

RHTP Letters of Interest: Summary of Submissions and Outcomes

The Alaska Rural Health Transformation Program (RHTP) Letter of Interest (LOI) portal was open from February 17 through March 11, 2026. During that period, the Alaska Department of Health (DOH) received 1,795 submissions from organizations across Alaska and beyond seeking Year 1 funding opportunities.

The table below lists all submitted LOIs and the outcome of the initial LOI review process for each submission. Some organizations submitted multiple LOIs and may appear more than once. These determinations reflect whether a proposal is advancing to the next stage of the RHTP process and do not represent final funding awards.

LOI Outcome Categories:

- **Advance to Implementation Application:** The LOI has been selected to advance to the full application stage for potential implementation pathway funding.
- **Advance to Planning:** The LOI has been selected to advance for planning pathway consideration.
- **Deferred or Not Advanced:** The LOI is not advancing in the current funding round. This category includes both LOIs that demonstrated meaningful alignment with RHTP priorities but may be better suited to future or more targeted funding opportunities as the program evolves, and LOIs that did not demonstrate sufficient alignment with RHTP priorities, health system transformation goals, federal allowability requirements, or the scope of this funding opportunity. Organizations whose LOIs did not advance in this round may apply in future funding cycles as the program evolves.

The information shown for each submission was provided directly by the applicant organization as part of the LOI process. Project descriptions and approaches reflect the applicant’s own language and have not been edited by DOH.

Under Alaska law and the terms of the federal cooperative agreement with the Centers for Medicare & Medicaid Services (CMS), DOH retains final authority over all RHTP funding determinations. The Alaska Community Foundation (ACF) serves as the program’s contracted grant administration partner and supported the LOI intake process

This project is supported by the Centers for Medicare & Medicaid Services (CMS) of the U.S. Department of Health and Human Services (HHS) as part of a financial assistance award totaling \$272,174,855.72 with 100 percent funded by CMS/HHS. The contents are those of the author(s) and do not necessarily represent the official views of, nor an endorsement, by CMS/HHS, or the U.S. Government.

Organization Name	Project Title	Location	Project Concept Opportunity	Project Concept Approach	Estimated Funding Range for First Year of Funding	Health Care Provider Primary Type	Geographic Reach of Project	Project Service Area	DOH Determined LOI Outcome
41-4273054 (Anchorage Orthopedic Society Inc.)	Expanding Pediatric Specialty Vision Access in the Mat-Su Borough	AK	Children and adolescents in the Mat-Su Borough and surrounding communities face growing challenges accessing specialty pediatric vision services beyond routine eye care. Vision screenings are conducted in local schools, often with support from Lions Clubs International, helping identify students who need further evaluation. However, there is currently no coordinated referral pathway connecting these screenings with specialty pediatric vision services in the borough. Recent changes in school health staffing and screening coordination have made follow-up more difficult. At the same time, reduced availability of local vision therapy and neurodevelopmental vision services has limited specialty capacity in the region. As a result, children with binocular vision disorders, developmental visual dysfunction, or concussion-related visual symptoms among student athletes may face delays in evaluation or must travel outside the borough for care. Because vision therapy often requires multiple visits over several weeks, travel outside the region can create significant barriers for families. Unlike many states that require comprehensive eye exams before kindergarten, Alaska relies primarily on vision screenings, increasing the importance of accessible specialty follow-up care. This project will establish the first coordinated pediatric specialty vision referral hub in the Mat-Su Borough, strengthening referral pathways and expanding access to care for complex pediatric visual conditions.	This project proposes establishing a coordinated pediatric specialty vision referral hub within the Mat-Su Borough to expand local access to evaluation and treatment for complex visual conditions affecting children and adolescents. The initiative will focus on conditions such as binocular vision disorders, developmental visual dysfunction, and concussion-related visual symptoms among youth. The project will build specialty clinical capacity through the development of advanced binocular vision diagnostics, developmental visual assessment, and vision therapy services designed to address complex pediatric visual conditions locally. In parallel, the project will work with schools, school health staff, and community partners to improve referral pathways following vision screenings so that students identified with potential visual concerns can receive timely specialty evaluation. Partnerships with youth athletics programs and healthcare providers will also support referral and evaluation of student athletes experiencing concussion-related visual symptoms. These efforts will help ensure that youth with visual challenges affecting learning, reading, and recovery from injury have access to appropriate specialty care within the borough. The project will also develop systems for tracking referrals, monitoring follow-up care, and evaluating improvements in access to specialty pediatric vision services. By strengthening collaboration between schools, healthcare providers, and community partners, the initiative aims to improve continuity of care and reduce the need for families to travel outside the Mat-Su region for specialty vision services.	\$50,000-\$250,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Copper River Census Area; Denali Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

A List Assisted Living LLC	Alaska Rural Health Child Placement Agency (CPA) Cooperative in Partnership SOA OCS	AK	Creation of a Child Placement Agency (CPA). This project is attempting to address is the disproportionate # of rural Alaska Native children and families with CINA cases who are removed from their culture, home community, and family due to the lack of accessible local trauma-informed, culturally appropriate safe and stable home placements as well as community based SUD and behavioral health services, and psychiatric care often requiring costly travel to regional hubs disrupting continuity of care. The Cooperative proposes a phased expansion of the services listed above, delivered as close to home as possible. The pilot will launch in a rural community agreed upon by OCS and the cooperative, then scale statewide using lessons learned. The model emphasizes stabilization, cultural responsiveness, safety, and reunification, when clinically appropriate, while building a sustainable workforce and care infrastructure in rural and frontier communities. Model & Services. The Cooperative integrates: (1) therapeutic foster home capacity and standard foster homes with training/licensing readiness and ongoing oversight; (2) BRS clinical oversight, treatment planning, therapy, telehealth nursing/medical coordination, and medication management; (3) waiver coordination and habilitative services; and (4) safety inspections and certification compliance.	Phased Implementation. Validate workflows, expand geographically to more remote villages based on operational learning and capacity. Staffing & Training: Magnolia Wellness will add three child-specialty therapists (play therapy, CBT, DBT-informed skills, EMDR, PCIT, and systemic family therapy) and will expand to add medical providers for child medication management, under a Clinical Director for fidelity and QA. Family therapy, caregiver groups, and SUD counseling are included as indicated. A List Assisted Living, LLC (ALAL) will add 1 Admin staff, 1 Program Manager responsible for assisting with the building out and expansion of capacity, training and supervision of all therapeutic home foster parents in maintaining licensing and treatment requirements, including licensing training and therapeutic program requirements. 1 Program Director, responsible for financial oversight, strategy development, team leadership, audit management, and client and partnership relationships with the state, tribes, and other stakeholders. ALAL, within the first year will also hire a consultant for grant oversight and management, performance measurement, data/reporting design; accountability for reporting, sustainability, and procurement of additional funding. Frontier Safety and Supply, LLC (FSS): will add 2 full time safety trainers, 1 full-time resource family licensing worker and 1 Program Director. • A List Assisted Living (ALAL): Prime; program administration, fiscal oversight, compliance, reporting aggregation, procurement, stakeholder engagement training, support and supervision of foster homes and therapeutic foster homes. Billing medicaid for therapeutic foster home services and any waiver services, if necessary. • Monarch Psychiatry of Alaska (MPA): referral resource for services that MPA and ALAL do not provide. • Magnolia Wellness (MW): Behavioral health access expansion, BRS oversight, therapy, telepsychiatry workflows, and training and supervision of BHAs and peer support folks in villages and rural communities via telehealth. • Blue Heron Consulting (BHC): Project management, performance measurement, data/reporting design; accountability for reporting, sustainability, and procurement of additional funding. • Frontier Safety & Supplies (FSS): Equipment procurement/deployment, safety/EMS gear, provide required licensing training for foster parents and also train and supervise all licensing staff and support tribal staff who are assisting in licensing.	\$1M-\$5M	Home- and community-based services provider	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Matanuska-Susitna Borough; North Slope Borough; Sitka (City and Borough); Skagway (Municipality)	Deferred or Not Advanced

About Fresh	Improving health and wellbeing in Alaska through food-as-medicine infrastructure	MA	Across Alaska, but particularly in rural communities, households struggle to afford the essential costs of life, including food. Insufficient nutrition and poor nutrition contribute to serious and life-threatening health conditions like high blood pressure, cardiovascular disease, and diabetes. In favor of solving for hunger, households enduring poverty oftentimes resort to shopping for lower-cost food that is less nutrient-dense and contributes to metabolic disease, particularly in regions that depend mostly or entirely on food shipped from further distances. It’s imperative that healthcare providers are equipped to combine clinical interventions and education with a solution to address cost as a barrier toward healthy eating. It is impossible for a low-income patient to adhere to dietary recommendations without changing their economic conditions.	Our project will focus on increasing access to nutritious food for Alaskans by increasing the number of producers and retailers who accept Fresh Connect and other OTC cards and partnering with healthcare providers and health plans to embed food-as-medicine programs into clinical care. We work with large retailers (like those available to residents of Anchorage, Fairbanks, and other population-dense areas) as well as small independent stores, individual farmers and producers, and farmers markets to make it possible for food sellers and producers to accept our Fresh Connect food as medicine technology as a form of payment. Expanding Fresh Connect to more retailers and food producers in Alaska will empower clinical providers to address cost as a barrier to healthy eating and increase nutritious food consumption among patients. Our team has extensive experience working with rural and tribal communities to leverage Fresh Connect as a therapeutic intervention that improves food security and health outcomes and would be honored to partner with Alaskan communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Accenture	AI-Enabled Administrative Automation and Documentation Support (Hospital Sustainability)	IL	Administrative burden continues to strain rural hospitals and community health systems. Time spent on administrative tasks diverts clinicians and staff time away from patient care. Deploying AI-driven automation to streamline scheduling, billing, prior authorizations, and documentation workflows will reduce costs, improve accuracy, and allow clinicians and staff to focus on direct patient care. As Alaska’s RHTP initiatives aim to bring innovation and advance the rural, Tribal, and frontier healthcare landscape, Accenture offers best-in-class AI tools and the professionals to successfully support implementation of solutions for scheduling, billing, prior authorizations, and documentation workflows. Based on our research, over 30% of appointments are missed or rescheduled, leading to massive revenue leakage. Inefficient scheduling contributes to underutilized resources, staff burnout, and patient dissatisfaction. In rural areas, scheduling inefficiencies lead to increased wait times and reduced patient access to the care they need. Our solutions allow for seamless integration with existing EHRs, and our AI technology learns patient and clinical patterns to adapt to the rural provider’s needs. Through our proposed AI solutions, Accenture will support Alaska in reducing administrative burden and modernizing the hospital and clinic back office across Alaska’s healthcare landscape.	Our proposed approach leverages AI enabled administrative automation to reduce the operational strain facing rural, Tribal, and frontier healthcare providers while strengthening long-term provider sustainability. Accenture will partner collaboratively with Alaska and its providers to identify high value administrative use cases that align with local priorities and readiness, ensuring solutions are practical, secure, and responsive to the realities of rural care delivery. Once pilot use cases are selected, such as provider scheduling, documentation, billing, and/or prior authorizations, Accenture will deploy secure AI and natural language processing tools that integrate seamlessly with existing EHR and administrative systems. These tools automate routine, time intensive tasks, improve accuracy, and adapt over time based on patient and clinical patterns. A shared service model would allow multiple providers to participate, expanding access to advanced capabilities while minimizing individual cost and implementation burden. Accenture brings deep healthcare implementation experience and a robust ecosystem of AI technology partners to support rural providers at scale. With more than 200 revenue cycle and operations experts, our team will work alongside hospital leadership and frontline staff to ensure successful adoption, change management, and workforce enablement. By reducing administrative burden, this approach allows clinicians and staff to focus on patient care, administrators to improve staff satisfaction, and the State to help rural providers capture lost revenue. Accenture is committed to advancing Alaska’s goal of futureproofing its healthcare system through responsible innovation. Our team is available to discuss with Alaska the demonstrated success of our AI solutions and share testimonials from clients across government, healthcare, and nonprofit organizations.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Accenture	AI-Enabled Healthcare Workforce Analytics Dashboard and Asset Maps	IL	The AI-Enabled Healthcare Workforce Analytics Dashboard and Asset Maps initiative is designed to address critical workforce shortages in rural healthcare by integrating fragmented data sources into a unified, actionable platform. The purpose is to provide state leaders with real-time insights into the healthcare workforce pipeline, barriers to workforce development, and the distribution of key assets. This initiative directly supports RHTP by enabling targeted, data-driven actions and investments to recruit, retain, and sustain talent in underserved areas. Alaska’s RHTP funding presents an opportunity to strengthen analytical capabilities and invest in a tool that illuminates insights to support decision-making surrounding resource allocation. Our AI-enabled analytics platform is designed to complement and enhance existing systems by providing dynamic, real-time insights that reveal where workforce investments will be most impactful. By cutting through perceived barriers and offering a more granular view of workforce pipelines, our platform empowers agencies and rural healthcare entities to make data-driven decisions that optimize resource allocation, address workforce gaps, and ultimately improves healthcare access for Alaskans. For example, by combining education and licensure data, the State can easily identify licensure and placement bottlenecks preventing providers from entering the workforce.	Our proposed solution is a modern, AI-enabled analytics platform that integrates data from education, licensure, labor markets, childcare availability, and healthcare assets. This platform will provide hyper-local insights into workforce gaps, education pipeline constraints, and asset clustering, enabling leaders to allocate resources strategically. The inclusion of an AI chatbot will allow leaders to query the data in natural language, generating real-time visualizations and insights to inform decision-making. This initiative supports rural health transformation by enabling the state to: • Identify workforce gaps by provider type at the local level and overlay with community need to ensure investments are impactful. • Pinpoint education pipeline constraints, such as clinical placement capacity and faculty shortages, and target incentives for student placement. • Monitor licensure bottlenecks and streamline processes to reduce time-to-license. • Target RHTP incentive programs to geographical areas and provider types where there is greatest need. • Evaluate the effectiveness of workforce recruitment and retention initiatives through measurable KPIs.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Accenture	Project Management Office & Grant Administration	IL	The opportunity this project addresses is the opportunity of the Rural Health Transformation Program (RHTP) funding and the State’s capacity to administer aggressive timelines and reporting requirements under a uniquely demanding federal award structure. RHTP is not a traditional grant; it is a five-year cooperative agreement in which CMS maintains an active role in oversight, collaboration, and implementation review. Continued funding depends not only on compliance, but on the State’s ability to establish meaningful outcome metrics, demonstrate progress, and report performance in support of annual funding decisions, as well as manage all subrecipients and vendors. For states balancing competing policy, operational, and fiscal priorities, sustaining this level of accountability can be challenging. Successful RHTP implementation requires rapid establishment of governance, oversight, staffing, and reporting infrastructure, while also coordinating stakeholders, budgets, procurements, and program activities on an accelerated timeline. This creates a clear opportunity for a trusted partner with deep experience in federal compliance, cooperative agreement administration, and PMO execution to help the State align grant requirements with program operations, strengthen reporting and risk management, and position RHTP investments to achieve lasting rural health outcomes while maintaining eligibility for continued funding.	Accenture will support Alaska across the full RHTP award lifecycle by applying an evidence-based PMO approach to grant administration that helps refine initial planning, bolster mobilization, and launch & manage RHTP initiatives from award acceptance through implementation and performance reporting. Because RHTP is structured as cooperative agreement with active CMS oversight, successful execution requires more than routine grant management; it requires disciplined coordination of compliance, program operations, and performance monitoring including across subrecipients. Our approach begins with establishing the governance, programming, and operating structures needed to manage the award effectively. Accenture will assist Alaska in establishing robust governance structure, managing reporting cadences, escalation pathways, and implementation workplans so that leadership has clear visibility into progress, risks, and dependencies. This foundation is especially important for this RHTP award, where continued funding depends on significant performance, compliance, and demonstrated implementation progress. Accenture will provide integrated support across financial management, stakeholder coordination, and procurement tracking. Our PMO tools and methods will enable Alaska to demonstrate effective and efficient alignment across CMS RHTP terms and conditions. Key elements of the approach include: Program Governance and PMO Setup: Establish and operate the RHTP Program Management Office, including decision-making authority, escalation pathways, risk management processes, and performance tracking. Accenture will support executive, advisory, and workgroup committees and convene quarterly advisory meetings to guide implementation. Grant Administration and Monitoring: Support subrecipient monitoring, fiscal oversight, and outcome reporting across the grant lifecycle to ensure compliance and accountability. Stakeholder Engagement and Change Management: Produce tailored communications, FAQs, and briefing materials; facilitate cross-agency collaboration; and design structured feedback mechanisms (surveys, listening sessions, reporting templates).	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Access Behavioral Services	Comprehensive Positive Behavior Support in Remote Alaska: help with complex needs in frontier Alaska	AK	Presently, Access travels to remote locations across the state to provide behavior consulting and training on appropriate Positive Behavior Supports for specific students and individual client teams that meet a certain eligibility criteria through either a school district's special education department or the state's Complex Behavior Collaborative program. This criteria typically includes high risk behaviors such as self injury or aggression towards others and the possibility of losing one's housing and services due to a lack of behavioral stability. In these locations, however, there are a multitude of other individuals who do not quite meet the eligibility requirements to receive services who would greatly benefit from them. This project is aimed at serving those who "fall through the cracks" between the standard assistance available through regular medical and mental health services and those we are typically contracted to provide for as specialists. The goal being providing intervention for these individuals before their circumstances elevate to the level that they qualify for specialty assistance which will improve the overall quality of life for the individual and their families, caretakers, and other major stakeholders.	Utilizing the current referral and delivery structure already in place for those qualifying for services under the eligibility requirements found within the CBC and present school-based contracts, Access' goal is to extend those same services to those who do not fully qualify under a closest-to-furthest scale of receiving services: those closest to qualifying receive services first. Referrals will be derived from major stakeholders already established including care coordinators, teachers, service providers, primary care agencies, etc. as an already established process, however, those referrals will be provided directly to Access as the providing agency instead of application process for other programs. Once referred, individuals/client teams will be provided with observation, coaching, mentoring, and training on the most appropriate Positive Behavior Supports to affect behavior in a therapeutic trend, ensuring all interventions are trauma informed and respect the local culture and traditions of those participating in services. Working collaboratively with local entities and stakeholders, Access will provide the intervention structure and interactive trainings to give the "boots on the ground" service providers the tools necessary to continue and maintain interventions while our consultants slowly fade their presence, minimizing the potential for long term dependence on our input and allowing for natural environment supports to remain in place permanently. Other aspects of this project would include accessibility options for families including childcare during training sessions, transportation to and from, and food accommodations to minimize potential barring factors associated with potential income disparities and the reality of life in remote locations with limited resources beyond daily survival.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Copper River Census Area; North Slope Borough; Northwest Arctic Borough; Prince of Wales-Hyder Census Area	Deferred or Not Advanced

Access TeleCare	Access TeleCare - Supporting Strong Rural Communities Through Specialty Telemedicine	TX	The U.S. projects a shortage of more than 34,000 specialty physicians by 2034. Forty percent of physicians will reach retirement age in the next decade. And in rural communities, nine percent of physicians are asked to care for almost a quarter of Americans. In Alaska specifically, geographic challenges compound these problem areas making access to specialty care even more difficult. Specialty telemedicine is a powerful solution that Access TeleCare is delivering on every day in all parts of the country and is eager to extend support to additional partners in Alaska to help Alaskans receive specialty care close to home. With funding from the Rural Health Transformation Program, Alaska’s rural hospitals have a new opportunity to strengthen local access to care, improve financial sustainability, and support the clinicians who serve their communities every day. For many rural hospitals, the question is no longer whether transformation is needed, but how to operationalize it in a way that is realistic, scalable, and sustainable. Access TeleCare has now worked alongside rural hospitals for more than 20 years to answer that question and will continue to support sustainable, hospital-first telemedicine solutions.	By partnering with Access TeleCare, grantees needing telemedicine support will be able to leverage Rural Health Transformation Program funds to offset telemedicine startup and early program costs. Access TeleCare implements custom programs for rural hospitals to align with their staffing model, workflows, patient demand, and community needs. Creating a tailored approach that aligns in these key areas ensures a sustainable program is in place for long-term impact, shifting rural hospital’s approach from “stabilize and transfer” to local definitive treatment. The first step is in taking inventory of models of care and identifying where a rural hospital or delivery partner is in order to know where to begin. Answering key questions with our potential partners can help determine the direction needed to support their challenge and opportunity areas. Unlike standard low-acuity telehealth, this project embeds board-certified specialists (TeleNeurologists, TeleIntensivists, TelePsychiatrists, etc.) directly into on-site workflows via the Telemed IQ platform. Deployment of services includes three core areas. 1. Technology Deployment: We will implement telemedicine carts with high-resolution PTZ cameras and digital stethoscopes in the ED and ICU, ensuring virtual specialists have "at-the-bedside" clinical precision. 2. Clinical Integration: The project will utilize a "pod" model, assigning a consistent team of physicians to each facility to build trust with on-site nursing staff and ensure continuity of care. 3. Service Line Expansion: Immediate implementation of TeleNeurology (for stroke), TelePsychiatry (for behavioral health crisis), TeleICU (for critical care retention), etc. allow a facility to treat complex cases locally that would otherwise bypass their facility. As outlined above, a data-driven approach can guide the formation and deployment of a sustainable and tailored telemedicine program that helps fill a current gap in care identified for Alaskans. With an Access TeleCare program, partners get unparalleled specialty and subspecialty coverage delivered via telemedicine that supports the patient-provider relationship. The technology prioritizes ease of use, high-reliability, and proactive 24/7 technical support with a clinical sense of urgency.	\$250K-\$1M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Adaego Recovery	Behavioral Health Pathways: Ending Alaska Youth Psychiatric Crisis With Full In-State Continuum Care	AK	Alaska has a legal obligation to provide psychiatric care to adolescents in the most integrated setting possible. The U.S. Department of Justice found Alaska in violation of the Americans with Disabilities Act in 2011 for its over-reliance on out-of-state psychiatric placements. Fourteen years later, Alaska still sends roughly 100 youth out of state every year — spending \$25 to \$40 million annually on care that separates children from their families and disconnects Alaska Native youth from the cultural identity that is their greatest protection against lifelong mental illness. The human cost is staggering. Alaska Native youth have a suicide rate 3.5 times higher than non-Native Alaska youth. Alaska has only 10 involuntary psychiatric beds for the entire state, meaning adolescents in crisis wait days in emergency departments while law enforcement manages situations that require clinical care. There is no residential treatment facility anywhere in Alaska between an acute hospital stay and outpatient services — that single gap forces out-of-state placement for hundreds of youth who could be treated closer to home. Alaska already spends enough to solve this. The \$25 to \$40 million currently leaving the state annually would fully sustain Adaego Recovery Center's operations. This is not a request for new spending — it is a request to redirect existing spending back into Alaska.	Adaego Recovery Center establishes Alaska's first complete three-tier adolescent psychiatric continuum, anchored in Anchorage with telepsychiatry extending to every corner of the state. Tier 1 — Acute Inpatient Unit (40 beds): Rapid stabilization for high-acuity crises including suicidality, psychosis, and severe mood dysregulation. Stays of 5 to 10 days with 24/7 psychiatric monitoring, comprehensive evaluation within 24 hours, crisis-focused CBT and DBT skills, medication management, and discharge planning that begins on day one. Annual capacity: 600 admissions. Tier 2 — Psychiatric Residential Treatment Facility (20 beds): Medium-length therapeutic intervention of 60 to 120 days for youth who need more than acute stabilization but do not need to leave Alaska. Evidence-based therapies include Trauma-Focused CBT, Dialectical Behavior Therapy for Adolescents, and Functional Family Therapy — all proven to reduce symptoms 40 to 80%. Daily credit-bearing education keeps youth on track academically. Cultural programming with Alaska Native elders is embedded throughout. Annual capacity: 90 admissions. Tier 3 — Step-Down Services (50 slots): Partial hospitalization and intensive outpatient programs sustain gains and prevent readmissions after residential treatment. Annual capacity: 300 youth. Telepsychiatry Hub: Reaches 75+ rural communities with urgent psychiatric consultation for rural emergency departments, virtual family therapy during residential stays so rural families stay engaged, and post-discharge telehealth preventing relapse. Annual capacity: 5,000+ encounters. Priority populations are Alaska Native youth, targeted at 45% of enrollment, and rural youth, targeted at 60% of enrollment — the two groups most failed by the current system. The model is built around DOJ compliance, cultural responsiveness, and keeping families together throughout.	Over \$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Advanced Dermatology of Alaska	Alaska Rural Dermatology Centers of Excellence & Access Network	AK	Rural Alaska faces near-complete absence of sustainable dermatologic specialty care outside Anchorage. In Fairbanks, Juneau, and frontier communities, 100% of Mohs surgery and advanced dermatologic cancer procedures occur in facility-based settings or out of state. Historically, single-provider rural dermatology practices have collapsed due to workforce instability, creating repeated service gaps and costly referral leakage. Alaska has high melanoma incidence and disproportionately elevated non-melanoma skin cancer rates, compounded by an outdoor-dependent, high UV-exposure population. Rural CAHs have no dermatology on-call coverage, leaving hospitalists and emergency providers without specialist support for inpatient skin conditions, wound care, and oncology consults. Chronic inflammatory diseases including psoriasis and hidradenitis suppurativa with established links to cardiovascular disease, metabolic syndrome, and depression are managed without subspecialty oversight, resulting in hospitalizations, and preventable complications. The opportunity exists to build a permanent, integrated, multi-component rural dermatology system that eliminates these gaps through place-based expansion, telehealth, workforce development, and a self-sustaining physician pipeline.	ADA implements a five-component model under unified statewide infrastructure: shared EMR, centralized scheduling, and coordinated clinical leadership. First: Urban Hub Clinics: Fairbanks & Juneau Full-service dermatology centers providing medical dermatology, Mohs surgery, IGSRT, dermoscopy, skin cancer surveillance, and inflammatory disease management. Leased space is in final negotiation with Fairbanks Memorial and Bartlett Regional Hospitals, minimizing capital costs and embedding ADA within existing health systems. These hubs serve as clinical, training, and telehealth anchors for rural outreach. Second: Rural Site Teledermatology & Staff Training Up to 20 rural clinics and Critical Access Hospitals (CAHs) will be equipped with dermatoscopes and integrated into ADA's store-and-forward platform. Primary care providers will receive training in dermoscopic imaging, treatment protocols, and referral criteria. Cases receive specialist review within 24-72 hours. Complex procedures will be referred to the nearest ADA hub, creating a structured hub-and-spoke pathway while reducing unnecessary travel. Third: On-Call Coverage, Disease Management & Medication Access ADA will establish a statewide dermatology consult line providing real-time telehealth for inpatient consults, ED triage, wound care, oncology decisions and biopsy guidance. Chronic diseases (psoriasis, hidradenitis suppurativa, eczema) will be managed via teledermatology with centralized biologic coordination and prior authorization support, reducing avoidable escalations and preventable hospitalizations. Fourth: PA Training Program A two-stage PA program will formalize rotations with UA and expand a structured one-year post-graduate dermatology training program at ADA hubs. Graduates commit to rural deployment. RHTP funds will support curriculum development, preceptor compensation, loan repayment incentives and relocation assistance for long-term workforce stability. Fifth: Alaska Rural Dermatology Fellowship Grant Program (MDs) Track A- Residency Commitment Grant: Sponsors one ACGME dermatology residency per cycle with a \$40,000–\$60,000 stipend supplement and \$50,000 retention bonus, tied to a 2-year rural ADA service agreement. Each cohort funds the next. Track B- Mohs Fellowship Grant: Years 1-2 fund a supplemental slot at an established ACMS program tied to a 2-year rural commitment. ADA simultaneously pursues its own ACMS accreditation targeting in-house training by Years 3-4	Over \$5M	Specialist	Statewide	Anchorage (Municipality); Chugach Census Area; Denali Borough; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough; Prince of Wales-Hyder Census Area; Skagway (Municipality); Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Advanced Practice Registered Nurse Alliance (APRN-AK)	Advanced Practice Registered Nurse (APRN) Alliance Comprehensive Gap Analysis and Needs Assessment	AK	Alaska is the largest geographic state with the smallest population density in the US. Advanced Practice Registered Nurses (APRN) are a vital component to the healthcare delivery workforce across all of AK. The APRN workforce are RN’s with graduate and/or doctoral degrees, licensed to independently provide advanced care including diagnosis of conditions, creation of treatment plans, and prescribing medications and interventions. They are essential providers in rural and remote Alaska, especially in the 13 critical access hospitals. The collective group of APRNs consists of Board-Certified Nurse Practitioners (CNP), Nurse Midwives (CNM), Clinical Nurse Specialists (CNS), and Registered Nurse Anesthetist (CRNA). According to statistics from the AK Board of Nursing, APRNs represent over 30% of the healthcare provider workforce in AK. There are 2,920 APRNs licensed in Alaska, however only 43% have in-state mailing addresses. It is not clear which APRN specialties are represented in this number, what type of care is provided by those who live in and out of state, what percentage of care is provided through tele-medicine, what other roles they fill and future retirement or attrition variables that should be considered in planning for educational and fellowship programs. The purpose of this project is to conduct a gap analysis of the APRN workforce in Alaska and develop a five- and ten-year plan for APRN resource allocation to improve rural, remote and frontier patient access.	The “Alaska APRN Comprehensive Gap Analysis and Needs Assessment” proposes to conduct a workforce survey of all APRNs licensed in the State of Alaska to understand the scope and type of their practice. The questions will include but not be limited to those about their educational preparation, role, scope of practice, practice location, longevity, anticipated attrition (relocation or retirement), salary, and percentage of face-to-face care versus telemedicine. In addition, we will inquire about the role, scope, and influence of APRNs who reside out of state and provide care to Alaska residents. Participants will be entered into a drawing for the chance to win one of ten \$1,000 gift cards for appreciation of their time. The second part of this program will be to evaluate all major health delivery units across the state to examine their need for future growth and healthcare provider needs in support of increasing access to care, especially in rural and frontier communities. The healthcare needs for individuals across the state are complex and require advanced level of care. Certified Nurse Practitioners are the fastest growing group of healthcare providers and currently provide 52% of primary care in Community Health Centers (McCann & Flinter 2025). Understanding health center organizations forecasted needs will allow the State to be able to prepare and anticipate the need for APRNs. A survey will be sent to the CEO/director/manager of each healthcare delivery unit across the state with subsequent invitations to participate in a focus group session. The theme of both the survey and the focus group sessions will be to understand the current workforce that is in place (number of physicians, physician assistants, APRNs), the types of services provided, current care gaps for comprehensive care for the community, retention and recruitment issues and the forecasted growth over the next five and ten years. These surveys will be completed online using Qualtrics ® as the online platform, however letters will be sent to all recipients with follow-up reminder postcards. Data will be analyzed using SPSS® for statistical analysis with both descriptive and inferential statistics. The focus group sessions will undergo thematic analysis. This data will be used to develop a comprehensive gap analysis and plan for APRN education, recruitment, retention, and development of future programs and improve access to health care in rural, remote and frontier communities in Alaska.	\$50,000-\$250,000	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Agapi Inc	Healthy Beginnings Alaska: Advancing Early Childhood Nutrition and Health in Rural Communities	AK	Alaska’s food system presents a structural challenge for infant and early childhood nutrition. Food must travel long distances before reaching families, increasing cost, impacting freshness and introducing availability constraints when logistics are constrained by Alaskan weather. When food supply disruptions occur, rural families with infants and toddlers, who depend on consistent access to nutritious foods during critical stages of development, are at particular risk. The opportunity our project appeals to is to intervene at this earliest and most influential stage of life. Nutrition in the first 1,000 days helps shape brain development, growth, immune health, and long-term eating patterns. In Alaska, this challenge is amplified by high food costs, limited fresh options, and weak connections between families, institutions, and local food resources. This project addresses this opportunity by protecting the nutritional health of Alaska’s youngest children while building practical, community-based solutions that can expand outward to support children, pregnant and postpartum women, elders, and caregivers. The goal is not only to improve food choices in the moment, but to create a healthier foundation for families statewide through education, local partnerships, and scalable approaches that fit Alaska’s realities.	The project has four connected methods: (1) Nutrition Education: First, AGAPI will deliver practical nutrition education for infants and caregivers. This will include guidance on balanced feeding, ingredient selection, meal preparation, allergy awareness, and healthy use of foods that are realistically available in Alaska, including subsistence harvested, WIC and food-assistance products where relevant. The goal is to give families simple, usable strategies that improve nutrition without requiring unrealistic cost or access. (2) Cooking Classes: Second, AGAPI will provide Alaska-based instruction through cooking classes, maternal and postpartum food guidance, and elder-centered programming. These activities are designed to help families translate nutrition knowledge into daily practice. Elders and caregivers often help feed children, so strengthening intergenerational food knowledge is part of the intervention, not a side issue. (3) Tele-Cuisine: Third, the project will extend access through remote delivery and technical assistance. Tele-cuisine instruction will allow AGAPI to reach rural and frontier communities where in-person support is limited. A faceted, multi-media technical assistance framework will be established to instruct schools, senior centers, clinics, and local organizations on how to improve food quality, food education, and nutrition practices. This in turn grows community understanding that this resource is available, and makes healthier food choices easier to understand, request, and adopt. (4) Alaskan Food Access Networks: Fourth, AGAPI will strengthen food access and resilience through partnerships and pilots. The project will work to build links with Alaska growers, producers, and community partners; identify underused local resources; and test scalable approaches that help families maintain healthy infant and child nutrition during supply interruptions, product shortages, or high-cost periods. These pilots will help AGAPI identify what works at the local level while also building a statewide model that can be adapted over time. The approach is intentionally low-barrier, practical, and Alaska-centered. Before larger systems can change, families and institutions need accessible knowledge, useful tools, and trusted community support, something which AGAPI and its heritage through Bambino's Baby Food, has demonstrated success in.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

