will partner with PwC to for their advisory and actuarial services. Alaska's progressive pharmacy practice laws (collaborative practice agreements; pending SB 147 prescriptive authority expansion) create the regulatory environment to immediately deploy pharmacist-led disease management at scale. PwC's actuarial expertise ensures these models are structured for Medicaid and Medicare Part D reimbursement sustainability.	Walgreens leads clinical delivery while PwC leads value-based care design and program infrastructure. Population Identification & Stratification (Walgreens): Deploy Walgreens' machine learning and AI algorithms to identify Alaska patients most likely to benefit from hypertension management support. Incorporate healthEconnect HIE data to identify patients requiring escalation. Reassess population monthly to trigger timely follow-up. Stratify outreach by care intensity needed. Clinical Service Delivery (Walgreens): Conduct hypertension screening at all 10 Alaska locations (in-person and telephonic). Provide evidence-based counseling on disease management, medication adherence, nutrition, and lifestyle. Deploy Walgreens' dedicated remote health outcomes pharmacist team for telephonic disease management reaching patients in communities without a Walgreens location. Under Alaska collaborative practice agreements, initiate bridge refills and therapy adjustments for patients without PCPs. Expand to A1C testing, lipid screening, and COPD management alongside hypertension in subsequent years. Digital Engagement (Walgreens): Deploy myWalgreens platform for refill management, adherence reminders, and virtual pharmacist consultation. Adapt for Alaska's low-bandwidth environments. VBC Payment Design (PwC): Structure outcomes-based reimbursement with partial payment for service delivery and majority payment contingent on: blood pressure control per clinical guidelines; medication adherence and reduction in preventable hospitalizations. Perform actuarial modeling for Alaska Medicaid and Medicare Part D sustainability. Build analytics dashboards for DOH performance monitoring. Care Coordination (PwC): Establish referral pathways to local PCPs for medication titration needs. Connect tribal pharmacies and FQHCs into shared care protocols.	\$1M-\$5M	Pharmacy	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Walgreens	Pharmacy Workforce Recruitment, Retention and Scope Expansion	IL	Alaska faces compound pharmacy workforce challenges: rural recruitment is difficult, retention is poor due to isolation and limited career development, and scope-of-practice limits prevent pharmacists from billing for the clinical services they are trained to provide. CMS Administrator Mehmet Oz has explicitly called on governors to expand pharmacist scope, stating that pharmacists should work at the height of their licensure. Alaska's SB 147 pending pharmacist prescriptive authority expansion creates the right moment for a comprehensive workforce investment. Walgreens' Pharmacist Recruitment and Retention Program offers scholarship and loan repayment, PharmStart tuition assistance for pre-pharmacy students, rural PGY1 residency tracks, milestone bonuses, and remote pharmacist coverage to relieve understaffed rural stores. PwC supports scope-of-practice optimization, policy design, billing framework development, and implementation of SB 147 — ensuring expanded pharmacist authority translates into reimbursable clinical services.	Walgreens leads workforce investment. PwC leads policy design and program evaluation. Pharmacist Pipeline (Walgreens): Deploy PharmStart program in partnership with Alaska pharmacy schools and colleges; identifying pre-pharmacy students with rural service interest and providing employer-sponsored tuition assistance. Engage Walgreens' National Deans Advisory Council to develop Alaska-specific rural pharmacy pipeline programming. Partner with University of Alaska system and Washington State University and Idaho State University for recruitment. Loan Repayment & Retention Incentives (Walgreens): Recruit high-performing technicians for paid training tied to guaranteed pharmacist roles at Alaska Walgreens locations. Rural PGY1 Residency Track (Walgreens): Develop a rural Alaska PGY1 pharmacy residency or fellowship with hybrid virtual preceptorship, focused on ambulatory care competencies for preventive and chronic disease delivery in frontier settings. Remote Pharmacist Staffing: Expand Walgreens' remote pharmacist coverage program to relieve Alaska stores with staffing constraints — ensuring continuity of pharmacy services during vacancies. Scope-of-Practice Optimization (PwC): Design billing and reimbursement frameworks aligned with Alaska's current and pending pharmacy scope laws. Develop collaborative practice agreement templates for Alaska provider settings. Support DOH in SB 147 implementation — translating expanded prescriptive authority into reimbursable clinical service codes. Provide workforce gap analysis by region to guide recruitment targeting. Evaluation (PwC): Track rural pharmacist retention, staffing level achievement, clinical service volume growth, and return-on-investment of incentive programs.	\$1M-\$5M	Pharmacy	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Wasilla Workforce Development Initiative	Alaska Rural Healthcare Workforce Access Hub Stabilizing Medicaid-Serving Facilities	AK	Alaska’s rural healthcare system faces ongoing instability that directly impacts Medicaid beneficiaries. Rural clinics, tribal health facilities, and critical access hospitals depend on reliable facility infrastructure, transportation systems, and trained local workforce to maintain continuity of care. In remote communities, when electrical systems fail or skilled personnel are unavailable, Medicaid-covered services may be delayed, reduced, or suspended. Rural residents face disproportionate barriers to workforce certification, including geographic isolation, high travel costs, limited local credentialing options, and caregiving responsibilities. These barriers restrict access to clinical and infrastructure workforce pathways essential to sustaining healthcare facilities. Without scalable workforce access infrastructure including hybrid training and short-term residential access, Medicaid-serving facilities will continue to experience staffing gaps and contractor dependency that undermine healthcare access across rural Alaska. There is a clear opportunity to align workforce certification delivery with rural healthcare system needs through a coordinated statewide model. By expanding credential access, strengthening retention, and equipping participants to return to their home communities with industry-recognized certifications, Alaska can stabilize clinical and operational capacity while protecting reliable access to Medicaid-covered services in rural and frontier regions.	The Wasilla Workforce Development Initiative proposes Phase 1 implementation of a statewide Rural Healthcare Workforce Access Hub designed to strengthen the clinical and operational capacity of Medicaid-serving healthcare facilities across Alaska. WWDI will expand certification pathways across both entry-level healthcare and infrastructure workforce tracks. Existing Patient Care Technician and Pharmacy Technician programs leading to state licensure currently operate at full capacity with active waitlists. Phase 1 will increase access to these clinical certifications while scaling electrical pre-apprenticeship, construction and facilities maintenance, marine systems technology, and related technical trades that support rural clinics, tribal health facilities, emergency transport systems, and telehealth infrastructure. The model integrates online coursework with three- to five-day in-person certification intensives hosted at a Wasilla-based training campus. Participants complete academic and theoretical components remotely and travel for hands-on instruction and competency assessment. To reduce geographic and caregiving barriers, WWDI will provide travel stipends, childcare during intensives, meal support, and short-term family-friendly residential access. Six time-limited residential training units and shared training space will function exclusively as workforce access infrastructure during scheduled intensives and train-the-trainer programs. These units are structured supports that enable participation from remote communities. In addition to credential attainment, WWDI will implement a Workforce Navigation and Retention Program providing individualized mentorship, employer alignment prior to completion, and structured post-placement follow-up focused on long-term workforce stability. Select participants will complete train-the-trainer preparation to expand local workforce delivery within their home regions. Over 36 months, the hub will scale multiple annual cohorts, formalize partnerships with tribal health organizations and rural clinics, and implement measurable placement and retention tracking aligned with Medicaid system stabilization goals.	\$1M-\$5M	Statewide	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough; Kusilvak Census Area; Matanuska-Susitna Borough; Nome Census Area; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

WEKA LLC	Alaska Behavioral Health-SecureTransport Initiative:	AK	Rural Alaska’s geographic reality presents significant barriers to accessing behavioral health crisis services. Many communities lack local inpatient psychiatric care, requiring individuals experiencing acute mental health emergencies to be transported long distances to regional hub cities where Designated Evaluation and Treatment (DET) facilities provide evaluation and stabilization. Alaska’s vast land area, limited transportation infrastructure, and remote communities make timely access to care particularly challenging. A critical bottleneck occurs when individuals in crisis must wait for placement availability at receiving facilities before transport can occur. Secure transport providers must maintain trained personnel ready to respond across large service areas, yet transports may be delayed when beds are unavailable. Once placements open, transport requests can surge rapidly, requiring immediate response to ensure individuals receive timely care. The Alaska Behavioral Health Secure Transport Initiative addresses this challenge by strengthening transport readiness capacity for rural communities. By maintaining trained personnel capable of responding quickly when placements become available, the project will improve timely access to behavioral health services, enhance safety for patients and responding officers, and strengthen the long-term sustainability of Alaska’s behavioral health crisis response system.	The Alaska Behavioral Health Secure Transport Initiative will strengthen the capacity of Alaska’s behavioral health crisis response system by expanding secure transport readiness for rural communities. The project will focus on increasing workforce capacity, improving response readiness, and ensuring that individuals experiencing behavioral health crises can be transported safely and without delay once placement at a designated facility becomes available. Grant funds will be used to recruit and hire additional trained transport personnel, including both male and female staff, to ensure appropriate staffing for a wide range of patient needs and safety considerations during secure transport operations. Expanding the workforce will allow transport providers to maintain adequate staffing levels to respond quickly across Alaska’s large and remote service areas. WEKA understands the difference between operational costs and using the available funds for increasing and sustaining a correct workforce, ready to go when needed. The funds will also assist in de-escalating possible threats to the community and our officers. The project will support workforce stability by allowing providers to retain trained personnel during periods when transports cannot occur due to placement availability or authorization delays. Maintaining this readiness capacity ensures that experienced staff remain available to respond immediately when transport requests arise, reducing delays once psychiatric placements become available. In addition, the initiative will support the acquisition of additional secure transport vehicles equipped to safely escort individuals experiencing behavioral health crises. Expanding the available vehicle fleet will increase operational capacity and improve the ability to respond simultaneously to multiple transport requests across rural regions. Together, these investments will strengthen Alaska’s behavioral health transport infrastructure by increasing surge capacity, improving response times, and supporting a sustainable workforce capable of safely serving rural and frontier communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

WEKA Medical	REACT (Rural Emergency Access and Coverage Timeliness) Initiative	AK	Rural, remote, and frontier communities across the Fairbanks, Mat-Su, Anchorage, Kenai Peninsula, and Valdez service regions face persistent barriers to timely emergency medical access due to vast geographic distances, limited transportation infrastructure, and environmental conditions that extend response and transport intervals. Many communities operate with minimal EMS redundancy, often relying on a single ambulance to support both emergency response and interfacility transport. When transport to regional hub facilities is required, local emergency coverage may be temporarily unavailable, creating service gaps and increasing risk exposure for residents. Terrain challenges, seasonal travel constraints, and communication dead zones further complicate dispatch coordination and continuity of care during transport. These conditions present a clear opportunity to strengthen rural health system reliability through expansion of EMS transport capacity that preserves community response readiness while supporting access to higher levels of care. The project will address coverage fragility and improve continuity of emergency medical services across participating rural communities.	The REACT (Rural Emergency Access and Coverage Timeliness) Initiative will address rural EMS coverage gaps and transport barriers through expansion of advanced life support ambulance capacity across the Fairbanks, Mat-Su, Anchorage, Kenai Peninsula, and Valdez service regions. The project will support acquisition, equipping, and deployment of additional ambulances strategically positioned to maintain local emergency response readiness while simultaneously enabling interfacility and specialty transports to regional hub facilities. Each unit will be outfitted with standardized advanced life support equipment, including cardiac monitoring and defibrillation capability, intravenous therapy resources, and stabilization equipment appropriate for prolonged rural transport intervals. Standardized equipment deployment will support consistent clinical capability across units and enhance the ability of EMS personnel to deliver evidence-informed pre-hospital care in remote and frontier environments. Deployment planning will be informed by service utilization patterns, geographic coverage needs, and coordination with regional health partners to ensure units are positioned where they can most effectively preserve community response capacity and reduce service gaps created by transport demands. Integration with existing dispatch and operational infrastructure will allow expanded fleet capacity to be incorporated into routine response coverage models without disruption to established workflows. The initiative will also support strengthened coordination with hospitals, clinics, and referral partners by improving predictability of transport availability and reducing delays associated with limited fleet redundancy. Enhanced transport capacity will facilitate more efficient patient movement between community providers and regional facilities, supporting continuity across the care continuum and improving access to specialty and higher-acuity services for rural residents. Through targeted expansion of EMS capacity, standardized clinical capability, and integration with regional care networks, the REACT Initiative will strengthen reliability of emergency medical response, preserve local coverage during transport events, and enhance access to time-sensitive care for rural and frontier communities.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Well Alaska Physical Therapy LLC	Community Access to Self-Administered Digital Wellness Screening and Targeted Home Programs	AK	Rural and frontier communities in Alaska face limited access to healthcare due to geographic isolation, small populations, and limited healthcare practitioners. At the same time, many residents experience lifestyle-related chronic conditions, such as poor nutrition, physical inactivity, inadequate sleep, and musculoskeletal limitation, without awareness that their health is suboptimal. These factors contribute to impaired mobility, functional limitations, and early-stage chronic disease, which reduce quality of life and increase reliance on an already overextended local healthcare workforce. This convergence of limited access, unrecognized health risks, and workforce constraints creates a critical need for scalable, preventive solutions that empower individuals to assess and manage their own health, while supporting community well-being.	To address these challenges, this project will provide rural Alaskan communities with access to a self-administered digital wellness screening through theSymmioplatform. Community members will complete a comprehensive assessment of movement quality, breathing patterns, physical activity, sleep, nutrition, behavioral health, injury history, and body composition using a smartphone, tablet, or computer. The app then identifies each individual’s two areas of greatest need and generates a personalized home program, including guided exercises, health behavior strategies, and functional mobility support. By empowering individuals to assess and manage their own wellness, the project expands preventive care access in communities with limited healthcare practitioners, promotes early identification of chronic disease risk factors, and supports functional health. This scalable, technology-enabled approach also helps reduce pressure on the rural healthcare workforce while fostering long-term community well-being and resilience. Welldoc	Transforming Rural Alaska Chronic Care through Digital Health Innovation	MD	The Problem: Rural and frontier Alaskans face disproportionate rates of chronic cardiometabolic conditions, including diabetes and hypertension. Traditional care delivery is hampered by extreme geography, high travel costs (medevacs/flights), and a critical shortage of specialized clinicians. Consequently, patients in remote villages often lack the daily support needed to manage complex conditions, leading to avoidable acute crises and high-cost emergency interventions that strain the state’s healthcare budget. The Opportunity: This project introduces a Digital Force Multiplier to Alaska’s hub-and-spoke healthcare model. By deploying Welldoc’s 11+ FDA-cleared, AI-driven platform, we have the opportunity to transform chronic care from an intermittent, clinic-based model to a continuous, home-based model. Key Transformation Pillars: Spark Technology & Innovation: We will bridge the "distance gap" by providing patients with real-time, clinical-grade digital coaching that functions offline and syncs when connectivity is available. Workforce Optimization: Our AI prioritizes patient data, allowing overextended rural nurses and Community Health Aides to focus their limited time on the highest-risk patients, practicing at the top of their license. Healthy Communities: By stabilizing chronic conditions locally, we reduce the necessity for travel to urban centers, keep care within the Tribal Health System, and improve long-term health outcomes for Alaska’s most vulnerable populations.	1. Strategic Alignment: The Digital Force Multiplier Our approach transforms chronic disease management from an episodic, clinic-bound model into a continuous, home-based support system. By deploying Welldoc’s 11+ FDA-cleared, AI-driven platform, we provide a "Digital Force Multiplier" for Alaska’s rural health workforce. This aligns with the RHTP’s Spark Technology and Strengthen Workforce initiatives by automating routine data collection and patient coaching, allowing Community Health Aides (CHAs) and nurses to practice at the "top of their license" by focusing only on high-risk alerts. 2. Implementation Framework: The "Hub-and-Spoke" Integration Welldoc will integrate seamlessly into Alaska’s existing delivery system: The Hub (Regional Centers): We provide regional clinicians with a population health dashboard that prioritizes patients based on real-time biometric trends (glucose, BP, weight). The Spoke (Village/Frontier): Patients receive the Welldoc app, which provides AI-driven, real-time coaching. Crucially for Alaska, the platform supports offline functionality, syncing data once the user reaches a Wi-Fi "hub" or cellular signal. 3. Three-Phase Execution Plan (Sub-6 Month Deployment) Phase I: Configuration (Month 1): We collaborate with Alaskan partners (THOs/FQHCs) to define clinical protocols and "co-brand" the digital experience to ensure cultural relevance and local trust. Phase II: Workforce Upskilling (Months 2-3): We conduct "Train-the-Trainer" sessions for local care teams. Our goal is to minimize administrative burden through EHR interoperability, ensuring that digital health data flows directly into existing workflows. Phase III: Scaled Enrollment (Months 4-6): Rapid patient onboarding via SMS and in-clinic prompts. We prioritize "High-Utilizers" to drive immediate ROI by reducing emergency medevacs and hospitalizations. 4. Sustainability & Fiscal Responsibility To meet the RHTP Pay for Value goal, our approach includes a roadmap for long-term solvency. We will assist partners in utilizing Medicaid Remote Patient Monitoring (RPM) codes and chronic care management (CCM) reimbursement to offset program costs. By stabilizing patients in their home communities, we reduce the aggregate cost of care, making the model self-sustaining beyond the initial grant period.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Whale Tail Pharmacy	Six Innovative Programs for Medication Compliance, Foster Healthy Living, and Reduce Cost	AK	1. Medipaks – Lack of long-term care and recent ending of home health services has caused an increasing need for patients with a substantial compliance hinderance to have medipaks. 2. TOC - Due to high provider turnover, low patient health literacy, and overtaxed local health entities, there is great need for intervention post-discharge related to a significant event with high risk for readmission (i.e. stroke, cardiac event, COPD, diabetes). 3. Tobacco Cessation – Alaska’s Tobacco Quit Line is a valuable partner, but for POW this program lacks timely accessibility, provides only 2 weeks of products, and impact is limited by the lack of personal relationships. 4. Nutrition and Healthy Living – Limited resources on POW result in higher level of dietary deficiencies that can be easily improved through multivitamins and education. 5. DME and Home Health Packs – POW has no long-term care nor home health services and medical supplies can take weeks for delivery. 6. Medicare and Medicaid Counseling – Two healthcare entities on POW provide some level of assistance with Medicare and Medicaid enrollment, but these resources are almost exclusively available through calling a person off POW or only during specific times when a person visits plus they are often overtaxed by the needs. Most patients on POW respond better to working with local people they trust and the success of these current services falls short when patients need support at a time of coverage crisis.	1. Medipaks - Pharmacists prepare medications into individualized weekly medipaks that divide all scheduled medications into daily sections for morning, midday, evening, and bedtime. Additionally, there is a monthly review of patients’ medical plans with their primary care clinic. 2. TOC - This program includes a first encounter between a patient and WTP pharmacist, which includes physically reconciling patient medications between pre and post discharge, checking vitals, medication counseling, discussing lifestyle changes, and provision of a collaboratively built individual health plan. After this encounter documentation is sent to their primary care provider and there is further collaboration as needed. Within a month there is a second patient encounter to determine patient’s satisfaction and compliance with their individual health plan with further follow up as needed. 3. Tobacco Cessation - Discussions with local law enforcement have revealed the need for cessation counseling and products for inmates. A similar program is needed for low-income patients who do not qualify for Medicaid. This includes providing 2-6 months of products given monthly with patient specific tailored cessation counseling at each encounter. 4. Nutrition and Health Living - WTP’s strong community relationships can be used for impactful improvements to pediatric health. First, through provision of free monthly vitamins those 2-18 years of age and vitamin D drops for patients under 2 years of age with counseling on healthy living at each monthly encounter. Second, WTP will provide education at local schools, pre-schools and after-school programs on diet, exercise, sleep, hydration, hygiene, and screentime. 5. DME and Home Health Packs - A DME lending program will allow patients to receive supplies when needed and overall healthcare costs are reduced by reusing equipment. Including home health supply packs specific for disease states can ensure patients have the supplies and education needed, such as keeping a diabetic ulcer from turning into an amputation. 6. Medicare and Medicaid Counseling - WTP has a known successful history of aiding patients for Medicare during open enrollment and throughout the year. WTP can better help patient access if there were more than 1 counselor and included Medicaid counseling, thus allowing patient local personalized counseling assistance 6 days/week 52 weeks/year.	\$250K-\$1M	Pharmacy	Single Community	Prince of Wales-Hyder Census Area	Advance to Implementation Application