AK Afterglow	AK Afterglow	AK	AK Afterglow seeks to address a critical gap in support for Alaska families who experience the death of a child, particularly in rural, remote, and frontier communities. When a child dies, families often face immediate financial burdens related to funeral, burial, and travel costs, while simultaneously navigating overwhelming grief and trauma. In many rural areas of Alaska, these families have limited access to grief counseling, behavioral health services, or community support networks. The combination of financial strain, geographic isolation, and lack of available services can significantly impact the mental health and long-term well-being of grieving parents and siblings. This project addresses the opportunity to provide immediate financial assistance and coordinated support to families during one of the most vulnerable moments in their lives. By reducing financial barriers and connecting families to grief support resources, AK Afterglow helps ensure that families across Alaska, regardless of location, have access to compassionate care and support following the loss of a child.	AK Afterglow will address this need through the Amelia and Kannon’s Assistance Program, which provides immediate financial support and coordinated resource connections to families following the loss of a child. The program offers direct assistance for funeral and burial expenses, helping families avoid significant financial hardship during an already traumatic time. In addition to financial support, AK Afterglow works with hospitals, providers, community organizations, and local partners across Alaska to identify families in need and connect them with grief support resources and peer networks. This approach helps ensure families are not navigating loss alone and have access to emotional support even in communities where behavioral health services may be limited or unavailable. By combining rapid financial assistance with coordinated support and community partnerships, the program reduces barriers to care, strengthens support systems for grieving families, and helps ensure that families in rural, remote, and frontier communities receive compassionate assistance during one of the most difficult moments of their lives.	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

AK Child & Family	Modernizing Behavioral Health Infrastructure to Strengthen Alaska’s Workforce and System of Care	AK	Strengthening Alaska’s behavioral health system requires modern infrastructure that supports workforce capacity and improves coordination across the continuum of care. Behavioral health providers and therapeutic foster care programs in Alaska often rely on fragmented documentation and communication systems such as spreadsheets, emails, paper records, and manual tracking of requirements. These processes limit workforce capacity and reduce the time clinicians, nurses, case managers, and supervisors can spend supporting youth and families. When information is shared and stored across multiple systems, it can be difficult for treatment teams to access timely information needed to coordinate care, identify emerging concerns, and ensure youth receive the services they need. These challenges can be particularly significant in Alaska’s geographically dispersed system where coordination across providers is essential for continuity of care. Technology-enabled coordination and documentation tools offer an opportunity to strengthen Alaska’s behavioral health system by improving information sharing, enhancing communication across care teams, and reducing administrative burden. By improving documentation efficiency and coordination processes, providers can devote more time to delivering coordinated services for youth and families across Alaska’s behavioral health system, including youth who live in rural and remote communities.	This project will implement technology-enabled tools designed to strengthen care coordination, improve documentation processes, and support workforce capacity across the behavioral health continuum of care. The first component will introduce AI-assisted documentation tools (such as Clinically AI software) that integrates with the organization’s existing electronic health record. These tools can support staff by translating clinical notes into structured documentation, identifying missing information, supporting documentation consistency and assisting with regulatory and payer requirements. The technology functions within existing clinical workflows and supports best practice decision-making while reducing time spent on antiquated documentation tasks. Improving documentation efficiency will allow treatment teams to devote more time to direct support of youth and families while strengthening documentation quality and information sharing across programs. The second component will introduce a centralized coordination platform to support treatment homes and treatment parents participating in therapeutic foster care programs (such as the Binti software system). This platform will allow automated tracking of training requirements, background checks, licensing documentation, and other program/regulatory expectations for treatment homes. Automated alerts will notify staff and treatment parents when documentation or requirements are approaching deadlines. The system will also support a secure communication hub connecting treatment parents, clinicians, supervisors, case managers, nurses and other members of the multidisciplinary team. Treatment parents will be able to securely upload documentation from mobile devices, allowing faster information sharing between treatment homes and care teams. Additional coordination tools track medical, dental, and behavioral health appointments, helping treatment teams identify missed appointments or emerging concerns earlier. Early visibility into missed appointments or emerging concerns allows treatment teams to intervene sooner and coordinate additional support for youth and families. Together, these tools move providers away from fragmented administrative processes toward a more coordinated and modern infrastructure supporting behavioral health services for youth and families across Alaska.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

AK Child & Family	Strengthening Family-Based Therapeutic Care for Alaska’s Children	AK	Children and youth from rural Alaska who have experienced significant trauma require therapeutic, family-based behavioral health care to stabilize and heal. However, access to therapeutic foster homes remains limited statewide, and youth from rural communities are placed far from their home regions to receive treatment. These placements can disrupt family and community connections. They can also make it more difficult to maintain placements consistent with the Indian Child Welfare Act (ICWA), which prioritizes keeping Alaska Native children connected to family, culture, and community. Alaska’s behavioral health system includes a continuum of care spanning outpatient services, therapeutic foster homes, and residential treatment. Therapeutic foster homes provide intensive trauma-informed support in family settings for youth who need more structure than traditional foster care but may not require residential treatment. This project proposes a planning effort to strengthen Therapeutic Treatment Home Services capacity in regional hub communities including Anchorage, the Matanuska-Susitna Borough, Fairbanks North Star Borough, and the Kenai Peninsula Borough, which serve as access points for surrounding rural communities. The planning process will explore strategies to strengthen caregiver recruitment, retention, and clinical support while examining opportunities to expand kinship and fictive kin placements for youth who may benefit from therapeutic support in family settings.	This project will conduct a structured planning process to strengthen Therapeutic Treatment Home Services (TTHS) capacity in regional hub communities that serve youth from rural Alaska. The effort will focus on identifying sustainable strategies to expand therapeutic foster home availability while strengthening caregiver preparation, clinical support, and system coordination. Within the first 18 months, the project will develop a regional hub-and-spoke framework for therapeutic foster care that outlines caregiver recruitment strategies, training models, clinical consultation structures, and partnerships needed to support therapeutic foster homes serving youth from surrounding rural communities. Planning activities will examine strategies to strengthen caregiver recruitment, preparation, and retention, including peer-to-peer recruitment, regionally focused community partnerships, trauma-informed caregiver training models such as Trust-Based Relational Intervention (TBRI), enhanced clinical consultation, and peer support networks for foster parents caring for youth with complex trauma. The planning process will also explore approaches to strengthen kinship and fictive kin caregiver preparation so that relatives or trusted community members willing to care for youth have access to training, consultation, and resources needed for therapeutic caregiving roles. Additional planning activities will focus on strengthening partnerships with tribal organizations, behavioral health providers, and child welfare partners to support culturally responsive care and improve coordination across Alaska’s behavioral health and child welfare systems. The project will also examine opportunities to incorporate telehealth-supported clinical consultation and caregiver coaching to ensure foster parents have access to consistent professional support. Findings from the planning process will inform future implementation strategies aimed at increasing therapeutic foster home availability in regional hubs and improving access to trauma-informed, family-based care for youth from rural Alaska.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

AK Child & Family	Transforming Early Behavioral Health and Family Stability for Alaska's Children	AK	Across Alaska, many children and families face significant barriers to accessing timely behavioral health support. These challenges are often more pronounced in rural and remote communities where provider shortages, travel barriers, and limited coordination across systems delay care. As a result, youth with emerging behavioral health needs often do not receive support until concerns escalate to crisis or higher levels of care. Delays in early intervention increase stress for families, strain schools and community systems, and contribute to reliance on intensive services that may have been preventable with earlier support. AK Child & Family's Coordination, Advocacy, Resources, Education, and Support (C.A.R.E.S.) Program provides a family-centered wraparound model that strengthens early identification, care coordination, and stabilization for youth and caregivers. CARES staff work with families, schools, community providers, and natural supports to coordinate behavioral health support, build caregiver skills, and connect families with resources that help youth remain safely at home and in their communities. By engaging families early, CARES helps stabilize concerns before they escalate to crisis or potential involvement with the child welfare system. Telehealth consultation expands access for rural communities. This project strengthens Alaska's community-based behavioral health continuum by improving early coordination so youth receive support closer to home and community.	AK Child & Family proposes to strengthen early behavioral health support for children and families through its Coordination, Advocacy, Resources, Education, and Support (C.A.R.E.S.) Program, a trauma-informed, family-centered wraparound model that connects caregivers, schools, and community providers to identify emerging needs and stabilize families before challenges escalate to higher levels of care or child welfare, keeping youth in their community. This work builds on the organization's participation in innovation and learning initiatives focused on family stabilization and system improvement, including collaboration with national partners such as the National Center for Innovation & Excellence, Lutheran Services in America, and Chapin Hall at the University of Chicago. Drawing on more than a century of experience serving Alaska's children and families, the organization will focus on strengthening how early family stressors are recognized, coordinated, and supported across community settings. The proposed approach emphasizes earlier identification of behavioral health needs and stronger coordination among families, schools, Tribal partners, and community providers. Through the C.A.R.E.S. model, staff work directly with caregivers and youth to provide trauma-informed support, caregiver coaching, school consultation, and coordination with behavioral health providers. Telehealth consultation also allows staff to support families and community partners statewide, including youth transitioning from higher levels of care. The initiative strengthens early family stabilization strategies that support caregivers and youth experiencing stressors and destabilizing challenges. By building caregiver skills, improving communication across systems, and connecting families with available supports, the project helps communities respond more effectively when behavioral health concerns first emerge. The approach also supports stronger coordination when youth transition from higher levels of care back to their home communities. By improving communication among families, schools, and referring providers, the project helps youth safely step down from intensive services while maintaining stability in their homes, schools, and communities. Together, these efforts strengthen coordinated, community-based responses to early behavioral health needs while contributing to a more connected and sustainable behavioral health system for Alaska's children and families.	\$250K-\$1M	Behavioral health/su bstance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Ak Orca	Rural Health Transformation through Physical Activity Wellness & Data Innovation	AK	Alaska’s geography and healthcare workforce shortages create significant barriers to preventive youth care. Over 80% of Alaska communities are not connected to the road system, requiring air travel for specialty services. Rural residents face high transportation costs and limited access to pediatric specialists, sports medicine screening, sleep diagnostics, and metabolic testing. Many frontier clinics operate with small staffs and rotating providers, focusing primarily on acute care. Alaska adolescents face growing health risks. State data show roughly one-third of high school students are overweight or obese, fewer than one in five meet recommended physical activity levels, and more than one-third report insufficient sleep on school nights. Injury hospitalization rates also exceed national averages. Alaska lacks a system for longitudinal monitoring of youth wellness indicators such as sleep health, metabolic risk, and injury markers. Without early detection, many risks for diabetes, cardiovascular disease, depression, and orthopedic injury go unnoticed. Preventive screening is inconsistent outside Anchorage and the Mat-Su region, leaving many youth evaluated only after injury or illness occurs. This project establishes a preventive health model integrating biometric monitoring, metabolic screening, and sleep tracking within school-day programming and rural telehealth access.	The project utilizes a hybrid preventative health model that integrates athletics, medical diagnostics, rural telehealth connectivity, and data analytics into a unified system. The approach is organized around five core pillars designed to work together to improve youth health outcomes. The first pillar is longitudinal health monitoring. Each participating athlete receives four integrated medical assessments during the program year. These assessments include metabolic blood panels measuring fasting glucose and insulin levels, sleep architecture analysis, and heart rate variability monitoring. Together, these indicators allow clinicians to track metabolic health, nervous system recovery, and overall physiological readiness. The second pillar focuses on biomechanical injury prevention. Using dual force plate technology and motion sensors, the program identifies neuromuscular imbalances that increase injury risk. Research shows that athletes displaying greater than ten to fifteen percent asymmetry between limbs are significantly more likely to experience ACL injuries or other orthopedic damage. Early detection allows coaches and clinicians to adjust training loads and introduce corrective strengthening exercises. The third pillar expands rural access to preventative care. The program utilizes a hub-and-spoke logistics model in which urban facilities provide the central data infrastructure while rural communities participate through village diagnostic kiosks. Satellite broadband technology ensures that biometric and diagnostic data collected in remote communities can be securely transmitted to the central monitoring platform in real time. The fourth pillar integrates data analytics and clinical oversight. All biometric, biomechanical, and metabolic data are aggregated into a unified health intelligence platform that identifies emerging risk patterns. Licensed medical professionals review the data and provide readiness assessments and health recommendations. The fifth pillar focuses on workforce development and knowledge transfer. Through a Train-the-Trainer model, local coaches and program staff receive education in fatigue science, injury prevention, and wellness monitoring. This knowledge remains within communities after the grant period, strengthening long-term health literacy and capacity.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough; North Slope Borough	Deferred or Not Advanced

Ak Orca	The Connected Elders: Remote Care Coaching & Digital Health	AK	Alaska Native elders experience significant health disparities/barriers to consistent healthcare access. Many elders in the Matanuska-Susitna Borough and rural communities across Alaska live in remote areas where travel to primary care, behavioral health, or specialty services requires long distances, complex transportation, and time commitments. These barriers contribute to delayed care, unmanaged chronic disease, and preventable emergency room utilization. Alaska’s older adult population is also growing rapidly. Residents age 85 and older are projected to increase dramatically in the coming decades, placing additional strain on already limited healthcare resources. In rural Alaska, behavioral health provider availability remains extremely limited, roughly one Medicare-accepting provider for every 614 older adults. Social isolation is another health risk. Many elders live alone and report limited support networks, increasing risks for depression, cognitive decline, and poor chronic disease management. Although telehealth systems exist across Alaska, many elders lack the devices, connectivity, and digital literacy needed to participate effectively. This project addresses that gap by enabling elders to remain healthy, connected, and independent at home through culturally responsive remote care coaching supported by digital health tools. The program establishes a scalable rural elder health access model that can be replicated across Alaska Native and other remote communities.	The Connected Elders program will implement a culturally responsive remote care model that combines digital health technology, community workforce development, and telehealth engagement to support Alaska Native elders living in rural communities across Alaska. The program trains Tribal Care Coaches—local community members who provide culturally grounded support and regular virtual check-ins with elders. Coaches will receive training in digital health tools, chronic disease support, elder engagement strategies, and telehealth protocols, building local workforce capacity ensuring culturally appropriate service delivery. Participating elders will receive tablets, connectivity support where needed, and training to use digital health tools. Weekly virtual check-ins will allow care coaches to monitor wellness, support plan adherence, and assist elders with telehealth visits with healthcare providers. The program will also utilize secure digital health monitoring software allowing coaches/healthcare partners to track health indicators, identify concerns and issues when needed. Early identification of health changes can help prevent hospitalizations and unnecessary emergency room visits. When appropriate, program data will be shared with healthcare providers to support coordinated care and timely follow-up. To address social isolation, the program will host monthly virtual cultural engagement activities including talking circles, storytelling sessions, and cultural discussions facilitated by tribal leaders and elders, strengthening community connection and cultural identity. The project will be implemented in phases. Year one will focus on program launch, recruitment and training of care coaches, and enrollment of approximately 60 elders. Year two will expand participation and refine operations based on evaluation findings. Years three through five will expand enrollment to additional rural Alaska communities while establishing Medicaid and tribal health reimbursement pathways and strengthening long-term sustainability. “This approach strengthens rural Alaska’s health system by extending preventive elder support into communities where access to regular care is limited. By integrating telehealth technology, culturally grounded engagement, and community-based workforce development, the program establishes a "scalable rural Alaska elder health support model" for culturally responsive remote elder care across rural Alaska’s tribal and rural health systems.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Fairbanks North Star Borough; Kusilvak Census Area; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Akeela Inc.	24-Bed ASAM Level 3.1 Residential Stabilization and Recovery Services for Rural Alaskans	AK	Alaska’s behavioral health continuum currently has a gap between crisis stabilization or detoxification services and sustained community recovery. Individuals leaving detox or short term crisis stabilization frequently require additional time in a structured environment to stabilize, develop relapse prevention skills, and reconnect with treatment providers before returning home. Without this stabilization step individuals often return directly to environments that contributed to substance use, resulting in repeated cycles of crisis care, detoxification, and relapse. This challenge is particularly significant for rural communities where treatment resources are limited and environmental pressures can undermine early recovery. ASAM Level 3.1 programs address this need by providing clinically managed residential environments that support individuals who are medically stable but require structure, peer support, and recovery skill development. Expanding ASAM Level 3.1 capacity improves continuity of care, strengthens the behavioral health continuum, and increases successful transition from crisis services to community based recovery.	Akeela will implement a 24 bed ASAM Level 3.1 residential recovery stabilization program within its existing residential treatment campus in Anchorage. The campus infrastructure, licensing framework, and staffing platform are already established. This allows the program to launch quickly while minimizing startup costs. The facility includes two residential buildings that support gender responsive programming with one building serving men and the other serving women. Clinical services will align with ASAM Level 3.1 criteria and include individual counseling, group therapy, relapse prevention programming, peer recovery support, life skills development, and case management. Participants will work with clinical staff to develop recovery stabilization plans and prepare for successful return to their home communities. Strong referral partnerships will be developed with Alaska Tribal Health System providers, regional behavioral health organizations, detoxification programs, crisis stabilization programs, and outpatient treatment providers. These partnerships ensure individuals from rural communities can access residential stabilization when local services are unavailable. Southcentral Foundation is developing a new behavioral health facility in Anchorage that will include detoxification services and adult crisis stabilization. The proposed ASAM Level 3.1 program complements this investment by providing the next step in the recovery continuum. Akeela also operates an ASAM Level 3.5 residential treatment program at Akeela House. Individuals who require higher clinical intensity can access that program, while the proposed ASAM Level 3.1 program provides an appropriate stabilization level for individuals who are medically stable but require temporary separation from environments that contribute to relapse risk.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Akeela Inc.	Akeela Statewide Telehealth Assessment Program	AK	A significant structural barrier in Alaska’s behavioral health continuum is the lack of a consistent statewide access gateway into care. Because most treatment programs require integrated clinical assessments prior to intake, limited assessment availability creates a bottleneck that delays service entry. Treatment readiness among individuals experiencing substance use disorder (SUD) and particularly Opioid Use Disorder (OUD) is often immediate and time-sensitive; when access to assessment is delayed, engagement declines, contributing to ongoing cycles of crisis and avoidable healthcare utilization. Rural communities are particularly affected due to limited workforce availability and geographic isolation. The opportunity is to establish a statewide behavioral health front door — a telehealth-enabled access infrastructure that provides integrated assessments when individuals are ready to engage. Rather than building new treatment programs, this project strengthens system flow by expanding access to the clinical entry point required across multiple providers and sectors.	Akeela will operationalize a statewide behavioral health front door through a telehealth-enabled after-hours assessment model that extends licensed clinical workforce capacity across Alaska. Core components include: • Rotating on-call master’s-level clinicians providing integrated behavioral health assessments evenings and weekends. • Telehealth delivery enabling access from rural communities without travel requirements. • Standardized evidence-based assessment protocols ensuring consistent clinical evaluation. • Active care navigation connecting individuals to appropriate levels of care including outpatient services, residential treatment, medication-assisted treatment, tribal health programs, or community supports. • Partnership development with tribal health organizations, rural providers, housing programs, and crisis response teams to support interoperability. The model functions as shared infrastructure supporting the broader behavioral health ecosystem rather than as a stand-alone service. By addressing the statewide intake bottleneck, the project improves system efficiency, reduces duplication, and strengthens coordination across behavioral health, medical, housing, and tribal systems.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

AK-GAL DESIGNS	Memories Across the North: A Letter for You – A Cultural Storytelling Program for Alaska Elders	AK	Rural Alaska communities face significant challenges related to social isolation, loneliness, and limited opportunities for meaningful engagement among aging populations. Elders living in long-term care, assisted living, or independently in remote communities often experience reduced social interaction due to geographic distance, harsh weather, transportation barriers, and workforce shortages. These conditions increase the risk of depression, anxiety, cognitive decline, and reduced emotional well-being. Social isolation among older adults is recognized nationally as a serious public health concern, and the risk is amplified in rural and frontier communities where access to behavioral health services and structured engagement programs may be limited. For Alaska Native communities, culturally meaningful engagement is especially important because elders serve as knowledge keepers and storytelling traditions play a central role in cultural continuity. However, many existing reminiscence and activity programs used in elder care settings do not reflect the lived experiences of elders in Alaska. Memories Across the North: A Letter for You addresses this gap by providing culturally grounded storytelling and reminiscence engagement designed to reduce isolation, stimulate cognitive engagement, and strengthen emotional well-being among Alaska elders.	AK-GAL DESIGNS proposes development and implementation of Memories Across the North, a culturally responsive elder engagement program delivered through structured storytelling letters. The program integrates reminiscence therapy techniques with Alaska-specific cultural storytelling prompts to encourage reflection, conversation, and memory recall among older adults. Participants receive letters that include culturally relevant prompts, short storytelling reflections, space to record personal memories, and illustrations depicting Alaska landscapes, wildlife, and traditional activities. These materials encourage engagement between elders, caregivers, and family members. In addition to monthly storytelling letters, participants may receive encouragement postcards and seasonal greeting cards designed to maintain ongoing connection throughout the year. Elders will also have opportunities to share their own stories using postage-paid reply envelopes, strengthening two-way engagement while helping preserve personal memories and community history. Storytelling prompts will reflect shared experiences common across Alaska communities, including subsistence traditions, seasonal living cycles, village celebrations, wildlife encounters, and northern landscapes. These culturally meaningful themes support emotional well-being while stimulating cognitive engagement. The program also encourages participation from family members, caregivers, volunteers, and students, creating opportunities for intergenerational storytelling and strengthening community connections. Because the program relies on mailed storytelling materials and caregiver-led engagement rather than clinical infrastructure, it can be implemented in rural and frontier communities across Alaska. This creates a scalable, low-cost model for improving social connection, emotional well-being, and quality of life among elders in remote communities.	\$250K-\$1M	Statewide	Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough	Deferred or Not Advanced

Alaska Academy of Family Physicians	AKAFP Rural and Frontier POCUS Initiative	AK	Alaska’s rural and remote communities face significant barriers to timely diagnostic care due to geographic isolation, limited specialty access, and workforce shortages. Clinicians often must make high-stakes decisions without immediate imaging support, and patients frequently travel long distances for basic diagnostic services. There is a critical opportunity to strengthen frontline providers’ diagnostic capabilities by expanding access to point-of-care ultrasound (POCUS) training and equipment within the communities where care is delivered.	We are proposing a first year project as part of a five-year, regionally based initiative delivering a series of intensive 2–3 day, hands-on POCUS training sessions across multiple rural and frontier communities. Training will be multidisciplinary and tailored to physicians, PA-Cs, APRNs, RNs, paramedics, community health aides, and other frontline providers. Each participating community will receive handheld ultrasound devices that remain locally to ensure sustained use beyond the training period. By bringing expert instruction and equipment to communities—rather than removing clinicians from practice for extended travel—this model addresses Alaska’s geographic realities while building durable, practice-ready skills. The lead instructor has two decades of experience living and practicing in rural Alaska, including Kodiak, Ketchikan , Prince of Wales Island, and Bethel, offering deep frontline insight into the realities of delivering care in remote and frontier settings.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Dillingham Census Area; Lake and Peninsula Borough	Advance to Implementation Application

Alaska Addiction Rehabilitatio n Services, Inc.	EMR Implementation	AK	Alaska Addiction Rehabilitation Services, Inc. (“AARS”) is submitting this Letter of Interest to request one-time start-up funding to implement an electronic medical record (EMR) system for our clinical team. AARS does not currently have an EMR and is evaluating behavioral-health-focused solutions (including Opus). We can sustain ongoing licensing and operating costs within our annual operating budget; RHTP support is requested for up-front implementation costs. AARS provides residential SUD treatment and related services for adults from across Alaska, including rural and remote communities. Our campus-based services operate as part of an interconnected statewide behavioral health system in which rural residents often receive care through hub providers. Operating without an EMR limits clinical documentation efficiency, care coordination, measurement-based care, and the organization’s ability to participate in modern interoperability and data-driven quality improvement. For SUD treatment settings, technology modernization must also prioritize privacy, security, and compliance.	RHTP funds would support one-time start-up costs to implement an EMR/EHR, such as: • Implementation and configuration services (clinical templates, workflows, permissions) • Staff training and go-live support • Initial licensing/start-up fees and required integrations • Hardware or one-time IT upgrades directly required for implementation (as applicable) • Data migration/setup costs (as applicable) AARS is evaluating an EHR designed for behavioral health/SUD settings and intends to select a platform that supports secure data practices and enables future participation in statewide interoperability pathways, including connection to Alaska’s designated health information exchange where appropriate.	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

Alaska Addiction Rehabilitatio n Services, Inc.	Four-Plex Activation for Outpatient and Transitional Housing	AK	AARS provides long-term residential substance use disorder (SUD) treatment and wraparound programming for adults from across Alaska, including people from rural and remote communities who must often travel to access residential care. For many Alaskans, particularly those returning to rural communities or transitioning out of residential care, housing instability can undermine engagement in outpatient care, continuity, and employment plans. The solution is to create a low-cost, time-limited, recovery-supportive housing option that is designed to stabilize clients as they step down and transition from higher levels of care while pursuing permanent housing. AARS already has one of these 16-bed four-plex's on site and fully in use. This request is for the second one which is also on site, and only needs fixtures, furnishing, equipment, and utility/septic connection.	RHTP funds would support one-time purchases required for one-time, non-operating expenses necessary to activate an existing asset. We anticipate that these one-time funds will be expended in Summer 2026. These purchases will include: • Utility connections and septic/start-up infrastructure necessary for occupancy (scope limited to activation; no significant construction involved). • Essential furnishing and equipment packages designed for basic occupancy (including beds, storage, and essential kitchen items as necessary). • Safety and accessibility fixtures, as well as any necessary inspections or permits that are directly related to activation. This housing would be used to support: • Outpatient clients seeking a short-term, cost-effective solution for consistent engagement in services. • Transitional housing for individuals completing treatment who require temporary stability while obtaining permanent housing. • Vocational training programs that emphasize practical job skills through on-site project work.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Addiction Rehabilitatio n Services, Inc.	Furniture, Fixtures and Equipment- Gym and Recreation Center	AK	Alaska Addiction Rehabilitation Services, Inc. ("AARS") is submitting this Letter of Interest to request one-time finishes, furniture and equipment support to activate our on-campus gym and recreation/community center. This investment will improve the recovery outcomes of approximately 94 clients by providing year-round access to structured physical wellness, particularly during Alaska winters. Additionally, it will serve as a shared space and storm-shelter resource for the broader Point Mackenzie community. AARS provides long-term residential substance use disorder (SUD) treatment and wraparound programming for adults from across Alaska, including people from rural and remote communities who must often travel to access residential care. People in recovery from substance use disorders frequently face compounding physical and behavioral health risks. In Alaska, the challenges posed by dark winters, isolation, limited indoor recreation opportunities, and disrupted routines may intensify these risks, especially in residential environments where structured daily schedules are essential for treatment engagement. The aim is to integrate evidence-informed physical wellness and prosocial activities into treatment and aftercare routines by utilizing a dedicated, accessible indoor space.	RHTP funds would support one-time purchases required for the opening and operation of the gym/recreation/community center space. We anticipate that these one-time funds will be expended in Summer 2026. These purchases will include: • Commercial grade fitness equipment and durable finishes appropriate for clinical and recovery settings. • Multifunctional furniture to support group wellness programming, peer support meetings, and recovery-oriented events. • Fixtures and finishes required for safe operation in a welcoming setting designed for universal access. • Furnishings and equipment to support dual-use for community events and emergency shelter functions. This project aligns with: • Advancing Healthy Communities through physical activity, prevention-oriented wellness, and social connection supports. • Enhancing Health Care Access by increasing the effectiveness and durability of a key behavioral health access point for rural Alaskans (improved engagement and outcomes in a hub-based treatment setting). • Supporting RHTP Goal 1 (lifelong health and wellbeing) and Goal 2 (outcomes-driven systems), by building durable recovery-support infrastructure that can be maintained beyond the RHTP period.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Addiction Rehabilitatio n Services, Inc.	Furniture, Fixtures and Equipment- Residential Expansion	AK	Alaska Addiction Rehabilitation Services, Inc. (“AARS”) respectfully submits this Letter of Interest for a one-time request for \$1,500,000 (estimated) to activate our near-completed residential expansion. This funding will support the purchase and installation of finishes, furniture, and equipment necessary to open 26 additional residential treatment beds, thereby doubling our licensed residential capacity on the Point MacKenzie campus and significantly expanding access to long-term substance use disorder treatment for Alaskans statewide. Alaska continues to face substantial access constraints for long-term residential substance use disorder SUD treatment. Rural and remote residents are disproportionately affected due to geographic isolation, travel requirements to hub communities, extended wait times, and disruptions in continuity of care. AARS has already made the primary capital investment to expand its residential facility. The sole remaining barrier to placing the 26 new beds into service is the purchase and installation of essential finishes, furniture and equipment required for safe and effective operations at the expanded scale.	RHTP funds would be used for one-time start-up purchases to operationalize the completed building, including: • Bedroom finishes and furniture including beds, mattresses, dressers, lockers, seating, and bedding systems (as applicable). • Common are finishes and furniture to support the needs of daily living and therapeutic communities. • Equipment necessary for safe clinical, medical, and program-support operations. • Accessibility, security, and life-safety fixtures • Activation-related technology directly tied to patient operations (non-recurring items only). The procurement plan is implementation-ready. Funds will be allocated in Spring 2026 to ensure expanded treatment capacity becomes operational within the calendar year. This project accomplishes several RHTP goals: • Health Care Access will be improved by increasing the practical capacity of a regional hub that serves rural residents and expanding access to behavioral health/SUD treatment services. • Healthy Communities can be strengthened with sustained recovery infrastructure and supportive services that reduce relapse risk and downstream acute-care utilization. • RHTP core goals are achieved by enhancing access, improving outcomes, and implementing a durable, one-time investment that is sustainable beyond the RHTP period.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Adoption Services	Potty Training Education & Support	AK	Too many children remain in diapers beyond developmentally appropriate timelines due to limited access to supplies, transportation barriers, and lack of practical potty-training support. These challenges are especially pronounced for families in rural and underserved communities, where diapers and pull-ups may be unaffordable or difficult to obtain. As a result, children may experience prolonged diaper dependence, increased household financial strain, and greater risk of preventable diaper-related health issues. This project addresses that gap by providing consistent access to pull-ups alongside structured potty training education and comprehensive potty training kits. By equipping families with both the materials and knowledge needed to support age-appropriate toileting independence, we aim to reduce long-term diaper reliance, improve child health, and ease financial pressure on families.	By combining pull-up distribution, targeted education, accessible potty training kits, and improved operational systems, this approach supports healthy child development, increases caregiver confidence, and reduces long-term diaper dependency while strengthening the sustainability of our mobile pantry services. Our proposed approach integrates potty training support into our existing mobile diaper pantry services to address both supply and education gaps. Families will receive developmentally appropriate potty training kits that include training underwear, child-friendly potties or seats, and visual supports, along with structured, easy-to-follow educational materials. Education will focus on recognizing readiness signs, establishing routines, and using positive reinforcement strategies to support age-appropriate toileting independence. Through our mobile pantry distribution, families will have consistent access to pull-ups while transitioning out of diapers, reducing setbacks caused by supply shortages. This ensures children remain comfortable and supported throughout the potty training process. To further expand access, we will utilize Project DASH through DoorDash to deliver potty training kits and pull-ups directly to families who travel to Anchorage from rural villages and to Anchorage families with transportation barriers. Many families traveling to Anchorage lack transportation during their stay, limiting their ability to purchase essential supplies. Direct delivery eliminates this barrier and ensures children have the hygiene items they need during short-term visits. By combining mobile distribution, caregiver education, and direct delivery for families, this approach reduces diaper dependence, strengthens equitable access to preventive support services, and improves child health outcomes.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Alaska Alternative Medicine clinic, LLC	Rural Integrative Mentorship & Telehealth Initiative	AK	The Problem: Rural and frontier Alaskans face a "specialty care gap." While primary care is available via Community Health Aides, patients with complex, chronic, or treatment-resistant conditions (autoimmune, chronic pain, environmental illness) have no local options. Currently, these patients must either fly to Anchorage at a massive personal and system cost or remain untreated, leading to long-term disability and reduced quality of life. Furthermore, rural providers lack access to high-level mentorship in integrative medicine—the very "root-cause" approach that can prevent medical evacuations for chronic conditions. The Opportunity: Dr. Sandra Denton represents a unique clinical asset. With 50+ years of experience—including 13 in Emergency Medicine and 41 in Integrative Practice—she is an international authority on restorative health. However, her expertise is currently "locked" behind a high-volume clinical load in Anchorage. There is a profound opportunity to transition Dr. Denton from a solo practitioner to a statewide "Tele-Preceptor." By hiring a secondary provider to manage the Anchorage hub, we can "unlock" Dr. Denton to provide specialized telehealth and clinical mentorship to the most remote corners of the state, creating a bridge between frontier clinics and world-class integrative expertise.	The "Hub-and-Spoke" Capacity Building Model Our approach utilizes a "Clinical Backfill" strategy to transform a single urban clinic into a statewide resource for rural health. The project consists of three core pillars: 1. Strategic Workforce Expansion (The Hub): We will utilize grant funds to recruit and onboard a board-certified Associate Provider (preferably within the state) at our Anchorage clinic. This provider will assume the daily management of the existing patient base. This is the "catalyst" hire that releases Dr. Denton from 40+ hours of routine clinical duty, allowing her to pivot 50% of her FTE toward rural outreach and workforce development. 2. Rural Provider Mentorship & "Train-the-Trainer" (The Spoke): Dr. Denton will establish a formal mentorship program for rural Community Health Aides (CHAs) and mid-level practitioners. • Case Consultations: Rural providers can "e-consult" with Dr. Denton on their most complex chronic cases, gaining insights into integrative protocols that can be administered locally. • Clinical Preceptorships: We will host rural providers for intensive short-term rotations in Anchorage, where they will learn non-invasive modalities (such as chelation and ozone therapy) and the "medical detective" methodology to identify environmental triggers in their home communities. 3. Frontier Telehealth Integration: We will deploy a specialized telehealth portal dedicated to patients in remote and frontier regions. This allows Dr. Denton to serve as a virtual specialist for conditions like Lyme disease and chronic toxicity—areas where she is one of the few (or only) certified experts in the state. By treating these patients in their home villages, we reduce the burden on the Medicaid travel system and ensure continuity of care. Sustainability: This approach creates a permanent legacy of knowledge. By the end of the grant period, the Associate Provider will be fully integrated into the Anchorage practice, and a cohort of rural providers will be upskilled in integrative care, ensuring that Dr. Denton's 50 years of clinical wisdom is codified and distributed throughout the Alaska Tribal Health System.	\$250K-\$1M	Private practitioner	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Assoc. for Infant and Early Childhood Mental Health	Asset Mapping for Success	AK	Babies, toddlers, preschoolers, and their families, including expecting families, are supported by professionals with diverse backgrounds across multiple systems of care. Professionals who promote and support early mental health and social-emotional well-being include not only mental health providers, but a range of allied professionals in fields such as early learning, home visiting, intervention, pediatric healthcare, and others. At present, there are several opportunities for the IECMH workforce development. However, the training and services are siloed, and organizations often do not know what other organizations are offering. This often leads to duplication of efforts or a total lack of services/training opportunities. The desired outcome of this project requires that agencies cross lines, leave silos behind, and unite around a common effort to improve the lives of Alaska's little ones. The outcomes of this project include; 1. Provide a deeper understanding of the existing gaps, needs, barriers, and areas of strength across the IECMH promotion, prevention, and intervention workforce continuum 2. Create an interactive map highlighting IECMH training for professionals 3. Use these results to inform the IECMH training and workforce needs of communities within Alaska.	A strong IECMH system that best supports young children and families in Alaska requires partnerships among agencies that are committed to providing training for professionals in the field. A consultant will be hired to convene a team or survey child-serving state agencies and community stakeholders from across IECMH disciplines. The Team will be composed of individuals who demonstrate commitment and leadership to young children and have the ability to advance IECMH practice in the state. It is anticipated that many agencies will submit letters of intent or proposals for IECMH training to the Rural Health Transformation Grant. The goal of the project is to conduct agency surveys to identify all proposed trainings, create a map of workforce development showing which agencies provide which training, and identify gaps for future training. The map will identify current and potential training across the continuum of IECMH — prevention, promotion, and intervention. The year-long project will identify potential partners, develop surveys, convene in-person gatherings, and collect information. The 12-month project will include both planning and data collection, providing an overall map of training opportunities to support those providing IECMH services. The project will also include surveys of the workforce in rural communities to determine what training they desire. This letter of intent outlines beginning thoughts for the project and will be further developed during the planning stage.	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Association for Play Therapy	Advancing Play Therapy Workforce and Research for Early Childhood Behavioral Health in Alaska	AK	Alaska faces significant behavioral health (BH) workforce shortages and limited access to developmentally appropriate evidence-based BH services for children ages 0-9 and their families, particularly in rural and remote communities. Large areas of the state are federally designated Mental Health Professional Shortage Areas (HRSA, 2023). Nationally, one in five children experience a diagnosable mental health disorder annually (CDC, 2022). In Alaska, 47% of 3-year-olds have experienced at least one Adverse Childhood Experience (ACE), and 10% have experienced four or more (Alaska Department of Health, 2023). Untreated BH challenges in early childhood have have long-term impacts on emotional regulation, school readiness, family functioning, and overall health outcomes. Despite this, many clinicians in Alaska receive minimal specialized training in developmentally appropriate evidence-based interventions. Evidence-based play therapy models are widely recognized as a gold-standard for children's interventions. Play is the primary language through which children communicate and process emotional experiences. However, access to formal play therapy training, certification pathways, and research support is extremely limited in Alaska. This project advances Alaska’s Rural Health Transformation priorities by expanding BH workforce, strengthening early intervention for young children, and improving access to developmentally appropriate BH services in rural and frontier communities.	This project proposes a three-prong initiative designed to build a BH ecosystem that strengthen Alaska’s early childhood BH workforce, expands training in evidence-based play therapy (PT), and develops research infrastructure to evaluate PT outcomes across Alaska's rural and urban communities. Initiative 1: Statewide Rural Behavioral Health Needs Assessment The first initiative establishes a statewide data foundation to guide workforce development and training priorities, examining: Behavioral health (BH) services available for children ages 0-9 and their families across Alaska; Gaps in counseling and BH services for young children, particularly in rural and frontier communities; Existing training and use of evidence-based PT models among BH providers; research involving Alaska’s diverse population to assess representation within the evidence base for PT models. Initiative 2: Statewide Training & Workforce Development Guided by the needs assessment findings, establish a statewide training program to expand provider capacity: Train two experienced clinicians to serve as statewide PT trainers; Develop foundational and advanced PT training for BH clinicians; Implement a train-the-trainer model to expand access to PT training across Alaska; Integrate Infant and Early Childhood Mental Health principles with evidence-based PT models for children ages 0-5; Delivering accessible training to BH clinicians, BH aids, home visitors, and early childhood providers. This training emphasizes play as the natural language of children and prepares providers to deliver developmentally appropriate care for children who have experienced adverse childhood experiences (ACEs), recognizing that effective treatment differs from traditional talk-based therapy approaches. Initiative 3: Establishing a Play Therapy Research Hub This hub evaluates PT effectiveness within Alaska's BH system by: Mapping existing PT research conducted within Alaska; Partnerships linking clinicians, BH aids, tribal organizations, and academic institutes for culturally responsive research; Provide pilot funding for research studies evaluating PT models in Alaska communities; Strengthening connections between training, clinical practice, and research, this initiative expands the evidence base for culturally responsible PT and builds capacity to generate locally relevant knowledge that informs policy, workforce development, and behavioral health services statewide.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Association of Conservation Districts	Creating a Produce Prescription Program for Alaska	AK	Food is medicine; but food is not prescribable, nor covered by insurance. We want to empower primary care providers in south central Alaska to prescribe one of the most powerful, legal medicines manufactured right in Alaska – locally grown produce and seafood. Many chronic diseases can be prevented or reversed with the right lifestyle behaviors – diet, exercise, weight loss, etc. However, since major insurances cover some part or all of medical visits and medicines, the patient will walk out of the exam room with a referral to either “see a specialist” or “take a medication.” Discussions about improved diet remain mere discussions between the doctor and patient, and do not manifest into priorities. There is nothing signed by the doctor, and free or nearly free to the patient. Additionally, we learned during Covid and numerous natural disasters since, that Alaska relies heavily on outside food sources. Teaching residents about how supporting local growers is the most reliable path towards food security in small Alaska communities. Six of the Healthy Alaskans 2020 goals were related to reduction of obesity; America’s Health Rankings reports only 8 percent of Alaskan adults report consuming three or more vegetables daily. And according to the National Library of Medicine NIH, Alaska Native communities face disproportionate levels of chronic diseases and vegetable and fruit intake is significantly less than their counterparts nationwide.	We would like to create a program where providers can prescribe locally grown fruits and vegetables (and possibly Alaska caught salmon) as part of a covered treatment option. This would mean providers write a prescription, the patient takes the prescription to identified hubs or programs of local growers who are participating; the patient gets their goods; and grower is reimbursed by the grant. There are many details to figure out – from who, what, how, where – the details all still have to be flushed out to create a meaningful and fundable project. But all the opportunities need time to research and develop. 1.) We need to understand the supply side of the equation to know if there are enough producers to grow the food, how long could they supply fresh food to patients during the year, and in what manner would they be most likely to deliver the produce. 2.) On the demand side of the equation, we need to know how many doctors would be interested in prescribing food to their patients, how many patients they could imagine giving prescriptions, and what kind of vegetables or seafood they would want to prescribe. 3.) The ideas and enthusiasm around this plan to improve eating habits and nutrition at home are endless. We could include a slow cooker or instant pot, salmon or other healthy seafood, or recipes to guide the patient to success. 4.) We need to figure out who would manage the prescription, what entity could act as the “pharmacy” or clearinghouse for patients to match up with farmers. Would it be best to create a list or a website to facilitate this connection? This round of funding would be used to hire someone to connect the dots with all the players, figure out what is possible and what is sustainable, and put forth a full project application for the next round of funding.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough	Deferred or Not Advanced

Alaska Association of Conservation Districts	Cultivating Preventative Care: Scaling the Anchor Gardens Model for Chronic Disease Reduction	AK	Community and home gardens bypass systemic barriers like cost or distance to fresh produce. Growing food at home reduces transport miles and makes adding nutrition to one's diet easy, fun, and habitual. A 2026 joint study by Yuka and Harvard Law School’s Food Law and Policy Clinic, "The Hidden Costs of Low-Priced Foods," found that the cheapest store-bought foods contain more additives, sugar, and sodium than pricier options. Healthy foods are often hard for low-income households to access, and diet-related illnesses are a rising burden. Healthy food should be the standard. Home-grown vegetables are a key strategy for nutrition, especially when grown by the consumer. Gardening skill is gained through experience, but a knowledge-sharing network helps gardeners produce results more efficiently. For example, many are intimidated by composting, which is vital for low-cost soil health. The network also encourages pooled resources—gardeners can access free supplies or find mentors for specialized tasks like raising chickens. Gardens also build community, bridging generational or cultural barriers by encouraging the sharing of skills, tools, and harvests.	This project would establish long-term, resilient networks for a sustainable nutrition program through home and community gardens. Gardens often operate on the fringes of their potential due to limited resources and fragmented knowledge. This project aims to transform these modest plots into beneficial hubs of health by building out a network coaching structure, bolstering physical infrastructure and pooled resources, and embedding structured educational opportunities directly into the soil of the community. We aim to scale Anchorage’s successful Anchor Gardens model, a network connecting individuals through gardening to build social capital, across Southcentral Alaska and the Kenai Peninsula. The model uses a team of coaches who volunteer their time to mentor anyone who wants to garden. Coaches support their neighbors with garden design, troubleshooting, access to resources (seeds, nursery pots, compost, etc), and connections to a community working to improve food security across the state. Anchor Gardens, developed over the past six years, has grown and strengthened through partnerships with local organizations and small pockets of funding. Organizers are eager to share these lessons and bring its success to a wider statewide network. The Anchorage, Kenai, and Homer Soil and Water Conservations Districts, along with community groups such as NeighborWorks Alaska, Alaska Master Gardeners, and other partners will collaborate to develop programming and organizational structures appropriate for each community. Hands-on workshops will demonstrate how to plan and care for gardens throughout the season, including workshops on how to preserve harvests through canning, fermenting, and drying, critical skills for food security. We will also provide training in regenerative agriculture techniques, such as composting and integrated pest management.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough	Deferred or Not Advanced

Alaska Association on Developmental Disabilities	Strengthening Alaska’s Rural Disability Workforce and Support System	AK	AADD was introduced to GoodLife Innovations at a national ANCOR conference. Founded by families, GoodLife is a community-based provider that has partnered with the University of Kansas for over 45 years to research, test, and implement evidence-based workforce strategies. Through continuous refinement, GoodLife develops practical strategies that promote healthy work-life balance for DSPs through innovative scheduling, technology that allows for remote support when requested, and a relationship-based approach to neighborhood support networks and shared living (host home) arrangements. After demonstrating strong success, GoodLife launched consulting services to help providers nationwide replicate its model. With support from the Alaska Mental Health Trust, AADD piloted this approach with two Alaska providers, producing promising early results. This project builds on that momentum to expand these strategies and advance systemwide transformation. This project strengthens Alaska’s rural healthcare ecosystem by modernizing service delivery, stabilizing the workforce, and expanding access to high-quality supports for individuals with barriers to independence. Rather than relying on short-term fixes, this approach positions Alaska to lead in next-generation service delivery—transforming workforce challenges into an opportunity to deliver more equitable, efficient, and connected care for rural communities.	GoodLife’s approach is a comprehensive, four-pillar strategy designed to move Alaska toward a transparent, high-performing service delivery model that integrates human expertise with advanced technology. Participating organizations and partners will have access to GoodLife University’s Subject Matter Experts (SMEs) to stabilize the workforce and modernize care. The strategy includes four integrated work-streams: 1. Workforce Stabilization (WF): Implementation of advanced workforce management, including scheduling and pay strategies, recruitment pipelines, and non-wage benefits. The goal is to reduce DSP vacancies and call-offs while transitioning more staff into stable, full-time positions. 2. Technology Advancements (TA): We will conduct waiver and barrier analyses to draft policy recommendations for remote and enabling support technology. Stakeholder education ensures program administrators, caregivers, and persons-served understand how technology can enhance human service models. 3. Fractional Care & Neighborhood Network (NN): This pillar introduces a fractional care model and neighborhood ecosystem capable of providing on-demand, 15-minute-unit staffing to fill care gaps traditional models often miss. Integrated with iLink Technologies, this approach ensures providers can maintain essential services and fill authorized care hours without canceling care due to staff shortages. 4. Professional & Natural Family Support (Host Home): GoodLife will expand the Shared Living concept by leveraging natural supports and Professional Family host-homes. This model improves housing stability and compensation for caregivers, creating a more durable support system for those with intensive needs. Host Homes, a future service to be added to Alaska’s 1915(c) waiver, will meet critical needs in remote communities where traditional services are not always a good fit. Support from an experienced organization like GoodLife, which has utilized and refined this model since 1999 and achieved measurable success, will greatly assist in the implementation of this service. Through these pillars, GoodLife delivers the right care at the right time, with the right human touch. Success will be measured through live metrics dashboards, tracking DSP satisfaction, wage growth, and the delivery of more authorized care hours.	\$1M-\$5M	Statewide	Anchorage (Municipality); Copper River Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Advance to Implementation Application

Alaska Association on Developmental Disabilities	The Road Home: Intensive Care and Community Integration for Alaskans with Complex Needs	AK	Alaska's is struggling to serve children and adults with complex, co-occurring behavioral needs. Changes over the past decade — increase in small providers, persistent workforce shortages, and depressed reimbursement rates — have created a destructive cycle. When a person loses their provider following an incident, the State must scramble to find an emergency placement. Inexperienced providers, drawn by higher acuity-based rates, accept referrals they lack the depth or experience to sustain. Placements fail. The trauma of repeated disruption discourages more established providers from accepting complex referrals. AADD recently completed a Trust-funded planning grant that validated this as well as further indicated some individuals are placed in settings that manage behavior through suppression rather than support, relying on approaches that keep people compliant without the clinical foundation or trained staff that person-centered behavior support requires. The Complex Behavior Collaborative has not kept pace: funding has remained flat, eligibility and referral processes are unchanged, there's a waitlist for situations requiring immediate response and a lack of clinical expertise. Coordinated transition planning is largely absent. This project also recognizes individuals who fall outside the 1915(c) waiver yet require long-term care or structured residential support due to co-occurring disabilities. This planning phase will evaluate their inclusion in this project.	Alaska is not without a roadmap. A 2009 WICHE report recommended a "three-legged stool" approach to complex care in Alaska: (1) a behavior hub providing technical assistance and consultation — fulfilled by the Complex Behavior Collaborative; (2) brief stabilization services — addressed through Mobile Crisis Teams; and (3) intensive intermediate intervention services. This project proposes to build this third leg. WICHE described this as a small ICF-IDD or intensive, structured residential setting — a step-down intervention designed to stabilize behavior so individuals can transition into community-based settings like group homes. Through AADD's Trust-funded planning grant, the team identified a successful model in Delaware that serves as the foundation for this pilot. The proposed approach is to establish two residential settings with dedicated clinical oversight — including a Board-Certified Behavior Analyst, a Licensed Clinical Social Worker, and a nurse — staffed by Registered Behavior Technicians. These would not be traditional group homes, but rather structured, time-limited intervention settings focused on assessment, behavior plan development, skill building, and planned transition back to the community. This phase will explore piloting Alaska's emerging complex care home license type as the regulatory and oversight framework for these settings, and will evaluate use of the Health Information Exchange (HIE) as a mechanism for sharing critical information across the team — including primary care, emergency services, and behavioral health — ensuring coordinated, informed support across the continuum. The project team brings exceptional depth. A veteran CBC consultant who also leads a provider organization has committed to serving as the pilot service provider. A consulting team with multi-state experience implementing complex care solutions will provide project management, technical assistance and implementation support. Eric Boyer with the Alaska Mental Health Trust have also been actively involved. SDS leadership has been consulted. AADD's director has nearly 30 years in DD services in Alaska. Together, this team combines on-the-ground Alaska expertise with national best practice knowledge. Goal 2 — to be addressed after launching the residential services — will map the broader continuum of care and develop an action plan to build capacity - highlighting preventative support options - for providing support at sub-acute level.	\$250K-\$1M	Home- and community-based services provider	Statewide	Anchorage (Municipality)	Advance to Implementation Application

Alaska Automation	Resilient Community Water SCADA to Safeguard Health Access in Rural Alaska	AK	Rural coastal and island communities in Alaska face recurring water and wastewater outages, contamination events, and slow emergency response because aging, fragmented SCADA systems provide limited situational awareness, delayed alarms, and no integrated asset context. Each incident directly threatens public health and disrupts health care access when clinics must curtail services, cancel procedures, or operate without confidence in water safety. These avoidable disruptions undermine healthy communities by increasing risk of gastrointestinal illness, skin infection, and other conditions that disproportionately affect elders, young children, and residents with chronic disease. We propose deploying Structure’s, unified SCADA platform—implemented and supported by Alaska Automation—to modernize water and wastewater monitoring and control in participating communities, including Chignik Lagoon and Yakutat (confirmed) with Juneau, Sitka, and Wrangell as additional hub sites under discussion. The opportunity is to convert raw telemetry into actionable incident workflows, automate emergency notifications to operators and clinics, and preserve institutional knowledge so that essential utilities remain reliable and safe, underpinning primary care, behavioral health, maternal health, and other services in rural Alaska.	Alaska Automation will lead a phased, operator centered deployment of Structure SCADA tailored to each participating community’s existing control network and communications constraints. • Phase 1 – Assessment and pilot (Health Care Access focus): Inventory critical water and wastewater assets; map existing PLCs, RTUs, and communication paths; and deploy Structure in parallel with legacy systems in two pilot communities (Chignik Lagoon and Yakutat) so operators and clinic partners can validate performance without operational risk. We will configure core GIS integrated views, role based access, and encrypted communications to meet cybersecurity expectations for health critical infrastructure. • Phase 2 – Workflow build out and regional expansion (Healthy Communities focus): Implement event based “Action Editor” logic for automated leak detection, stale signal and device health alerts, point of entry shutdowns, and preconfigured incident packets that include GIS maps, affected customers, and communication templates for clinics and the public. Deploy QR based inventory tracking for critical spares, develop clear SOPs embedded in the system, and extend the platform to additional communities (e.g., Juneau, Sitka, Wrangell) using a hub and spoke model that supports regional health partners. • Phase 3 – Validation, drills, and sustainment: Conduct tabletop and live simulation exercises with utility operators, clinic staff, and borough emergency managers to test response workflows and clinic notification pathways. Refine predictive alerts and escalation rules based on incident data, formalize knowledge capture requirements (incident reports, photos, corrective actions), and execute a multi year training and support plan that gradually transitions day to day oversight to local staff while maintaining remote technical support from Alaska Automation. Throughout all phases, the project will document health relevant metrics—such as outage frequency, boil water notices, and clinic service disruptions—to demonstrate impact on health care access and community health over time.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Juneau (City and Borough); Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Alaska Backcountry Medicine	Alaska Frontier Wilderness Medicine Scholarship & Education Center Development Program	AK	Alaska has a wilderness and rural medicine problem that nobody is systematically solving. Wilderness medicine isn't defined by a specific number of minutes — it's defined by managing a patient for hours or days with limited resources while making time-critical evacuation decisions. That reality describes most of Alaska, and it extends well beyond backcountry hiking emergencies. You don't have to go far from Anchorage before EMS response is measured in hours — in rural and remote communities, that gap can be a day or more. WFA and WFR carry no nationally standardized certification, but courses from established providers like NOLS, SOLO, WMA, and Base Medical follow Wilderness Medicine Education Collaborative standards and are widely recognized by employers, SAR programs, federal land managers, and guiding operations. More importantly, they're accessible in a way that EMT training isn't — a 16-hour WFA or 70-hour WFR fits around a fishing season, a work schedule, or a subsistence lifestyle. An EMT course requires 140–160 hours, clinical rotations, and ongoing agency affiliation. For most rural Alaskans, wilderness medicine is a realistic first step. For many, myself included, it becomes the reason they pursue EMS at all. Still, no organization is proactively bringing this stepping stone to the communities that need it most. This project removes those barriers and turns a stepping stone into a keystone for emergency preparedness in a community.	ABM will deliver zero-cost WFA, WFR, and Wilderness BLS scholarships across six Alaska regions through direct proactive outreach — we contact communities, they don't have to find us. Courses reach road-system communities, off-road hubs like Bethel and Kodiak, Southeast Alaska, and bush fly-in for the most isolated villages. Curriculum is through Base Medical, following Wilderness Medicine Education Collaborative standards — the same as NOLS, SOLO, and WMA, recognized by NPS, federal land managers, and SAR programs nationwide. WFA is 16 hours; WFR is 70+ hours with online content and in-person practical days I fly in to deliver. Wilderness BLS — developed through Base Medical's American Red Cross partnership — bridges standard BLS skills with wilderness and remote contexts. Integrated from Year 1, it gives students a recognized resuscitation credential alongside their wilderness training. I will design ABM's WFR course to meet not just WFR standards but also those of the Alaska ETT and NREMT-EMR. The ETT provides state recognition and civil liability immunity under Alaska statute; the NREMT-EMR provides national registry recognition accepted by agencies like NPS. Which credential a student leaves with is determined before the course begins based on the community's or organization's needs. Both are a direct path to EMT-1. The long-term goal is permanent infrastructure, and I've watched the model work. ODFW was one of my first clients — 24 students in 2022. In 2023 one of their staff had a serious field injury; their trained colleagues handled it correctly. That incident made it real. They came back with 42 students in 2024, 46 this year, and are becoming a Base Medical Education Center. The economics drove it: in-house instructors pay \$65/student for WFA instead of \$250+. Recertifying 50 students drops from \$13,000 every two years to \$5,410 — saving \$7,590 per cycle, indefinitely. In McCarthy I've run for-profit courses since 2022 and enrollment keeps growing. WFRs I trained now volunteer with the response group and/or SAR; several earned their EMT, which I also taught. A WFA is often the first time someone realizes they can do this work — the gateway into EMS. I instruct EMT courses for APEC statewide, and through this grant Dane Wallace and I are formalizing that connection with a wilderness add-on scholarship track for APEC graduates. APEC's separate RHTP deliverables are additional infrastructure this program connects to directly.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Prince of Wales-Hyder Census Area; Skagway (Municipality); Wrangell (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Behavioral Health	Alaska Seeds of Change Model Transition	AK	Client disengagement is a critical barrier in behavioral healthcare, especially for people with serious mental illness. Research estimates disengagement rates as high as 46% (PMID 19037573). At AKBH, more than half of clients are discharged without completing treatment. Alaska’s suicide rate of 26.2 per 100,000—nearly double the national average of 13.9—reflects the devastating cost of untreated mental illness (Alaska Dept. of Health). Evidence shows outcomes improve significantly when clients engage earlier and stay engaged, making retention the highest-leverage intervention point. Group therapy offers a proven, scalable solution: a meta-analysis of 329 randomized controlled trials and 27,000+ patients confirms group therapy produces outcomes equivalent to individual therapy for depression, anxiety, PTSD, and substance use disorders (Burlingame et al., 2016). The APA estimates that if 10% of people needing mental health care accessed group therapy, 350 million more Americans would gain access, allowing limited providers to serve far more clients (APA Monitor, 2023). AKBH currently lacks adequate group space and large motor activity space at several facilities. We see a clear opportunity to increase engagement and expand group services through our CCBHC, extending the full spectrum of behavioral healthcare to more Alaskans.	Alaska Seeds of Change has a strong record of supporting transition-age youth through hydroponic farming, gardening, vocational training, and therapeutic engagement. This project broadens that proven model to serve clients of all ages across AKBH. The initiative includes: 1) Revamping the AKSOC facility to create dedicated spaces for group therapy, physical activity, art therapy, skill development, and individual counseling—directly addressing the infrastructure gap limiting group service delivery. 2) Creating enriching therapeutic environments designed to support behavioral activation, peer connection, and skill development—evidence-based mechanisms strongly correlated with treatment retention. 3) Developing a client computer lab, kitchen space, and recreational areas to reduce participation barriers and support daily living skills. 4) Integrating vocational apprenticeships for youth including farm maintenance, customer service, event management, and exposure to behavioral health careers. This transformation will create a versatile, welcoming hub that supports clinical services, skill building, and community connection.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Single Community	Anchorage (Municipality)	Advance to Implementation Application