Whale Tail Pharmacy	Three Services to Increase Access and Monitoring	AK	1. CLIA-Waived Test and Treat - Current clinics have high provider turnover/overload, which results in long waits and high cost for appointments. In line with other Alaska pharmacies, WTP is preparing for test to treat in order to expand timely access, improve early detection and treatment rates for common infectious diseases, and reduce unnecessary emergency visits and costs. 2. Remote Disease State Monitoring - For years WTP's professional staff has regrettably observed inadequate outcomes due to insufficient chronic disease state monitoring. WTP has made best efforts by loaning equipment, providing free monitors when needed, typing personalized patient monitoring charts, and providing free vital measurements. While clearly impactful, these efforts have fallen short of needs. This issue is multifaceted from deficient patient education and/or buy in, inability for patients to purchase or locate monitoring supplies, high provider turnover/overload, and patient transportation barriers. 3. 24-Hour Prescription Pick Up Access - The POW community faces barriers due to the lack of resources, geographical constraints, and weather-related emergencies. For 26 years, WTP has accommodated patients by having pharmacists arrange to meet them after hours when patients cannot pick up necessary medications during operational hours and have even used boats to deliver medications to patients after landslides. While this system has been meaningful it remains deficient for the needs.	1. CLIA-Waived Test and Treat - WTP's exceptional reputation of service, well-trained tenured staff, and ongoing collaboration with community partners, uniquely positions WTP to offer rapid, point-of-care testing for conditions such as influenza, strep throat, COVID-19, and other common health concerns that are CLIA-waived. These services reduce barriers to timely diagnosis and treatment, particularly for underserved and rural populations. WTP has already been contacted by an Alaska licensed Doctor of Osteopathy with residence on POW to partner in this project and WTP has secured a CLIA Certificate of Waiver. CPESN consultant is visiting WTP March 16th to help develop the framework for this service in anticipation of funding. 2. Remote Disease State Monitoring - WTP is in a pivotal position to provide at home disease state monitoring given patients frequent visits to and trust in WTP, as well as WTP's close collaboration with local providers and related entities. Building upon current unfunded efforts, WTP is ready and able to put in place a sustainable program that equips POW patients to successfully monitor disease states at home thus improving health outcomes and preventing burden on the medical system for emergency care. WTP is partnering with Truentity Health to provide the framework for this service. 3. 24-Hour Prescription Pick Up Access - Directly beside WTP's location is an indoor temperature controlled unlocked entryway containing an ATM machine and behind this entryway is the Alaska State Troopers POW post, thus providing an ideal place to install a prescription pick-up locker (most likely containing 12 units). Once installed, WTP's policy will be to have the vast majority of prescriptions being picked up in person to maintain our contact time with patients. However, when specific needs arise having 24-hour access will remove a barrier to care and support overall patient health. WTP has arranged for the location with the plaza owners and is currently getting multiple quotes to establish the best price on the locker, delivery, installation, and technology.	\$50,000-\$250,000	Pharmacy	Single Community	Prince of Wales-Hyder Census Area	Advance to Implementation Application

White Wave Counseling, LLC	Rural Youth Digital Health Initiative	AK	Across rural Alaska, educators, families, and healthcare providers are often the first to observe changes in youth behavior that may signal emerging mental health concerns. However, many community members lack the training needed to recognize early warning signs or understand how newer risk factors—particularly those related to digital technology use—can influence youth well-being. Increased use of social media, gaming, and other digital platforms has introduced behavioral health challenges that many communities are still learning how to address. Excessive screen use can contribute to sleep disruption, emotional dysregulation, reduced in-person social connection, and increased vulnerability to substance misuse and other mental health concerns. In rural communities already facing elevated risks of substance abuse and suicide, these factors can compound existing vulnerabilities. While these issues often appear first in schools, homes, and primary care settings, these adults may not have the tools to identify maladaptive patterns early or respond effectively. This creates a gap between the emergence of behavioral health concerns and timely intervention. This project addresses that gap by increasing community-wide awareness of technology-related behavioral health risks and equipping educators, families, and healthcare providers with practical tools to identify concerns earlier and respond appropriately, strengthening local capacity to support youth mental health in rural Alaska.	This initiative will implement a cohort-based learning and implementation model across 3–4 rural Alaska communities during the first year, with a primary focus on strengthening digital wellness awareness and youth behavioral health prevention. Participating communities will engage in a structured series of trainings delivered by Alaska-based clinicians with experience serving rural populations. The training series will center on how digital technology use—including social media, gaming, and constant connectivity—affects youth sleep, emotional regulation, social development, and behavioral health risk. Sessions will provide educators, families, and healthcare providers with practical strategies to recognize unhealthy technology patterns, understand how digital behaviors influence mental health, and support healthier technology habits for youth. Additional training topics will include early warning signs of behavioral health concerns, emotional regulation, sleep and mental health, substance use risk pathways, and suicide prevention. Each topic will be delivered consistently across participating communities to ensure continuity and efficient use of the limited behavioral health workforce. The initiative will utilize a hybrid delivery model combining virtual sessions, limited in-person engagement, and recorded learning modules to maximize access for remote communities. Participants will also receive practical tools that can be applied in classrooms, primary care visits, and family settings. By integrating digital wellness education with broader youth behavioral health prevention strategies, the project strengthens coordination between schools, families, and healthcare providers and builds practical skills within the existing community workforce	\$250K-\$1M	Behavioral health/substance use disorder treatment	Other	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Whitecoat Technologies, Inc	Sustainable Clinical Workforce Readiness, Talent Pipeline, and Standardized Onboarding	TN	The Problem: Nationally, our country is facing significant and persistent health care workforce shortages that directly impact timely access to care, continuity of services, and long-term system stability. In Alaska, metro, rural, remote, and frontier communities face persistent health care workforce shortages that reduce access to care and strain care delivery. A major driver of this challenge is a fragmented clinical training-to-employment pipeline: learner training, competency development, clinical placement, and workforce hiring are often managed in disconnected systems with limited shared visibility. As a result, educators, clinical sites, and workforce leaders have difficulty tracking learner readiness, identifying skill gaps early, coordinating transitions into practice, and planning for future workforce needs. This fragmentation contributes to delayed hiring, inconsistent preparedness of new clinicians, increased early career turnover, and limited ability for states and rural health systems to make strategic, data-informed workforce investments. The problem we are seeking to solve is the lack of a coordinated, competency-based, and data-visible pathway from learner to practice-ready clinician -especially in rural settings where workforce shortages are most acute, and the margin for staffing disruption is smallest.	How the Platform Will Address These Challenges The Whitecoat Platform addresses these challenges by creating a connected, competency-based infrastructure that links clinical education, training sites, and workforce planning into a single, shared pathway from learner to practice-ready hire. 1) Improves visibility into the rural workforce pipeline The platform gives educators, clinical partners, and state/regional leaders a clearer view of where learners are training, how they are progressing, and when they may be ready to enter practice. This shared visibility helps rural stakeholders move from reactive staffing decisions to proactive workforce planning. 2) Standardizes competency development and readiness tracking The platform supports structured competency tracking, real-time feedback, and longitudinal learner records across training experiences. This helps reduce variability in learner preparedness and provides a more consistent way to assess readiness for practice in rural care settings. 3) Identifies gaps earlier and enables targeted support By capturing training progress and performance data in one system, the platform helps stakeholders identify skills gaps, training bottlenecks, or placement issues earlier. This allows for targeted remediation, upskilling, and support before those issues become hiring delays or early-career performance challenges. 4) Strengthens transition-to-practice and early-career success The platform helps bridge the gap between education and employment by carrying forward verified competency and experience data into onboarding and early workforce development. This supports smoother transitions into practice, improved confidence for new clinicians, and better alignment between learner preparation and employer expectations. 5) Supports “grow-your-own” rural workforce strategies Rural communities often need to develop and retain local talent. The platform supports this by helping organizations build intentional pathways from local learner recruitment to clinical training to employment, making it easier to cultivate a durable pipeline of clinicians who are more likely to serve rural communities long term. In summary, the platform solves these challenges by replacing fragmented, siloed processes with a shared, data-informed system that improves coordination, strengthens learner readiness, and enables more reliable rural workforce development over time.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