Alaska Behavioral Health	Behavioral Health Workforce Development, Clinical Internship Program	AK	Alaska continues to experience significant unmet behavioral health needs, with many individuals requiring complex, sustained care. There is an urgent need to expand and strengthen Alaska’s behavioral health workforce. Addressing the statewide shortage of qualified providers requires intentional investment in training pathways that prepare clinicians to deliver effective, culturally attuned care across Alaska’s broad geography. Building this workforce begins with high-quality clinical internships that offer hands-on experience, structured supervision, and training in evidence-based interventions proven effective for telehealth delivery. As a Certified Community Behavioral Health Clinic (CCBHC), a National Child Traumatic Stress Network Center, and one of Alaska’s longest-standing behavioral health providers with more than 50 years of service, Alaska Behavioral Health is uniquely prepared to meet this need. The organization has established clinical internship partnerships with over 35 universities and colleges nationwide, creating a strong pipeline of students seeking high-quality internship experiences in Alaska. Drawing on decades of experience, statewide reach, and deep clinical expertise, Alaska Behavioral Health is ready to expand and scale its clinical internship training program. This expansion will directly address the behavioral health workforce shortage while improving access to culturally responsive care for rural Alaskans.	Workforce development is essential to meeting the complex behavioral health needs of Alaskans. A critical and often limiting factor in training clinical providers is access to high-quality clinical internship placements within behavioral health organizations. These internships provide trainees with evidence-based treatment training, real-world experience, supervision, and the support needed to develop into culturally competent, highly skilled Alaskan behavioral health professionals. Master’s level clinicians are best equipped to lead clinical treatments for complex behavioral health conditions, and clinical internships are one of the most important components of these graduate programs. It is during these internships that academic knowledge is integrated into real-world health care delivery. While student fees and other resources support academic training, the clinical internship experience that occurs within community behavioral health clinics requires dedicated funding. Historically, this activity was supported through a CBHTR grant; however, the downsizing and eventual elimination of that funding has left this critical program unsupported. Without renewed investment, the capacity to train the future behavioral health workforce will be significantly diminished. With RHTP funding, Alaska Behavioral Health would support 25 master’s level clinical placements in FY 2026, directly addressing the need for highly trained providers capable of serving rural Alaskans. Interns would receive training in evidence-based treatments proven effective for delivery via telehealth, a critical strategy for reaching rural, remote, and frontier communities. Training would include MATCH-ADTC (Modular Approach to Therapy for Children with Anxiety, Depression, Trauma or Conduct Problems), TF-CBT (Trauma-Focused Cognitive Behavioral Therapy), CBT (Cognitive Behavioral Therapy), and PC CARE (a modular, trans-diagnostic treatment for families). Interns will receive clinical supervision from on-site, Alaska-based supervisors and mentors, and will participate in a weekly didactic lecture series focused on delivering evidence-based, culturally responsive care to rural Alaskans.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Matanuska-Susitna Borough	Advance to Implementation Application

Alaska Behavioral Health	Facility Remodel for Fairbanks Crisis Stabilization Center	AK	SAMHSA identifies 3 essential elements for Behavioral Health Crisis Services: 1) Someone to Contact, 2) Someone to Respond, and A Safe Place for Help. The Fairbanks community has access to the the first element through 988 and the AKBH Crisis Line. The Fairbanks Mobile Crisis Team fulfills the second element. What is missing is the third. The lack of a Crisis Stabilization Center means that many individuals end up in the hospital emergency room or jail that would be better served in a Crisis Stabilization Center. A crisis stabilization center in Fairbanks addresses a persistent gap in behavioral health care across Interior and northern Alaska. Rural residents often face long wait times and limited local services for urgent behavioral health support. These delays increase the likelihood that a manageable crisis escalates into hospitalization, involvement with law enforcement, or extended stays in emergency departments that are not designed for behavioral health needs. The lack of timely, culturally responsive care close to home places strain on families, first responders, and small rural clinics that are already operating at capacity.	AKBH has been working with the City of Fairbanks and the Alaska Mental Health Trust Authority for several years to develop a Crisis Stabilization Center in Fairbanks. With support from Foundation Health Partners we were able to obtain a lease on a well suited facility in Fairbanks. We intend to open a Medium Intensity Crisis Stabilization Center in that facility within the next year. The building will need substantial remodeling to make it a safe, effective space for delivery of these services. We have site visits planned to facilities in other States to inform best practices for facility layout and operational procedures. We have the right clinical leadership in place to implement and operate the facility and plans are in place to recruit the staffing needed. This project request would be for the capital to complete the remodel which could be completed in the first funding year.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Advance to Implementation Application

Alaska Behavioral Health	Health Technology	AK	Medicaid recipients in Alaska face a two-tiered health system. Commercially insured and self-funded plan members routinely receive free wellness tools, remote monitoring devices, and prevention programs subsidized by their insurers. These interventions are associated with better chronic disease outcomes and reduced downstream medical costs. Medicaid’s traditional fee-for-service payment model, with reimbursement rates in Alaska that don’t fully cover the cost of care, has effectively excluded Medicaid recipients from these benefits. Approximately 80% of AKBH’s clients are Medicaid recipients. Inadequate reimbursement has also prevented our clinics from implementing technology upgrades that could streamline workflows, reduce staff burden, and increase client engagement. Hypertension is a leading driver of cardiovascular disease, stroke, and premature death, yet many low-income clients lack basic home monitoring tools. Insomnia and sleep disorders are highly prevalent among individuals with behavioral health conditions, with research showing that 50–80% of individuals with mental health diagnoses experience co-occurring sleep disturbances. Untreated insomnia exacerbates depression, anxiety, and substance use. This project aims to close the equity gap by providing Medicaid recipients with the same preventive and self-management tools available to privately insured Alaskans, while also equipping our clinics with technology that improves care quality and operational efficiency.	AKBH requests funding for four integrated technology components designed to improve integrated care delivery and health self-management: 1. PharmaSmart Health Kiosks - We will implement PharmaSmart kiosks in our primary care-integrated clinic locations. These clinically validated kiosks measure blood pressure, pulse rate, weight, and BMI while identifying patients at risk for hypertension and diabetes. Kiosk data integrates directly with our EHR system, eliminating manual transcription errors and reducing nurse check-in time. Patients also gain secure, private access to their own health data.2. Neurofeedback Equipment and Staff Training - For clients with treatment-resistant behavioral health conditions, neurofeedback represents a promising adjunct to traditional therapy. The technology uses real-time EEG monitoring to provide audio-visual feedback that helps clients identify and self-regulate their own brainwave activity. Research published in Applied Psychophysiology and Biofeedback supports neurofeedback as an evidence-based intervention for ADHD, PTSD, anxiety, and depression in populations where conventional medication and therapy have yielded limited results. 3. Insomnia Reduction Kits for Clients (CBT-I Support) -Cognitive Behavioral Therapy for Insomnia (CBT-I) is designated as the first-line treatment for chronic insomnia by the American College of Physicians, the American Academy of Sleep Medicine, and the VA. Unlike sleep medications, CBT-I addresses the root causes of insomnia and produces durable long-term improvements. Effective implementation of CBT-I requires basic home tools that are often inaccessible to low-income clients, including sleep masks, blackout aids, and sunrise alarm clocks that regulate circadian rhythms. AKBH will distribute insomnia reduction kits to clients engaged in CBT-I programs statewide, including rural clients receiving services via telehealth. 4. Home Blood Pressure Monitoring Kits for Clients -Hypertension is known as the “silent killer”. The American Heart Association recommends home blood pressure monitoring as a complement to clinical measurement, and studies consistently show that home monitoring leads to better blood pressure control, reduced white coat hypertension effect, and improved medication adherence. AKBH will provide validated, AHA-recommended home BP monitors to high-risk clients, paired with provider education on how to log and report readings through our telehealth platform.	\$50,000- \$250,000	Behavioral health/su bstance use disorder treatment	Multi- Community or Participating in Regional Hub-and- Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Matanuska- Susitna Borough	Advance to Implementati on Application

Alaska Behavioral Health	Patient Portal and HIE Integration	AK	As a provider serving patients across Alaska, we still lack the ability to reliably share real time health information across the many systems where patients receive care. Rural Alaskans often move between tribal health organizations, local clinics, hospitals, and behavioral health providers, but these systems are not fully connected. Without integration with Alaska’s Health Information Exchange (HIE), clinicians frequently work with incomplete medication lists, outdated histories, and limited visibility into recent care. This leads to fragmented treatment, duplicated services, and delays that disproportionately affect patients who travel long distances or rely on multiple care settings. Patients also have no easy way to view their own records, request refills, or communicate securely with their care team. For people in remote communities, this lack of access makes it harder to manage chronic conditions, stay engaged in treatment, or resolve issues without traveling. Implementing a patient portal linked to our integrated EHR would give patients direct access to their information and providers, improving continuity and reducing avoidable gaps in care. This project addresses the opportunity to create a connected, statewide information system that improves coordination, strengthens safety, and empowers patients. Integrating our EHR with the Alaska HIE and launching a patient portal would ensure that every patient, regardless of location, benefits from timely information.	The project has two core components: integrating our electronic health record (EHR) with the State of Alaska’s Health Information Exchange (HIE) and implementing a patient portal that gives individuals direct access to their health information and care team. Integrating the EHR with the Alaska HIE. The first part of the project establishes real time, bidirectional data exchange between our EHR and the statewide HIE. This includes secure sharing of medication histories, diagnoses, care plans, lab results, and encounter summaries. The integration will follow national interoperability standards and use structured interfaces to ensure consistent, accurate data flow. This allows our clinicians to see the most current information from tribal health organizations, hospitals, primary care clinics, and other behavioral health providers; reducing duplication, improving safety, and supporting coordinated treatment for patients who move between regions. The project team will work closely with the HIE’s technical staff, our EHR vendor, and internal IT to complete interface development, testing, and validation. Implementing a statewide patient portal. The second component is launching a patient portal that allows individuals to view their records, request medication refills, send secure messages, and access visit summaries from any location. This is especially important for rural Alaskans who often travel long distances for care or rely on intermittent connectivity. The portal will be configured to support mobile access, culturally responsive communication, and user friendly navigation. Staff will be trained to help patients enroll, and outreach materials will be developed to support adoption across diverse communities. Building long term capacity. The project includes workflow redesign, staff training, and patient education to ensure the new tools are fully integrated into daily practice. Policies for data governance, privacy, and secure messaging will be updated to align with statewide standards. By the end of the project, we will have a sustainable, interoperable system that strengthens care coordination, improves patient engagement, and supports continuity of care for Alaskans regardless of where they live.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Matanuska-Susitna Borough	Advance to Implementation Application
Alaska Behavioral Health	Fairbanks Mobile Crisis Team Van	AK	The Fairbanks Mobile Crisis Team serves the entire Fairbanks North Star Borough. The borough experiences both extreme cold in the winter as well as some hot days in the summer. The situations that the team respond to vary greatly and they often don't know what they will encounter until they arrive on the scene. Most of the encounters happen during the nighttime. At times, safety concerns limit the amount of time our team is able to spend with community members due to weather conditions or conditions within the location to which they are responding. Having a mobile behavioral health clinic would allow us to appropriate care in a wide variety of situations across the large, variable response area.	VanDolt is a company that designs and builds modular vehicle systems for a variety of purposes including mobile healthcare operations. They have partnered with Netsmart (AKBH's electronic health record (EHR) vendor) to create platforms designed for Mental Health Mobile Crisis Teams. They have experience building these vans for use in rural areas such as Wyoming and understand the needs of a service area like Fairbanks North Star Borough. The van will be outfitted with satellite internet for accessing the EHR. It will have safety features for transporting patients when needed; secure storage for first aid supplies; and a comfortable environment for crisis intervention.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Deferred or Not Advanced

Alaska Behavioral Health Association	Alaska Rural Routine Outcome Monitoring & Measurement-Informed Care Initiative	AK	Alaska’s rural and frontier communities face persistent barriers to delivering coordinated, high-quality behavioral health care. Geographic isolation, workforce shortages, limited specialty access, and fragmented electronic health record systems constrain providers’ ability to systematically determine whether treatment is effective. Most rural settings lack consistent Routine Outcome Monitoring (ROM) infrastructure that supports standardized symptom tracking and longitudinal review. ROM is a structured process in which validated outcome measures are administered at intake and at regular intervals during treatment. Scores are trended over time, allowing clinicians and patients to see whether symptoms are improving, plateauing, or worsening. When incorporated into supervision and treatment planning, ROM becomes Measurement-Informed Care, enabling earlier identification of non-response and more timely clinical adjustments—critical in communities where crisis response and specialty services are limited. Inconsistent, non-interoperable outcome data limits quality improvement, benchmarking, and readiness for value-based payment models. Establishing a standardized, EHR-agnostic ROM framework creates the clinical measurement backbone necessary to improve quality, strengthen workforce practice, and support sustainable rural health transformation aligned with RHTP priorities.	ABHA proposes a phased Routine Outcome Monitoring (ROM) implementation beginning with six to eight rural pilot behavioral health providers. The purpose of this module is to establish foundational clinical measurement infrastructure that supports Measurement-Informed Care (MIC) within participating organizations. In Year 1, ABHA will coordinate selection of geographically diverse rural sites and support implementation of a standardized, EHR-agnostic ROM platform. Participating providers will work directly with the selected platform’s clinical implementation specialists to configure validated outcome measures, integrate ROM into existing workflows, and align onboarding within current electronic health record environments. Outcome measures will be administered at intake and at regular intervals during treatment. The selected platform will enable clinicians to access symptom trend data within sessions and support supervisors in reviewing longitudinal outcome trajectories during case consultation as implementation stabilizes. The intent is to build capacity for structured measurement to inform clinical decision-making over time rather than functioning solely as documentation. ABHA’s role in this module is limited to pilot coordination, milestone tracking, and alignment with RHTP objectives. Broader quality improvement infrastructure, communications strategy, and statewide technical assistance are addressed in complementary modules and are not included in this scope. The selected platform will be EHR-agnostic to prevent vendor lock-in and reduce long-term financial risk for rural providers. Aggregated, de-identified pilot data will be reviewed to assess feasibility, clinician adoption, and early symptom trend patterns. Findings from the six-to-eight site cohort will inform decisions regarding phased expansion in subsequent years. This initiative focuses specifically on provider-level implementation of Routine Outcome Monitoring infrastructure. Complementary initiatives proposed by ABHA address supervisory training, operational alignment, statewide communications, and long-term data architecture planning.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Behavioral Health Association	Behavioral Health Operations & Quality Infrastructure Initiative	AK	As Routine Outcome Monitoring and supervisory capacity expand within Alaska’s rural behavioral health system, organizations require structured operational alignment to embed measurement into policy, workflow, and quality systems. Clinical measurement alone does not produce transformation unless it is integrated into documentation standards, supervision protocols, quality review processes, and fiscal oversight structures. Many rural behavioral health organizations operate with limited administrative bandwidth and minimal formalized quality infrastructure. Policies governing use of structured data, documentation alignment, performance review, accreditation preparation, and billing consistency are often underdeveloped due to competing operational demands. As value-aligned financing expectations evolve, organizations require internal clarity regarding governance, quality monitoring, and operational readiness. This module addresses the ancillary operational work necessary to translate Measurement-Informed Care into sustainable organizational practice. It focuses on strengthening internal policy frameworks, documentation alignment, accreditation readiness considerations, and billing consistency related to structured measurement, without duplicating regulatory or payment reform functions.	ABHA proposes establishment of an Operations & Quality Infrastructure Initiative to assist participating organizations in aligning internal systems with emerging measurement practices. During the project period, structured consultation will focus on organizational policy refinement related to outcome data use, documentation standards, supervision alignment, and internal quality monitoring processes. Participating organizations will review existing policies to determine whether updates are necessary to reflect integration of structured clinical measurement. Attention will also be given to accreditation alignment and billing documentation consistency where measurement integration affects record structure. This may include review of how structured outcome tools are incorporated into treatment plans, progress notes, supervision documentation, and internal audit practices. The objective is not regulatory compliance oversight but strengthening organizational clarity and consistency. In addition, participating organizations may complete structured readiness assessments related to quality monitoring, data governance roles, and value-aligned payment preparedness. These assessments will inform identification of operational gaps and practical next steps tailored to rural environments. ABHA’s role will be limited to development of adaptable policy templates, readiness tools, and structured consultation pacing. The initiative will not replace existing regulatory functions or payment reform activities. Findings from participating organizations will inform refinement of materials prior to consideration of broader expansion. Statewide communication alignment, clinical measurement implementation, and regional planning activities are addressed through separate complementary initiatives.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Behavioral Health Association	Behavioral Health Supervisor Academy Implementation Initiative	AK	Alaska’s rural behavioral health system faces workforce instability, supervisory variation, and limited structured leadership development pathways. Supervisors are often promoted based on clinical experience rather than formal preparation in leadership, ethical oversight, or structured performance management. In geographically isolated settings, limited access to peer consultation and training further constrains supervisory consistency. Research indicates that structured supervision is associated with increased clinician confidence, professional identity development, and perceived competence. ABHA has already convened an advisory committee of rural providers and workforce leaders to define core competency domains for a statewide Supervisor Academy. This proposal advances that established foundation into formal curriculum development and pilot cohort implementation. Curriculum domains will include structured supervision practices, ethical oversight, leadership in resource-constrained environments, and supervisor education in Routine Outcome Monitoring principles to ensure that, as clinical measurement infrastructure expands, supervisors are prepared to interpret structured data and incorporate it appropriately into supervision conversations. This academy complements Alaska’s Routine Outcome Monitoring implementation efforts by preparing supervisors to interpret structured outcome data and incorporate measurement-informed discussion into supervision practice.	ABHA proposes a structured implementation initiative to develop and launch a rural-focused Behavioral Health Supervisor Academy in partnership with the University of Alaska Anchorage School of Social Work. This module builds on existing advisory planning and advances into curriculum finalization and pilot cohort delivery within the project period. During the first three to six months, ABHA and UAA SSW will formalize a competency-based curriculum grounded in rural supervision practice. Content domains will include supervision models, ethical oversight, structured performance feedback, workforce retention strategies, leadership in resource-constrained environments, and integration of structured clinical data into supervision conversations. This ensures supervisory readiness as clinical measurement infrastructure expands through complementary initiatives. Advisory committee input will inform refinement to ensure alignment with rural provider realities. Following curriculum development and platform preparation, at least one pilot cohort of rural behavioral health supervisors will be launched during the project period. Delivery will occur through a structured virtual learning model designed to accommodate geographic isolation and workforce demands. Evaluation tools will be administered to assess changes in supervisor confidence, perceived competence, and consistency of supervision structure. ABHA’s role will include coordination, milestone tracking, and alignment with RHTP objectives. The academic partner will support instructional design, learning platform preparation, and evaluation framework execution. Findings from the pilot cohort will inform refinement prior to broader expansion in future funding cycles.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Behavioral Health Association	Behavioral Health Technology Vendor Readiness & Alignment Initiative	AK	Behavioral health providers in Alaska rely on technology platforms to support care delivery, data collection, quality improvement, and administrative operations. These platforms include electronic health records, clinical measurement systems, telehealth tools, analytics software, and other digital infrastructure. Vendors entering the Alaska market frequently lack familiarity with the state’s unique health system environment. Alaska’s behavioral health landscape includes a diverse mix of tribal systems, providers, and rural/frontier environments. Providers operate across multiple EHR platforms, often with limited interoperability and broadband infrastructure. Technology vendors may underestimate the complexity of integrating with these systems or may not understand the realities of delivering services in remote communities. As a result, providers can face significant implementation challenges, including high integration costs, limited compatibility across platforms, and tools not designed for Alaska’s geographic and service delivery context. This initiative creates a structured orientation and alignment process for vendors seeking to operate within Alaska’s system by strengthening vendor understanding of the state’s infrastructure, encouraging realistic implementation planning, and promoting approaches suited to rural/frontier environments. Tis effort also supports alignment with broader behavioral health data and measurement initiatives.	ABHA proposes to develop a structured vendor readiness initiative designed to improve alignment between technology vendors and Alaska’s behavioral health system environment. The initiative will begin with development of a comprehensive orientation framework describing Alaska’s behavioral health infrastructure. This will include guidance on the diversity of provider organizations, tribal health governance structures, rural service delivery conditions, and the wide range of electronic health record systems currently used across the state. Materials will also address interoperability challenges, integration cost considerations, and broadband limitations commonly encountered in rural and frontier communities. These materials will form the basis of a structured orientation program for vendors interested in serving Alaska’s behavioral health providers. Orientation sessions will focus on helping vendors understand the operational realities of Alaska’s system so that technology solutions can be designed and implemented more effectively. The initiative seeks to include periodic vendor convenings in both rural and urban areas designed to provide education about Alaska’s behavioral health environment and encourage dialogue between vendors and system stakeholders regarding implementation challenges. The purpose of these sessions will be system alignment and shared understanding rather than vendor promotion or endorsement, although connections may be made during the convenings. ABHA will serve as a neutral convener focused on improving system readiness for technology innovation. The initiative will not recommend specific vendors or products but will instead focus on improving the broader technology ecosystem serving Alaska’s behavioral health providers.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Behavioral Health Association	Behavioral Health Interoperability Design & Feasibility Initiative	AK	ABHA proposes a focused planning initiative to identify and contract with a qualified interoperability vendor to scope, design, and assess feasibility of a regional and statewide behavioral health data aggregation framework. During the project period, ABHA will conduct a competitive vendor solicitation process seeking firms with demonstrated expertise in multi-EHR interoperability and secure health data aggregation. The selected vendor will conduct technical analysis to determine the requirements for securely transmitting de-identified, standardized behavioral health indicators from diverse EHR systems into a unified aggregation structure. The vendor’s scope will include identification of necessary common data elements, technical transmission specifications, data normalization requirements, security protocols, estimated implementation costs, scalability considerations, and anticipated interoperability constraints across representative EHR environments. The final deliverable of this module will be a formal proposed design and implementation plan, including phased deployment options, cost modeling, risk assessment, and technical architecture specifications. No aggregation platform will be built or deployed during this phase. Advancement to implementation would occur only if feasibility findings demonstrate technical viability and fiscal prudence.	ABHA proposes a focused planning initiative to identify and contract with a qualified interoperability vendor to scope, design, and assess feasibility of a regional and statewide behavioral health data aggregation framework. Alaska Behavioral Health Association	Behavioral Health Professional Quality of Life & Resilience Network	AK	Behavioral health professionals in Alaska frequently work in high-intensity environments characterized by crisis response, complex trauma exposure, workforce shortages, and geographic isolation. In rural and frontier communities, clinicians often manage large caseloads and community-level crises while operating with limited peer consultation and organizational support structures. Research on trauma-exposed professions demonstrates prolonged exposure to client trauma can contribute to secondary traumatic stress, burnout, and compassion fatigue. Clinicians may also experience vicarious resilience and compassion satisfaction when witnessing client recovery and strength. Supporting professional quality of life requires intentional attention to both the risks and protective factors inherent in behavioral health work. Despite these realities, Alaska currently lacks coordinated structure to support professional quality of life across behavioral health organizations and regions. Workforce turnover and burnout are frequently discussed challenges, yet few durable resources exist to help clinicians and supervisors understand and navigate the emotional impact of this work. This initiative establishes a statewide Behavioral Health Professional Quality of Life & Resilience Network designed to strengthen workforce sustainability by developing durable educational resources, facilitating peer connection, and normalizing discussion of the emotional realities of behavioral health practice.	ABHA proposes to develop a statewide network focused on strengthening professional sustainability for behavioral health clinicians and supervisors working in trauma-exposed environments. The initiative will begin with development of a durable educational resource suite addressing core professional quality-of-life topics relevant to behavioral health practice. Materials will address burnout, secondary traumatic stress, compassion fatigue, compassion satisfaction, and vicarious resilience. These resources will emphasize the realities of behavioral health work while providing practical frameworks for maintaining professional sustainability. In addition to educational materials, the initiative will facilitate periodic statewide virtual convenings that allow behavioral health professionals to engage in reflective dialogue about the impact of their work. These sessions will emphasize peer connection, shared learning, and normalization of the emotional challenges inherent in behavioral health practice, particularly in rural and frontier settings. The network will also explore strategies for supervisors and organizational leaders to incorporate professional quality-of-life concepts into team environments and supervisory conversations. While distinct from formal supervisory training initiatives, this effort will complement broader workforce development efforts by reinforcing professional sustainability and reflective practice. This initiative complements supervisory training and workforce development initiatives by addressing the emotional sustainability of behavioral health practice across Alaska. It will create durable resources and peer structures that can support the behavioral health workforce over time.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Behavioral Health Association	Behavioral Health Regional & Statewide Transformation Planning Initiative	AK	Alaska’s behavioral health system operates across highly diverse regional environments. Workforce capacity, supervisory infrastructure, service access, and integration readiness vary significantly between tribal health systems, frontier communities, and road-system providers. While statewide transformation initiatives provide structural direction, durable progress requires coordinated regional planning grounded in local realities. Across Alaska, multiple regional coalitions, alliances, and cross-sector partnerships already exist. However, there is no structured, multi-year planning process that integrates these regional conditions into a cohesive statewide behavioral health transformation framework aligned with RHTP initiative areas. Without disciplined regional planning aligned with statewide objectives, implementation efforts risk fragmentation, uneven pacing, and duplication. This module establishes a structured three-year regional and statewide behavioral health transformation planning process designed to build upon existing convenings, ensure inclusive representation, clarify priorities, and strengthen alignment across diverse regions and governance contexts.	ABHA proposes to facilitate a structured regional and statewide planning initiative culminating in a defined three-year transformation framework. The process will begin with identification and assessment of existing regional behavioral health coalitions, tribal health alliances, workforce groups, and cross-sector partnerships. This landscape review will determine where effective convening structures already exist and where representation gaps might require supplemental engagement. Rather than creating parallel planning bodies, this initiative will align with and leverage existing forums wherever feasible. Regional ABHA members will be invited to identify additional providers, tribal behavioral health leaders, and relevant stakeholders essential to accurately reflecting local conditions. This engagement model allows regional leadership to shape participation while ensuring inclusion of tribal and frontier perspectives. Regional planning sessions will examine workforce stability, supervisory capacity, clinical measurement readiness, operational infrastructure conditions, and long-term sustainability considerations. Discussions will focus on strategic prioritization and sequencing rather than organization-level technical assistance, policy drafting, or implementation activities. The Alaska Department of Health and relevant state representatives will be invited to participate in regional and statewide sessions to promote transparency and alignment between provider realities and statewide policy priorities. Participation will support shared understanding while preserving the provider-informed structure of the planning process. Regional input will be synthesized into a statewide three-year behavioral health transformation framework that identifies shared priorities, highlights regional variation, and outlines practical sequencing considerations. Periodic progress reviews will allow priorities to be revisited and refined over time without redeveloping the overall framework. Insights from regional planning sessions will also help guide the pacing and prioritization of related initiatives, including workforce development, clinical measurement infrastructure, and operational alignment efforts.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Behavioral Health Association	Behavioral Health Statewide Transformation Communication & Alignment Initiative	AK	Alaska’s behavioral health transformation efforts led by ABHA span multiple domains, including Routine Outcome Monitoring and Measurement-Informed Care (MIC) implementation, development of a statewide Supervisor Academy, operational alignment supports for providers, and exploration of data infrastructure. As these initiatives expand across rural and frontier regions, there is increasing need for consistent statewide language, sequencing clarity, and shared understanding of how the components of this transformation framework fit together. Leadership turnover, workforce instability, and shifting policy environments can unintentionally fragment interpretation of complex system initiatives. Without clear communication about the purpose, scope, and relationship of ABHA’s initiatives, providers and stakeholders may interpret them differently across regions, slowing progress and creating avoidable variability. This module addresses that statewide alignment gap by developing a structured communications approach for ABHA’s behavioral health transformation initiatives. The goal is to clarify how the Measurement-Informed Care pilots, Supervisor Academy, operational infrastructure supports, and related initiatives function together as part of a coordinated transformation strategy. This initiative focuses on statewide communication architecture and shared understanding of ABHA’s transformation initiatives rather than organization-level operational consultation.	ABHA proposes development of a Statewide Transformation Architecture & Alignment Framework that documents the structure, sequencing, and interdependencies of ongoing behavioral health initiatives. This effort will produce durable statewide resources that clearly describe initiative purpose, explain scope boundaries between modules, standardize terminology, and articulate sequencing logic. Materials will illustrate how clinical measurement infrastructure, supervisory development, operational quality supports, and long-term data planning function as coordinated components of a broader rural health transformation strategy. In addition to structured documentation, ABHA will facilitate periodic statewide alignment forums and architectural briefings designed to reinforce shared understanding across regions. These convenings will focus on clarifying initiative design, pacing expectations, and system-level interdependencies. They will not provide operational consultation or internal policy drafting, which remain within other modules, but will ensure consistent interpretation of transformation goals. Resources developed through this initiative will be adaptable for leadership onboarding, board briefings, statewide communications, and transition periods. Emphasis will be placed on clarity, neutrality, and preservation of initiative intent across administrative changes. This module functions as a statewide coordination layer, reinforcing coherence across complementary initiatives while remaining distinct from organization-level operational activities.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

ALASKA BRAIN INJURY CONSORTI UM	Transforming Care Networks for Traumatic Brain Injury in Rural Alaska	AK	Although Alaska has one of the highest rates of traumatic brain injury (TBI) in the nation, the state lacks a coordinated system for identifying individuals with TBI and connecting them to support. Many Alaskans with TBI must recognize their condition, locate services, travel long distances to reach care, and navigate complex payment systems with a brain that may be struggling with cognitive and sensory challenges. Services are often difficult to access and not consistently covered by Medicaid, IHS, or private insurance, leaving many individuals disengaged from care or unaware support exists. These barriers are especially severe in rural communities where most TBIs occur. Geographic isolation, limited specialty resources, and social stigma often leave individuals with TBI disconnected from family, employment, and community life. Cognitive and sensory changes after injury can make communication and social interaction difficult, contributing to isolation and economic instability. As a result, TBI survivors are disproportionately represented among people experiencing homelessness, incarceration, substance use treatment, domestic violence shelters, and suicide. Yet these systems rarely identify TBI or connect individuals to appropriate support. This project addresses the opportunity to create an accessible pathway for identifying rural Alaskans with TBI and connecting them to resources, navigation, and community-based supports before challenges escalate into long-term crises.	Our approach builds on extensive experience working with rural Alaska communities to create a widely distributed, community-designed safety net for Alaskans living with TBI. The model uses a hub-and-spoke structure that centralizes expertise, training, and administrative support while enabling locally adapted programs to operate across rural and frontier communities. This approach avoids the need for new facilities or a large specialized workforce while ensuring programs remain culturally relevant and responsive to community needs. The hub provides ongoing training, coordination, and shared resources that allow communities to launch and sustain local programs without duplicating effort. The first initiative, Alaska Brain Circles, is ready to launch on the Kenai Peninsula in late 2026. Brain Circles are locally organized peer networks designed to support TBI survivors, caregivers, and communities. Circles may meet in person or virtually on a monthly or bi-monthly basis and can be organized geographically, thematically, or by audience. The hub will provide training, materials, and administrative support so communities can operate their own circles while maintaining access to centralized expertise and resources. The second initiative, Alaska Brain Camps, is planned as a demonstration project in the Mat-Su region beginning in spring 2027. Brain Camps are annual, five-day residential programs designed to bring together TBI survivors, caregivers, advocates, and community members in supportive rural settings. Camps will foster social connection, increase understanding of brain injury, and provide a venue for education, implementation of novel supports, skill building, and community engagement. Camps will also amplify rural perspectives and provide a focus for recovery, research and innovation. The first camp will serve as a demonstration model that can expand over time to additional regions across Alaska. Together, Brain Circles and Brain Camps address the social isolation, stigma, and lack of coordinated resources experienced by many rural Alaskans with TBI. The hub-and-spoke structure allows communities to shape programs that reflect their local cultures and priorities while benefiting from shared expertise and infrastructure. Over time, communities will assume leadership and operational roles, allowing the model to remain sustainable while continuing to expand access to knowledge, peer support, and coordinated resources for rural Alaskans living with TBI.	\$50,000- \$250,000	Multi- Community or Participating in Regional Hub-and- Spoke	Fairbanks North Star Borough; Kenai Peninsula Borough; Kodiak Island Borough; Matanuska- Susitna Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Alaska Center for Children and Adults	Community Pathways for Early Development Project	AK	Young children in our state who are at risk for developmental delays or environmental stressors often do not receive timely, coordinated support that can set the foundation for long term health and family stability. Families frequently face barriers such as limited access to early intervention resources, inconsistent referral pathways, and a lack of culturally responsive, relationship based services. ACCA has identified these gaps through previous grant funded pilot projects, which have generated valuable data showing both unmet needs and effective strategies for early engagement. Previous projects were not focused on sustainability and discontinued without further support for integration. Utilizing this data, this project presents an opportunity to scale these promising approaches and strengthen our state’s capacity to provide early, preventive services. By building on ACCA’s proven ability to launch responsive programs in collaboration with community outreach, this initiative will expand targeted support for young children and their caregivers while promoting healthy starts, reducing future risk, and supporting resilient, thriving families in a thoughtful and sustainable manner.	ACCA’s approach builds on proven strategies, pilot data, and regional experience to reduce barriers and expand access to early intervention, health services, and family support across our vast service area with limited resources. The project integrates organizational improvements with community focused service delivery ensuring families receive timely, coordinated support regardless of geography. A core component of the approach is the creation of a single referral office to streamline access to all ACCA services. This centralized process will ensure every child is referred to appropriate services quickly and efficiently and reduces wait times while areas of need are met sooner. This coordinated “no wrong door” approach ensures each child is assessed, matched to the appropriate level of care, and connected to every program they are eligible for without multiple referral pathways or delays both internally and for external services. The approach also includes implementation of a tiered service model that tailors support to each family’s level of need while building staff capacity for serving families through workforce development plans and educational opportunities. To overcome geographic challenges, ACCA will expand the use of virtual developmental screenings, telehealth supported family coaching, and targeted in person outreach during travel to rural areas. These methods extend reach into remote communities, reduce delays caused by weather or staffing limitations, and allow families to receive consistent support in their home environments. Enhanced data sharing, tracking, and coordination with partner agencies will improve early identification of developmental and health concerns. Staff will monitor referrals, maintain timely follow up, and ensure continuity of care to support families where they are. Data collected through this project will inform service adjustments and contribute to long term planning for region specific improvements and potential eligibility reform while developing processes and structure to bill for services provided. Together, these strategies create an integrated, responsive system that increases access, improves quality, and strengthens sustainability of early childhood services for rural Alaska families.	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Center for Children and Adults	Health Systems Integration and Modernization Project	AK	Rural communities and our hub and spoke community face persistent barriers to accessing consistent, high quality services. Relying on disconnected systems, paper forms, and mixed electronic and manual processes reduce care, are prone to errors, and make coordination across systems and the organization challenging for staff, clients, and others we coordinate care with. With limited ongoing funding available, this is an opportunity to modernize our systems to support care while reducing the administrative burden for care. This project addresses the opportunity to unify these fragmented systems into a single digital infrastructure. By implementing a universal EMR, electronic forms, integrated telehealth tools, an integrated accounting system, agency-specific applications, and secure digital access, we can streamline workflows, reduce travel burdens, improve accuracy of patient information, and increase continuity of care. This modernization would enable providers to work more efficiently across locations, support flexible and mobile care delivery, and strengthen the resilience of health services in the smallest and most isolated communities.	ACCA’s project manager will be responsible for working with technology vendors and our IT vendor to source a comprehensive EMR strategy along with billing and accounting systems that will integrate into one unified platform. The project will begin with a detailed assessment of current workflows, data gaps, and user needs across programs. This will ensure that selected technologies support rural and hub and spoke service models, including mobile care, intermittent connectivity, and multi disciplinary teams. Next, ACCA will convene clinical, administrative, and IT staff to participate in system demonstrations, vendor evaluations, and security reviews. Input from providers and administrative staff will guide the configuration of electronic forms, and telehealth tools to ensure they are intuitive, culturally appropriate, and practical for remote environments. The mobile app will require multiple stakeholders to beta test the system and confirm it is friendly for both caregiver and staff use. Once a unified system is selected, the project team will develop a phased implementation plan that includes data migration, staff training, and testing in low risk pilot locations. Lessons learned from early rollout will shape improvements before expanding to all programs and communities. Telehealth integration will be prioritized to enable immediate access to specialty care, and the agency app will be developed in parallel to support appointment management, secure messaging, and client/caregiver engagement. Simultaneously, ACCA will modernize secure building access by implementing digital credentials that integrate with staff identity management systems. This will access , support after regular business hours and telehealth hubs, and enhance facility safety. Throughout the project, ACCA will track performance measures such as visit efficiency, reduced paperwork, decreased travel burden, and improved care coordination. Continuous feedback loops will ensure the system evolves to meet the needs of rural communities and remain sustainable long term.	\$250K-\$1M	Home- and communit y-based services provider	Multi- Community or Participating in Regional Hub-and- Spoke	Bethel Census Area; Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Center for Children and Adults	Strengthening Workforce and Continuity of Care for Rural Alaska Families	AK	Alaska’s rural communities face persistent barriers to timely, high quality care due to distance, weather, workforce shortages, and limited infrastructure. ACCA’s salaries are 20–30% below market, fueling turnover and vacancies that lengthen wait times, fragment care, and erode quality. Recruitment is costly and slow; early tenure attrition compounds the problem. Yet our internal data reveals a solvable leverage point: staff who remain beyond year 3 typically continue for a decade or more, leaving mainly for retirement or out of state moves. The opportunity is to align compensation, incentives, and infrastructure to cross that 3 year threshold and convert hires into long term, rural committed professionals. Recruitment and retention compensation allows for salary catch up without compounding salary costs from year to year. Retention compensation is only paid as a set amount and will not impact on salaries. Purpose built workspace is also a gap: without modernized areas to document, coordinate, and conduct telehealth work, clinicians lose time to inefficiencies and limit virtual access that could otherwise bridge cost for distance travel and weather barriers. Professional development and licensure support remain underfunded, limiting career progression and retention. Supporting staff with this annual cost is an area identified in recent surveys as a gap and a recruitment and retention strategy that would benefit ACCA.	1) Recruitment & Retention Incentives (Five Year Commitment): a. Implement tiered recruitment and retention bonuses for positions serving rural/remote regions. b. Structure a 5 year service agreement with pro rated payback for unserved years to reinforce the proven retention threshold. c. Pair incentives with relocation assistance and first year housing and childcare stipends in hardest to staff areas. 2) Purpose Built Care Coordination & Telehealth Space: a. Refit a dedicated workspace featuring: private documentation stations with secure EHR access; team rooms for case reviews and cross provider huddles; sound treated telehealth pods with room to ensure delivery of services is appropriate for the service (demonstration or use of items to support care), HIPAA compliant with appropriate technology. b. Establish shared scheduling and room use analytics to maximize utilization. 3) Professional Development & Licensure Support: a. Fund CE/CME, supervision hours, exam fees, and study time for licensed and pre licensure staff. b. Create clinical and rural practice salary elevators (e.g., telehealth proficiency, care coordination) tied to modest step increases. c. Launch annual skills intensives focused on rural priorities (well child checks, behavioral health integration, emergency stabilization, cultural competence, and telehealth best practices). 4) Implementation & Continuous Improvement: a. Governance: designate a Workforce Stabilization Lead and cross functional steering group (HR, clinical coordinator, IT, performance and quality). b. Timeline: ramp hiring/incentives ongoing as appropriate through September 30, 2027; space build out is complete and final order can be completed by month 3 with space completed by month 6; fully operational by month 6; evaluate all areas quarterly. c. Data: track vacancies, time to fill, 1–3–5+ year retention, visit volume/mix (in person vs. telehealth), wait times, no shows, care coordination metrics, quality indicators, staff satisfaction, and cost per encounter. d. Equity & Cultural Safety: engage local partners and community advisors to tailor workflows and ensure culturally responsive care.	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Center for Pain Relief Inc.	Alaska Rural Women’s Health Clinical Center of Excellence and Provider Support Network	AK	Access to specialty women’s health care is limited in many rural communities across Alaska. Many communities lack local obstetrics and gynecology providers, leaving primary care clinicians and Community Health Aides responsible for managing complex hormonal and reproductive health conditions without access to specialist consultation or training. Perimenopause and menopause-related conditions are frequently underdiagnosed or undertreated in rural settings. Untreated symptoms can contribute to sleep disruption, mental health challenges, increased cardiovascular risk, bone loss, and reduced quality of life for women in midlife. At the same time, rural healthcare providers often report limited opportunities for continuing education in menopause management, hormone therapy, and evidence-based evaluation of abnormal bleeding and metabolic risk in women. This project addresses these gaps by establishing the Alaska Rural Women’s Health Clinical Center of Excellence, a statewide consultation and training network designed to support rural providers through specialist consultation, clinical education, and standardized care pathways. By expanding provider capacity and improving access to specialist expertise, the initiative will improve women’s health care access for rural communities across Alaska.	The Alaska Rural Women’s Health Clinical Center of Excellence will function as a statewide hub supporting rural healthcare providers through consultation services, workforce training, clinical decision tools, and a statewide learning network focused on improving women’s health outcomes. The project will be led by Dr. Jillian Woodruff, MD, a board-certified gynecologic surgeon with expertise in hormone therapy and midlife women’s health, who will serve as clinical lead for the consultation network and provider training program. The initiative will include five integrated components. Rural Women’s Health Consultation Network Rural providers will have access to a specialist consultation network allowing them to review patient cases and receive clinical guidance. Providers may submit asynchronous consultations or schedule telehealth case discussions to develop treatment plans for complex hormonal and reproductive health conditions. Rural Provider Training Program A structured education program will provide training for Community Health Aides, nurse practitioners, physician assistants, and primary care clinicians managing women’s health conditions in rural settings. Training will focus on menopause care, hormone therapy management, abnormal uterine bleeding evaluation, metabolic risk, contraception management, and preventive health in midlife women. Case-Based Learning Network Regular case conferences will allow rural clinicians to present patient cases and discuss management strategies with specialists and peers, supporting collaborative learning and clinical mentorship. Clinical Care Pathways and Protocol Toolkit The Center of Excellence will develop standardized clinical protocols and decision-support tools designed to help rural providers manage common women’s health conditions locally. These tools will include screening tools, diagnostic pathways, hormone therapy algorithms, laboratory evaluation guides, and referral criteria. Statewide Outcomes and Learning Network Participating providers will contribute to a statewide learning network focused on improving women’s health care delivery in rural communities. The network will track implementation of clinical protocols, identify care gaps, and support continuous improvement through shared learning and collaboration among providers. This integrated model allows rural clinicians to manage more women’s health conditions locally while maintaining access to specialist expertise when needed.	\$1M-\$5M	Clinic	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Center for Pain Relief Inc.	Alaska Specialty Access & Procedural Skills (ASAP) Rural Workforce Development Program	AK	Rural healthcare providers across Alaska face critical workforce shortages that limit access to care and contribute to delays in specialty referrals. Many rural clinics lack sufficient trained clinical staff to manage patient intake, coordinate medical records, and prepare patients for specialty consultations. As a result, patients often travel long distances to regional centers only to discover that additional testing, imaging, or documentation is required before care can proceed. At the same time, many Alaska residents are interested in healthcare careers but face financial and geographic barriers to training programs. The Accelerated Skills Advancement Program (ASAP) addresses these challenges by creating a hybrid training pipeline that prepares Alaska residents for nationally recognized medical assistant certification while developing specialized skills in patient intake, care coordination, and specialty referral preparation. By strengthening the rural healthcare workforce and improving the coordination of specialty referrals, the program expands access to care while reducing delays and unnecessary travel for patients in rural and frontier communities.	The Accelerated Skills Advancement Program (ASAP) will establish a hybrid workforce training model designed to strengthen clinical support capacity in rural healthcare systems across Alaska. Participants will complete a structured three-phase training pathway. First, students complete virtual coursework covering medical terminology, anatomy and physiology, clinical documentation, infection control, patient intake procedures, and electronic medical record workflows. Second, students participate in regional clinical skills labs where they develop hands-on competencies including vital signs assessment, phlebotomy, EKG acquisition, injection techniques, and clinical workflow procedures. Third, students complete supervised clinical apprenticeships within rural healthcare organizations, tribal health systems, and community clinics. These apprenticeships provide real-world experience while strengthening the clinical teams serving rural communities. Graduates will be eligible to sit for nationally recognized certification exams such as the National Certified Medical Assistant (NCMA) or Certified Clinical Medical Assistant (CCMA). Once placed within rural clinics, these trained workers support intake visits, medication reconciliation, chart preparation, and coordination of specialty referrals. By ensuring that patient histories, diagnostic information, and outside records are complete prior to referral visits, the program improves the efficiency of specialty consultations and reduces unnecessary travel. The program will begin with pilot cohorts and expand as additional rural partners participate.	\$250K-\$1M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Hoonah-Angoon Census Area; Nome Census Area; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Center for Pain Relief Inc.	Rural Pain Access & Procedural Capacity Initiative for Alaska Communities	AK	Rural Alaskans experiencing spine-related, musculoskeletal, and neuropathic pain often face delays in specialty evaluation and treatment. In many communities, primary care clinics and emergency departments must manage complex pain conditions without access to pain specialists. This can lead to fragmented care, prolonged suffering, unnecessary opioid exposure, and costly patient travel or medical transport to regional referral centers. At the same time, some rural facilities possess imaging infrastructure and procedure space that could support basic interventional pain procedures but lack structured training pathways and specialty consultation support. This project addresses that gap by creating a model that expands access to specialty pain care while strengthening the capacity of rural providers and health systems. By combining telehealth consultation with workforce training and standardized clinical protocols, rural providers can receive specialist guidance earlier in the care process and manage more patients locally when appropriate. Earlier specialty triage and improved coordination of care have the potential to reduce unnecessary travel, repeat emergency visits, and high-cost medical transport while improving patient outcomes. This opportunity aligns with Alaska’s broader goals of strengthening rural health care access, workforce capability, and system sustainability across geographically dispersed communities.	This project will establish a rural specialty access model built around telehealth consultation, workforce training, and coordinated care pathways between an Anchorage-based specialty hub and participating rural communities. The first component will create a structured telehealth consultation pathway to support rural clinics, hospitals, and providers. Rural providers will be able to obtain specialty input through telehealth visits or asynchronous chart review. These consultations will help guide appropriate imaging decisions, conservative treatment strategies, and identification of patients who may benefit from interventional procedures or referral. The second component will focus on workforce development. Selected rural providers and facilities that already possess imaging infrastructure, such as fluoroscopy suites, will receive training, technical assistance, and standardized protocols to safely perform appropriate procedures locally. Remote specialty consultation and case review will help support quality and safety while expanding local treatment capacity. The project will begin with a pilot implementation in several rural communities representing different geographic regions of Alaska. During the pilot phase, the project will track measurable outcomes such as specialty consultation turnaround time, number of patients managed locally rather than referred out, provider participation in training, and reductions in repeat patient travel for evaluation and treatment. By integrating telehealth consultation with workforce development and coordinated referral pathways, this model aims to improve access to specialty care, strengthen rural provider capacity, and support the long-term sustainability of rural health systems. The consultation and training framework developed through this initiative may also serve as a model for expanding specialty access for other clinical disciplines across rural Alaska.	\$250K-\$1M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Hoonah-Angoon Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Children's Academy II	Facility Floor repairs, replacement of indoor and outdoor materials	AK	These improvements are essential. Updated materials will significantly enhance our ability to engage with children, providing age-appropriate tools that deepen learning and social interaction. Making these resources widely available will expand community access so more families can benefit from our programs through distributed materials and local partnerships. Additionally, renovating the walls and flooring is urgently needed to improve sanitation and create a healthier, cleaner learning environment that supports students’ well-being and academic success.	Rapid needs assessment to inventory materials, assess classroom conditions, and identify priority age groups and community gaps. Procurement of evidence-based instructional resources (books, manipulatives, kits) matched to identified needs. Facility upgrades: phased replacement/repair of walls and flooring with durable, low-VOC, easy-sanitize materials; address moisture/safety issues. Distribution network: establish resource hubs at the school and partner sites, implement a simple loaning/catalog system, and run periodic outreach pop-ups. Training: short staff and volunteer workshops on using materials and maintaining sanitation protocols. Monitoring & evaluation: track usage, families served, student engagement, attendance, and classroom sanitation metrics with a 6- and 12-month review.	Under \$50,000	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Alaska Children's Museum	Improving Alaska Early Childhood Health Outcomes through Active Play Environments & Education	AK	Alaska children face significant challenges building healthy habits that include active play, contributing to negative impacts on their physical, social, and developmental health. One in three Alaska children are overweight or obese, and in 2017, 77% of parents reported their three-year-olds receive more than one hour of screen time daily, exceeding American Academy of Pediatrics recommendations. The 2024 Early Childhood Alaska Needs Assessment indicates this trend has continued to worsen. Excessive screen use in early childhood is associated with reduced physical activity, language delays, sleep disruption, and challenges in social-emotional development. One barrier to reducing screen time and increasing physical activity is the lack of free and low-cost indoor spaces designed for young children and families to spend extended time together, particularly given Alaska’s climate. At the same time, many Alaska families face barriers to accessing early developmental education, caregiver support, and timely developmental screening services. Early identification of developmental delays and access to therapies such as occupational, physical, speech, and behavioral services are critical to improving long-term outcomes but can be difficult to access in traditional clinical settings or through home visiting programs. Social skills, emotional regulation, fine motor development, and speech services are often most effective when delivered in natural, community-based environments.	This project will create a community-based early childhood development environment housed within the Alaska Children’s Museum that integrates active play exhibits, caregiver education, and partnerships with developmental screening and therapy providers. The museum will serve as a welcoming public space where families can engage in healthy, screen-free activities that promote movement, imagination, and caregiver-child interaction. Funding will support the development of interactive exhibits that encourage physical activity, emotional learning, and cooperative play while providing engaging alternatives to passive screen entertainment. Exhibit design will draw on proven models developed by leading children’s museums, including the social-emotional learning framework used in Emotions at Play with Pixar’s Inside Out, developed by the Children’s Museum of Pittsburgh in collaboration with Pixar Animation Studios. That exhibit demonstrates how interactive experiences such as emotion mirrors, storytelling environments, and cooperative play can help children recognize and regulate emotions while strengthening empathy and communication skills. Additional inspiration comes from the caregiver-focused exhibition AlegreMENTE / Happy Brain: Celebrating Early Connections, which helps adults understand how playful interactions support early brain development and encourages caregivers to actively participate in children’s learning and health. The project will also include a hands-on nutrition learning environment modeled after children’s museum “test kitchen” programs where children and caregivers prepare simple healthy foods together while learning about nutrition and healthy habits. Caregiver workshops will provide practical guidance on early brain development, healthy media habits, nutrition, and strategies that support language, social-emotional skills, and physical activity. The museum will partner with infant learning programs, developmental screening agencies, and pediatric therapists to offer space for screenings and therapy sessions. Occupational, physical, speech, and behavioral therapists will be able to work with families in a natural play-based setting that supports developmental skill building. By combining active play environments, caregiver education, nutrition learning, and access to developmental services, this project will reduce screen reliance, increase physical activity, and strengthen early childhood development for Alaska families.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Alaska Children's Trust	One Alaska: Coordinated Enrollment & Eligibility portal for public programs and state services.	AK	Alaska has a robust array of publicly funded programs spanning health care, food assistance, housing, behavioral health, early childhood services, disability services, and more, yet these programs are administered across public and tribal health care systems and dozens of separate agencies, each with their own website, eligibility criteria, and application process. The consequences of this fragmentation are well-documented and severe. Chronic understaffing, outdated systems, and disconnected processes have created persistent backlogs in Medicaid and SNAP, leaving thousands of eligible Alaskans waiting months for benefits they qualify for. Error rates have consistently ranked among the highest in the nation, resulting in federal penalties and court orders requiring the state to meet basic processing timelines. These failures disproportionately harm rural and remote residents, who have the fewest alternative resources while they wait. The problem is not a lack of programs. It is a system too fragmented and difficult to navigate to reliably connect eligible Alaskans with the help they need. A CCE system/portal would directly reduce the administrative burden driving these failures, improving accuracy, cutting processing times, and making it easier for families, navigators, community partners and agency staff to manage applications from submission through renewal.	The project will develop a centralized Coordinated Enrollment & Eligibility (CEE) system publicly accessible online, modeled on initiatives like First Five SC, First Five Alameda and other state systems, but expanded in scope to serve Alaskans of all ages across all major state and federal program categories. The portal will be built in three phases over approximately 24 months. Phase 1 — Discovery and Design (Year 1-2): A cross-agency steering committee will be convened including representatives from DOH, DFCS, and DEED, tribal health organizations, and community navigator networks (Help Me Grow Alaska, 2-1-1, Aging & Disability Resource Centers) and community providers. This group will conduct a comprehensive gaps analysis to catalog all publicly funded programs eligible for inclusion, map eligibility criteria and data requirements, and identify existing digital infrastructure that can be integrated. Lived experience advisors, including rural residents, Alaska Native community members, and service providers, will inform user experience design priorities. Wireframes and technical specifications will be developed and reviewed. A contractor with CEE systems experience/knowledge will be hired to provide support and guide the work of the steering committee. Phase 2 — Development and Pilot (Year 2-3): A vendor will be selected through a competitive procurement process to build the portal to specification. Core features will include but not limited to: a plain-language eligibility screener; a unified program database searchable by category, age, geography, and need; a common application that pre-populates across programs; and a navigator-facing interface that simplifies referrals. In addition, the system will allow individuals to access local resource systems like Help Me Grow AK or AK 211. A pilot will be conducted in 3–5 communities representing urban, rural, and remote contexts, with structured feedback loops to refine the tool. Phase 3 — Launch and Transition (Year 3-4): Following pilot refinement, the portal will launch statewide. An outreach campaign will target both families and front-line service providers. Training materials and technical assistance will be provided to tribal navigators, community health aides, school counselors, and others who serve as trusted intermediaries. The portal will be transitioned to ongoing state agency management with a sustainability plan in place.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Children's Urgent Care and Outreach, LLC	Alaska Pediatric Integrated Access & Telehealth Network	AK	Children in rural, remote, and frontier regions of Alaska face significant barriers to timely, high-quality pediatric care due to geographic isolation, limited pediatric workforce availability, and fragmented specialty access. Many communities rely on Community Health Aides/Practitioners and small clinics without immediate pediatric consultation, resulting in delayed diagnoses, variable treatment approaches, and high rates of costly and disruptive medevac transfers. Families of medically complex children often must travel multiple times to Anchorage for separate subspecialty visits, creating substantial financial and social burden and increasing Medicaid travel expenditures. At the same time, rural providers lack standardized pediatric clinical pathways and real-time access to pediatric emergency and subspecialty expertise to support urgent care decisions. Parents and caregivers also face challenges navigating healthcare access, insurance, developmental services, and social supports across Alaska’s complex and regionally variable systems. These gaps create preventable disparities in pediatric outcomes, inefficiencies in healthcare delivery, and unsustainable costs. Alaska has an opportunity to transform pediatric care by creating a coordinated statewide network that connects rural providers and families to pediatric expertise, standardizes care pathways, and supports safe local management whenever possible.	To address gaps in pediatric access, quality, and coordination across rural and remote Alaska, the Alaska Pediatric Integrated Access & Telehealth Network (APIA-TN) will implement a statewide integrated model combining digital clinical infrastructure, centralized subspecialty coordination, and 24/7 pediatric telehealth triage. Statewide Pediatric Digital Access Platform APIA-TN will develop a secure web-based platform with two components: a provider portal and a public portal. The provider portal will include pediatric subspecialty directories, referral pathways, and evidence-based clinical algorithms for high-risk conditions such as trauma, traumatic brain injury, sepsis, respiratory distress, and behavioral health crises. The public portal will provide Alaska-specific information on accessing care, Medicaid and insurance navigation, developmental and behavioral resources, and social supports including food, housing, and emergency services. This platform will standardize pediatric care guidance and improve navigation for rural providers and families. Pediatric Subspecialty Hub with Outreach APIA-TN will establish coordinated pediatric subspecialty services in Anchorage to streamline scheduling and reduce fragmented visits for children traveling from rural regions. Centralized coordination and nurse case management will consolidate appointments and support medically complex children. The hub will deploy traveling subspecialty teams and tele-subspecialty clinics to high-need rural communities, expanding specialty access closer to home. Statewide 24/7 Pediatric Telehealth Triage Network A continuous telehealth network will connect rural clinicians, Community Health Aides/Practitioners with pediatric providers (“quarterbacks”) and on-call subspecialists. This system will support urgent decision-making, stabilization guidance, and appropriate transfer coordination, enabling safe local care when feasible and faster escalation when necessary. APIA-TN will partner with Tribal health organizations, rural hospitals, and community leaders to ensure culturally responsive implementation. In-person training in priority remote regions will build telehealth competency and pediatric emergency readiness. Continuous evaluation will track transfer rates, access, and cost impacts. Together, these components create a coordinated statewide pediatric care network that improves access, standardizes quality, and supports sustainable rural care delivery.	\$1M-\$5M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Christian College	Professional Counseling Services for Indigenous Rural College Students	AK	The mental health needs of college-age students are widespread, and their care is critical for their educational success. Students ages 18-25 suffer from many addictions, including alcohol, cannabis, and some recreational drugs. In addition, the vast majority of rural indigenous students have been abused in a variety of ways, especially the women. It is estimated that 80% of all these matriculating students have been abused in a variety of ways, including sexual, physical, and emotional. Until they come to college, they are not usually able to address the problems that have plagued many of them since early childhood. Suicide rates are extremely high with this population, and immediate care for these students is critical for their safety. Many students to date have been served by NHCC counselors to "talk them off the cliff" before they harmed themselves. Finally, these students struggle with depression and a lack of engagement. Since COVID-19, the number of students struggling with depression has been significant. Enabling better access will support the individual mental health needs of each student, regardless of their specific crisis or emotional care.	The proposed approach includes identifying, evaluating, and serving students who would benefit from professional counseling services. NHCC is the partner organization closest to the location of the students that can best accommodate the mental health needs of the college students. It is the request of the college to seek a grant, over the life of the grant, to be expended for the cost of professional services for each student who seeks care. The counseling center will charge the college the average cost of services that the grant will allow. This is a fee-for-service opportunity for each indigenous (and others) student to have no cost to them or the college. A fee will be established between the college and the counseling center for all services and interventions on a contractual basis. Students will have access to talk therapy, neurofeedback, and other interventions to meet their mental health needs.	Under \$50,000	Statewide	Kenai Peninsula Borough	Advance to Implementation Application
Alaska Church of the Nazarene - Camp Maranatha	ADA shower/toilet house	AK	Construct facility with showers and toilets for ADA guests on the property. We need an elevator to get into meeting room above the shower toilet area. Zero entrance on ground level for wheelchair	Construction project that would address all the ADA needs for the camp. This would allow inclusion for guests that are in need of ADA accommodations.	\$1M-\$5M	Statewide	Matanuska-Susitna Borough	Deferred or Not Advanced