White's Incorporated	After Hours Access to Pharmaceuticals	AK	We have a very busy cruise ship season, and this often deters patients from coming into the pharmacy on those busy days and can delay treatment. Additionally, patients who have limited access and for any reason cannot use our delivery service will be able to access their medications after-hours at the pharmacy with only a call.	We plan to add a secured locker for medications that will verify the patient picking up and open to allow them to access the required medication (and ONLY their medication).	Under \$50,000	Pharmacy	Single Community	Sitka (City and Borough)	Advance to Implementation Application
WIM Tracking LLC	Telehealth Utilization Infrastructure Pilot – Alaska	SC	Rural healthcare systems increasingly rely on telehealth to deliver care across remote communities, yet most states lack a standardized way to track telehealth utilization across providers and programs. As a result, state and regional leaders have limited visibility into where telehealth services are being delivered, how frequently they are used, and where gaps in access remain. Telehealth service locations across Alaska are already mapped through the Find Telehealth platform, but there is currently no consistent infrastructure for collecting and analyzing telehealth utilization data across providers. Without this information, it is difficult for healthcare leaders and policymakers to evaluate telehealth programs, identify underserved regions, or make informed investments in rural healthcare access. This project builds on telehealth utilization reporting methods first developed through collaboration between the South Carolina Telehealth Alliance and WIM Tracking and expands that model to support statewide telehealth intelligence. By establishing a standardized system for reporting telehealth utilization and service delivery across rural providers, Alaska will gain a clearer understanding of how telehealth is used across remote communities and where opportunities exist to strengthen access to care.	This project will develop the Telehealth Utilization Infrastructure in Alaska by enabling rural healthcare providers to report telehealth utilization and telehealth service location data through a secure reporting platform developed by WIM Tracking. Participating providers will submit standardized information on telehealth visits, service specialties, and delivery locations. In return, the system will provide immediate value to providers through automated leadership reports, program benchmarking against similar rural organizations, and longitudinal trend analysis that supports internal planning, grant applications, and board reporting. Financial incentives will support rural providers for the time required to submit and maintain utilization and site data. These incentives will help establish a cohort of participating organizations representing hospitals, community health centers, tribal health organizations, and other rural providers delivering telehealth services across Alaska. The platform will build on telehealth site data already collected across Alaska through the Find Telehealth project since 2022. Integrating utilization reporting with existing site mapping will allow Alaska to better understand where telehealth services are delivered and how those services are used across rural and frontier communities. The project will also generate aggregated, de-identified datasets that provide state leaders with a clearer view of telehealth adoption across regions, helping inform policy decisions, identify gaps in access, and guide future telehealth investment. Implementation will be supported through partnerships with the Northwest Regional Telehealth Resource Center, national Telehealth Centers of Excellence, the Telehealth Technology Assessment Center, and GIS partner Sanborn. Together, these partners will support provider engagement, technical implementation, data quality, and long-term sustainability of the telehealth utilization reporting infrastructure.	\$250K-\$1M		Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Wisdom Traditions Counseling Services LLC	Generative Healing for Women, Veterans, Alaskans & Alaska Native People Addressing Trauma & SUD	AK	Statement of Need Women, veterans, elderly, Alaskans and Alaska Native people experience disproportionately high rates of trauma exposure, military sexual trauma (MST), intergenerational trauma, and substance use disorders (SUD). Rural isolation, limited culturally responsive specialty care, and gaps in gender-specific and veteran specific services create barriers to sustained recovery. For many, lack of purpose, and inability to attain a purpose-fulfilled life is a barrier to a healthy and productive life. This program addresses co-occurring trauma and SUD through an integrated, culturally grounded model that moves from treatment to career development, education/training and certification as a Peer Mentor, Traditional Peer/Counselor Healer or SUD Counselor. This Generative Healing Program operates through a four-phase model: Stabilization & Safety, Trauma Processing, Identity Rebuilding, and Generativity. Participants transition from receiving care to becoming peer mentors, counselors, community leaders, and contributors to sustainable economic initiatives. By combining behavioral health treatment with cultural restoration and workforce development, this program addresses root causes of trauma, reduces relapse rates, increases employment outcomes through career development, and strengthens intergenerational resilience.	Program Design and Implementation This program aligns with SAMHSA’s Strategic Prevention Framework and Trauma-Informed Care principles. Services integrate evidence-based practices (EMDR, IFS, somatic therapies and ketamine assisted psychotherapy (KAP), Medically Assisted Treatment (MAT) as appropriate, recovery support, and culturally grounded healing modalities. Core Components: • Integrated trauma and SUD treatment • Peer recovery support and mentorship pipeline • Cultural healing circles and land-based practices • Workforce development, education and training and leadership training Program Logic Model Inputs • Licensed clinical staff (trauma & SUD specialists) * PNP/PA staff for medical evaluation and support * Case Management and referral • Cultural advisors and elders (Dr. Gary Ferguson, Bobby Dorton, and Don Coyhis) • Peer mentors with lived experience (Wisdom Warriors) • Facility space (treatment & healing individual spaces, group space, vocational training) • Grant and braided funding sources Activities • Trauma-informed therapy (EMDR, Internal Family Systems Therapy (IFS), somatic modalities and comprehensive ketamine assisted psychotherapy (KAP), Brainspotting, Native Prayers & Wisdom) • Substance use treatment and Relapse Prevention • Cultural healing circles and land-based practices (Dr. Gary Ferguson, Bobby Dorton and Don Coyhis) • Leadership, mentorship and SUD training • Establishing careers in SUD through workforce development	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Wise Solutions	Rural Community Resilience & Conflict Resolution Initiative	AK	Rural and frontier communities in Alaska often face limited access to conflict resolution services, family support resources, and structured dispute resolution systems. When conflicts between family members, community members, or co-parents go unresolved, they can escalate into chronic stress, family instability, behavioral health challenges, and increased involvement with courts, child welfare systems, or other crisis-driven services. These outcomes place additional strain on already limited rural health, behavioral health, and community resources. At the same time, many Tribal governments and local communities are seeking culturally appropriate approaches to address disputes, strengthen families, and support community well-being, but may lack access to trained mediators, conflict resolution education, or systems that support early intervention. This project presents an opportunity to expand access to mediation, conflict resolution services, and community education for rural and remote communities through a combination of tele-services and travel to provide in-person support. By partnering with Tribal governments, Tribal courts, and local organizations, the initiative will help build community capacity to address conflict constructively, strengthen family relationships, and support healthier, more resilient communities.	Our proposed approach combines tele-services, in-person outreach, and community partnerships to address conflict, family instability, and gaps in local dispute resolution systems in rural and frontier Alaska communities. We will provide mediation, parenting coordination, reunification support, and family coaching to help families resolve conflicts early, reduce chronic stress, and improve child and family well-being. To strengthen communities more broadly, we will collaborate with Tribal governments, Tribal courts, and local organizations to provide culturally responsive support, training, and education in conflict resolution. This includes offering workshops, coaching, and guidance for community leaders and court staff to build local capacity for constructive dispute resolution. Services will be delivered through a hybrid model, combining virtual sessions for accessibility with periodic travel to rural communities for in-person mediation, education, and capacity-building. By integrating direct family support with community-level education and Tribal court collaboration, the initiative addresses both individual and systemic needs, helping families, communities, and local systems work together to prevent conflicts from escalating and strengthen overall community resilience.	\$50,000-\$250,000	Statewide	Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Nome Census Area; North Slope Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Women In Safe Homes Inc (WISH)	Sustaining Services for Domestic Violence & Sexual Assault Survivors in Southern SE Alaska	AK	Rural communities face persistent barriers to recruiting and retaining qualified professionals, particularly in specialized fields of crisis intervention, behavioral health and legal services for victims of domestic violence and sexual assault. This project will recruit and retain these professionals to provide barrier-free services in response to incidents of domestic and sexual violence. By addressing historical barriers to rural recruitment and retention, including geographic isolation, housing limitations, and financial constraints, WISH will ensure consistent, long-term access to high-quality legal services without gaps in care. To recruit and retain high-need professionals, WISH will offer structured incentives tied to a five-year service commitment, including upfront recruitment bonuses weighted toward later years of service and repayment requirements if the obligation is not fulfilled. The project will also coordinate housing placement with local partners and provide time-limited housing and childcare stipends to reduce relocation barriers and support long-term provider stability in our rural community. This project will also implement a structured retention strategy for existing employees, projecting support and incentives over the next five years to strengthen workforce stability, reduce turnover, and sustain the capacity needed to provide reliable, trauma-informed services to survivors in our rural community.	Recruit Professionals: WISH will implement a targeted, multi-faceted approach to recruit and retain professionals in the fields of crisis intervention, behavioral health and legal services, to serve survivors of domestic violence and sexual assault in Southern Southeast Alaska. Recognizing the persistent challenges of geographic isolation, high cost of living, and limited housing, this project combines national recruitment, financial incentives, and community support to attract highly qualified professionals and ensure their long-term retention. To expand the applicant pool beyond Alaska, WISH will contract with professional recruitment agencies. Recruitment efforts will be paired with structured incentives tied to a five-year service commitment, including upfront hiring bonuses and incremental payments weighted toward later years, with repayment requirements if obligations are not fulfilled. This approach encourages sustained service and reduces turnover. Relocation barriers will be addressed through WISH’s long-standing relationships with local landlords, housing providers, and childcare agencies, allowing hired professionals to secure housing and childcare prior to arrival. Time-limited housing stipends and childcare support further ease relocation, helping the individual settle quickly and focus on service delivery. Retain Existing Employees: Current employees will be eligible for retention bonuses distributed in phases over the five-year project period. These incentives will be tied to continued employment milestones of their annual service benchmarks, to encourage long-term commitment and reduce turnover. The project will allocate resources for continuing education, advanced certifications, and specialized training related to trauma-informed care, victim advocacy, crisis response, and legal services for survivors of domestic and sexual violence. Supporting staff in maintaining credentials and expanding professional expertise will strengthen service quality while increasing job satisfaction and long-term retention.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

World Wide Technology	Building the commercial and operational framework required to manage Microsoft solutions.	AK	WWT, through its fully integrated Softchoice Microsoft organization, brings the experience, scale, and operating discipline required to procure and enable Microsoft solutions. Microsoft solutions encompass innovative products and services such as AI, cloud computing, productivity tools like Microsoft 365 and Teams, and advanced hardware like Surface devices, designed to enhance personal and business efficiency, creativity, and connectivity. WWT can support the RHTP Program (and Healthcare Partners) in negotiating and structuring Microsoft Enterprise Agreements, as well as build the broader commercial and operational frameworks required to manage Microsoft successfully over the life of the relationship. A Microsoft agreement must support more than procurement. It must create a stable foundation for: • Secure statewide collaboration • Identity modernization • Endpoint and device governance • Security and compliance expansion • Cloud adoption and optimization • Future AI readiness Without a disciplined commercial structure and governance, organizations often end up with fragmented purchasing, limited transparency, pricing exposure, duplicated services, or agreement terms that do not align with actual modernization priorities. WWT helps prevent this by ensuring the commercial model is built to support the technology strategy, not work against it.	WWT would serve as the Alaska RHTP Program's strategic Microsoft commercial advisor and program partner. Our role is: • Understand the most appropriate Microsoft agreement structure based on current needs and future modernization goals • Establish a like-for-like baseline of licensing, cloud usage, support constructs, and projected growth • Evaluate Enterprise Agreement, Microsoft Customer Agreement, and Cloud Solution Provider options with clear trade-off analysis • Guide commercial negotiations with Microsoft using fact-based benchmarks and governance • Build a long-term management framework for renewals, true-ups, optimization, support alignment, and ongoing commercial transparency Our approach is designed to remove ambiguity, reduce risk, and ensure the RHTP participants enter Microsoft negotiations with a clear understanding of what it has, what it needs, and what commercial structure best supports its long-term objectives. WWT would help the Alaska RHTP Program (and Healthcare Partners) through the full Microsoft commercial lifecycle: 1. Discovery and Baseline We begin by understanding the State's current environment, planned modernization roadmap, organizational structure, projected user base, and existing Microsoft or adjacent technology investments. The goal is to establish a clear and defensible baseline of current and future need. 2. Scenario Modeling We then evaluate the available commercial paths. This includes modeling Enterprise Agreement versus other Microsoft channels, identifying where price protection matters most, and aligning commercial options to the State's operational realities and funding profile. 3. Negotiation Readiness WWT prepares the State for commercial engagement with Microsoft through pricing transparency, market perspective, benchmark validation, and clear recommendation of the preferred structure. 4. Negotiation Support WWT can operate as first chair or second chair in Microsoft discussions, depending on the State's preference. In either posture, our role is to help drive disciplined, fact-based negotiation and avoid unnecessary commercial complexity. 5. Ongoing Governance After the agreement is established, WWT remains engaged to support lifecycle management, reporting, optimization, true-up preparation, roadmap alignment, and future renewal planning.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

WWT’s strength is that we stay engaged beyond the initial transaction and help clients actively manage the agreement over time.

World Wide Technology	Microsoft Enablement and Solutions Delivery	AK	Healthcare delivery across Alaska is challenged by geographic isolation, limited specialist availability, and fragmented technology environments that make collaboration between regional hospitals, clinics, and public health organizations difficult. Many providers rely on disconnected communication tools, legacy identity systems, and inconsistent device management models, which limits the ability of clinicians to securely access systems, consult with specialists, and coordinate care across organizations. These constraints are particularly impactful in rural and frontier communities, where clinicians must often operate with smaller teams and limited on-site expertise. This project presents an opportunity to establish a secure, modern Microsoft-based healthcare collaboration platform that connects providers across Alaska and enables clinicians to access expertise, information, and collaboration tools regardless of location. WWT, in partnership with Microsoft, will implement an identity and collaboration foundation built on: -Microsoft Entra ID, Microsoft 365, and modern endpoint management with Intune -Microsoft Teams (Telehealth), SharePoint, Dragon Copilot (Ambient Listening for Clinician/Patient Transcription/Summarization) -Microsoft’s security framework, including Conditional Access and Microsoft Defender, enabling secure remote access for healthcare professionals working in distributed locations -Support for innovation such as AI-assisted clinical workflows	WWT proposes a structured five-year modernization program designed to strengthen collaboration, security, and operational sustainability across Alaska’s healthcare ecosystem while ensuring uninterrupted care for rural and frontier communities. We recognize this transformation must balance modernization with the realities of geographically dispersed care delivery, limited local technical resources, and existing infrastructure constraints. The program begins with a focused Discovery and Assessment phase, where WWT collaborates with RHTP AK Program leadership, regional hospitals, and clinical stakeholders to evaluate the current technology landscape across identity, endpoint management, collaboration platforms, security posture, and cloud readiness. This assessment identifies barriers preventing clinicians from securely accessing systems, collaborating across organizations, and efficiently coordinating care—particularly in rural environments where staff and technical resources may be limited. Following discovery, WWT will lead a Solution Architecture and Design phase establishing a secure, scalable Microsoft platform leveraging Microsoft Entra ID, Microsoft 365 (Teams, SharePoint, OneDrive), Microsoft Intune, Microsoft Defender, Microsoft Purview, and Azure cloud services. Together these technologies allow clinicians to securely communicate, share information, and access systems regardless of location while maintaining strict governance over sensitive healthcare data. To ensure reliability across Alaska’s diverse infrastructure environments, WWT will validate key components through targeted proof-of-concept deployments before statewide rollout. Implementation will follow a phased rollout model, prioritizing foundational capabilities such as identity modernization, secure collaboration, and endpoint management. Later phases expand Telehealth, Clinical Workflow enablement (including Dragon Copilot), security, data governance, and cloud capabilities through Defender, Purview, and Azure to support long-term scalability and innovation. WWT will also leverage insights from successful urban/rural/tribal healthcare programs. Through this approach, WWT and Microsoft will establish a secure collaboration platform that expands access to expertise, strengthens care coordination, improves Clinician productivity and improves healthcare delivery for communities across the state.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

World Wide Technology	Sovereign Health Program: Intelligent Edge, Secure SD-WAN Network & AI-Driven Observability	AK	Rural healthcare facilities face challenges in enhancing the ability to deliver quality care efficiently, effectively and securely. Connectivity and Bandwidth Limitations: WWT's Intelligent Edge Solution (IE) optimizes the use of available bandwidth by dynamically routing traffic over multiple connections, such as broadband, LTE, and MPLS, ensuring reliable connectivity. This is crucial for telemedicine services, which require stable, high-speed internet for video and data sharing. Ineffective Management of Resources: IE allows IT teams to manage the entire network from a single interface, reducing the need for on-site technical support. Security: Healthcare facilities handle sensitive HIPAA patient data. IE enhances security by integrating advanced security features such as encryption, firewalls, and intrusion prevention systems directly into the network. Scalability and Flexibility: IE provides the flexibility to add new sites and services without significant infrastructure changes. This is beneficial for rural healthcare providers looking to expand telehealth services. Cost Efficiency: IE reduces costs by allowing the use of more affordable broadband connections while maintaining performance and reliability. Improved Application Performance: An IE prioritizes critical healthcare applications, ensuring they receive the necessary bandwidth required. This is essential for EHR systems, which need to be accessible and responsive to support patient care.	In order to meet this challenge, we must take the Wide Area Network (WAN) in its totality. An architecture that encompasses SD-WAN, Firewalls, East/West Traffic Management, along with circuit management/telemetry, AI, Observability. An approach which has proven itself within Alaska's largest provider, Providence Health. Our approach, while holistic is not bound by any one technology OEM. The WWT ATC can support the proving out of any specific use case we have not already vetted across infrastructure, data, and AI, security, and cloud. The ATC is where we partner in the testing of products and architectures to help Healthcare leaders make informed technology decisions. North America Integration Center (NAIC) Much like the pre-fabrication of buildings shipped to the North Slope, WWT has the ability to pre-fabricate technology and deliver it to remote locations. This reduces technology and supply chain challenges in rural sites, while delivering an operationally excellent outcome. IE can leverage other funding mechanisms to support Bandwidth and Cloud Adjacency. Universal Service Administration Co. (USAC) Rural Healthcare support for broadband has been a rural enabler, offsetting 65% of the Underlay/Overlay costs. We have yet to fully appreciate the impact of Alaska's Broadband Equity, Access, and Deployment (BEAD) and how this will support Rural Broadband. WWT is currently in discussions to better understand 2026 BEAD Program potential impact. 24/7 operational support of this service is another critical component of an IE and WWT proposes phased options. These options include leveraging what is already in place, to building this capability within AK, to leveraging the Providence Global Center (PGC) capability who supports the Infrastructure and Helios (AI/Observability Platform) for Providence AK. In order to drive efficient change, we are proposing a three phased delivery methodology: Phase 1: Requirements and Design definition builds a foundation of scope, aligned to expected outcomes. Phase 2: Enablement begins once we define the outcome and agree upon the work/effort/cost involved in its achievement, we ensure compliance with RHTP/DOH policy and manage funding/outcome. Includes Solution Development, Testing and User Group Enablement. Phase 3: Operate confirms the solution operates to a set of SLA's in	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

combination with a Continuous Improvement process so that the solution continues to meet Rural Healthcare’s evolving needs.

Wrangell Public School District	Grow Our Own: VR-Enabled K-12 Healthcare Certification Pipeline for Rural Alaska	AK	Alaska’s RHTP Strengthen Workforce Initiative has explicitly identified “Grow Our Own” pipelines as a top priority, calling for programs that prepare rural students for healthcare certification while allowing them to remain in or near their home communities. Two intersecting barriers block that STEM continuum: the absence of local, advanced-level health science instructional expertise, and the digital divide in villages like Wrangell. WPSD has a dedicated science teacher, but they lack the specific background to teach advanced subjects like anatomy and physiology. Consequently, our rural students have limited exposure to foundational healthcare concepts, creating an inequitable gap in career-connected learning. This lack of early exposure directly exacerbates our health workforce shortages, as fewer rural youth are inspired or prepared to pursue healthcare careers. Without foundational coursework available locally, rural students have limited opportunities to build the knowledge base needed to pursue certification as CNAs, EMTs, BHA/Ps, CHA/Ps, DHATs, & CHAs — the roles most critically understaffed in remote Alaska. The opportunity is to eliminate both barriers simultaneously by bringing advanced-level health-related instruction directly to students via VR technology, creating high school certification programs, and retaining local talent to provide healthcare services in a single deployment.	Our approach is to implement a healthcare professional career track in Wrangell Public School District’s (WPSD) middle school and high school that provides (a) students with instruction for healthcare careers, (b) teachers with training to support advance-science content courses, (c) offers the potential for dual credit and micro-credentialing to students, and (d) partners with local healthcare professionals for student training. We will leverage syGlass technology, an innovative VR technology K-12 to Medical School STEM instructional model, across the program. WPSD will distribute the VR technology and headsets, instantly transforming any space into an advanced science/health learning environment. WPSD will conduct a 5-year program: Year-1 pilot implementation to optimize a syGlass technology and curriculum deployment; Year 2 WPSD full-program implementation, partnership expansion with neighboring school districts, and local healthcare systems (e.g., Southeast Regional Hospital); and Years 3-5 ongoing WPSD implementation, implementation in neighboring school districts and regional school district consortium, and dual credit and micro-credentialing with Alaska colleges/universities. To ensure successful adoption, we will use our phased Pre-Launch, Launch, and Sustain implementation framework. Students will be guided through highly detailed, interactive 3D anatomical models by world-class experts, ensuring they receive the highest quality instruction regardless of their geographic location. The curriculum goes beyond passive viewing by integrating active learning experiences and formative assessments directly within the 3D VR environment. Students must demonstrate their understanding by completing spatial and conceptual assessments in VR. The curriculum is aligned to Alaska K–12 Science Standards, CTE Health Science pathway standards (Perkins V-eligible), and supports direct entry into certification pathways including CNA, CHA/P, EMT, BHA/P, DHAT, CHW, and Medical Laboratory Personnel. We will coordinate our program with existing healthcare workforce programs (e.g., Alaska AHEC). We will provide teachers with synchronous and asynchronous job-embedded professional learning to advance their skills and content development, as desired. syGlass’s 96.6% student engagement rate and proven instructional outcomes, combined with WPSD’s STEM and CNA training program, position this program to build a local healthcare workforce pipeline in Wrangell and beyond.	\$250K-\$1M	Single Community	Wrangell (City and Borough)	Advance to Implementation Application

xpio group health, llc	Alaska Rural Behavioral Health Technology and Data Transformation	WA	Alaska's rural behavioral health providers operate on fragmented, poorly optimized technology that prevents effective care coordination, outcomes measurement, and participation in value-based payment models. Community mental health centers and substance use treatment providers across rural and frontier Alaska use EHR systems that are misconfigured for their clinical workflows, cannot exchange data with hospitals, tribal health organizations, or state agencies, and lack basic cybersecurity protections for the highly sensitive data they hold under 42 CFR Part 2 and HIPAA. The result: clinicians cannot see what happened to a patient in crisis who was treated at another facility. DOH cannot track follow-up rates for Medicaid youth after behavioral health hospitalization. Providers cannot generate the quality data needed to shift toward value-based care. And every technology investment the state makes sits on an insecure foundation vulnerable to breach. This project addresses that gap by optimizing EHR systems, deploying interoperable data exchange connecting rural behavioral health providers to statewide health information infrastructure, and establishing cybersecurity baselines — building the technology foundation Alaska needs to achieve its RHTP goals across Initiatives #2, #4, and #6.	Xpio Health will leverage our existing relationships with 25 Alaska behavioral health providers and ABHA to execute a phased project across three workstreams. EHR Optimization: Conduct assessments at participating rural behavioral health providers to identify configuration gaps in clinical documentation, billing, quality reporting, and data capture. Deliver hands-on remediation including workflow redesign, staff training, and system configuration so providers can capture complete, accurate data — the prerequisite for everything else. Interoperability & Data Exchange: Design and deploy standards-based interfaces connecting rural behavioral health providers to Alaska's statewide HIE and state reporting systems. Priority use cases include behavioral health care transitions, crisis notifications, medication reconciliation, and outcomes reporting. We bring proven capability here — Xpio's leadership operates Idaho's statewide HIE, where we delivered 1.5 TB of FHIR data at a 99.96% patient match rate across rural and frontier providers. Our Pryzma platform provides Mirth Connect open source integration and automated state reporting already in production for behavioral health systems. Cybersecurity & Compliance: Perform HIPAA Security Risk Assessments and cybersecurity evaluations at each participating provider. Establish incident response plans, 42 CFR Part 2 compliance frameworks, and ongoing monitoring through our Xpio+Vanta compliance platform. This protects sensitive behavioral health data and ensures RHTP investments are sustainable. Timeline: Months 1-8 focus on EHR optimization and cybersecurity baselines. Months 6-18 deploy interoperability infrastructure. Months 15-24 support value-based care readiness and document a replicable model for scaling to additional regions in RHTP Years 2-5. Because Xpio already works with these providers, and with ABHA, we can begin immediately with no procurement delays or relationship-building ramp-up.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yakutat Air	Alaska Bush Medicine Training Initiative: Strengthening Alaska’s rural emergency response network.	AK	Alaska’s vast geography and limited transportation infrastructure mean that many remote communities, wilderness tourism sites, and lodges are located hours from the nearest medical services. In these high-risk environments, bush pilots, wilderness guides, and lodge operators are often the first on scene during medical emergencies including injuries, hypothermia, drug overdose. However, they typically have little or no formal emergency medical training, and delays in initial stabilization can significantly affect patient outcomes. Alaska’s aviation network includes an estimated 2,000 bush pilots and air taxi operators who transport people to remote locations not connected by roads. The state also hosts hundreds of remote fishing lodges and wilderness tourism operations that rely on aviation access. The Alaska Bush Medicine Training Initiative will strengthen Alaska’s rural emergency response network by providing bush pilots, wilderness guides, and remote tourism operators with immersive simulation training and practical emergency stabilization tools. Using a virtual Reality training platform capable of remote instruction and operation in offline environments, the program will deliver realistic emergency training to remote, difficult to reach locations. By expanding the capacity of non-medical responders to stabilize patients until evacuation is possible, the project will improve early response capability and help save lives in Alaska’s most remote regions.	The Alaska Bush Medicine Training Initiative will expand rural emergency response capacity by delivering immersive virtual reality (VR) training and emergency stabilization tools to wilderness operators, bush pilots, and remote tourism providers across Alaska. Yakutat Air will lead the initiative, coordinating scenario development, program deployment, and training distribution in partnership with SimX, which will develop the immersive VR simulations and provide the training platform. In Year 1, Yakutat Air and SimX will collaborate with experienced bush pilots, wilderness guides, and emergency response professionals to develop five VR training scenarios tailored to medical emergencies commonly encountered in Alaska’s remote environments. Core scenarios will include severe bleeding and tourniquet use, hypothermia and cold-water immersion, opioid overdose and Narcan administration, bear or wildlife attack trauma, and remote patient stabilization while awaiting evacuation. These simulations will replicate realistic environments and allow participants to practice recognizing emergencies, making rapid decisions, and performing basic stabilization steps before professional medical evacuation arrives. In Years 2 and 3, the program will deploy VR training equipment and emergency stabilization kits through a hybrid delivery model. Yakutat Air will serve as a permanent training hub, while additional VR headsets will rotate among remote lodges, air taxi operators, and wilderness tourism operators throughout Southeast Alaska and other rural regions. Yakutat Air will use its aviation network to deliver equipment and facilitate training sessions at remote sites that are difficult to reach through conventional training programs. Each participating location will receive access to immersive training modules as well as Remote Emergency Stabilization Kits containing essential tools such as tourniquets, Narcan, glucose, and emergency blankets. By pairing hands-on tools with simulation-based training, participants will gain both the knowledge and resources needed to stabilize affected individuals. Project evaluation will measure the number of remote locations served, the number of wilderness operators participating, the number of individuals trained, and improvements in emergency response knowledge and simulation performance. These findings will inform refinement of the training program and support potential expansion to additional rural regions across Alaska.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Skagway (Municipality); Yakutat (City and Borough)	Deferred or Not Advanced

Yakutat Tlingit Tribe	Yakutat Workforce & Enhanced Rural Care Initiative	AK	Aligned with the State’s focus on improving health outcomes for all Alaskans, Yakutat’s North Star in this project is improving overall health outcomes for chronically ill patients, many of whom are elders. Yakutat is a remote, isolated community accessible only by plane or boat. Geographic isolation, weather disruptions, housing shortages, and high operational costs create persistent barriers to healthcare access. Recruiting and retaining qualified providers is challenging, and reliance on outside workforce models is not sustainable long-term. At the same time, our population is aging, and chronic disease rates continue to rise. Patients often experience gaps in follow-up between visits, and elders and high-risk individuals are especially vulnerable during emergency events. While telehealth expansion during COVID improved access, rural residents continue to value in-person care and trusted provider relationships. Many emerging care models attempt to replace traditional delivery with virtual services; however, that approach does not fully address rural Alaska’s realities. The opportunity is to strengthen traditional care by building local workforce capacity and enhancing continuity of care. By developing Community Health Workers from within the community and pairing them with strategically applied remote support tools, we can improve access, quality, and long-term sustainability without sacrificing relationship-based care.	Our approach is workforce-first and community-based. We will build local healthcare capacity by recruiting and training Community Health Workers (CHWs) from within Yakutat. These CHWs will be trained to support chronic disease management, conduct wellness checks, assist with care coordination, and provide follow-up between provider visits. To strengthen clinical capability and emergency response integration, CHWs will receive EMT-level training (ETT, EMT, or EMT-I), either through an onsite training partnership or contracted instructors brought to Yakutat. Training locally addresses two barriers at once: workforce shortages and housing limitations that make recruitment difficult. By developing our own workforce, we create sustainable career pathways for residents while expanding healthcare access. The Yakutat Senior Center will serve as a community health hub and operational base for CHWs. Targeted infrastructure and equipment upgrades will support training, coordination, and service expansion. The Center will also function as a support location during emergencies, improving resilience for elders and high-risk individuals. This project does not replace traditional care delivery. In-person provider relationships remain primary. We will implement remote monitoring strategically—only where clinically actionable—to support provider decision-making between visits. CHWs will assist patients with understanding and using monitoring tools, ensuring technology enhances rather than replaces relationship-based care. Daily review of physiologic data with defined intervention thresholds and structured provider notification protocols. CHWs will also support transitional care management following hospital discharge to reduce preventable readmissions and ensure safe recovery in the home setting. We will work closely with the Yakutat Community Health Center and EMS partners to develop coordinated workflows and compliant third-party billing pathways for eligible services delivered in community or alternate settings. This integration strengthens access, improves continuity of care, reduces preventable emergency utilization, and builds long-term financial sustainability. Medication reconciliation and coordination with primary care providers to support timely titration and care plan adjustments By combining local workforce development, enhanced care coordination, and strategic technology support, this approach strengthens traditional rural healthcare delivery.	\$250K-\$1M	Single Community	Yakutat (City and Borough)	Advance to Implementation Application

Yakutat Tlingit Tribe	Yakutat Community Health Center Dental Clinic Service Expansion Improvements	AK	Yakutat’s geographic isolation creates significant barriers to specialty dental care. Due to limited equipment, many procedures cannot currently be performed in the community. Patients must travel by commercial air to receive higher-level care, resulting in: High transportation and lodging costs Weather-related delays Missed school and subsistence activities Delayed or deferred treatment Increased risk of preventable dental infections Oral health disparities in rural Alaska include high rates of untreated decay and advanced periodontal disease. Due to historical trauma in remote villages of Alaska, dental phobia is high and trust is hard earned. Dental anxiety is a significant barrier that prevents many individuals from seeking timely treatment, often leading to more complex oral health issues. The current equipment limitations restrict the visiting dentist’s ability to provide comprehensive care, increasing outside referrals and avoidable system costs. The opportunity is to transform the local dental program from a limited-service clinic to a more comprehensive rural dental hub capable of providing advanced care in-community.	We propose to expand in-community dental service capacity through strategic capital investment in: Electronic Patient Record that communicates with the existing Medical Patient Record Prosthodontic instrumentation and equipment for implants Surgical instrumentation and equipment for complex extractions Orthodontia scanner and clear aligner program fees Guided Biofilm Therapy unit for Periodontics Equipment and practices installed to reduce dental fear These upgrades will allow the visiting dentist to perform procedures that are currently referred out. Implementation steps include: Equipment procurement and installation Staff training and calibration Workflow redesign to maximize visiting provider productivity Data tracking of referral reductions and travel cost avoidance The approach focuses on cost-effective infrastructure enhancement rather than workforce expansion, making it sustainable within Yakutat’s existing staffing model.	\$250K-\$1M	Federally qualified health center	Single Community	Yakutat (City and Borough)	Deferred or Not Advanced

Yakutat Tlingit Tribe	Yakutat Community Health Center Improved Care Capacity through Health Warehouse renovation	AK	The clinic facility is stocked with medical, maintenance, and equipment supplies. The emergency vehicle garage cannot be used for its primary purpose as it is filled with essential equipment and supplies needed to operate the facility. Limited space has required several versatile rooms to be used for storage rather than for medical care. Additional impacts include improper storage of medical gas, occasional egress infringements, and off-site storage of patient transportation and facility maintenance vehicles. Energy costs in Yakutat are very high, significantly higher than most communities in S.E. Alaska, with fuel costs exceeding \$5 per gallon and continuing to rise. Heating costs for the existing warehouse are estimated to exceed \$12,000 per year. The proposed project is anticipated to reduce heating costs by approximately \$8,000 annually by connecting the facility to the heat recovery district heating system. The current warehouse facility lacks dedicated water service. Maintenance tasks such as vehicle cleaning and equipment repair are difficult. Water must be supplied through a hose from the health center across the parking lot or hauled in. This limits water availability, particularly in winter, reducing maintenance efficiency. Providing dedicated maintenance space and storage with a low-cost operational model will allow YCHC to expand care options, reduce safety and code concerns, improve operational efficiency, and lower costs in both the short and long term.	The solution to the proposed project is to build simple, cost-effective, and collocated storage space for the Health Center's benefit. The proposed project will renovate the interior to include a mezzanine within the YCHC Warehouse facility, add piped water service, and a piped connection to the existing waste heat recovery district heating system for the facility. This project improves access to care and sustainability by renovating existing storage space to drastically expand healthcare facility maintenance and storage capacity, providing collocated emergency vehicle storage, reducing facility operations costs, and expanding available space for care provision in the Health Center. This will reduce heating costs by 66% in the facility and expand supplies/equipment storage by 1,000 square feet. Additionally, improved maintenance space and vehicle storage will extend the useful life of equipment, improve efficiency and efficacy of building maintenance functions. The additional storage space will open up multiple rooms within the Health Center for expanded and improve space allocation for medical services.	\$250K-\$1M	Federally qualified health center	Single Community	Yakutat (City and Borough)	Deferred or Not Advanced