Alaska Clubhouses, Inc.	Establish a Certified Clubhouse Model program in Anchorage, Alaska	AK	Alaska has one of the highest rates of mental health issues in the U.S., with many individuals experiencing conditions like depression, anxiety, and severe mental illnesses such as PTSD, Bipolar disorder, and schizophrenia. Mental health programs often face inadequate funding, leading to reduced services, limited staffing, and longer waitlists. The lack of mental health services and recovery programs in Alaska is a critical issue that affects not only individuals but also the broader community. Addressing these gaps is essential for promoting recovery, reducing homelessness, and improving quality of life. Many individuals with mental illness also struggle with substance use disorders, yet integrated treatment programs that address both issues are scarce. This gap can lead to worsening mental health and increased risk of homelessness or incarceration. But addressing the needs of individuals with severe mental illness in Anchorage requires a comprehensive approach that includes expanding services, improving access to care, and fostering collaboration among providers. Choices among community-based services are essential to complement clinical services and to provide opportunities for people to truly recover, work, be housed, and thrive.	Despite the demonstrated effectiveness of Psychiatric Rehabilitation models such as certified Clubhouse Model programs across the world, Anchorage currently lacks such a resource. By adhering to international clubhouse standards, we aim to implement a program that has well-documented outcomes, empowering individuals to reclaim their lives and actively participate in their communities. This initiative aims to serve the largest population in the state experiencing mental illness. The Clubhouse Model is a proven approach that fosters recovery, employment, socialization, and community integration for individuals facing mental health challenges. The RHTP opportunity can help to launch our efforts to begin to fill this gap, a program that so many Alaskans deserve. By providing a safe and welcoming space where participants can belong, recover, receive assistance with basic needs, housing, employment, and community support, we can anticipate the positive outcomes seen by clubhouse model programs throughout the country that are adhering to the standards and are fully funded. Specifically, clubhouses are effective because they provide the essentials for recovery: Support: Members engage with peers who understand their experiences, fostering connection and reducing isolation. Empowerment: Individuals are encouraged to take an active role in their recovery, promoting self-esteem and agency. Structure: Members participate in daily activities that provide structure and purpose, helping to develop skills and routine. The model emphasizes individual strengths and abilities rather than limitations, fostering a positive self-image. Integrated Services: Clubhouses often provide access to a range of services, including vocational training, social activities, and mental health support in one location. Collaboration with Professionals: Mental health professionals work alongside members, ensuring that support is tailored to individual needs. Vocational Opportunities: Clubhouses offer job training and placement services, helping members gain employment and achieve economic independence. Skill Development: Members can develop work-related skills in a supportive environment, enhancing their employability. Social and Recreational Activities: Clubhouses provide opportunities for social interaction, reducing feelings of loneliness and fostering relationships. Members participate in recreational activities that promote wellness and enjoyment, contributing to overall quality of life.	\$1M-\$5M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Alaska Coalition on Housing and Homelessness	Update of the Homeless Management Information System for Data Sharing with the Dept. of Health	AK	The Alaska Coalition on Housing and Homelessness (AKCH2) partners with rural healthcare providers to assist with the development of supportive housing programs targeting individuals experiencing homelessness. Healthcare integration with emergency shelters and housing programs serving people experiencing homelessness is vital in bringing much needed access to high utilizers of emergency medical services and people with complex medical needs. Housing is a social driver of health, and lack of housing often leads to serious health complications. The current AKHMIS is not interoperable with existing Department of Health (DOH) data systems. A data system that can talk to other systems will increase the efficiency of referrals to federally funded housing programs, and leverage federal resources by identifying clients receiving high levels of care in multiple systems that would improve patient health outcomes. There is also potential for AKHMIS to share data with other systems operated by the Division of Public Assistance, Department of Corrections, and Office of Family and Children Services. Reducing data silos will increase efficiency, improve client outcomes and streamline service delivery.	This proposal outlines how funding will support the continued operations of the AKHMIS, identify and implement a new data system capable of integrating with health data systems, enhance data integration and matching capabilities, and expand data entry for federally funded housing programs through the Alaska Coalition on Housing and Homelessness. The proposal includes: 1. Assessment of current AKHMIS operations, identify gaps in data management, and determine integration limitations and requirements with health data systems, 2. Engagement with key stakeholders, including the Department of Health, data system users, and the Institute for Community Alliances, to gather input on system requirements and needs, 3. Establish Request for Proposals process to assess HMIS software options leading to a recommended new vendor, 4. Ensure that the funding objectives align with broader goals of improving healthcare coordination and service delivery for vulnerable populations, and 5. Implementation of a new data management system, training for all users, and overlapping with the old system. The new system will share data with the Department of Health and other agencies with shared clients, and 6. Review and analyze data quality, sharing capabilities, and opportunities for service delivery alignment or preventive care interventions.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Commercial Company (AC Stores)	Building healthier communities through containerized aeroponic mini-farms off the road system	AK	Rural Alaskans face some of the highest rates of diet-related chronic disease in the country. Diabetes, obesity, heart disease, and other conditions are directly tied to poor nutrition and this generates enormous downstream costs for health systems that are already under-resourced. The goal of this project is to reduce the incidence of these medical conditions over the long-term by providing access to healthy, fresh produce in much larger quantities than is currently available. Alaska Commercial Company operates 38 grocery stores in 35 communities off the road system. In most communities where we have stores (as well as the nearby villages), we are the main and sometimes only source of fresh produce. We are also fully aware that the availability of fresh produce is unreliable in some of our stores due to freight and logistics issues, especially in the winter. Once one of our Store Managers is sending berries and leafy greens to the landfill for the sixth week in a row due to freight issues, they often stop ordering those items. The result is that many community members simply go without fresh produce for much of the year. The problem is structural: as long as fresh produce availability depends on long, expensive, weather-sensitive freight methods, communities will remain underserved by healthy food. This project addresses that structural problem by producing fresh produce locally, year-round, eliminating freight dependency for these crops entirely.	Alaska Commercial Company will partner with SkyAcres Agrotechnologies to deploy 15 containerized aeroponic mini-farms adjacent to AC stores in rural Alaska. SkyAcres is an agricultural technology company with experience deploying these systems. Their 'fogponic' technology delivers nutrients to plant roots as an ultra-fine mist rather than circulating water through pumps and pipes. This means no plumbing, no mechanical failure points, and very low energy consumption. These systems are purpose-built to be easy to manage in a remote environment. Each mini-farm will be housed in a reefer container, which provides insulation and weatherproofing suited to the rural Alaska climate. Inside each container, SkyAcres racks will be pre-installed before shipping, so units arrive essentially ready to operate. Each rack produces approximately 500 lbs of fresh produce per year and requires only 20 minutes of weekly maintenance. A single community-based operator will be hired at each location to manage the growing system, harvest produce, and stock it directly into the adjacent AC store. RHTP funding will cover the reefer container, SkyAcres equipment, installation, and the first three months of operator labor, training, and support at each of the 15 locations. AC will provide the physical footprint, existing store infrastructure, cold storage, and the retail distribution channel that puts the produce directly in front of community members at equal or cheaper prices than the current selection of produce. Site selection will prioritize communities where freight disruption is most severe and produce availability is most unreliable. AC's store operations team has direct visibility into which locations are most affected and will lead site selection in consultation with local store managers. Containerized hydroponic systems have been attempted in rural Alaska in the past (e.g. Maniilaq in Kotzebue in 2016-17) but failed due to several issues: staffing/turnover, high cost of electricity, system complexity, and lack of clean water access. Our plan solves all of these issues. AC will provide the staffing through our existing store network, SkyAcres systems are intentionally simple and require much less electricity than hydroponics, and SkyAcres requires 90% less water than hydroponics. Water can be taken directly from the AC store shelf to run the system when there is a disruption in a community's water supply.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Consumer Direct Personal Care, LLC	Caregiver Recruitment and Onboarding Enhancement	AK	Caregiver shortages are particularly acute in rural and frontier communities, where limited training opportunities, long travel distances, lower wages, and high onboarding costs deter potential applicants. Many qualified individuals cannot afford the upfront expenses required to begin work, even though caregiver roles are in high demand. This creates a bottleneck in hiring, leaving vulnerable individuals without adequate in-home support. The opportunity exists to remove these financial barriers and create a more accessible, efficient, and reliable pathway into caregiving roles.	The project will fully fund required onboarding costs for new caregivers, including CPR/First Aid training, background checks, fingerprinting, and other mandated certifications. By centralizing and paying for these costs, we streamline the hiring process and reduce the financial burden on applicants. We will coordinate with training providers to ensure timely class availability and leverage partnerships with community organizations to promote recruitment. Additionally, we will track applicants from initial inquiry through hire to monitor improved hiring timelines, workforce growth, and overall impact.	\$50,000-\$250,000	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Consumer Direct Personal Care, LLC	Caregiver Training Modernization Project: Transition to a Centralized LMS System	AK	Current caregiver training relies heavily on paper quizzes and manual processes that are inefficient, inconsistent, and difficult to manage. These limitations disproportionately affect caregivers in rural areas who may have limited access to in-person training or face logistical challenges when submitting paper materials. Additionally, tracking compliance is labor-intensive and prone to delays or errors. The opportunity is to replace this fragmented system with a centralized, user-friendly digital training platform that improves accessibility, consistency, and accuracy for both caregivers and administrators.	The project proposes implementing a modern LMS (e.g., Workday Learning, Relias, or similar) to deliver all initial and ongoing caregiver education. The approach includes: 1.) Digitizing all onboarding, mandatory, and continuing education courses. 2.) Automating training assignments based on caregiver roles, regulatory requirements, and timelines. 3.) Providing mobile-friendly, on-demand access to coursework. 4.) Offering simple, centralized tracking dashboards for compliance and reporting. 5.) Migrating legacy materials into standardized, high-quality online modules. 6.) Training caregivers and managers on how to use the system effectively. This approach ensures training is accessible, trackable, and easy to complete regardless of location.	\$50,000-\$250,000	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Consumer Direct Personal Care, LLC	CDAK Digital Transformation Initiative: Implementing Electronic Forms and e-Signatures	AK	Alaska’s rural and remote communities face unique barriers to accessing health and caregiver support services. Paper-based forms require printing, mailing, or traveling long distances, often hundreds of miles or more, to complete essential documentation. These delays can slow service enrollment, prevent timely caregiver onboarding, and create significant inequities for individuals living in off-road or hard-to-reach regions. The opportunity lies in replacing these outdated processes with digital tools that allow clients and caregivers to complete forms electronically, improving speed, accessibility, and accuracy statewide.	The project will transition all client and caregiver paperwork to electronic, mobile-friendly forms supported by secure DocuSign e-signatures. This includes redesigning existing documents for digital use, implementing an integrated workflow for routing and tracking submissions, and training staff, caregivers, and clients in the new system. The approach focuses on accessibility: forms will be easy to complete on smartphones, available in multiple formats, and supported by remote assistance when needed. By removing reliance on physical paperwork, the project creates a seamless documentation experience that works from any location, regardless of connectivity challenges or distance from service offices.	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Consumer Direct Personal Care, LLC	CDAK Provider Directory: A Digital Solution for Matching Caregivers and Clients	AK	Rural, remote, and frontier communities face persistent shortages of qualified caregivers, limited transportation options, and long distances between clients and available services. These barriers make it difficult for individuals and families to access consistent, high-quality home and community-based care. At the same time, caregivers in these regions often struggle to find stable, nearby employment because there is no centralized way to connect with clients or showcase their skills. This project addresses the opportunity to close that gap by creating a digital platform that improves visibility, coordination, and matching between caregivers and the people who need their support, strengthening the caregiving workforce and expanding access to care across underserved areas.	CDAK will build a Provider Directory that offers a comprehensive, user-centered platform that better connects caregivers with clients, especially in rural, remote, and frontier communities where the matching process is most challenging. We will explore both in-house build options and off-the-shelf solutions that may best address this approach. Key development priorities include profile creation, search and matching capabilities, robust caregiver and client profile tools, streamlining job posting and application workflows, and integrating secure, accessible communication channels. The enhanced platform will be designed to reduce the administrative burden on families, increase visibility for local caregivers, and create a more reliable pathway for filling open caregiving roles. By strengthening this digital infrastructure, the project will create a more efficient, equitable, and responsive system for connecting people to the care they need within their own communities.	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Eating Disorders Alliance	Strengthening Alaska’s Eating Disorders Continuum of Care	AK	Eating disorders have historically been under-recognized and under-resourced in Alaska, resulting in delayed diagnoses, fragmented care, frequent out-of-state treatment, and preventable medical crises. The lack of eating disorder services across all levels of care in Alaska is especially urgent given that eating disorders have the second-highest mortality rate of all mental health conditions - surpassed only by opioid use disorders - making gaps in access a critical threat to health and survival. While progress has been made in recent years, major gaps persist across the continuum of care - particularly in regions where provider shortages and geographic isolation compound risk. Alaska lacks sufficient trained providers to screen and assess eating disorders, hospitals often feel unprepared to admit medically unstable patients, and families frequently navigate complex systems without guidance. New higher levels of care (Intensive Outpatient and Partial Hospitalization Programs) launched recently, but require specialized training and consultation to operate safely and effectively. Without coordinated investment, these gaps will continue to place Alaskans at heightened risk. This project addresses a critical opportunity: to strategically strengthen the most impactful pressure points in Alaska’s eating disorder care continuum so Alaska communities benefit from education ad earlier intervention, safer treatment, and sustained recovery support.	AKEDA proposes a multi-year, phased approach to strengthen Alaska’s eating disorder continuum of care, with an emphasis on rural access, workforce capacity, and system sustainability. Activities are organized across prevention and early intervention, treatment capacity, and aftercare, with the goal of strengthening each level so the overall system becomes more comprehensive and resilient for Alaska. 1. Prevention and Early Intervention -Expand evidence-based prevention programming statewide, including rural school districts. -Increase provider education to strengthen Alaska's healthcare workforce for improved screening and early identification, diagnosis, and assessments in primary care, behavioral health, and tribal health settings. -Support development of standardized screening and assessment pathways, coordinated patient navigation for highly complex patients, and decrease other barriers to accessing treatment. 2. Treatment Capacity Across Levels of Care -Increase provider consultation with subject matter experts to increase support and capacity within the local workforce. -Expand provider education to increase the number of outpatient providers treating eating disorders. -Strengthen Alaska partner IOP and PHP program patient recovery outcomes through expert consultation, protocol development, staff trainings, and deepening family involvements. -Collaborate with adolescent residential treatment centers (RTCs) to support patients with body dissatisfaction and/or disordered eating and integrate eating disorder care into dual-diagnosis environments. -Increase Alaska hospital readiness and capacity to admit and medically stabilize patients with acute eating disorders by training interdisciplinary teams, refining admission criteria, and supporting coordinated medical stabilization protocols. 3. Aftercare and Family Support -Expand recovery-focused facilitated support groups for individuals and families, including rural-accessible formats. -Develop and disseminate structured family education to support meal supervision, relapse prevention, and transitions from higher levels of care.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

This approach led by our organization - the only group focused on improving eating disorders outcomes in Alaska - supports sustained, coordinated efforts to strengthen a complex system of care. It is work that cannot be meaningfully accomplished within a single year, and allows for progressive improvements and partnerships that build on one another over time.

Alaska Eating Disorders Alliance	Eating Disorders Workforce Development and Interdisciplinary Training Infrastructure Initiative	AK	This project will build a coordinated statewide workforce development strategy focused on eating disorder care. Alaska faces a critical shortage of healthcare professionals trained to identify and treat eating disorders. Without adequate interventions, patients leave Alaska in crisis. And while eating disorders carry the second-highest mortality rate of psychiatric illnesses, Alaska currently lacks coordinated training pathways to develop specialized clinical expertise and to treat Alaskans. Increasingly, healthcare providers across disciplines encounter patients experiencing disordered eating, body image distress, and eating disorders, yet many report limited training or comfort level in assessment and treatment. Workforce shortages further constrain healthcare systems ability to expand services, particularly in rural communities. This project will develop scalable training pathways and infrastructure designed to strengthen provider capacity across behavioral health, primary care, nutrition, nursing, and related disciplines, engage healthcare partners across Alaska (including behavioral health providers, tribal health organizations, and healthcare systems), and formalize academic partnerships to support long-term workforce development.	AKEDA will lead a 12-month planning and early implementation phase to design and build a sustainable model and statewide infrastructure to expand Alaska's eating disorder workforce. This initiative has been developed in partnership with UAA. As the primary eating disorders community partner, AKEDA will lead the Year 1 planning phase, to include: 1) Formative Workforce Needs Assessment - Coordination of a structured assessment of workforce capacity and training needs across Alaska using a mixed-methods approach of quantitative surveys and qualitative interviews. The assessment will engage behavioral health and medical providers, primary care clinicians, dietitians, school-based professionals, rural healthcare organizations and community partners to identify gaps in eating disorder identification, referral pathways, and treatment capacities. 2) Identification of Provider Training Opportunities - Identification of existing professional education opportunities for Alaska Healthcare Providers, including physicians, registered dietitian nutritionists, nurses, physician associates, and more. Select personnel will be trained and certified in eating disorder care, to build an Alaska-based workforce of healthcare providers who can serve as preceptors and educators in scaling and building curricula and continuing education opportunities. 3) Interdisciplinary Workforce Advisory Structure - Establish an interdisciplinary advisory structure that includes clinical partners and faculty leaders from UAA's College of Health. Faculty disciplinary workforce leads will represent social work, psychology, nutrition and dietetics, nursing, and medicine. Each discipline will contribute to support workforce assessment, the identification and assessment of competencies, and curriculum development. 4) Exploration and Preliminary Planning for Graduate-Level Training - The project will explore the feasibility of an interdisciplinary graduate-level training pathway focused on eating disorder treatment. Activities will include curriculum mapping, competency development, student interest survey, and exploration of hybrid training models that support rural access. 5) Workforce Infrastructure and Sustainability Planning - Produce an implementation roadmap for expanding Alaska's eating disorder workforce through continuing education programs, interdisciplinary training models, and potential academic pathways.	\$250K-\$1M	Statewide	Anchorage (Municipality); Bethel Census Area; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; Northwest Arctic Borough; Sitka (City and Borough)	Advance to Planning

Alaska EXCEL	Alaska EXCEL Campus Expansion for Rural Transition Training & Education: Bridging the Gap	AK	Alaska EXCEL currently operates without a permanent campus, limiting long-term stability for staff, students, and program growth. Reliance on short-term housing and leased facilities creates uncertainty, constrains enrollment, and limits the program’s ability to expand services for graduates transitioning from rural communities to Anchorage or the Mat-Su region for work, training, or postsecondary education. Demand for the program continues to grow, with additional school districts requesting participation. However, the current capacity of leased housing limits Alaska EXCEL's ability to serve more students without reducing support for those already enrolled. Acquiring permanent land and developing the Alaska EXCEL Campus would provide a stable home base while expanding opportunities for rural youth pursuing careers in healthcare and other high-demand fields. The campus expansion will include transitional housing for EXCEL graduates entering employment, apprenticeships, or postsecondary programs. A small, tiny-home village will provide safe, affordable housing while graduates establish employment and financial independence. A shared bathhouse and gathering space will support wellness, cultural connection, and community. By investing in permanent infrastructure, Alaska EXCEL can expand capacity, strengthen workforce pathways, and help address Alaska’s workforce shortages while building long-term stability for rural youth and the communities they serve.	Demand for the Alaska EXCEL program continues to grow, with additional school districts requesting participation. However, the current capacity of leased housing limits Alaska EXCEL's ability to serve more students without reducing support for those already enrolled. To address this limitation, Alaska EXCEL proposes acquiring an existing large home and surrounding land to establish the permanent Alaska EXCEL Campus. Purchasing an existing property allows the program to quickly create a stable residential and program hub while providing space to expand facilities over time. The property will serve as the central campus residence for students and staff, while the surrounding land will allow for future development of small training shops and program space that support hands-on career exploration and workforce preparation. The campus expansion will also include development of a small transitional tiny-home housing village for Alaska EXCEL graduates relocating to Anchorage or the Mat-Su region to pursue postsecondary education, apprenticeships, or early employment. Transitional housing will provide safe, affordable accommodations during the critical transition period when graduates are establishing careers and financial stability. Residents will receive mentorship, case management, and connections to the workforce, education, and health resources. Consistent housing and coordinated support help reduce barriers that often prevent rural youth from completing training programs or maintaining early employment. The campus will also incorporate shared wellness and gathering spaces that foster community connection, cultural grounding, and peer support. Establishing a permanent campus will significantly expand Alaska EXCEL’s ability to serve rural students across the state. Increased housing capacity will enable the program to accept additional students from participating school districts while also supporting graduates as they transition into careers and postsecondary pathways. Over time, this investment is expected to increase the number of rural youth who complete training programs, enter Alaska’s workforce, and maintain stable employment. By providing housing stability, mentorship, and career pathways, the Alaska EXCEL Campus will strengthen workforce development, improve long-term outcomes for participants, and contribute to stronger, more resilient rural communities across Alaska.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; North Slope Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska EXCEL	Alaska EXCEL Rural Community Outreach for Healthy Villages - Community-Wide Career Exploration	AK	Rural Alaska communities face persistent barriers to postsecondary access, workforce readiness, and youth engagement. Geographic isolation, limited exposure to career pathways, high teacher turnover, and strained relationships between schools and families often leave students without consistent mentorship, leadership development opportunities, or clear post-high school plans. Many students—particularly in remote villages—have few opportunities to build employability skills or confidence navigating postsecondary systems. A large percentage of these students are first-generation college students, and many families have limited familiarity with postsecondary programs, financial aid, or enrollment processes. This knowledge gap can reduce participation and create barriers to trust and engagement. Alaska EXCEL has successfully implemented this approach before. In 2016, the organization led a five-year initiative that included a Community Outreach plan, resulting in strong outcomes and the publication of two peer-reviewed studies by the Institute of Social and Economic Research (ISER) at the University of Alaska Anchorage. Building on this proven model, Alaska EXCEL will implement community-based outreach that strengthens partnerships with school staff, families, Elders, and local leaders. Through culturally responsive workshops, participants will explore leadership development, postsecondary preparation, and workforce pathways available within their regions.	Alaska EXCEL will design and implement a framework for sustained community collaboration to promote postsecondary training and career readiness for high school students and young adults in the communities it serves. This approach centers local leadership, mentorship, and partnerships with schools, families, and community members. The framework will be implemented through the following process: Training and Launch: Alaska EXCEL will train a designated school-site advisor at the annual Village Convening at the start of the funding cycle. Advisors will receive resources and tools to support outreach and workshop implementation. Monthly check-ins with Alaska EXCEL staff will provide technical assistance. Community Cohort Formation: During the Convening, two community members will join the Site Advisor to form a local cohort responsible for planning and implementing workshops. Local Action Planning: Each cohort will develop a yearly action plan outlining workshop topics, outreach strategies, and participant support. Workshops will focus on leadership development, postsecondary preparation, and workforce readiness. Ongoing Collaboration: Site cohorts will meet monthly with Alaska EXCEL staff to monitor progress, share updates, and address challenges. Community Support: A stipend will be provided to cohort members to support planning, outreach, and workshop facilitation. Participant Evaluation: Pre- and post-workshop surveys will assess knowledge gained, program relevance, and participant experience. Continuous Improvement: A Plus/Delta debrief will be conducted with Alaska EXCEL staff and site cohorts after each workshop to identify successes and improvements. Through hands-on learning, mentorship, and leadership development, students strengthen communication, teamwork, problem-solving, and self-advocacy skills. Outreach builds community trust and creates pathways of support for youth and young adults. This approach positions Alaska EXCEL as a collaborative partner working with rural communities to promote educational success and workforce readiness across rural Alaska. The goal of the outreach program is to increase participation from rural school districts and strengthen referral systems with educators, school personnel, and community leaders. These partnerships create pathways for rural youth to access EXCEL intensives, leadership development, and workforce training, strengthening local talent pipelines and supporting long-term economic resilience.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; North Slope Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska EXCEL	Alaska EXCEL Rural Native Youth Career Pathways: Education, Careers, and Whole-Person Support	AK	Rural Alaska Native youth face significant barriers to postsecondary education, entering the workforce, and achieving long-term stability. Geographic isolation, limited career exposure, housing instability during transitions, and intergenerational trauma contribute to gaps in leadership development, educational achievement, and employment. Many students lack consistent mentorship, practical training, and clear pathways linking high school to trade schools, apprenticeships, college, or careers. Youth moving from rural to urban communities often encounter additional challenges with housing, financial literacy, transportation, and navigating unfamiliar systems, including healthcare. EXCEL addresses these barriers through leadership development, employability skills training, and culturally responsive mentorship that support rural workforce pathways and long-term well-being. Through hands-on Foundational, Mini Bridging, and Specialty Sessions, as well as postsecondary preparation intensives, EXCEL equips youth with practical skills for postsecondary readiness, employment, resilience, and confidence. Optional wraparound case management and supportive services help address mental health needs, stability, and transition planning. By connecting rural youth with education, training, and employment opportunities, EXCEL enhances rural workforce development, promotes health equity, and builds healthier, more resilient communities across rural Alaska.	Alaska EXCEL addresses barriers facing rural Alaska Native youth through a relationship-centered, community-embedded model that integrates leadership development, workforce training, educational support, and wraparound services. The core component of our model is short-term, high-impact intensives hosted at the Alaska EXCEL campus in Wasilla. Rural students travel to EXCEL for structured residential sessions lasting 4 to 30 days, depending on age and training. These intensives immerse participants in leadership development, employability skills, and hands-on career exploration aligned with Alaska’s high-demand workforce needs in a safe, supportive environment. Students begin with hands-on Foundational Sessions focused on healthy living, employability skills, and emotional wellness. All EXCEL coursework is tied to high school credit, ensuring participants make academic progress while engaging in experiential learning. Students then progress to Specialty Sessions introducing multiple career pathways, including a medical pathway that exposes youth to healthcare professions and strengthens the rural healthcare workforce pipeline. Both Foundational and Specialty Sessions also provide opportunities to earn industry-recognized entry-level certifications, creating pathways from entry-level training to healthcare and other high-demand careers. Throughout these sessions, students build essential life and workplace skills—communication, teamwork, accountability, resilience, and problem-solving—preparing them for postsecondary education, training, and employment. EXCEL also supports postsecondary preparation and transition planning, including credit recovery in math, language arts, and science for students needing additional academic support. Staff assists youth with career exploration, applications, resume development, and planning for employment, apprenticeships, or further education. For youth relocating from rural to urban communities, EXCEL helps address barriers such as housing navigation, financial literacy, healthcare access, and workplace readiness. Optional wraparound clinical and case management services help youth address trauma, mental health challenges, family instability, and other barriers to persistence. Through coordinated outreach, campus-based intensives, transition support, and follow-up services, EXCEL creates pathways from rural high school to postsecondary success while strengthening Alaska Native leadership and a grow-your-own rural workforce.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; North Slope Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Farmers Market Association	Locally Grown Food; Alaskans feeding Alaska for the Health of People and Place	AK	Alaska has the opportunity to invest in the local food production and distribution momentum underway as a mechanism to address the health of our people and this uniquely special place. Local food production momentum includes the growing number of Alaska farmers, 48% of whom are women, largely growing on less than 10 acres, and including the nations’ largest proportion of new and beginning farmers (supported by AFMA). Local food distribution momentum includes the quadrupling of farmers markets (65 markets up from 13 in 2005), the success of AFMA's food access program pilots (SNAP Market Match and Local Food Purchasing Assistance- both ending this year without new investment), and the rise of Food is Medicine approaches including prescription produce programs (that Alaska’s farmers operating community-supported-agriculture subscription programs are well positioned to support). The momentum of Alaska’s local food production and distribution presents good news for easing pressure on the precarious supply chain that imports 95% of Alaska’s food at the price of \$2B/year and for addressing the rising burden of chronic disease including the only 8% of Alaskans getting recommended daily servings of fruits and vegetables. AFMA, founded in 2009 and led by a public health practitioner with a Board of Directors of engaged farmers and market managers statewide, stands ready to partner with Alaska’s organizations seeking to increase fresh food in the diet of Alaskans.	Our proposed approach, to continue the momentum of local food production and distribution, is to invest in Local Food First as opportunities expand for Alaskans feeding Alaska. RHTP funding is an opportunity to bring AFMA, and the farmers and markets it represents, to the table as partners in designing Alaska’s food future to meet the needs of everyone. Investing in Local Food First looks like... Alaska’s produce prescription boxes filled first with locally grown food and then with what must still be imported. Alaska's current growers, 1173 at last USDA count, can offer what they have this coming season as a pilot, plan growing seasons to meet increased demand, and mentor new growers to enter farming as a profession. The CSA model (community supported agriculture) lays the groundwork for produce prescription programs from managing distribution logistics, to utilizing technology (such as Farmingo for customizing produce boxes), to growing culturally preferred foods. As current members of the Food is Medicine and Alaska Food Coalition, we propose our farmers as partners to health organizations bringing produce prescriptions into their approach. Investing in Local Food First looks like.... Expanding upon AFMA’s successful food access programs to ensure all of Alaska’s current and new farmers markets offer nutrition incentives. Direct to consumer markets are the best way for new and small growers to make a viable living from farming, offer nourishing connections between community members and farmers, connect kids to their foodways, and bring communities together. AFMA’s 2024 market data presents an estimated \$3.1M in sales, from 180 farmers, and 316,000 visitors. Our food access programs welcome all-comers and remove the burden of potential overharvest for farmers through supported community donations. AFMA’s Power of Produce program offers \$5 to every child who shows up at farmers market to direct their families spending and engage in food choices. AFMA’s SNAP Market Match saw a 272% in SNAP redemptions across 8 farmers markets in the 2023-2025 pilot (2025 redemptions surpassed \$67,000 with pre-program data reporting \$18,000 annually). AFMA’s Local Food Purchasing Assistance 2023-2025 pilot supported \$314,000 in local food purchases from 39 farmers at 10 farmers markets donated to 22 anti-hunger organizations in local communities statewide. We propose continuing this work with AFMA as a key partner to expand nutrition incentive programs statewide.	\$50,000-\$250,000	Statewide	Anchorage (Municipality); Bethel Census Area; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Food Policy Council	Alaska Cold Chain Infrastructure Framework: A Foundational Roadmap for Rural Health and Food Supply	AK	Rural Alaska’s medical and food supply chains are compromised by a critical last-mile bottleneck: the lack of reliable temperature-controlled storage at rural airports. Research from the University of Alaska Anchorage shows nearly 60% of rural weather stations experience outages triggering aviation delays, leaving perishable cargo, including medicines, vaccines, and fresh foods, sitting for days. These disruptions have measurable consequences: 360,000 servings of fresh produce were lost in 2022 alone, and pharmaceutical deliveries face similar risks. Spoilage rates for air routes are triple those of barge routes, yet Alaska lacks a coordinated framework to guide cold-chain infrastructure investment, technical standards, or workforce readiness. With growing cross-sector awareness of this vulnerability, there is a timely opportunity to establish an Alaska Cold Chain Transformation Framework. This one-year project will map critical gaps across the rural aviation network, develop practical standards for resilient, low-tech temperature-controlled storage, and design community-based workforce pathways to prepare local operators to maintain these systems. By producing a strategic roadmap for coordinated investment, the Alaska Food Policy Council will help ensure future cold-chain infrastructure is durable and aligned across health, aviation, and distribution systems—transforming a persistent supply chain failure into a reliable health and fresh food lifeline for rural communities.	This one-year project establishes planning frameworks and decision tools to strengthen Alaska’s rural cold chain - the temperature-controlled transportation network that allows medicines and fresh foods to reach rural communities safely. Statewide Supply Chain Gap Analysis & Asset Mapping: Using existing research and datasets, we will integrate aviation reliability data, community health indicators, and the Alaska Food Systems Atlas to map critical cold-chain gaps. This analysis will identify where temperature-controlled storage is most urgently needed to prevent medication and food spoilage and will produce a Priority Investment Roadmap aligning public and private sector investment. Arctic Cold Chain Technical Toolkit: Drawing on existing research, case studies, and feedback from the Food Value Chain Coordination Council, we will develop a standardized framework for selecting appropriate technology for temperature-controlled storage at rural airports. The toolkit will include site-selection standards addressing permafrost conditions, energy requirement estimates, guidance on modular and low-cost infrastructure, integration with existing logistics assets, and coordination opportunities with industries such as seafood distribution. Community Workforce Framework: In alignment with Alaska’s Strengthening Workforce initiative, we will design a workforce roadmap outlining technical standards and local-hire pathways for village-based logistics monitors responsible for equipment oversight, temperature monitoring, and basic maintenance. This planning will ensure communities are prepared to operate and maintain systems when infrastructure investments occur. This planning phase supports Alaska’s RHTP goals—including Building Sustainable Systems and Healthy Communities—by creating a coordinated, community-led strategy to address a critical gap in the state’s rural transportation network for medicines and fresh foods.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Food Policy Council	Farm to Tray, Fish to Fork: Expanding Wellness Through Local Nutrition for Rural Alaskan Students	AK	Food security and behavioral health share a profound, scientifically established relationship. Through investments that enhance local food utilization in school lunches and nutrition education, this project seeks to influence positive behavioral and nutritional health outcomes in communities throughout 1200 miles of rural Alaska coastline. Alaska’s food systems are shaped by geographic isolation, cultural diversity, and economic challenges, all of which contribute to widespread food insecurity. Statewide, 14.6% of Alaskans experience food insecurity, including 20% of children, according to the Food Bank of AK. The problem is even more severe among Alaska Native communities, where approximately 28% of households face food insecurity, compared to 12% of non-Native households. Despite the challenges of high transportation costs and limited access to fresh produce, Alaska’s school nutrition programs demonstrate significant resourcefulness in addressing food insecurity for children. Efforts to integrate Alaska-grown and culturally relevant foods into school nutrition programs are gaining momentum. This project works with School Food Authorities (SFAs) representing diverse regions, each with its own food system dynamics. Many districts already partner with local food producers and seek innovative solutions to improve food sourcing and logistics; dedicated RHTP funding for infrastructure and resources supporting food security has potential for measurable generational health effects.	This project aligns with RHTP’s Healthy Beginnings and Healthy Communities initiative areas by using local food systems as a platform for prevention-focused health improvement among youth in rural AK. The Alaska Food Policy Council and its partners have storied histories transforming Alaska food systems through relationship-rooted work. This proposal creates alignment between needs assessments, grassroots and governmental support, and community resources to positively influence the physical and behavioral health of Alaska’s youth. RHTP funding will expand a network of food producers, School Food Authorities and other partners to develop culturally and locally relevant nutritional education, through enhancement of local food procurement and consumption within schools, in a wide swath of rural Alaska with scalable outputs and results. Despite the challenges to health and food security in rural Alaska, there has been tremendous interest and creativity across Alaska’s schools in improving school meal programs. Over the years, individual districts have piloted farm-to-school initiatives, integrated traditional foods, and experimented with scratch cooking and similar projects. These efforts have demonstrated the potential for innovation and sustainability but often lacked systemic support to scale statewide. At the same time, there has been tremendous growth in Alaska’s agricultural industry, with large increases in new and beginning farmers across the state. Alaska, from the grassroots up to the Governor, has identified and prioritized food security as a top concern, and there is significant interest in Alaska Grown/ Harvested/ Made foods, including seafood, entering institutional markets and supporting Alaska's schools. In fact, a legislative food security task force identified the establishment of co-op purchasing for school foods as a top recommendation earlier this year. Building on these insights through a best-practices local and regional food procurement toolkit, targeted training for child nutrition program staff and food producers, and deeper engagement through our statewide School Nutrition Working Group, this project will help shift Alaska’s farm-to-school landscape from isolation toward collaboration. Pass-through funding will be made available to program participants for infrastructure that supports locally-relevant production and purchasing, ensuring that such collaboration is effective by making long-term implementation tangible with resources.	\$1M-\$5M	Statewide	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Genetic Counseling Services	AKUA Sobriety Outreach Alaska - preformation LOI via AGCS	AK	Anchorage's behavioral health and recovery ecosystem is dense, well-established, and genuinely capable. Catholic Social Services, Cook Inlet Tribal Council Recovery, Providence Breakthrough, Clitheroe Center, Akeela House, Four Directions, Dena'ina Coy, Cornerstone Recovery, Alaska Wisdom Recovery, Aeon Counseling, the Narcotic Drug Treatment Center of Alaska, Rational Recovery, the VA, and ADAPT represent a remarkable concentration of recovery resources in a single city. The problem is not the absence of services. The problem is that the people who need them most cannot reliably get between them. AGCS is submitting this Concept Formation LOI on behalf of AKUA Alaska Sobriety Outreach, a recovery transportation ministry in formation as a religious nonprofit under Alaska law. AGCS is providing pro-bono administrative and organizational development assistance to AKUA to support this application — a service consistent with AGCS's broader commitment to strengthening Alaska's recovery and rural health ecosystem. AKUA's founding vision is specific and actionable: a peer-operated, recovery-dedicated transportation service connecting rural Alaskans in Anchorage to the shelters, detox facilities, inpatient programs, sober living homes, and peer recovery meetings that constitute the ecosystem of sobriety. This 12-month concept formation grant completes the organizational foundation and service design required to launch that service sustainably.	This LOI suggests 3 formation workstreams. AGCS provides pro-bono organizational support throughout, drawing on its principal's expertise in program development and delivery. 1 - Administrative Readiness: AKUA's articles of organization have been submitted to the Alaska DCED. We are in process obtaining the entity ID and business license, and will pursue 501(c)(3) federal tax-exempt status. As required, we may also form a board, adopt bylaws and conflict of interest policies, and document administrative infrastructure — accounting, reporting, insurance — required to manage grant funds and vehicle operations. 2 — Service Concept Refinement and Partner Formalization: Early conversations with more than fifteen Anchorage recovery, shelter, and behavioral health organizations have produced strong expressed interest, and Catholic Social Services has already provided a supportive memo of understanding. We will convert expressed interest into operational structure: more MOUs with priority partners; service design conversations to map transport routes, timing, volumes, and populations; and driver recruitment and documented vetting protocols. Vehicle fleet planning, including insurance, storage, maintenance, and liability frameworks, will be completed during this workstream. Simultaneously, AKUA will conduct early outreach to rural village airline service offices and airport law enforcement partners to begin scoping the aspirational rural-to-Anchorage intake transport network that represents AKUA's long-term vision for serving communities at the point of crisis. 3 — Sustainability and Funding Architecture: As detailed in the sustainability, this workstream produces the financial modeling and sustainability narrative required to take this work to the appropriate next RHTP funding application and program delivery stage. AKUA's founding operational leader — William Broad, a recovery advocate and sober living house owner/operator with lived experience of addiction and recovery in Alaska — has the community credibility, peer network access, and operational grounding required to deliver on this program's potential.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Chugach Census Area; Copper River Census Area; Dillingham Census Area; Kenai Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Genetic Counseling Services	The Alaska Genomics Partnership	AK	Alaska has no board-certified genetic counselor or medical geneticist practicing within the state. This single fact defines the problem. When Alaska Native women are referred for BRCA counseling following a hereditary cancer diagnosis, there is no in-state provider to see them. When a rural pediatrician suspects a congenital genetic syndrome in a village child, there is no specialist to consult. When a cardiologist identifies familial hypercholesterolemia, the standard cascade genetic testing pathway simply does not exist here. This absence could be accurately called a void. Alaska Native populations carry elevated risk for multiple hereditary conditions documented in medical literature, yet benefit from none of the clinical genetics infrastructure available in every other state. Primary care providers navigate genetic results without specialist support, increasing misinterpretation risk and delaying treatment. Out-of-state referrals are cost-prohibitive for rural patients and frequently abandoned. Direct-to-consumer testing reaches patients without counseling infrastructure to interpret results meaningfully. AGCS was established specifically to address this absence, but has not gone beyond planning. A grant would fund the missing pre-implementation work needed to predict real impact— needs assessment, tribal partnership formalization, workforce recruitment activities. These will ensure future work is done sustainably and with full community alignment.	AGCS proposes four interdependent planning workstreams over one year to prepare for a fully-specified Implementation-stage grant application. 1 — Community and Clinical Needs Assessment: A structured needs assessment engaging rural primary care providers, tribal health directors, Alaska Native community health workers, and patient communities across at least three geographic regions. Assessment tools will be adapted for Alaska Native cultural contexts, drawing on the AGCS principal's doctoral expertise in adult learning and community-based education. Findings will quantify unmet demand, document provider referral practices, and identify community-specific barriers to genetic services uptake, producing the evidence base for service design decisions. 2 — Tribal and Clinical Partnership Formalization: AGCS has identified as SCF and CITC as primary tribal health system partners, and inroads to established Anchorage medical practices for initial clinical collaboration. We will convert identified partner interest into executed MOUs establishing roles, data governance expectations, referral protocols, aommunity education planning, and co-design processes for implementation-phase service delivery. We hope to explore genuine co-ownership of the design with tribal partners. 3 - Workforce Recruitment Design and Candidate Pipeline: AGCS will develop and execute a national recruitment strategy targeting board-certified genetic counselors (CGC) and/or medical geneticists from accredited programs willing to commit to Alaska service. Recruitment materials will emphasize Alaska's professional opportunity, NHSC loan repayment eligibility, and the rare chance to establish a clinical field from the ground up. Notably, Alaska's absence of a state genetic counselor licensure requirement means a credentialed CGC can begin practicing immediately upon relocation — a meaningful competitive advantage in a national market where multi-month licensure queues are the norm. The planning period will result in at least one qualified candidate in active recruitment. 4 — Implementation Workplan and Budget: All planning outputs — needs assessment findings, partnership MOUs, recruitment pipeline data, validated delivery model — will be merged into a detailed implementation workplan with milestones, evaluation metrics, staffing plan, and 3-year budget projection positioning AGCS for a competitive Implementation-stage application, should that lign with ACF guidance.	\$50,000-\$250,000	Statewide	Anchorage (Municipality)	Deferred or Not Advanced