YMCA of Alaska	Alaska Rural Youth Injury Prevention & Safe Sport Infrastructure Initiative	AK	According to the Alaska Department of Health, Alaska has the highest drowning rate in the nation, with rural regions experiencing the highest rates in the state. Unintentional injury remains a leading cause of death among youth, and extended EMS response times in remote communities increase the importance of local emergency response capacity. While youth sports and recreation provide critical protective benefits, many rural communities lack standardized safety protocols, certified responders, and trained officials. Emergency preparedness during community sporting events is inconsistent. This initiative establishes a structured, deployable injury prevention model that strengthens rural community safety infrastructure through training, certification, and workforce development. By integrating emergency response capacity into youth sports systems, the project reduces preventable injury risk while creating paid youth employment pathways.	The YMCA of Alaska will deploy a traveling Youth Injury Prevention Team to 4–6 rural Alaska communities annually. RHTP funds will support: - Deployment of certified CPR/AED instructors to rural sites - Training of volunteer coaches and youth officials in First Aid, concussion protocols, and emergency response - Development of standardized Emergency Action Plans for participating facilities - Creation of a Youth Referee Certification & Paid Placement Pipeline - Training-of-trainers model to build local certification capacity - Workforce scholarships for youth participants - Injury prevention data tracking and evaluation systems Each participating community will receive comprehensive in person training sessions, written safety protocols, and follow-up support to ensure sustained implementation. The initiative combines injury prevention education, workforce development, and emergency response readiness into a replicable rural safety infrastructure model.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Bristol Bay Borough; Kenai Peninsula Borough; Kodiak Island Borough; Kuskilvak Census Area; Nome Census Area; Northwest Arctic Borough	Deferred or Not Advanced

YMCA of Alaska	Alaska Statewide Aquatics Safety & Lifeguard Workforce Initiative	AK	Drowning is a major, preventable injury burden in Alaska. Alaska DOH surveillance recorded 342 drowning deaths during 2016–2021 and noted Alaska had the highest age-adjusted drowning rate in the U.S. in 2021. Rates are disproportionately high in rural regions (Southwest 31.1 per 100,000; Northern 26.8 per 100,000). At the same time, Alaska lacks a coordinated, scalable in-state system to deploy certification instructors to rural communities on a regular cycle—limiting local capacity to staff pools safely, provide consistent swim and water-safety programming, and maintain rapid response readiness for water emergencies. This project addresses a clear rural health transformation opportunity by building public safety infrastructure through workforce credentialing that is deployable, measurable, and sustainable.	The YMCA of Alaska will establish and deploy a traveling aquatics certification team to deliver industry-recognized credentials to rural and regional Alaska communities (initially 6–10 communities in year one, with expansion in subsequent cycles). This approach is designed as injury prevention infrastructure and public safety workforce development, not construction. Activities include: Delivering lifeguard, CPR/First Aid, and rescue-related certification courses locally (reducing travel barriers for rural residents) Building a rural youth/young-adult employment pipeline through credential attainment and job readiness Supporting community facilities’ ability to operate safely by increasing the supply of certified staff Strengthening emergency response capacity by expanding the number of trained responders present in communities Tracking certifications and participation as measurable outputs tied to injury-prevention objectives Integrating DOH-informed prevention emphasis. DOH surveillance shows 39% of non-occupational drownings involved boating and PFD non-wear reached 88% in boating-related drownings (2019–2021), underscoring the need for practical safety skill-building and reinforcement of preventive behaviors.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Nome Census Area	Deferred or Not Advanced

YMCA of Alaska	YMCA of Alaska – Lake Otis Preventative Health Activation Project	AK	Alaska faces persistent challenges in chronic disease prevalence, workforce shortages, youth behavioral health concerns, and limited preventative infrastructure capacity. Community-based prevention systems are critical to reducing long-term healthcare costs and supporting rural health stability. The Lake Otis YMCA has reached physical capacity and cannot expand preventative health programming, physician-referred services, or youth protective engagement initiatives. Current space constraints limit enrollment, reduce referral acceptance, and require rental of external facilities for youth sports. This project presents an opportunity to activate expanded preventative health capacity within an existing community institution to strengthen access, workforce stability, and rural continuity of care.	The YMCA of Alaska will activate expanded prevention infrastructure at its Lake Otis facility through a hybrid capital activation and program integration strategy. While construction of a 20,400-square-foot addition is being funded through diversified sources, RHTP funds will support activation of the expanded space for health system transformation outcomes, including: • Development of formal healthcare referral pathways with Alaska-based hospital systems • Expansion of chronic disease prevention and physician-referred wellness programming • Transition support for cardiac rehabilitation and post-acute recovery patients • Expansion of youth sports as behavioral health protective factors • 24-hour access to structured fitness to accommodate healthcare workforce shift schedules • Workforce family stabilization through expanded childcare capacity • Equipment acquisition and program staffing to operationalize expanded capacity • Data tracking and evaluation infrastructure to measure prevention impact Statewide construction partners Watterson Construction and Bettisworth North are leading the design and build process, reinforcing Alaska-based collaboration and economic sustainability. The project will provide 24-hour facility access to accommodate healthcare workforce shift schedules and reduce barriers to preventative wellness participation. Expanded childcare capacity and scholarship support will reduce workforce strain and help retain clinical staff serving Alaska’s rural communities.	\$250K-\$1M	Statewide	Anchorage (Municipality); Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

You Aesthetics LLC	Healthcare Access Expanding Essential Services in Remote Frontier Areas	AK	Rural and frontier Alaskan residents face significant barriers to specialized preventative care for chronic conditions such as obesity, prediabetes/type 2 diabetes risk, and women's hormonal imbalances. Limited local access contributes to higher preventable disease rates, poorer outcomes, and elevated long-term healthcare costs. As an Anchorage-based clinic specializing in GLP-1 therapies and women's hormone health, we are well-positioned to extend evidence-based preventative services via telehealth to bridge these gaps.	You Aesthetics proposes expanding our evidence-based telehealth program to deliver GLP-1 agonist therapies for weight management and chronic disease prevention, combined with women's hormone health optimization. Funds will support: (1) enhanced secure telehealth infrastructure and remote monitoring tools, (2) targeted training for rural clinic staff, and (3) outcome tracking (e.g., weight reduction, improved metabolic markers, symptom relief). This enables sustainable, locally supported preventive care for rural patients without requiring travel to Anchorage.	\$250K-\$1M	Clinic	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Youth Advocates of Sitka Inc	Coastal Haven - Increasing Access to Mental Health Treatment for Our Youth	AK	Rural children and adolescents in Alaska face many barriers to seeking mental health and substance use treatment, including stigma and limited resources such as women's shelters or domestic violence support. Alaska Native youth are more likely to experience adverse childhood experiences that have a significant impact on future violence victimization and perpetration, and lifelong health and opportunity. Alaska Native girls and young women have historically experienced high rates of rape, domestic violence, sexual assault, suicide, mental health, and substance use. These experiences create vulnerable youth that can easily become homeless or trafficked, or worse, becoming another statistic for missing and murdered indigenous women and girls. These youth may have experienced a history of foster care involvement, child poverty, child abuse or neglect, human trafficking, juvenile justice involvement, or substance use. Many of these youth come from a variety of settings such as residential treatment centers, homeless youth or youth living in unsafe environments. Often these youth find themselves living in unsafe environments. Many of these youth experience severe emotional disturbances or mental health challenges, and are often diagnosed with fetal alcohol spectrum disorder, autism spectrum disorder, or other developmental disabilities. Support services are limited for homeless youth, youth that have been trafficked, and youth at-risk throughout the state in general.	The overall goal of the Coastal Haven program is to prevent and reduce victimization of youths who are at risk for trafficking and homelessness. Youth Advocates of Sitka will provide delivery of multiple beneficial services such as providing basic needs, including immediate shelter, skills training, connecting individuals to employers, and providing access to long-term mental health treatment services. Coastal Haven will serve up to 10 youth at one time, who are homeless, at risk of homelessness, and human trafficking. Coastal Haven will provide basic needs, including immediate shelter, housing, skills training, connecting individuals to employers, and providing access to long-term mental health treatment services. The average length of stay in the program is about 6 to 9 months. Additionally, youth who prefer or are recommended for residential treatment at Coastal Haven have the option to matriculate to the Transitional Living Program upon discharge, ensuring programming and service availability to youth and furthering the continuum of care. The Transitional Living Program can provide safe housing for 5 youth ages 18 to 25, for up to 540 days.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon Koyukuk Elder Assisted Living Consortium	The Yukon-Koyukuk Elder Assisted Living Facility (YKEALF) Expansion Plan	AK	The Yukon-Koyukuk Elder Assisted Living Facility is now 17 years old and requires significant heating infrastructure improvements. Currently, we are using blankets on outside doors, plastic on windows, and 2" foam board on the dining room windows to manage the cold. The individual client's rooms have unused electric ranges and kitchen sinks that we would like to remove to allow our clients to have a safer space and more room for their belongings. The staff housing for our caregivers and cooks is approximately 40 years old and also needs upgrades, particularly for doors, windows and boiler maintenance. Regarding our residents, about 70% are affected by ADRD, and we would like to offer annual training to staff and families to assist with their care. We also want to provide our newer administrative staff with leadership and administrative training. In our Medication room, our locked cabinet needs to be replaced with a ventilated locked cabinet. Finally, as our operations are almost entirely digital, we need to ensure our IT infrastructure is secure. We purchased three new computers last year and want to ensure all devices are properly networked and maintained through professional IT support. We would like to have a website designed for potential clients and employees of YKEALF to apply and learn about our services.	Louden Council has applied for the VEEP grant on behalf of YKEALF that would cover some of the project, if awarded. (The proposed project for the VEEP grant will reduce the use of diesel fuel by replacing the non-functioning wood fueled boiler to serve as the primary heat source, repairing and optimizing the diesel fueled boiler systems to serve as back up heat source only and repairing the Energy Recovery Ventilator to ensure outside air is pre-heated before entering the building. An energy audit for the facility is also needed to specify upgrades to the building thermal envelope, windows, doors and lighting as currently there is significant air infiltration causing uncomfortable living conditions for the community elders.) We can potentially use the same auditor and construction company to do work on staff housing. (The renovation of the windows and doors of YKEALF and control panel will be in phase 2 of the VEEP grant if awarded.) Sustainable Energy of Galena Alaska, Inc. (SEGA) has done the renovation of one unit, removing the electric range and sink) and know the process of renovating other units. The cabinet will be purchased from ULINE. It is a ventilated locking cabinet. The training will be provided by Alzheimer's Association of Alaska and University of Alaska Anchorage trainers. Other trainings would be "training the trainer" so that we could eventually lead a more in house training. The administrative and leadership trainings would be courses, trainings and workshops that will cover all topics of ALH Administration such as business, management, human resources, Food Service and specialized health care. The IT support would be provided by IT Guys. The website will be done by WEB907.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon West Defense Technologies LLC	Mountain Village RX Kiosk	AK	Mountain Village faces ongoing barriers to timely prescription access, particularly for patients who must navigate long travel distances, transportation challenges, weather-related disruptions, workforce shortages, or limited pharmacy availability. These barriers can delay treatment, interrupt continuity of care, and make it harder for patients to begin and maintain prescribed therapies. In some cases, patients receive a prescription during a care encounter but still face significant obstacles to obtaining the medication in a timely and reliable way. The RX Kiosk is intended to address that gap by creating a more accessible, dependable, and patient-centered medication access pathway. The opportunity is to strengthen how our organization supports the community after a prescription is written, especially in cases where traditional pharmacy access may be limited or inconsistent. By improving access to medications closer to where patients live and receive care, we can reduce delays between prescribing and dispensing, support continuity of care, and improve the overall patient experience. This project also represents an opportunity to build a more sustainable rural access model by using practical infrastructure and local partnership to better meet the needs of our community.	Our proposed approach is to implement a secure automated prescription access model as part of a broader effort to strengthen medication access and care delivery in Mountain Village. The project will be designed to complement existing clinical and pharmacy services by creating a structured, technology-enabled pathway for eligible patients to obtain prescribed medications more efficiently. Implementation will focus on several core elements. First, we will identify the highest-priority use cases for the project based on community need, care delivery goals, and patient access challenges. Second, we will work with relevant pharmacy, clinical, operational, and technology stakeholders to define the appropriate operating model, site placement, workflows, and oversight structure. As part of this process, we will identify and evaluate an appropriate vendor partner with experience in secure automated prescription access technology and determine the solution that best fits our clinical, operational, and community needs. Third, we will plan for the operational components needed to support implementation, including system integration, staff training, patient education, and ongoing monitoring. This approach is intended to ensure that the project is not implemented as a standalone technology purchase, but as part of a coordinated care access strategy that fits our local environment and supports existing services. We expect the project design to reflect the realities of our service area, available partnerships, and long-term sustainability goals.	\$50,000- \$250,000	Single Community	Kusilvak Census Area	Deferred or Not Advanced

Yukon-Koyukuk School District	Pathways for Alaskas Technical Healthcare Careers - PATH	AK	YKSD serves remote Alaska villages where geographic isolation, workforce shortages, and limited emergency response capacity restrict access to care. Many communities depend on traveling providers, expensive medevac services, and clinics with few staff. Managing chronic illnesses, supporting behavioral health, and preparing for emergencies remain ongoing challenges. Healthcare support jobs make up a large part of the U.S. workforce, with about 1.4 million nursing assistants employed nationwide (BLS). Nursing assistants rank third among healthcare roles, after RNs and home health aides, highlighting the high demand for them. Although growth is modest at around 2% through 2034, there will be over 200,000 job openings each year for replacements, due to ongoing turnover and the need for a steady supply of credentialed workers (BLS & ONET). In rural Alaska, local workforce development is essential. Without structured pathways, students lack accessible routes into credentialed careers, and villages remain dependent on external staffing. Additionally, rural clinics increasingly deploy telehealth and remote patient monitoring devices, yet lack trained local support for setup and troubleshooting. This project directly addresses rural workforce shortages, strengthens technology-enabled care capacity, and enhances community-level emergency preparedness across the Doyon region of Alaska partnering with multiple school districts.	YKSD will implement a three-year Rural Health Workforce & Emergency Readiness Initiative beginning August 2026. The program integrates clinical training, behavioral health awareness, remote patient monitoring support, and emergency response readiness to strengthen rural healthcare delivery in Yukon-Koyukuk communities. CNA & Clinical Pathway: Students complete Medical Terminology, First Aid/CPR, Basic Life Support, Emergency Trauma Care, Teen Mental Health First Aid, and Certified Nursing Assistant coursework aligned with the University of Alaska Fairbanks Community & Technical College. Dual credit creates a direct pathway to postsecondary healthcare careers. Behavioral Health Foundations: Training in trauma-informed care, crisis awareness, and behavioral health fundamentals prepares students to support early identification and referral for mental health needs in rural communities. Remote Patient Monitoring & Telehealth Support: In partnership with Remote Hands Alaska and T3 Alliance, students earn micro-credentials in telehealth device setup, remote patient monitoring support, and HIPAA data practices. Supervised Work-Based Learning placements that assist village clinics and residents with device installation and troubleshooting. Emergency Response Readiness: Students receive training in triage awareness, incident support, and documentation protocols that strengthen community readiness during health emergencies. Stackable Credentialing: Competency-based digital badges lead to industry-recognized credentials that support employment in one of the nation’s largest healthcare support sectors while expanding the rural clinic workforce and technology capacity	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Koyukuk School District	WRAP: Wellness, Resilience, and Prevention Initiative	AK	Yukon-Koyukuk School District serves approximately 4,500 students and staff across village schools and Raven Homeschool, where these communities face limited access to consistent behavioral health support, prevention-based mental health resources, and structured social-emotional intervention. Recent mortality data estimates the suicide rate in the Yukon-Koyukuk Census Area at approximately 69.7 deaths per 100,000 people, more than double the U.S. rate. In the past two years alone, the district and surrounding education community have experienced approximately six deaths by suicide among students and members of the education community. Contributing factors include geographic isolation, limited access to behavioral health professionals, intergenerational trauma, substance misuse, seasonal affective disorder (SAD), and limited prevention-focused supports. Because schools are often the most consistent anchors within these communities, strengthening school-based behavioral health capacity offers a practical pathway for earlier identification, prevention, and connection to care.	Our proposed approach is to strengthen school-based behavioral health access across Yukon-Koyukuk School District’s remote communities by building a practical, locally anchored support system that helps students and staff receive earlier intervention, stronger prevention services, and more consistent pathways to care. Because many communities face significant transportation and accessibility limitations, schools often serve as the most consistent setting for identifying behavioral health needs and linking families to support. This project would strengthen that role by adding qualified counselors and social work capacity within the district while also equipping school staff with clearer protocols for response, curriculum, referral, and ongoing coordination when concerns arise. The approach combines direct intervention with prevention-focused systems. Counselors and social workers would provide services such as individual support, family coordination, crisis response, and referral navigation when higher levels of care are needed. In parallel, the project would strengthen school-wide prevention through evidence-based social-emotional learning (SEL), staff training, and structured supports that build resilience, emotional regulation, and positive peer relationships. The project aligns with the Healthy Beginnings initiative by expanding access to evidence-based mental and behavioral health supports in communities where access to such programming is limited. It reflects the initiative’s emphasis on strengthening mental health resilience, family engagement practices, and positive social connections as core drivers of better long-term health outcomes for youth, while using schools as trusted local settings for prevention-focused support. [2] Where possible, services would be coordinated with regional providers, tribal partners, and family supports so schools function as a practical entry point into broader care systems rather than operating in isolation. This also supports local delivery models that respect community priorities and strengthen coordination across existing support networks. Over time, this approach supports sustainability by building internal staff capacity, clearer referral pathways, and school-based systems that remain valuable beyond the grant period while helping communities respond earlier to behavioral health concerns before they escalate into more serious educational, social, or health outcomes.	\$1M-\$5M	Statewide	Anchorage (Municipality); Chugach Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Matanuska-Susitna Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon-Kuskokwim Health Corporation	Bridge to Home: Behavioral Health Step-Down Care	AK	Stabilization is a critical component of care for individuals experiencing a mental health crisis, but the time required for stabilization varies based on factors such as medication adjustments, behavioral health needs, and the availability of a safe home environment. In many cases, patients may no longer require the intensive care provided in a stabilization unit but would benefit from additional monitoring and support before safely returning home. In the Yukon-Kuskokwim region, patients experiencing a mental health crisis are typically treated in the Emergency Department (ED) or the Designated Evaluation and Stabilization (DES) unit and discharged shortly after the acute crisis resolves. While this approach addresses the immediate episode, patients may still require additional time to stabilize on medications, receive care coordination, and prepare for a safe transition home. These challenges are particularly significant for individuals returning to rural villages, where transportation to and from Bethel must be coordinated and delays can create additional barriers to care. Because the ED and DES units are designed for acute stabilization, they are not structured to support longer recovery or transition periods. Establishing a behavioral health step-down unit would address this gap by providing a supportive environment where patients can continue stabilizing and safely transition back to their communities.	The proposed approach is to develop a behavioral health step-down unit that provides a supportive transition environment for patients who have stabilized from an acute mental health crisis but are not yet ready to safely return home. This unit would serve as an intermediate level of care between the crisis stabilization unit and discharge to the community. The step-down unit would allow patients additional time to stabilize on medications, participate in therapeutic activities, and build behavioral coping skills before returning to their home environment. Clinical staff would monitor patients during this transition period while providing care coordination, discharge planning, and support for reintegration into their communities. By transferring stabilized patients to the step-down unit, additional capacity would be created within the crisis stabilization unit, allowing it to remain focused on patients experiencing active mental health crises. This approach helps improve patient flow, reduces unnecessary use of emergency department resources, and ensures patients receive the appropriate level of care throughout their recovery process. Additionally, the step-down setting allows for rapid intervention if a patient experiences a recurrence of symptoms, enabling clinical staff to respond quickly without requiring a new admission through the emergency department. An initial step in implementing this model will be identifying appropriate space for the step-down unit and determining the staffing, operational protocols, and care pathways needed to support this level of service within the Yukon-Kuskokwim health system.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Bringing Psychiatric Care Closer to Home in the Yukon-Kuskokwim Region	AK	In the Yukon-Kuskokwim region, psychiatric services are currently provided through contracted external providers. While this arrangement ensures some level of access, it creates challenges for patients and providers, including limited continuity of care between visits, heavy reliance on tele-behavioral health services that may miss important clinical cues, and gaps in medication management and follow-up for patients transitioning from inpatient care. Establishing an in-house psychiatric care team would strengthen care coordination, improve continuity between inpatient and outpatient services, and allow patients to receive more consistent, culturally responsive behavioral health care closer to home. Building a dedicated in-house psychiatric workforce would address these challenges while improving the overall quality and accessibility of mental health services in the region.	This project proposes establishing in-house psychiatric services by recruiting and hiring two full-time psychiatrists and five advanced practice providers (APPs) with specialized psychiatric training. This staffing model would support 24-hour inpatient psychiatric coverage and strengthen coordination between inpatient and outpatient behavioral health services. Bringing psychiatric services in-house would allow patients to receive care closer to home while improving continuity of care across the treatment continuum. Local psychiatric providers would be able to oversee medication management, coordinate with behavioral health teams, and ensure appropriate follow-up after inpatient stays. This approach would reduce fragmentation in care and improve communication between providers and patients. In-person psychiatric care is particularly important for behavioral health treatment. Face-to-face visits allow providers to observe physical and behavioral cues that may not be evident during tele-behavioral visits, enabling more accurate assessments and more effective treatment planning. Having providers embedded in the community also supports culturally responsive care, as clinicians become more familiar with the local population, cultural context, and community needs. By establishing a dedicated in-house psychiatric workforce, this project will improve access to mental health services, strengthen care coordination, reduce reliance on tele-behavioral health, and support more consistent patient-provider relationships. Over time, these improvements are expected to increase medication adherence, reduce stigma associated with seeking behavioral health care, and ensure that patients can receive high-quality psychiatric services within their own region.	\$50,000-\$250,000	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Building a Foundation to Support Food as Medicine	AK	Food insecurity is a major barrier to health in the Yukon-Kuskokwim Delta. High food costs, limited availability of healthy foods, and transportation challenges make it difficult for many families to consistently access nutritious food. These conditions contribute to chronic disease, complicate treatment plans, and reduce the effectiveness of medical care. Although food insecurity is increasingly identified through routine screening in health care settings, many patients struggle to navigate complex application processes for safety net programs such as SNAP, WIC, and Medicaid, and providers often lack the time or resources to connect patients with these services. Even when applications are successfully submitted, it can take weeks before benefits begin. During this period, many families continue to face food shortages. This program will provide healthy emergency food support while patients wait for benefits to begin. When possible, these food boxes will include culturally relevant and traditional foods such as fish, moose, and reindeer. This project addresses this gap by piloting a patient navigator model that provides short term nutritional support while helping patients access long term assistance programs and appropriate health care services. The program represents an opportunity to better integrate social needs screening with care coordination and to develop a scalable model for addressing food insecurity within rural and frontier health systems.	YKHC will pilot a patient navigator program to support patients who have screened positive for food insecurity. This pilot will fund 5 registration/scheduling specialists and 6 care navigators who will work directly with individuals and families identified through routine screening. Navigators will provide culturally relevant food boxes as a short-term, stabilizing measure while helping patients apply for longer-term safety net programs for which they may be eligible, including Medicaid, WIC, and SNAP. Navigators will also work with patients to identify preventive health and chronic care services they are eligible for and assist with scheduling those appointments. They will work closely with providers, case managers, and community health aides to integrate food insecurity interventions into existing continuity of care models and to standardize scheduling and referral workflows so the program can be sustained beyond the pilot period. This pilot builds on lessons learned from the YKHC prescription produce program and is intended to inform work with the State of Alaska to evaluate this model as a potential framework for Section 1115 “food is medicine” waivers that reflect the realities of rural and remote health systems. This transformative program requires highly trained staff familiar with regional and statewide services, complex eligibility processes, and one-on-one patient support. YKHC is requesting \$1.2M in staffing and \$1.4M in food boxes to implement and evaluate this pilot.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Deployment of Virtual Care Units to Expand Telehealth in Village Clinics	AK	This project provides the opportunity to expand the available services in the remote village clinics operated by YKHC. Through the deployment of Virtual Care Units, village clinics will be able to provide access to specialty care and higher acuity care via telehealth. YKHC will deploy Virtual Care Units in village clinics to enable reliable telehealth connections between patients and remote providers. Each unit will consist of a secure Dell Pro 24 ThinOS all-in-one telehealth workstation designed for clinical use. The devices are remotely managed and optimized for low-bandwidth environments, making them well suited for rural settings where connectivity can be limited. Once installed, these units will allow clinic staff to connect patients with providers located in Bethel or other facilities, supporting specialty consultations, follow-up care, and higher-acuity evaluations. Training will be provided to clinic staff to assist patients with connecting to remote providers and to support basic troubleshooting when needed. The Virtual Care Units will integrate with YKHC’s broader digital health infrastructure, helping expand telehealth services and improve care coordination across the regional healthcare system.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Expanding Community Health Aide Training Capacity in the Yukon-Kuskokwim Region	AK	The Yukon-Kuskokwim Health Corporation operates the first and largest Community Health Aide Training (CHAT) program in Alaska. The CHAT Center in Bethel trains most of the Community Health Aides (CHAs) serving the Yukon-Kuskokwim Delta, and YKHC employs the largest number of CHAs of any tribal health organization in the state. CHAs play a critical role in delivering healthcare in rural communities by providing routine, acute, and emergency direct patient care in village clinics. The Basic Training program for CHAs consists of four training sessions that typically progress over a two-year period and include both didactic instruction and clinical experience. Each session expands the level of care that CHAs are able to provide in their communities, with those completing the third and fourth session able to support emergency birthing services in the clinics prior to transport to a higher level of care. After a successful preceptorship and examination, they receive the Community Health Practitioner (CHP) Certification. Demand for training currently exceeds available capacity. The program maintains a growing waitlist for each training session, with the Session I waitlist averaging 36–40 trainees. Increasing the training capacity of the CHAT Center in Bethel represents an opportunity to expand the regional healthcare workforce, improve access to care in rural communities, and strengthen the long-term stability of the healthcare system across the Yukon-Kuskokwim Delta.	To increase training capacity at the CHAT Center, YKHC proposes expanding both staffing and classroom space to support additional trainees. The project will include hiring additional instructional and support staff to deliver classroom education, supervise clinical training, and manage administrative responsibilities associated with a larger student cohort. These positions may include advanced practice providers (APPs), community health practitioners (CHPs), and administrative support staff. In addition to expanding staffing, YKHC will renovate existing hospital space to create additional classroom facilities for the CHAT program. Space currently used by other departments will be reconfigured and remodeled to support training activities, allowing the program to accommodate more students and conduct additional training sessions each year. By increasing both instructional capacity and classroom space, the CHAT Center will be able to reduce trainee waitlists and expand the number of Community Health Aides trained to serve rural communities across the Yukon-Kuskokwim Delta.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Expanding Rural Diagnostic Imaging Access Through MRI Technology	AK	Currently, patients in the Yukon-Kuskokwim region must travel outside the region to obtain MRI imaging services. This creates significant delays in care and places a substantial travel burden on patients and their families. Non-urgent MRI referrals can take between six and nine months before imaging is completed. In addition to long wait times, patients often must travel hundreds of miles to Anchorage to access imaging services. These delays can lead to prolonged symptoms, delayed diagnoses, and postponed treatment for patients requiring specialty or surgical care. Establishing local MRI services in Bethel represents an opportunity to significantly improve diagnostic capabilities in the region. Providing MRI imaging locally will reduce travel requirements, shorten diagnostic timelines, and improve access to timely care for patients across rural communities.	The project proposes renovating existing space within the Bethel hospital to create a dedicated MRI suite and procuring MRI equipment to establish a new diagnostic imaging service line. The approach includes preparing or renovating space to accommodate MRI equipment, procuring an MRI machine suitable for rural healthcare environments, and integrating the new service into existing clinical workflows and health information systems. The team is exploring self-contained MRI technology similar to equipment used in other rural Alaska communities that reduces infrastructure requirements and supports reliable operation in remote settings. Implementation will occur in several phases, including planning and design, renovation or construction of the MRI suite, equipment procurement and installation, and operational readiness activities. Operational readiness will include workforce recruitment and training, development of imaging workflows, and coordination of radiology interpretation services. Preliminary capital estimates suggest that installation of a new MRI suite would require approximately \$2–4 million in total project costs, including equipment procurement, site preparation, and installation. Based on a preliminary vendor quote, the estimated cost for the MRI equipment alone is approximately \$1,207,284. These estimates are informed by comparable recent imaging equipment projects currently underway at the hospital, including the replacement of a CT scanner estimated at approximately \$1 million utilizing existing space.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Healthcare Express: Increasing colonoscopy access to patients in remote locations	AK	Alaska Native populations experience significantly higher rates of colorectal cancer and require preventive screenings earlier than the general population. In the Yukon-Kuskokwim (YKD) region, geographic isolation creates substantial barriers to accessing routine colonoscopy services. Patients must often travel by plane to Bethel to complete the preparation, procedure, and recovery phases of a routine colonoscopy. Travel requirements create challenges for patients and the health system. Weather conditions and flight delays contribute to a colonoscopy no-show rate of approximately 30%. Patients must leave their home communities during the preparation and recovery phases of the procedure, which can discourage participation in screening. The need for improved colorectal cancer screening access is particularly urgent in the YKD region, where colorectal cancer rates are more than double the state average (102.4 cases per 100,000 people in the YKD compared to 41.3 cases per 100,000 statewide). Screening rates are also significantly lower among YKHC patients (40%) compared to the Alaska state average (63.8%). This project presents an opportunity to improve access to preventive screenings by sending a medical team to subregional clinics to perform routine colonoscopies. Providing services closer to patients’ home communities will increase screening participation, support earlier detection and prevention of colorectal cancer, reduce no-show rates, and improve access to timely care.	