Alaska Genetic Counseling Services	Transformation program management and advisory - Technical assistance provider	AK	RHTP grantees face a consistent structural challenge: the funding to transform rural healthcare is available, but the organizational capacity to execute transformation is not evenly distributed. A Readiness-stage grantee that cannot scope a project clearly will never reach Planning. A Planning-stage grantee that cannot build a credible implementation workplan will not compete for Implementation funding. An Implementation-stage grantee that underestimates organizational change complexity will absorb resources without producing durable outcomes. These are predictable patterns in every large-scale grant portfolio serving community-based organizations in frontier environments. More guidance documents are not the answer though ACF has excelled so far in knowledge management. It is access to an experienced practitioner who can work alongside grantee teams, diagnose where work is breaking down, and provide hands-on support tailored and aligned to each organization's stage, capacity, and context. I approach this with validated relevant expertise and an ethos of service. How ACF structures TA within RHTP — services, delivery model, resources, governance — are genuine open questions that this concept formation grant hopes to answer in concert with other potential TA partners. An architecture to maximize the impact of RHTP requires early coordination, stakeholder engagement, and concept refinement. This proposed TA formation grant proposes to be part of those holistic supports.	This grant funding idea is for concept development, not service delivery. AGCS proposes three workstreams to transform an early-stage idea into a fully specified, partner-validated project concept ready for a Planning or Implementation-stage application. 1 — ACF Partnership Exploration: The foundational question is where ACF, as RHTP's administering agent, sees value in a dedicated grantee TA function and what role it envisions for an external partner in that work. AGCS will seek to understand the ACF current view of grantee capacity challenges, existing TA touchpoints, and the forms of partnership — if any — that would complement a TA service mission. ACF's ownership of the concept remains primary. To avert conflict of interest, ACF retains sole authority over grantee TA assignments, and that AGCS formally recuses from any engagement involving projects in which it holds a direct funding interest. 2 — Grantee Needs Exploration: In parallel, AGCS will conduct early-stage outreach to a small sample of RHTP grantees across readiness stages — with ACF's facilitation and endorsement — to develop a preliminary picture of where TA is most needed, what forms would be most useful, and what barriers to TA uptake exist in the rural Alaska context. This is preliminary listening, not a formal assessment — sufficient to determine whether a formal needs assessment is warranted and what it should ask. It is assumed ACF has already established some scope and direction for TA that may preclude this need. 3 — Concept Refinement and Administrative Readiness: Drawing on available data and initial findings, AGCS will refine the project concept with ACF guidance and to ACF requirements. The concept formation period concludes with a fully developed project narrative, partnership documentation, and budget ready for submission as a Planning or Implementation-stage LOI as preferred. Dr. Havelock's doctoral expertise in adult learning and organizational change, applied in over 20 years of healthcare systems improvement, is operationally relevant throughout. How rural healthcare professionals absorb new frameworks, change existing workflows, and sustain new organizational behaviors under resource constraint is a design challenge he is uniquely skilled to address. Technical assistance that ignores the learning dimension produces plans that exist on paper and die in practice. AGCS will apply systems knowledge and learning science to ensure TA is internalized, not borrowed.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Health Collaborative	Haw'áa - Health and Wellness Across Alaska	AK	1.) Lack of access to care which prevents early detection (especially colon cancer), mitigation and longitudinal care of illness 2.) Cost prohibitive or interpersonal impediment to reach primary care services 3.) Isolation from MAT services for those experiencing SUD 4.) Opportunity to enrich and sustain cultural values surrounding whole person wellness 5.) Opportunity to support and empower youth in skill development and early healthy decisions	1.) Once invited by community leaders, anticipate 2-3 days travel with care team via charter, commercial or local transport to the area of need with Piccolo or similar for point of care real time laboratory testing for screening and diagnostic purposes. Pathology samples (i.e. pap, skin lesion excision) will be collected preserved and submitted to commercial lab upon return to hub. Age appropriate health and safety surveys. Follow up can be arranged with regional medical center if appropriate and desired or continued with Alaska Health Collaborative. Full spectrum care for all those interested regardless of ability to pay. Colon Cancer specific screening: offer fecal immunoglobulin testing if appropriate and or schedule colonoscopy upon our return with General Surgeon, CRNA and RN offering to volunteer time and expertise. 2.) Example: in 2018 North Slope Borough School District advised me of a \$25,000 price tag to charter flights for students in just one outlying community to Utqiagvik and back for sports physicals where as my travel expense was \$1,600 and I was sometimes able to visit 2 villages in 1 day not leaving any students out. The fiscal logic of sending an MD to people as opposed to people out to MD is undeniable. Offer assistance with MCD/MCR application navigation. Interpersonal and privacy concerns often prevent people in smaller communities from seeking care when the Health Aid is a cousin or in-law and having an outside provider offer services has enabled confidential care of STIs, substance misuse and domestic safety issues on multiple occasions. 3.) I helped design and was the Medical Director for the first fully CARF accredited wrap around MAT program in the State and have subsequently worked with 2 additional agencies. A Psychiatric Nurse Practitioner and assessment specialist are part of my team willing to travel as well as offer telehealth. 4.) Traditional healing and connection to culture are central to a wellness that extends beyond what medication can offer. Gathering for storytelling, food, song and dance. Gathering reminds us that we are connected and rely upon one another. 5.) Ensuring every school child has a sports physical and is eligible to learn the power of their bodies, the strength of a team working toward a goal, the wisdom earned in failure. Host Science Power Camp/events to share the wonder of STEM. Mentor students interested in learning about allied health professions or trades. Assist in scholarship applications.	\$50,000-\$250,000	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Health Link LLC	Alaska Rural Value-Based Care Transformation Collaborative	AK	Rural health providers across Alaska face significant financial and operational challenges due to low patient volumes, workforce shortages, geographic isolation, and the high cost of delivering care in remote communities. In many rural settings, fee-for-service reimbursement has historically been preferred because it provides predictable revenue in environments where the cost of providing care is exceptionally high. Recent policy changes, including the repeal of Alaska’s long-standing 80th percentile reimbursement standard for out-of-network services, have increased financial uncertainty for many providers. At the same time, many rural hospitals, clinics, and behavioral health providers lack the administrative capacity, billing systems, data infrastructure, and technical expertise needed to evaluate emerging value-based care and alternative payment models. Without targeted support, rural providers may struggle to adapt to evolving reimbursement structures while maintaining essential health services. This project addresses the opportunity to support rural providers during this transition by building the operational capacity, collaborative partnerships, and shared learning networks needed to strengthen the long-term sustainability of rural health systems across Alaska.	Alaska Health Link will implement a regional, multi-community initiative that helps rural providers build the operational systems and partnerships needed to evaluate and participate in value-based care and alternative payment models. The project will establish a regional collaborative that brings together rural hospitals, primary care clinics, behavioral health providers, and Tribal health partners to share knowledge, strengthen partnerships, and explore sustainable care delivery strategies. Through this collaborative structure, participating communities will engage in shared learning, peer exchange, and coordinated planning that supports stronger regional health systems and improved care coordination across providers. Alaska Health Link will provide targeted technical assistance, planning support, and training to help participating providers develop the capabilities required to participate in evolving reimbursement models. This support will include financial modeling, contract evaluation, and planning for alternative payment models that incentivize care coordination, chronic disease management, and improved patient outcomes. Consistent with RHTP guidelines, the project will support capacity-building activities directly tied to project implementation. This may include strengthening billing and revenue cycle management systems, improving administrative workflows that support value-based care participation, and implementing population health and quality reporting tools needed to track outcomes and coordinate care across providers. The initiative will also support providers in assessing and preparing for provider payment opportunities within value-based care arrangements, including shared savings models, performance-based payments, and other payment structures that reward improved quality and coordinated care delivery. Training will be provided for clinical and administrative staff to build competencies in care coordination, quality reporting, and population health management. Alaska Health Link will also facilitate collaboration among participating communities to identify practical strategies that improve financial sustainability while maintaining access to essential health services. This initiative aligns with RHTP priorities by strengthening provider capacity, supporting chronic disease management, advancing value-based care readiness, supporting sustainable provider payment models, and fostering regional collaboration among rural health providers.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Health Link LLC	Community-Led Water Security and Health Protection Network	AK	Many rural Alaskans rely on community-managed water and sanitation systems that face increasing pressure from aging infrastructure, permafrost thaw, and weather events. When systems become unreliable, households may lose access to water needed for hygiene and sanitation, increasing risks of respiratory, skin, and gastrointestinal infections. Water insecurity can also affect maternal, family, and mental health by limiting practices that support healthy pregnancies, infant care, and daily well-being. Despite these risks, coordination between water system management and public health systems is often limited, leaving communities without the information or technical resources needed to identify emerging water-related health threats. This project addresses that gap by supporting community-led adaptation that connects environmental monitoring, water system awareness, and public health knowledge. Using a Two-Eyed Seeing approach that combines Indigenous knowledge and community experience with scientific expertise, the initiative will generate actionable environmental health data and support locally tailored solutions that strengthen water security and health protection in rural Alaska communities. The initiative will also establish a replicable model for community-based environmental health surveillance that can inform water security planning and public health prevention strategies across rural Alaska.	The project will implement a community-led adaptation model that strengthens the connection between water system management and public health protection in rural Alaska. The initiative will coordinate with participating communities, Tribal health organizations, public health partners, and local water system operators to identify water-related health risks and implement locally tailored solutions. First, the project team will conduct water and sanitation health risk assessments with participating communities. These assessments will evaluate infrastructure vulnerabilities, environmental conditions, and household-level water security challenges. Environmental water testing will identify contamination risks and establish baseline water quality data. Second, the initiative will deploy a multidisciplinary team of scientists and technical specialists to support environmental monitoring and risk analysis. Using a Two-Eyed Seeing approach, the team will integrate Indigenous knowledge and community experience with scientific expertise to interpret testing results and develop mitigation strategies suited to each community’s environmental and infrastructure conditions. Third, the program will provide training and technical assistance to community residents and local partners to strengthen their ability to monitor and respond to water-related health risks. Training will focus on water quality monitoring practices, proactive monitoring methodologies for weather-related impacts and infrastructure stress, sanitation risk mitigation, and coordination between water system management and community health programs. Fourth, the project will establish community-based environmental health surveillance systems integrating environmental water testing, infrastructure monitoring, and local health indicators. These systems will generate actionable environmental health data to identify emerging risks and guide prevention strategies. Participating communities will also develop locally tailored water security and health protection plans outlining adaptation strategies and monitoring practices. The initiative will establish a replicable model for community-based environmental health surveillance that connects water monitoring, environmental testing, and public health response to prevent water-related health risks in rural communities. The project will strengthen water security and health protection, improve community resilience and capacity to respond to water insecurity events.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Health Link LLC	Emergency Response Readiness and Community Preparedness Program	AK	Many rural and remote communities in Alaska face significant challenges responding effectively to medical emergencies and public health crises. Geographic isolation, severe weather, limited health infrastructure, and workforce shortages can make it difficult for communities to rapidly assess and manage emergency situations before advanced care becomes available. These challenges became especially apparent during events such as the COVID-19 pandemic, when communities were required to respond quickly to evolving public health threats with limited local resources. Emergency medical services and community health systems often operate with small teams and limited access to specialized clinical guidance, training, and coordinated response planning. Without structured emergency preparedness strategies, communities may struggle to rapidly assess emerging threats, coordinate response efforts, and deliver effective care during large-scale events. This project addresses the opportunity to strengthen community emergency response readiness by providing clinical expertise, training, and planning support to help communities evaluate and improve their emergency response capabilities. By strengthening coordination between EMS providers, health systems, and community partners, the project will help communities better prepare for and respond to emergency events and public health crises across Alaska.	The project will strengthen community emergency response readiness through assessment, training, and coordinated response planning. Alaska Health Link will partner with Juneau Emergency Medical Associates to provide clinical expertise in emergency medicine and EMS response planning while working with communities to evaluate and improve their emergency preparedness capabilities. First, the project will conduct assessments with participating communities, EMS providers, and healthcare facilities to evaluate existing emergency response capacity. These assessments will examine current response protocols, communication systems, workforce capabilities, and coordination between EMS, healthcare facilities, and community leadership during emergency events or public health crises. Second, the initiative will support development of community-specific emergency response improvement plans based on the findings of these assessments. These plans will identify opportunities to strengthen response coordination, improve clinical decision-making during emergency events, and clarify roles and responsibilities across local response partners. Third, the project will provide training and technical assistance for EMS providers, healthcare personnel, and community partners to strengthen emergency response practices. Training will focus on improving patient assessment, emergency triage, response coordination, and preparedness for large-scale events such as pandemics or other public health emergencies. Finally, the initiative will support development of practical guidance and response protocols that communities can use to improve readiness for future emergency events. Lessons learned through the project will inform a replicable framework that other communities can use to strengthen emergency preparedness and response capacity across Alaska. By combining clinical expertise, training, and coordinated planning, the project will help communities improve their ability to respond to emergencies and protect the health and safety of residents in rural and remote regions.	Under \$50,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Health Link LLC	Rapid Maternal Infection Detection and Clinical Decision Support	AK	Timely detection of maternal infections is critical to protecting both maternal and neonatal health. In many Alaska communities, particularly those serving rural and remote populations, access to rapid diagnostic testing during labor and delivery can be limited. Pregnant patients may arrive in labor without documented screening results for infections such as Group B Streptococcus (GBS), leaving providers without confirmed diagnostic information at the time clinical decisions must be made. When infection status is unknown, providers often administer prophylactic antibiotics to prevent neonatal infection. While this approach protects infants, it can also result in unnecessary antibiotic exposure for mothers and newborns when infection is not present. Overuse of antibiotics can contribute to antimicrobial resistance and may affect maternal and neonatal microbiome health. This project addresses an opportunity to improve maternal infection detection by supporting rapid diagnostic screening and clinical decision support during labor and delivery. Strengthening infection detection capacity will help providers make more informed treatment decisions, improve maternal and neonatal care quality, and support responsible antibiotic stewardship in health facilities serving communities across Alaska.	The project will strengthen maternal infection detection by combining gap analysis, clinical protocol development, and rapid diagnostic decision support. The initiative will work with participating hospitals and healthcare facilities to evaluate current maternal infection screening practices, particularly for patients who arrive in labor without documented prenatal screening results. First, the project will conduct an assessment of prenatal screening gaps and labor and delivery practices related to maternal infection detection. This assessment will examine the frequency of undocumented infection screening at the time of delivery, identify barriers that limit access to prenatal screening in rural and remote communities, and evaluate current clinical practices used when infection status is unknown. Factors such as limited prenatal care access, travel barriers, and care coordination challenges will be analyzed to better understand drivers of missed screening opportunities. Second, the project will support implementation of rapid maternal infection detection approaches that allow providers to obtain diagnostic information during labor when prior screening results are unavailable. Clinical decision support protocols will be developed to help providers interpret rapid diagnostic results and guide evidence-based treatment decisions. Third, the initiative will provide technical assistance and training for participating facilities to strengthen infection detection practices during labor and delivery. Training will focus on integrating rapid diagnostic testing into clinical workflows, improving documentation of infection screening status, and supporting responsible antibiotic stewardship. By strengthening infection detection capacity and improving clinical decision-making during labor, the project will help facilities provide safer maternal care, reduce unnecessary antibiotic exposure, and improve maternal and neonatal health outcomes across Alaska.	Under \$50,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Health Link LLC	Recovery Housing and Workforce Support Initiative	AK	Many Alaska communities face housing shortages that directly affect health care access and patient recovery. Patients who are medically stable may remain hospitalized longer than necessary when safe recovery environments are unavailable. Some individuals cannot safely return home due to housing conditions, lack of support services, or the need for short-term recovery space following hospitalization or treatment. At the same time, health care systems in rural and remote communities often struggle to recruit and retain traveling providers because safe and reliable housing options are limited. When providers cannot secure stable housing, staffing shortages can occur, reducing access to essential services and placing additional strain on local health systems. This project addresses these challenges by developing a coordinated model for recovery housing and workforce lodging that supports patient recovery and health system stability. By working with housing providers, health entities, and community partners, the initiative will identify existing housing resources and develop locally appropriate strategies that support safe recovery environments and stable housing options for health care workers. The project will also establish a replicable model that can improve care transitions, strengthen workforce stability, and expand access to health services in communities across Alaska.	The project will develop a coordinated approach to strengthen post-acute recovery support and workforce stability by connecting housing resources with health care delivery systems. The initiative will work with hospitals, healthcare facilities, housing providers, recruiters, and health entities to identify housing barriers that affect patient discharge, recovery, and provider availability. First, the project will conduct assessments with participating health care facilities and housing partners to identify gaps in recovery housing and workforce lodging. These assessments will examine discharge challenges, availability of temporary recovery environments, and housing needs for traveling providers that affect health system capacity and continuity of care. Second, the initiative will coordinate partnerships between housing providers, health care facilities, and community organizations to identify existing housing resources that can support post-acute recovery and provider lodging. Where appropriate, the project may support planning and adaptation of existing facilities that could serve as recovery housing environments for patients who require short-term stabilization after hospitalization. Third, the program will provide technical assistance and coordination support to help health systems and housing partners develop locally appropriate recovery housing strategies. This may include guidance on operational models, referral pathways for discharge planning, and coordination mechanisms between health care facilities and housing providers to support safe care transitions. Fourth, the initiative will support planning for post-discharge recovery programs that allow patients to stabilize in safe environments while continuing follow-up care. These approaches may include coordination with telehealth services, remote monitoring, and home-based recovery supports that help reduce readmissions and improve recovery outcomes. Through these activities, the project will strengthen care transitions, improve post-acute recovery support, and enhance workforce stability in communities with limited housing infrastructure. The initiative will also establish a replicable model for recovery housing coordination and post-acute care transitions that can inform health care access strategies across Alaska.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Alaska Heart Institute	Alaska Independent Cyclotron Initiative: Bringing Reliable Next-Gen Imaging Home for All Alaskans	AK	Currently Alaska's nuclear imaging infrastructure suffers from a critical vulnerability: 100% of short-lived radiopharmaceuticals required for PET/CT scans are manufactured in the Pacific Northwest and flown into the state daily. This "air bridge" creates a severe crisis governed by physics. Fluorine-18, the primary isotope for PET imaging, has a half-life of 110 minutes. Because door-to-door transit time often exceeds six hours, nearly 90% of the usable dose decays before reaching the patient. Alaskan providers must pay an exorbitant and wasteful "decay penalty" to secure viable doses, raising costs and threatening our financial independence. Furthermore, minor flight delays break this fragile supply chain, resulting in wasted batches and abruptly canceled procedures. For rural Alaskans, this is devastating. Patients spend significant amounts of their financial resources and days traveling for critical cancer staging or cardiac scans; a last-minute cancellation inflicts immense clinical and financial strain. The solution is to build Alaska's first medical cyclotron. Local manufacturing will stabilize this supply chain, ensuring reliable care for rural patients without delay. It will also unlock access to next-generation, ultra-short half-life tracers—like Carbon-11 and Gallium-68—bringing advanced precision oncology to Alaska. This project establishes true healthcare resilience, workforce expansion, and financial sustainability for the entire state.	We propose a multi-phase, staged grant strategy. This systematic approach mitigates risk, ensures RHTP compliance, and enables creation of vital healthcare infrastructure that would be impossible without RHTP funding. Stage 1: Feasibility, Market Validation, & Partnership Structuring. This phase utilizes seed funding to execute a feasibility study via an independent, nationally recognized consultant, producing a data-driven "Go/No-Go" analysis. • Timeline: 3–4 Months • Funding Requested: \$350,000 • Deliverables: Independent validation of use case volumes; logistics modeling for regional air-transit of isotopes; high-level financial pro-forma for the standalone facility; and the formal execution of Memorandums of Understanding (MOUs) with third-party partners (e.g., hospitals, oncology practices, universities, and possibly industrial clients). Stage 2: Seismic Engineering & Regulatory Licensing. If the Stage 1 report is positive, a follow-on grant application would request the funds necessary to navigate the stringent state and federal regulatory landscapes, alongside Alaska's unique seismic building requirements. • Timeline: 12–18 Months • Future Funding Range: \$1,500,000 – \$3,500,000 • Deliverables: Acquisition of a state-level Certificate of Need; geotechnical soil audits and structural shielding design for a Seismic Design Category D/E vault; submission of the Radioactive Materials License application to the Nuclear Regulatory Commission; cGMP facility design schematics for FDA compliance; and formal RFP execution for the cyclotron hardware manufacturer. Stage 3: Equipment Acquisition, Retrofitting, & Commissioning. After successful completion of Stage 2, a final grant would request the core implementation funds. This would be strictly framed around procuring advanced medical manufacturing equipment and retrofitting an existing clinical or industrial footprint. This ensures full compliance with the federal RHTP guidelines prohibiting new facility construction. • Timeline: 24–36 Months • Future Funding Range: \$15,000,000 – \$30,000,000 • Deliverables: Procurement, shipping, and specialized rigging of a cyclotron and radiopharmacy "hot cells"; facility retrofitting (pouring the high-density concrete vault and upgrading high-voltage/cooling utilities); beam tuning, physics commissioning, and FDA Abbreviated New Drug Application validation batches; and facility launch with the first commercial sale of short-lived isotopes.	\$250K-\$1M	Specialist	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Alaska Hospital & Healthcare Association	Find your Fit - Recruiting for Alaska's Healthcare Workforce	AK	Workforce shortages persist across Alaska’s healthcare industry. Vacancies are high and filling positions takes months. Nearly 10,000 new healthcare workers must be hired across Alaska every year to keep up with staffing needs, including more than 1,100 registered nursing (RN) recruits annually. Driven by high turnover, an aging population, and pandemic-related burnout, healthcare providers are facing severe staffing gaps, with RN vacancies averaging 20% and taking nearly five months to fill. Although our hospitals and clinics have raised wages substantially, recruitment remains highly competitive and Alaska must contend with nationwide pressures while also facing higher living costs and housing shortages that can deter relocation.	In 2024, AHHA launched the "Find Your Fit" microsite, funded by a federal US Economic Development Administration Good Jobs Challenge (GJC) grant. As a centralized digital hub, the site connects students and jobseekers with diverse roles across Alaska’s hospitals and Long-Term Care (LTC) facilities. The platform is supported by an integrated multi-channel campaign designed to: • Increase Awareness: Highlight the breadth of healthcare career paths available in Alaska. The site features photos, videos, and testimonials sharing stories and perspectives of healthcare workers at facilities across the state. • Drive Engagement: Direct traffic toward Alaska’s hospitals and long-term care providers and professional training opportunities across the state. • Support Recruitment: Bridge the gap between talent and the state's healthcare infrastructure through ongoing multimedia promotion. While the GJC funding period has ended, the site was intentionally designed to be sustained through in-house management by AHHA staff and a smaller, reduced budget has been allocated from AHHA operating funds to continue to support the promotional campaign, although at a largely reduced rate from its initial budget and scope. The requested funding from RHTP would allow us to enhance our promotional campaign so that we are able to boost and extend its impact, reach new audiences, and drive further engagement. Funding would also give us the opportunity to refresh and build on content for the site and campaign, including a new component based on People Worth Caring About – an award-winning docuseries that has showcased caregivers transforming lives in long-term care communities across Nebraska, Ohio, and New Mexico. By highlighting the dedication and humanity of frontline staff, the series challenges stereotypes, inspires career interest, and elevates public perception of caregiving. The first season is now airing on national television, and the latest season alone has garnered more than 310,000 views, with nearly 50% of viewers under the age of 35, demonstrating its resonance with younger generations and its potential to attract new talent to the field. This spring, Florida, Kentucky, and North Dakota will join the project. Funds from RHTP would make it possible for Alaska to adopt and tailor the series to complement Find Your Fit by developing segments highlighting healthcare workers and facilities across the state.	\$50,000- \$250,000	Statewide	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Sitka (City and Borough); Wrangell (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