The proposed approach is to establish a traveling colonoscopy service that allows a clinical team to provide colorectal cancer screening at subregional clinics across the Yukon-Kuskokwim region. Rather than requiring patients to travel to Bethel for routine procedures, the clinical team will travel to subregional clinic sites with the necessary equipment to perform colonoscopy services safely in a rural setting. The traveling clinical team is expected to include a gastroenterology provider or surgeon, anesthesia support such as a CRNA, nursing staff, and additional clinical support personnel as needed. Portable colonoscopy equipment and high-level disinfection systems will be used to ensure procedures can be performed safely while meeting infection prevention standards. Patients will be identified and scheduled in advance through coordination with subregional clinics. Local clinic staff will assist with patient preparation, scheduling, and follow-up care, allowing procedures to be completed efficiently during scheduled clinic visits. Equipment and supplies will be transported to subregional clinics and maintained according to established infection control protocols. Implementation will occur in phases. Initial planning will focus on identifying appropriate portable equipment and high-level disinfection solutions suitable for rural clinic settings. The project will then develop clinical workflows and train staff on equipment use and infection prevention procedures. Pilot colonoscopy services will be conducted at one subregional clinic before expanding services to additional sites across the region. This traveling service model will allow the health system to deliver colorectal cancer screening closer to patients’ home communities while improving access to preventive care in rural areas.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Modernizing Village Clinic Network Infrastructure to Support Telehealth and Cloud Systems	AK	YKHC operates 48 village clinics across a remote and geographically dispersed region where reliable network connectivity is essential for delivering modern healthcare services. Much of the existing network infrastructure in these clinics is aging and approaching end-of-life, which increases the risk of performance issues, cybersecurity vulnerabilities, and unreliable connectivity. Outdated network equipment limits the ability of clinics to fully utilize telehealth services, access cloud-based electronic medical record (EMR) systems, and support emerging technologies such as AI-assisted clinical tools. These limitations can disrupt care delivery and reduce the reliability of systems providers depend on to serve patients in rural communities. This project presents the opportunity to replace aging network infrastructure across village clinics with modern, secure equipment that supports reliable connectivity, strengthens cybersecurity protections, and enables the technology platforms needed to support telehealth, cloud-based systems, and data-driven care.	YKHC will replace aging network infrastructure in village clinics with modern routers, switches, and wireless access points designed to support secure and reliable connectivity. These upgrades will improve network performance and ensure compatibility with cloud-based systems and telehealth platforms used throughout the healthcare system. The project will include assessment of existing network infrastructure, procurement of updated equipment, installation and configuration of new devices, and testing to ensure stable connectivity across each clinic location. The upgraded infrastructure will support secure access to cloud-based EMR systems, enable real-time data exchange from remote monitoring tools, and improve system reliability for telehealth visits and other digital health services. By modernizing the network infrastructure, YKHC will strengthen cybersecurity protections while ensuring that providers in village clinics can access the digital tools required to support proactive and coordinated care for patients across the region.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Strengthening the Rural Health Workforce Through Recruitment and Retention Incentives	AK	The Yukon-Kuskokwim region faces ongoing workforce shortages in rural health clinics and community health programs, particularly in village-based roles. While many individuals in these communities have strong cultural knowledge, language skills, and community ties, there are not enough trained healthcare workers to meet the needs of patients across the region. Staffing shortages contribute to high turnover rates, increased workload for existing staff, and disruptions in continuity of care. This project seeks to address the opportunity to strengthen the rural healthcare workforce by creating incentives that attract and retain healthcare workers in both village-based and Bethel-based roles. By supporting recruitment bonuses, housing assistance, travel support, and training opportunities, the initiative will help build a stable workforce that reflects the communities it serves and can provide consistent care to rural and remote populations.	This project will establish a recruitment and retention incentive program designed to attract and support healthcare workers serving rural communities throughout the Yukon-Kuskokwim region. The program will prioritize local Alaska Native hires and individuals from the communities served, recognizing the importance of cultural knowledge and community relationships in delivering effective healthcare. Funding will support recruitment bonuses and incentives for healthcare workers in both Bethel-based and village-based roles. To strengthen long-term retention and ensure workforce stability, recruitment bonuses may be tied to a five-year service commitment. Additional support may include housing assistance, relocation support, travel funding, and training opportunities to help new employees transition successfully into rural healthcare positions. The program will also focus on developing workforce pipelines through partnerships with schools, nursing programs, and other healthcare training institutions. These partnerships will help identify potential candidates early and create pathways for individuals interested in pursuing healthcare careers that serve their communities. By providing targeted incentives and workforce support, the project aims to increase recruitment, reduce turnover, and create a more stable healthcare workforce across rural communities.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Transforming Tuberculosis Screening, Detection, and Treatment in the YK Delta	AK	Between 2014 and 2021, the YK Delta averaged approximately 25 new cases of active TB disease each year. In 2022 and 2023, there were over 50 cases annually in communities throughout the region. In 2024 and 2025, more than 200 cases of latent TB infection were identified, six times the 2014–2018 average, reflecting expanded screening and a critical opportunity to prevent future TB disease. After TB disease is identified, the State provides directly observed therapy in partnership with YKHC providers and RN case managers, requiring hundreds of staff hours per case. Earlier identification reduces treatment intensity and long-term staffing demands. With State support, YKHC purchased several mobile chest X-ray units and evaluated their effectiveness in partnership with the University of Washington. We have now incorporated them into our standard of care. YKHC is also working with Tribes and communities to pilot wastewater testing to identify TB disease earlier. These approaches are promising, but limited staffing and travel capacity prevent consistent deployment in high-risk communities. This request is for \$1.2 million annually to support salaries, recruitment, and retention incentives, and travel to expand screening over the next five years. This investment transforms TB care in the YK Delta by shifting from late detection and intensive treatment to early identification and prevention, reducing disease burden while making TB control sustainable over time.	This project expands the existing proactive tuberculosis (TB) detection and prevention in high-priority communities across the Yukon-Kuskokwim Delta. YKHC will increase travel to villages to conduct targeted screening in communities with elevated risk, using mobile chest X-ray units and community-based outreach to identify TB disease and latent TB infection earlier. These added screening efforts will be guided by epidemiologic data and coordinated with Tribal leadership and local health providers to ensure activities are focused where they will have the greatest impact. YKHC will partner closely with the State of Alaska to strengthen case finding and align screening, treatment, and public health response efforts. This collaboration will help ensure that individuals with suspected TB are identified quickly, linked to care, and supported through evaluation and treatment. The project will also provide enhanced pilot support for patients with complex needs, particularly those experiencing substance use disorders or behavioral health challenges that can make treatment adherence difficult. Through coordinated care management with the State and collaboration with behavioral health and substance use services, the project will test strategies to improve medication adherence and continuity of care. Improving adherence reduces treatment interruptions and helps prevent ongoing transmission of TB within households and communities. By combining expanded village screening, novel screening tools, strengthened partnerships for case finding, and targeted support for high-risk patients, this project aims to identify TB earlier, improve treatment completion, and reduce the spread of disease across rural communities.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Yukon-Kuskokwim Health Corporation	Building Immunity through Community: Immunization remodel for permanent space within the hospital	AK	The Immunization program was recently relocated from an offsite location into the hospital within the Infusion Clinic. The original offsite location created several operational and safety challenges, including inefficient staff transportation between facilities and the absence of 24-hour on-call monitoring for vaccine storage. Without continuous monitoring, temperature fluctuations outside safe ranges could risk the loss of high-value vaccines and disrupt immunization services. While the move into the hospital addressed these immediate concerns, the program was placed in temporary space within the Infusion Clinic. This has created ongoing space constraints and operational inefficiencies for both programs, limiting workflow efficiency and reducing available capacity for infusion services. Identifying and establishing a permanent space for the Immunization program within the hospital will resolve these operational challenges, protect vaccine storage requirements, and allow both the Immunization and Infusion programs to operate efficiently while supporting timely vaccine delivery for patients and surrounding communities.	This project will identify, renovate, and allocate a permanent location for the Immunization program within the hospital. Establishing a dedicated space will improve operational efficiency, ensure appropriate infrastructure for vaccine storage, and support program growth. Locating Immunization within the hospital will provide several operational benefits. The program will have improved proximity to the hospital loading dock, enabling more efficient delivery and handling of vaccine shipments. It will also allow vaccines to be stored and administered within the same facility where more than half of vaccinations already occur. In addition, staff who travel to surrounding villages will have improved access to vaccine supplies prior to departure. The proposed space will also allow the program to meet mechanical and environmental requirements necessary for vaccine storage equipment, including ventilation, cooling, and temperature monitoring systems. By situating Immunization within the hospital, facilities staff can maintain continuous 24-hour monitoring of vaccine storage conditions, ensuring compliance with safety standards and protecting valuable medical inventory.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon-Kuskokwim Health Corporation	Ears, Noses, Muscles & Bones: Bringing specialty care of ENT, Cardiology & Orthopedics close to home	AK	This project provides an opportunity to expand specialty care services in the Yukon-Kuskokwim region by adding cardiology, otolaryngology, and orthopedic services at Yukon-Kuskokwim Delta Regional Hospital in Bethel, while also providing visiting specialty services to sub-regional clinics in Aniak, Emmonak, Hooper Bay, St. Mary’s, and Toksook Bay. Currently, patients requiring specialty care are referred to Alaska Native Medical Center (ANMC) in Anchorage. The selected specialties represent the most frequently referred services, accounting for approximately 1,200 referrals annually. This referral process often results in significant delays in care, with patients waiting up to 176 days to be scheduled and up to 198 days before their appointment. Patients must also travel more than 400 miles to Anchorage to receive care, creating a substantial travel burden for individuals and families in rural communities. Providing specialty services closer to home will improve access to care, reduce delays, and offer greater flexibility when travel is disrupted due to weather or other challenges common in the region.	The proposed approach is to expand access to specialty care within the Yukon-Kuskokwim region by recruiting additional specialty providers and expanding the diagnostic capabilities needed to support specialty services locally. New specialty providers will deliver services using existing clinical space and exam rooms, allowing services to begin quickly once providers are hired. Expanding the local specialty workforce will reduce delays in care associated with referral processes, decrease patient travel to Anchorage Native Medical Center (ANMC), and shorten wait times for specialty appointments. In addition to provider recruitment, the project will include the acquisition of specialty diagnostic equipment needed to support expanded services. For example, equipment such as echocardiography machines will allow providers to complete diagnostic testing locally rather than referring patients to outside facilities. Expanding local diagnostic capabilities will allow specialists to practice at the top of their license and provide more comprehensive care within the region. Together, the addition of specialty providers and equipment will allow more patients to receive timely care closer to home, improving access to specialty services for communities across the Yukon-Kuskokwim region.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon-Kuskokwim Health Corporation	Expanding Patient Lodging Capacity at Qavartavik Customer Lodge	AK	A significant barrier to accessing healthcare in the Yukon-Kuskokwim region is the limited availability of patient lodging in Bethel. Patients often travel long distances from remote villages to receive care and require overnight accommodations while completing appointments, procedures, and follow-up visits. Currently, the Qavartavik Customer Lodge operates over capacity for much of the week, particularly during the winter months. Reports indicate that the lodge frequently exceeds its room capacity between Monday and Thursday and must use an average of 10 to 25 cots per night to accommodate patients. In some cases, patients are referred to Anchorage for care due to limited lodging availability in Bethel. As healthcare services expand and specialty care availability increases, demand for patient lodging is expected to grow. Without additional lodging capacity, the ability to provide timely care for patients traveling from rural communities will remain constrained. This project presents an opportunity to improve healthcare access by expanding the Qavartavik Customer Lodge through architectural planning and design for additional patient lodging capacity.	The proposed project will focus on architectural and engineering planning to support the expansion of the Qavartavik Customer Lodge in Bethel. This phase will evaluate options to add approximately 60 additional patient lodging rooms to the existing facility in order to better accommodate patients traveling from remote villages for medical care. The planning phase will include architectural design, engineering assessments, and the development of construction-ready plans to support a future expansion project. The design process will evaluate space requirements, patient flow logistics, and the supporting infrastructure needed to accommodate increased lodging capacity while maintaining a safe and comfortable environment for patients and families. Completing architectural and engineering planning through this initiative will position the organization to pursue future construction funding through additional grants, partnerships, or internal capital planning processes. Having completed design and engineering documentation will allow the expansion project to move forward more efficiently once funding becomes available. Expanding lodging capacity will allow more patients traveling for care to remain in Bethel long enough to complete multiple appointments, procedures, and follow-up visits during a single trip. Additional lodging will also improve coordination of specialty care services and preventative screenings by reducing the need for patients to return to their home villages before completing necessary care.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon-Kuskokwim Health Corporation	Implementing a Centralized Infection Control Module to Improve Infection Surveillance	AK	The hospital’s current electronic health record system does not provide a centralized method for collecting, monitoring, and reporting infection-related data. This creates challenges in identifying abnormal laboratory results, tracking potential infection events, and ensuring timely communication among clinical staff. As a result, infection monitoring and response efforts may be delayed, increasing the risk of healthcare-associated infections and creating additional reporting burdens for staff. Implementing an infection control module within the Cerner system presents an opportunity to strengthen infection surveillance and response across the health system. The module will provide a centralized platform for monitoring infection indicators, tracking abnormal results, and supporting timely clinical intervention. In addition, the module will enable interoperability with national reporting systems for hospital-acquired infections, improving the efficiency and accuracy of required reporting while reducing administrative workload for staff.	The proposed approach is to implement Oracle Health’s centralized infection control module within the hospital’s electronic health record system. This module will integrate infection surveillance data across multiple clinical systems, including laboratory results, patient records, and reportable condition tracking, into a single centralized platform. Implementation will include configuring the infection control module, integrating it with existing clinical and laboratory workflows, and developing reporting dashboards that allow clinicians and infection prevention staff to quickly identify abnormal laboratory results, potential infection events, and other reportable conditions. The system will support automated alerts and streamlined reporting to help staff monitor infection risks and respond more efficiently. The project will also include staff training and workflow development to ensure clinical teams and infection prevention personnel can effectively use the system for monitoring and reporting. Once implemented, the centralized platform will improve internal communication, strengthen infection surveillance, and enable more efficient reporting to state and national systems.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon-Kuskokwim Health Corporation	Migrating the Oracle Health Millennium EMR to Oracle Cloud to Strengthen Rural Healthcare Delivery	AK	Yukon-Kuskokwim Health Corporation seeks RHTP funding to migrate its on-premise Oracle Health Millennium electronic medical record (EMR) system to Oracle Cloud. YKHC serves a geographically dispersed region of 48 remote villages where reliable digital infrastructure is essential to delivering coordinated, high-quality care. The current on-premise environment limits system performance, scalability, and the ability to support modern care delivery tools needed in rural settings. Migrating the EMR to Oracle Cloud will provide a secure, scalable platform that improves system reliability and enables expanded telehealth services, AI-supported clinical workflows, and advanced analytics to support chronic disease management and care coordination. These capabilities are critical to strengthening access to care and improving outcomes across remote communities. Protecting sensitive patient information remains a core priority. Transitioning to a modern cloud architecture enhances data security while improving operational efficiency for both patients and providers. The migration will include a secure Citrix virtualization layer, along with Citrix licensing and compatible endpoint hardware, to ensure reliable and secure access for clinicians across YKHC’s regional network.	YKHC will transition its existing on-premise Oracle Health Millennium electronic medical record (EMR) system to Oracle Cloud through a phased migration that prioritizes system stability, data security, and uninterrupted clinical operations. The project will include cloud migration planning, system configuration, secure data transfer, testing, and final system cutover to ensure a smooth transition for providers and staff. To support secure and reliable access to the cloud-based EMR across YKHC’s regional network, the project will implement a Citrix virtualization layer along with required Citrix licensing and compatible endpoint hardware. This infrastructure will enable clinicians in remote village clinics to securely access the EMR while maintaining system performance in low-bandwidth environments. Once implemented, the cloud-based platform will support expanded telehealth services, remote monitoring, and patient portal engagement across 48 villages. It will also enable advanced capabilities such as AI-assisted documentation, clinical decision support, prior-authorization automation, and improved data governance. Training and technical support will be provided to ensure clinical and administrative staff can effectively adopt the new system. By improving system reliability, reducing downtime, and enabling more efficient clinical workflows, the project will enhance provider productivity and support workforce retention while strengthening access to care for rural communities.	Over \$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon-Kuskokwim Health Corporation	Modernization of IT Infrastructure to Support Healthy Communities	AK	Yukon-Kuskokwim Health Corporation operates 48 village clinics across a geographically dispersed and remote region of Alaska. Many of these facilities require on-site upgrades to telehealth equipment, replacement of aging network infrastructure, and preparation for cloud-based electronic medical record (EMR) and enterprise data warehouse (EDW) systems. Due to the rural and remote nature of these clinics, many of these upgrades cannot be completed remotely and require technical teams to travel to each facility. This project will support the professional services, travel, and logistical coordination necessary to deploy technical teams to each village clinic to complete critical modernization work. These upgrades will ensure village clinics are equipped to support telehealth services, secure network connectivity, and future cloud-based systems that strengthen healthcare delivery across the region.	YKHC will implement this project by deploying technical teams to each of the 48 village clinics to complete on-site installation, system upgrades, and infrastructure improvements. Site visits will include installing Virtual Care Units, replacing or upgrading network infrastructure, and preparing clinic environments for cloud-based EMR and EDW systems. During each deployment, technical teams will assess existing infrastructure, complete required installations, configure equipment, and test system connectivity to ensure reliable performance. In addition to the technical work, staff at each clinic will receive training to support adoption and ongoing use of the new technology platforms. This approach ensures that each village clinic receives consistent upgrades and support necessary to enable telehealth services, improve real-time data exchange, support remote monitoring and chronic disease management, and strengthen system reliability. By completing this work through coordinated field deployments, YKHC can efficiently modernize infrastructure across its regional network while minimizing disruption to clinical operations.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon-Kuskokwim Health Corporation	Strengthening Healthcare Workforce Career Pathways in the Yukon-Kuskokwim Region	AK	Yukon-Kuskokwim Health Corporation (YKHC) operates 41 village clinics, five subregional clinics, and a large outpatient clinic in Bethel. Clinics across the region face persistent staffing shortages that limit access to care and increase strain on providers. In many cases, providers must perform nursing and medical assistant duties in addition to clinical responsibilities, resulting in longer visits and reduced patient capacity. Recruitment is also difficult due to the region’s remote geography and limited local training pipelines. YKHC currently supports several workforce development opportunities, including scholarships for Dental Health Aide Therapy training and apprenticeships through the Alaska Primary Care Association. However, many programs remain underutilized due to limited awareness and lack of coordination. This project will strengthen and expand career pathways for local residents by coordinating existing workforce development resources and increasing awareness of healthcare training opportunities. A centralized Career Pathways Academy will help expand participation in training programs, support development of additional pathways such as medical assistants, and strengthen the local healthcare workforce across the Yukon-Kuskokwim region.	To address workforce shortages and improve access to care, this project will establish a coordinated Career Pathways Academy that centralizes workforce development resources and expands local training opportunities for healthcare careers. The initial phase will focus on planning and coordination activities to map existing workforce training programs currently supported by Yukon-Kuskokwim Health Corporation and partner organizations. This process will identify gaps in training opportunities and areas where programs may overlap or require additional support. The project will work with education providers, workforce organizations, and regional partners to strengthen collaboration and develop a more coordinated pathway for community members to enter healthcare careers. This includes evaluating current scholarship programs, apprenticeships, and training partnerships and identifying opportunities to expand programs such as Certified Medical Assistant (CMA) training. In addition, the project will develop strategies to improve awareness and accessibility of workforce development opportunities. This will include creating centralized communication and promotion of career pathway programs so that community members can more easily identify training options and enrollment processes. The planning process will also identify key supports needed for trainees to successfully participate in workforce programs, such as housing, travel support, and access to required testing or certification resources. By coordinating existing programs, identifying gaps, and developing a structured framework for career pathways, the project will create a scalable model for expanding the local healthcare workforce and increasing participation in training programs across the region.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon-Kuskokwim Health Corporation	Strengthening Workforce Infrastructure to Support Rural Healthcare Access	AK	Rural healthcare systems face significant workforce recruitment and retention challenges due to geographic isolation, workforce shortages, and limited training pipelines. Yukon-Kuskokwim Health Corporation (YKHC) serves a large and geographically dispersed region where the availability of qualified healthcare professionals directly affects access to care in village clinics and regional facilities. As YKHC expands services and advances the One System of Care (OSS) model, the demand for workforce recruitment, onboarding, training, and workforce planning continues to grow. The current Workforce Division structure has evolved over time and was not originally designed to support the scale and complexity required for a regional healthcare system serving remote communities. This project provides an opportunity to strengthen and modernize workforce infrastructure to support recruitment pipelines, workforce development programs, improved onboarding processes, and enhanced workforce data systems. By strengthening workforce capacity, YKHC will improve its ability to recruit, develop, and retain healthcare professionals needed to sustain healthcare services across the Yukon-Kuskokwim region.	YKHC will implement a phased approach to strengthen and modernize its Workforce Division to better support recruitment, training, workforce planning, and employee support systems. The first phase will include a comprehensive assessment of current workforce operations, staffing structure, and supporting systems to identify gaps in recruitment capacity, workforce development, employee relations, and HR technology infrastructure. Findings from this assessment will inform a strategic workforce infrastructure plan aligned with the organization’s long-term service expansion and the One System of Care model. The second phase will focus on modernizing workforce systems and operations. Key activities will include strengthening recruitment infrastructure, improving onboarding and training programs, expanding workforce development initiatives, and enhancing HR information systems and workforce analytics capabilities to support data-driven decision making. The final phase will focus on long-term workforce sustainability by strengthening partnerships with educational institutions and workforce development programs, expanding leadership development initiatives, and integrating workforce planning into the organization’s long-term strategic planning. This phased approach allows YKHC to strengthen workforce infrastructure while maintaining continuity of operations.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Yukon-Kuskokwim Health Corporation	YKHC Immunization Backlog Reduction and System Improvement Project	AK	Pre-COVID-19, YKHC consistently achieved on-time childhood immunization rates above 80% and in some years exceeded 90%. In recent years, these rates have declined substantially. While YKHC can still reach on-time coverage above 80% among younger children, we have been unable to resolve the backlog of children who fell behind during the pandemic. The electronic health record (EHR)/VacTrAK interface and vaccine inventory management issues have led to high documentation and reconciliation error rates. These errors burden YKHC and State of Alaska staff and contribute to inaccurate forecasting in the EHR. As a result, providers are not flagged when children are overdue, and staff face increased risk of missed vaccination opportunities and vaccine waste. YKHC has worked with ANTHC to identify an inventory management solution that integrates with Cerner and VacTrAK and is expected to reduce errors by approximately 80%, saving thousands of staff hours each year. YKHC has also identified a method to import complete VacTrAK records into the EHR to resolve forecasting and due list issues. These system improvements and addressing the immunization backlog require a temporary increase in nursing capacity. YKHC is requesting \$1.3 million annually to support temporary staff, travel, and lodging. This short-term investment will reduce ongoing inefficiencies that cost YKHC and the State thousands of staff hours each year and improve patient care by reducing missed opportunities and vaccine waste.	YKHC proposes a coordinated approach that combines system improvements with targeted clinical outreach to resolve the childhood immunization backlog created during the COVID-19 pandemic and improve long-term immunization program performance in the Yukon-Kuskokwim Delta. First, YKHC will implement an inventory management solution that integrates with Cerner and VacTrAK to significantly reduce vaccine documentation and reconciliation errors. This system improvement is expected to reduce inventory discrepancies by approximately 80 percent and eliminate thousands of hours of staff time currently spent correcting errors. Improved inventory accuracy will reduce vaccine waste, improve forecasting, and ensure clinics maintain appropriate vaccine supplies. Second, YKHC will complete a manual registry import process to correct historical immunization records in the electronic health record. Staff will systematically import vaccination records from VacTrAK into the YKHC EHR, beginning with the youngest children and progressing to older age groups. This process will involve reviewing and importing more than 50,000 immunization records to ensure the EHR contains complete and accurate vaccination histories. In addition, YKHC will develop a monitoring system to routinely identify and correct discrepancies between VacTrAK and the EHR so records remain synchronized over time. Once accurate records are established in the EHR, YKHC will be able to fully utilize built-in forecasting tools to identify when children are due or overdue for vaccines, similar to other clinical follow-up needs tracked in the EHR. This will allow providers and clinic staff to see accurate immunization alerts during patient visits and reduce missed vaccination opportunities. Finally, the EHR will be used to generate community level lists of children who are past due for immunizations. These lists will allow YKHC to plan targeted outreach and send nursing staff to specific villages to conduct catch up vaccination clinics. This approach replaces current VacTrAK reminder and coverage reports, which have been found to miss up to 80 percent of children due for vaccines when compared to manual record review. Despite several years of collaboration with VacTrAK staff to address these limitations, the reporting issues have not been resolved. By maintaining accurate immunization records in the EHR, YKHC will be able to generate reliable due lists and restore high on-time vaccination coverage across the region.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Zender Environment al Health and Research Group	Reducing community exposures to toxic chemicals via landfill worker safety and health interventions.	AK	The project targets about 120 remote, "frontier" communities, or 'villages' of populations between 100 and 1,000, with State inspection scores of less than 80, all of whom with which we have active working relationships through training, assistance, and Backhaul Alaska. Serious health risks are present.. Lacking a containment liner, leachate collection and treatment, and cover to control vectors and reduce waste contact, with passive burning of the full municipal wastestream as a volume reduction method, chemical contact and inhalation (and ingestion) exposures are unavoidable. Health studies specific to these sites indicate an extreme 4.3 positive odds ratio of certain congenital anomalies. Surrogate exposure studies indicate dose response relationships of 2 to 4 times greater risk of a variety of short term health symptoms such as eye and ear irritation, stomach upset, coughing, and more from just visiting these sites, from burning trash near homes. Living within one-half mile of the site or smelling the it at home also was associated with increased health risk. These results are supported by research for 3rd world communities living near open waste sites. Toxic chemical and PM 2.5 exposures via dermal, inhalation, and ingestion routes can precipitate, worsen, or predispose residents, to a range of chronic disease for which the population has increased prevalence, such as COPD, asthma, certain types of cancers, and diabetes (lead exposure).	There are two associated factors for improved site inspection scores, both correlating with exposure eliminations: 1. Experienced landfill workers that ensure waste burning occurs with favorable wind direction, site access is clear of waste, hazardous waste is separated, the salvage yard surface is free from trash such as diapers, and lead an petroleum soaked soil from fluids, batteries, etc., and waste is covered when possible -- all of which reduce toxic exposures. 2. Better community disposal practices. But trained, experienced landfill workers are very rare, with high turnover and unfilled positions because of working conditions. Target landfills lack a warming or rest shelter. Workers are in the dark and cold in winter throughout the work day, presenting grave risk of cold over-exposure as well as dehydration and heat exhaustion in summer, risking fatigue and stress related injury and illness. And 2. Community disposal practices are often subpar. With a poor economy of scale supporting a landfill utility, and one that has little design performance integrated into its infrastructure, community decisions regarding willingness to pay for operators, and individual decisions on when and how often to visit the sites, whether to separate out and drop off hazardous waste at storage sites if available, to bring children and infants, to unload waste at the designated area or to unload it in a way that impairs access and expands the site, all contribute to, or minimize, exposures. This project provides prefabricated container shelters to site at landfills, with lighting as well as generator supplied heat source, PPE, eyewash station, and hand sanitation station. Our idea would be to purchase and ship out these interventions to 20 to 25 communities each year, such that over a 5-year period, every landfill worker now at risk would be protected, greatly enhancing their productivity and retention, and in turn improving the landfill condition and exposure risks present. The project also would develop a public awareness campaign with various culturally relevant posters similar to the successful Kids Don't Float effort that would result in improved respect for landfill workers and reduced site and waste exposures for children, infants, and pregnant women. A coloring book with scenes from around rural Alaska of recycling, trash segregation, and waste collection would also increase familiarity with other regions. The book would be distributed via schools.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Dillingham Census Area; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Zero Overdose Corp	Strengthening Rural Alaska Healthcare with Integrated Suicide and Overdose Safety Planning	NY	Suicide remains a significant public health challenge in Alaska, which has one of the highest suicide rates in the United States (CDC, 2023). Approximately 200 Alaskans die by suicide each year, underscoring the need for strengthened prevention strategies across healthcare systems. Healthcare settings represent a critical opportunity for intervention. Research indicates that more than 50% of individuals who die by suicide have a healthcare visit within the month prior to death, highlighting the importance of equipping healthcare providers to identify and respond to risk during routine care encounters (Ahmedani et al., 2020). At the same time, suicide and drug overdose risks often overlap and share common drivers. Individuals with substance use disorders frequently experience elevated suicide risk, yet prevention efforts addressing suicide and overdose are often implemented separately within healthcare systems (American Public Health Association, 2022; Olfson et al., 2018). This project presents an opportunity to strengthen rural healthcare systems across Alaska by integrating suicide safer care and overdose safety planning into collaborative care models within primary care clinics, hospitals, and community health settings. By equipping healthcare teams with evidence-based safety planning tools and integrated care workflows, this initiative aims to improve identification of individuals at risk and support earlier, coordinated interventions across Alaska’s healthcare system.	This project will strengthen Alaska’s healthcare system by implementing a collaborative care model that integrates suicide safer care and overdose safety planning into routine healthcare delivery across primary care clinics, hospitals, and community health settings. The approach focuses on strengthening frontline providers’ capacity to identify and respond to overlapping suicide, overdose, and social risk factors during routine patient encounters. 1. Integrated Safety Planning Training for Healthcare Providers Healthcare providers and care teams will receive training in an integrated safety planning framework that combines evidence-based suicide prevention practices with overdose risk identification and response strategies. The training incorporates the Stanley & Brown Safety Planning Intervention, which has demonstrated reductions in suicidal behavior and increased engagement in outpatient mental health care when combined with follow-up support (Stanley et al., 2018). Additional research shows safety planning interventions can reduce suicidal behaviors by more than 40% (Marshall et al., 2022). A key innovation is training clinicians to create one coordinated safety plan addressing suicide risk, overdose risk, and relevant social drivers, rather than developing separate plans for each risk domain. 2. Integration into Clinical Workflows Participating healthcare organizations will receive implementation support to integrate safety planning practices into existing clinical workflows, including incorporating screening, collaborative safety planning, and referral coordination into routine patient visits. This workflow-focused approach allows providers to deliver effective interventions within time-limited clinical encounters. 3. Strengthening Collaborative Care Systems The project will strengthen coordination between primary care providers, behavioral health professionals, and community resources to ensure individuals identified at risk receive appropriate follow-up care and support. 4. Implementation Support and Technical Assistance Zero Overdose will provide implementation guidance, training materials, and technical assistance to support adoption of integrated safety planning practices. The approach is designed to be adaptable across diverse healthcare environments and scalable across rural and frontier communities in Alaska.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Zoya Ratner Consulting LLC DBA Rural Healthcare Financial Partners	Primary-to-specialty Access Through Harmonized Workflows for Accelerated Year-round Services-Alaska	AK	Alaska’s Rural Health Transformation Program (RHTP) identifies access barriers and workforce shortages as key drivers of vulnerability in rural health systems. Limited appointment availability contributes to delayed or forgone care among rural Alaska Native individuals with Indian Health Service access, reflecting constrained outpatient capacity (Jacobson et al., 2025). Studies of rural and predominantly rural primary care systems report no-show rates of approximately 6–8%; when late cancellations are included, total missed-appointment rates can exceed 13%, reducing effective clinic capacity (Shour & Onitilo, 2023; Shour et al., 2023; Tuan et al., 2025). These challenges are compounded by administrative burden. Physicians spend nearly two hours on EHR data entry and administrative tasks for every hour of direct patient care, reducing clinical capacity (Arndt et al., 2017). In rural and Tribal health systems reliant on small clinics, this burden translates into fewer available appointments and delayed care (Kozhimannil et al., 2025). Administrative workload further constrains throughput, driving after-hours work and, in some settings, leading clinics to shorten schedules or close appointment slots (Budd, 2023; Wu et al., 2024). Large portions of Alaska remain designated Health Professional Shortage Areas for primary care, reflecting persistent provider gaps (HRSA, 2024). Addressing these problems would improve access to healthcare for rural Alaskans.	PATHWAYS-AK will apply the Theory of Constraints (TOC) to streamline outpatient care pathways and improve timely access to primary, specialty, and behavioral health services in rural Alaska. The project optimizes patient flow from first contact to definitive care so services are delivered earlier and in appropriate settings, reducing reliance on emergency department services. TOC improves healthcare access by managing the system’s core constraint, provider capacity. In rural Alaska, this capacity is often reduced by inefficient scheduling and workflows, high no-show and cancellation rates, and administrative burden that limits clinician-to-patient time. The methodology increases efficiency through streamlined scheduling, coordinated referrals, prioritization of higher-risk patients, and aligned processes that optimize clinical time. A systematic review found that TOC has been successfully applied in healthcare, improving capacity and timeliness of care (Bacelar-Silva et al., 2020). Implementation will begin with two pilot sites that provide primary and specialty care services and, where feasible, behavioral health care. Pilots will include locally guided assessments, co-designed workflows, repeatable operating practices, targeted EHR configuration changes, implementation of TOC-enabling technologies, and staff training, with tools designed for re-use. Financial reviews and adjustments will align operational changes with revenue and cost structures. Tribal, municipal, and private health systems will serve as implementation partners, contributing local operational knowledge, clinical leadership engagement, and access to frontline teams. Accountability will be maintained through site-level improvement leads, shared performance dashboards, and cross-site learning reviews. TOC will be applied through defined patient-flow boundaries, optimized scheduling templates, standardized intake, urgency-based triage, and flexible access models. Alaska healthcare experts will be trained and certified in TOC to build in-state capability. Following the initial pilots, the project will expand to 10 or more concurrent improvement initiatives. Progress will be measured using operational metrics (see details in the next section), which will be aggregated to support learning and alignment with Alaska’s RHTP priorities. PATHWAYS-AK will coordinate with existing access, workforce, and technology initiatives to ensure improvements complement other RHTP-funded efforts.