Alaska Hospital & Healthcare Association	The Alaska Sepsis Safety Net: Standardizing Early Detection and Treatment Across the Continuum	AK	Sepsis is a leading cause of preventable mortality in Alaska. Geographic isolation and limited specialty care can turn clinical delays into life-threatening crises. Sepsis requires aggressive early intervention to prevent organ failure and death. According to the 2024 Alaska Health Facilities Data Reporting (HFDR), septicemia is the #2 cause of hospitalizations statewide, with a \$77,978 median charge per stay, the highest among top diagnoses. With mortality risk increasing 4–9% for every hour treatment is delayed, early recognition is paramount[EK1.1]. This is especially true for Alaska Native populations who face sepsis mortality rates 1.6 times higher than the national average. Current data reveals systemic failures in Alaska's sepsis chain of survival. In 2024, Alaska's SEP-1 Bundle Compliance was 59%, trailing the national 64% average. This gap is now a financial risk, as CMS integrated SEP-1 into the Pay-for-Performance Value-Based Purchasing Program for FY 2026. Furthermore, Alaska's SNF-to-hospital readmission rate is 18.5%, exceeding national benchmarks and driven largely by acute infections. This 18-month IHI Breakthrough Series collaborative will unite Alaska hospitals and LTCs to standardize early detection, treatment, and clinical handoffs. By closing the compliance gap and improving early intervention in nursing facilities, we aim to reduce avoidable admissions, optimize hospital reimbursement, and decrease sepsis mortality for all Alaskans.	Our approach utilizes the IHI Breakthrough Series (BTS) model, a proven framework designed to close the gap between clinical evidence and bedside practice. This 18-month initiative is structured as a "High-Intensity Learning Network" tailored to Alaska's unique geography. 1. The Collaborative Framework The project consists of three integrated phases to move participants from learning to rapid implementation: • Planning: We will assemble a faculty of Alaska-based sepsis experts and QI advisors to develop a change package. This is a toolkit of evidence-based interventions (e.g., NEWS2 screening, standardized SBAR transfer forms) optimized for rural and low-resource settings. • Learning Sessions (LS): Three in-person, "All Teach, All Learn" sessions held over 18 months. Teams from hospitals and nursing homes will gather to share data, troubleshoot barriers, and adapt best practices to their local contexts. • Action Periods (AP): Between sessions, teams return to their facilities to test small-scale changes using PDSA (Plan-Do-Study-Act) cycles. This ensures that improvements are practical and sustainable before being scaled. 2. Clinical Strategy: The Sepsis Safety Net We will focus on the chain of survival through three primary drivers: • Standardized Detection: Hospitals and Nursing homes will implement standardized sepsis screening, utilizing EHR optimization tools if appropriate. • Seamless Communication: We will standardize communication for transfers to ensure critical clinical data is not lost during transit. • Bundle Compliance: We will work to increase adherence to the CMS 3-hour Sepsis Bundle (part of the SEP-1 measure), focusing on the golden hour of antibiotic administration and fluid resuscitation for management of sepsis. 3. Implementation Support To bridge the distance between in-person sessions, the collaborative provides: • Monthly Facility Team Meetings: Technical assistance to help teams overcome local staffing or resource barriers and for shared learning. • Shared Data Dashboard: A de-identified portal where facilities can track their progress against statewide benchmarks and peer performance. • Regional Integration: Strengthening the hub and spoke relationship between regional hospitals and their referring facilities and nursing homes and receiving hospitals. By aligning protocols across the continuum of care, we transform fragmented responses into a unified system that catches sepsis earlier and treats it more effectively.	\$50,000-\$250,000	Statewide	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Sitka (City and Borough); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Hospital & Healthcare Association	Development of an Alaska Nursing Workforce Center	AK	Alaska faces persistent nursing workforce shortages that threaten access to care across the state. These challenges are especially acute in rural and frontier communities, where workforce shortages directly limit access to essential health services. Despite these challenges, Alaska is one of only four states without a nursing workforce center to support research based long-term workforce planning strategy. The state lacks a centralized entity responsible for collecting, analyzing, and translating workforce data into coordinated strategies to strengthen the nursing pipeline and support retention. As a result, workforce solutions are often reactive and fragmented rather than guided by a shared understanding of statewide needs. Establishing the Alaska Nursing Workforce Center represents a critical opportunity to create the infrastructure needed for coordinated, data-driven workforce planning. The Center would serve as a hub for research, collaboration, and strategic action to ensure a stable and sustainable nursing workforce across Alaska’s healthcare system. By utilizing RHTP funding, this project will support the development of the Alaska Nursing Workforce Center as an initiative housed within the Alaska Hospital & Healthcare Association (AHHA), with the goal of transitioning to a fully functional, sustainable independent entity.	Our approach focuses on the formal incubation and eventual independence of the Alaska Nursing Workforce Center. The project will establish the organizational, operational, and research infrastructure needed to support long-term nursing workforce planning across the state. The project will move through the following strategic phases: • Finalizing the Foundational Blueprint: While a mission statement exists, the project will define specific short- and long-term objectives and develop a comprehensive three-year strategic plan. This plan will identify priority workforce issues, establish measurable outcomes and ensure alignment with Alaska’s unique needs, particularly in rural and frontier communities. • Strengthening Governance and Organizational Structure: The original steering committee has transitioned into a formal Board of Directors. During the project period, the Board will establish clear decision-making structures and reporting lines to our fiscal sponsor. These structures will support effective leadership and prepare the organization for long-term independence. • Establishing Operational and Financial Infrastructure: The project will develop the operational systems necessary to support a sustainable workforce center. This includes creating a dedicated budget, outlining fundraising mechanisms, and establishing rigorous accounting processes in partnership with the host organization. • Building a Data-Driven Workforce Strategy: The Center will act as Alaska’s primary hub for nursing workforce data collection, analysis. This research will focus on the nursing pipeline, education pathways, including LPN, RN, and APRN, as well as workforce demand for nursing care in Alaska’s unique healthcare environment. Regular reports and data briefs will provide employers, legislators, educators, and policymakers with the information needed to guide workforce investments and policy decisions. • Collaborative Policy Development: As a member of the National Forum of State Nursing Workforce Centers, the Center can leverage a network of 46 workforce centers to share research, tools, and proven strategies. This collaboration will accelerate the implementation of evidence-based solutions for upskilling the nursing workforce, addressing retention, and improving nurse well-being. Through these activities, the project will create the organizational and analytical foundation needed to guide Alaska’s nursing workforce strategy for years to come	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Planning

Alaska Hospital & Healthcare Association	Rural Health Clinic (RHC) Transformation & Financial Sustainability Project	AK	Alaska’s rural hospitals operate in one of the most challenging healthcare environments in the country. Low volumes, high fixed costs, and predominantly Fee-for-Service (FFS) payment models mean that Alaskan hospitals operate on very narrow margins. A small commercial insurance market, heavy reliance on Medicaid and Tribal health systems, fragmented payment structures, and limited local public health authority further strain coordination and sustainability. The upcoming changes to Medicaid including implementing work requirements and the reduction in enhanced health coverage subsidies will further strain facilities. Aging infrastructure and heavy dependence on federal and state funding underscore the fragile financial footing of Alaska’s rural healthcare system. This creates an environment in which rural hospitals must continually strive for greater efficiency and leverage every opportunity to increase payment for services so that they can continue to provide consistent, high-quality care for their communities. We propose to address the challenges of fragile financial conditions and outdated payment models, system modernization and transformation needs, high operating costs and low patient volumes, reliance on Medicaid and Tribal care systems, and limited adoption of managed care or value-based models.	Alaska has the opportunity to strengthen our rural healthcare system’s financial position through in-depth financial and operational analysis. AHHA partnered with Stroudwater Associates to begin Phase 1 of the project, evaluating the financial and operational feasibility of the Rural Health Clinic (RHC) designation to expand primary care and stabilize service area revenue for Alaska’s 3 independent CAHs and 1 Sole Community Hospital. Phase 2 of the project would expand to include an in-depth Strategic, Financial, and Operational Assessment (SOFA) to identify improvement opportunities for Petersburg Medical Center, Cordova Community Medical Center, and South Peninsula Hospital. In addition to the SFOAs, assistance will be provided to these four hospitals with implementation of the RHC designation as needed based upon the analysis completed in a previous project. To build on that project, each hospital will receive implementation assistance should they choose to proceed with this designation. During the first year of this project we will identify other rural facilities that would benefit from the opportunity evaluate alternative payment structures in their facility, such as a RHC. Activity 1: Operational Assessment Conduct a comprehensive yet focused evaluation of key performance drivers, targeting the following areas: Market & Environmental Analysis, Physician & Provider Assessment, Clinical Service Lines, Physician Practice Operations, Volume-Based Departmental Staffing, Financial Performance, Strategic & Capital Planning, Quality & Governance. Deliverables: Executive-level report summarizing findings and opportunities based upon comparison to rural hospital best practices; identification of prioritized, high-impact initiatives; Preliminary improvement targets. Activity 2: Action Planning Translate priority recommendations into a structured implementation roadmap including; presentation of findings to leadership and department directors, facilitated prioritization of initiatives, and collaborative development of: a timeframe for objectives including: defined tactical steps, assigned accountabilities, measurable performance metrics, clear timelines and resource requirements, and financial impact estimates. Deliverables: A comprehensive work plan designed to serve as a roadmap for execution. Activity 3: Implementation Assistance Continued support post-action plan development to promote follow-through on identified high-impact initiatives.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Petersburg Borough	Advance to Planning

Alaska Hospital & Healthcare Association	Healthy Communities: Cognitive and Physical Wellness via Interactive Senior Activity Consoles	AK	The project addresses the critical need to improve the quality of life for residents in skilled nursing facilities (SNFs) and Assisted Living Homes (ALH) by deploying research-backed Interactive Senior Activity Consoles. Specifically, the project targets the widespread issues of social isolation, loneliness, reduced mobility, and cognitive decline among seniors. There is a significant opportunity to use interactive technology to engage residents in meaningful play and foster stronger relationships between them. This project provides an opportunity for AHHA SNF and ALH members to deploy non-pharmacological interventions that use interactive activities to combat apathy and reduce challenging behaviors like agitation and wandering.	We will offer participating AHHA member SNFs and ALHs a choice of high-quality interactive projection systems to best fit their specific facility layout and resident needs: Obie for Seniors: A mobile-cart-based system that projects onto any surface (floors, walls, or tables), ideal for moving between resident rooms or communal areas. Lucynt Magic Table: Offers ceiling-mounted, shelf-mounted, or mobile options with a library of over 160 research-based games tailored for specific stages of dementia (Early, Middle, and Late). Shared Methodology: Both systems utilize motion-detection sensors to encourage active play, sensory stimulation (sound/light), and social interaction without requiring seniors to learn complex digital interfaces.	\$250K-\$1M	Statewide	Anchorage (Municipality); Bethel Census Area; Chugach Census Area; Copper River Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; Petersburg Borough; Sitka (City and Borough); Wrangell (City and Borough)	Deferred or Not Advanced

Alaska Housing Finance Corporation	Healthcare Workforce Housing Catalyst	AK	The Healthcare Workforce Housing Catalyst will address the acute housing needs of healthcare workers with a flexible model that adapts to the individual worker’s housing needs and the resources available to the underlying community. Healthcare workers need a place to live, and many have families. If employers expect them to stay for any length of time, their homes need to be safe, within budget and welcoming enough to put down roots in the community. Outside of Alaska’s urban hubs, finding housing of any type is increasingly hard. But finding quality, affordable housing that families feel comfortable calling home for years to come is even harder. Operationally, the housing challenges faced by healthcare workers in rural communities have resulted in extended vacancies, expensive recruitments, and high turnover. The consequences for the Alaskans our remote healthcare providers serve are disrupted access to health services, frequent turnover in healthcare providers, and an increased need for expensive travel for health services. In some communities, the housing crisis is so severe that healthcare providers have resorted to building and / or buying properties of their own to house their workers. In addition to being prohibitively expensive for some providers, this approach further dilutes our healthcare provider capacity by directing scarce staffing and financial resources to support housing operations that are not part of their primary mission.	The Healthcare Workforce Housing Catalyst (HWHC) aims to optimize the overlapping incentives across stakeholders and their respective resources in the healthcare workforce to help workers find safe, quality and lasting housing in rural Alaska. Our proposed solution starts with the underlying healthcare workers by empowering them to pursue the housing option that best fits their family’s needs and goals. The goal is to reduce the financial stress in their first year as a new healthcare worker in the community by leveraging the resources they’re bringing to the table. Workers can receive monthly housing assistance that covers a portion of their mortgage or rental costs. The assistance would be available for up to 60% of their monthly housing costs or \$1,000 per month (whichever is less) for one year and be paid to their lender or landlord. If a renter chooses to become a homeowner before month 12 of their assistance, remaining HWHC assistance can be converted to mortgage assistance. This flexibility empowers workers with choice in the housing they pursue and the ability to adapt to the new housing opportunities that may become available to them during their term of assistance. Underpinning the HWHC assistance is a durable link between ongoing healthcare services and the underlying worker’s buy-in to the community. The HWHC assistance will provide funds that help lower, rather than eliminate, the cost of housing during the first year of employment. In addition to employee funds that match HWHC assistance, the assistance itself requires continued employment with a healthcare provider. The ability to serve prospective renters and homeowners with a single model allows the HWHC funds to meet communities and prospective workers where they are. Not all communities have robust rental or for-sale housing markets, and those that do often face a housing stock that is disparately accessible for healthcare workers based on their relative income or time entering the community. The HWHC can adapt to communities and workforce needs to match what housing is actually available with the prospective workers in the moment. The flexibility to adapt the HWHC assistance from rent to homeowner assistance during the term of service represents an innovative dynamic that incentivizes further integration into the community for the healthcare worker(s).	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kuskilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Housing Finance Corporation	Healthy and Housed	AK	Recognizing housing as a critical factor for an individual’s overall health creates opportunity for an innovative project approach. Improving patient outcomes through housing interventions is not only proven, but cost-effective. An inability to complete treatment plans, improper medication storage, missing follow-ups, or returning to the source of the health issue can not only become expensive, but create a cycle of symptom management without end. Housing is a public health intervention that has the potential to be uniquely effective in rural Alaska due to the specific challenges faced. Unexpected medical events, and even expected ones, can destabilize a household to the point that homelessness becomes possible. Being homeless comes with further health challenges that become much harder to address. A cascade effect leads to chronic conditions, an inability to manage those conditions or aftercare, and ultimately, more hospital visits and longer stays. The remoteness of some communities can leave people stranded in unfamiliar places after discharge, another path to housing instability. For those who do return home, the environment may not be conducive to recovery without some form of minor home improvement. Having to return for a follow-up appointment can put a strain on a household, and even be unnecessary if Telehealth options can be made available. Most importantly, short-term housing interventions can improve a patient’s overall health and thus their quality of life.	Alaska Housing Finance Corporation (AHFC) is requesting \$2,000,000.00 in funding to subaward to nonprofit partners for the purpose of providing Housing Interventions for those in rural Alaska interacting with the health care system. AHFC would focus on communities with Critical Access Hospitals, several of which have agencies administering AHFC-funded housing programs already. Partners will receive subawards with the following program parameters: • \$8,000.00 per household budget • 10% of total award for administrative expenses • AHFC will provide grant compliance and reporting infrastructure, technical assistance, access to data systems, and partnerships • Dynamic budgeting by which unused funds are rolled over to support new households • Uses include: - o Medical Respite Transitional Housing § Short-term housing for individuals needing safe and sanitary housing to recover or with follow-up appointments - o Eviction Prevention § Assistance to prevent eviction as a result of medical events - o Emergency Discharge Housing § Housing for individuals who would otherwise be discharged into homelessness - o Travel § Travel costs to get individuals back to home community after hospital stay - o Rental Assistance § Up to six months of rent for those escaping violent living situations such as victims of domestic violence § Unhoused populations with more extensive medical needs such as medication storage, multiple follow-ups, or health issues directly tied to housing situation - o Minor Home Upgrades/Repairs § Small, health-related home improvements such as air purifiers, grab bars, ventilation, or other minor items directly related to improving health § Potential Telehealth technology AHFC expects to serve 225 households minimum. Dynamic Budgeting will allow partners to use only the amount of budget necessary per household, which will likely lead to a larger total served, up to 30% more, as was seen in other AHFC housing programs. Subawardees will use AHFC’s data system as a condition of awards in order to track households served and outcomes. AHFC will leverage partnerships with local stakeholders to establish a community referral system to connect individuals being discharged with the local housing resources. AHFC’s pandemic-era programs fostered new, innovative approaches to addressing housing instability with great success. The experience, partnerships, and proven housing methods will be leveraged to achieve a rural health transformation rooted in housing as health care.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Housing Finance Corporation	Healthy Families Playground for Mutual Renewal Initiative	AK	With a large, deferred maintenance need, it is hard to direct resources to playgrounds and site improvements. AHFC must prioritize safety upgrades first. With the better part of a thousand units, with common spaces, parking lots, boiler rooms, and other critical facets of Public Housing, the beneficial but unfortunately not comparatively urgent need of playground renewal falls further down on the list of projects. The effect is that most playground equipment on Public Housing sites are decades old. When the equipment reaches a point of dereliction, there may be a need to remove the potentially hazardous equipment, but not enough resources to replace and update the equipment to ensure it complies with ADA and other requirements. The result is an exponential rate of deterioration for playground equipment in areas that are often the only place nearby for families to play.	In 2021, AHFC employed Design Alaska, INC to create a Site Improvement and Amenity Standard to help create an easy way to identify replacement needs based upon specific details, like useable area and median age of the resident children. The agency has successfully utilized the standard for the replacement of two of our community play areas, the first in Kodiak and the second in Ketchikan. There are three shovel ready locations, two in Juneau and one in Anchorage. The Facilities team have developed design and construction Rough Order of Magnitude (ROM) for seven other sites. Alaska Housing Finance Corporation, Public Housing Department is requesting consideration for a grant in the amount of \$4,296,000.00 for the completion of our vision to replace outdated equipment and play areas around the State.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Nome Census Area; Sitka (City and Borough)	Deferred or Not Advanced

Alaska Humanities Forum	Story Works Rural Readiness: Planning to Build Protective Factors for Rural Alaskan Youth	AK	The need to strengthen protective factors among Alaska's youth is clear. The 2023 Alaska YRBS found 23% of high schoolers seriously considered suicide, 43% have poor mental health, and 65% lack three or more trusted adults they could turn to for help. Rates are even higher for Alaska Native youth. The 2024 School Climate and Connectedness Survey finds only 26% of students report peers are respectful and helpful. These challenges are amplified in rural communities, where behavioral health providers are scarce, geographic isolation limits programming, and schools are often the only consistent institutional presence. Story Works addresses this gap through trauma-informed classroom storytelling workshops that build protective factors, including connection to trusted adults, peer support, self-regulation, and belonging, that research shows prevent and mitigate the impact of ACEs. The program has served over 6,000 students, and 88% of participants reported increases in protective factors. A Bering Strait School District pilot demonstrated that local teachers can be trained to deliver the program independently, creating a sustainable path to scale. The opportunity is to plan expansion into three rural regions where AKHF has existing relationships but Story Works has not yet been delivered. This readiness grant will fund partnership development, curriculum adaptation, and planning needed to prepare for implementation.	AKHF will use this readiness grant to plan the expansion of Story Works, a proven model for strengthening protective factors, into three rural regions: the Yukon Kuskokwim Delta, the Northwest Arctic Borough, and Interior Alaska. The planning year will build the partnerships, adapt the curriculum, and develop the implementation infrastructure needed to launch a teacher training model in each region. The project has four core components: Partnership Development. AKHF will travel to each region to formalize partnerships with school districts, tribal organizations, and behavioral health providers. In the Yukon-Kuskokwim Delta, AKHF will partner with LKSD and Calista Education and Culture. In the Northwest Arctic, AKHF will build on an existing grant partnership with the school district and develop a formal relationship with Maniilaq Association. In Interior Alaska, AKHF will formalize its relationship with Tanana Chiefs Conference and engage the local school district. In all three regions, AKHF will identify and begin partnerships with regional mental health providers to ensure the program connects students to appropriate clinical support. Curriculum Adaptation. AKHF will engage curriculum consultants to adapt Story Works for each region, ensuring cultural responsiveness across Yup'ik, Iñupiaq, and Athabascan communities. The successful Bering Strait pilot provides a strong starting point. A key focus will be aligning Story Works with state educational standards so that teachers can count the workshop toward their curriculum requirements, making adoption seamless and sustainable. Mental Health Consultation. AKHF will engage mental health consultants to review the adapted program model for each region, ensuring it meets the specific behavioral health needs of the communities served. The Story Works model has been reviewed by mental health clinicians multiple times and is grounded in SAMHSA's Six Guiding Principles for a Trauma-Informed Approach. This consultation is a targeted review to ensure the model fits each community context. Implementation Planning. AKHF will develop a detailed implementation plan for each region, including teacher recruitment and training timelines, logistics, data collection procedures, and a budget for a future RHTP implementation grant application. This plan will position AKHF to move from readiness to launch.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Fairbanks North Star Borough; Kusilvak Census Area; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Imaging Associates, LLC	Nurse Navigator	AK	Patients in Alaska face significant barriers to accessing specialty diagnostic and preventive healthcare services. Long travel distances, limited specialty providers, and complex referral processes often delay care and can result in missed screenings or incomplete follow-up. Mammography and lung cancer screening programs require consistent patient follow-up and coordination to ensure early detection and timely intervention. Rural patients may experience delays in scheduling, difficulty understanding follow-up requirements, and challenges coordinating travel and appointments. Without dedicated coordination, abnormal screening results may not receive timely follow-up, increasing the risk of delayed diagnosis. Rural providers often have limited administrative resources to manage screening programs, track abnormal results, and coordinate specialty referrals and follow-up care. As a result, patients may experience fragmented care and delays in diagnosis or treatment. The addition of a Nurse Navigator will address these barriers by providing centralized coordination and patient support for mammography and lung cancer screening services. The Nurse Navigator will assist with referral management, patient education, scheduling, and follow-up tracking and receive timely follow-up when abnormalities are identified. This coordinated approach will improve continuity of care and strengthen access to preventive and diagnostic services for rural communities across Alaska.	This project will establish a dedicated Nurse Navigator position responsible for coordinating mammography and lung cancer screening services for rural patients and referring providers. The Nurse Navigator will serve as a central point of contact for rural providers and patients and will assist with referral coordination, scheduling, patient education, and follow-up care. Responsibilities will include: • Coordinating mammography and lung cancer screening referrals • Tracking abnormal screening results and ensuring timely follow-up care • Supporting communication between rural providers and specialty teams • Assisting patients with appointment scheduling and preparation • Coordinating imaging and consultation requirements • Monitoring patient progress through the care pathway The Nurse Navigator will work closely with referring providers and specialty teams to ensure efficient coordination and timely care.	\$50,000-\$250,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Matanuska-Susitna Borough; North Slope Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Imaging Associates, LLC	Radiology workflow and care coordination platform	AK	Rural healthcare providers in Alaska face significant challenges in coordinating diagnostic imaging services due to geographic isolation, limited staffing, and fragmented communication workflows. Many rural facilities rely on manual tracking, phone calls, and disconnected systems to coordinate imaging studies and report delivery. These processes limit visibility into exam status and increase the risk of delays in communication and care coordination. Diagnostic imaging plays a critical role in guiding clinical decision-making in rural and frontier communities where specialty care is limited. When imaging interpretation is delayed, diagnosis and treatment decisions may be slowed, and patients may be transferred unnecessarily to regional medical centers. Rural providers often have limited tools to monitor imaging study status or identify urgent cases requiring priority review. Implementation of the New Vue platform, including the Radiologist Cockpit, will create an integrated workflow management system that centralizes imaging coordination across rural facilities. Radiologists will manage studies from multiple sites through a single interface with real-time visibility into exam status, priority cases, and report completion. By replacing fragmented workflows with a technology-enabled system, this project will strengthen care coordination, improve report turnaround times, and expand rural capacity to deliver timely diagnostic imaging services across Alaska’s rural communities.	This project will implement the New Vue platform using a structured, phased approach designed to support successful adoption across rural partner facilities while minimizing disruption to patient care. The implementation will include system configuration, workflow design, integration into existing radiology operations, and phased deployment across rural sites. Initial deployment will focus on core facilities, followed by expansion to additional rural partners once workflows are optimized. Comprehensive training will be provided for radiologists, administrative staff, and rural healthcare providers. Training will focus on standardized workflows, exam tracking, and communication processes to ensure consistent and effective system use. Implementation will include ongoing technical support and workflow monitoring to ensure that the system continues to meet the needs of rural providers. Continuous improvement processes will be used to refine workflows and address emerging needs. Recruitment and staffing resources will be allocated to support implementation and ensure long-term operational success. Targeted implementation will ensure that rural and frontier facilities with the greatest coordination challenges receive priority support.	\$50,000-\$250,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Matanuska-Susitna Borough; North Slope Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Imaging Associates, LLC	Recruitment & Retention of a Teleradiologist	AK	Rural and frontier communities in Alaska face significant barriers to accessing specialty diagnostic services due to geographic isolation and limited specialty workforce availability. As a result, many rural healthcare facilities depend on teleradiology to obtain timely diagnostic imaging interpretation. Alaska Imaging Associates (AIA) provides radiology services to healthcare facilities across the state through a structured teleradiology model. However, increasing imaging volumes across CT, MRI, ultrasound, mammography, and X-ray, combined with national radiologist workforce shortages, have placed substantial strain on the current workforce. AIA radiologists are currently operating near full capacity, limiting the organization’s ability to accept additional rural facilities seeking radiology coverage. Recruiting a dedicated teleradiologist will expand workforce capacity, improve report turnaround times, and strengthen diagnostic imaging support for rural healthcare providers. This project will improve access to timely diagnostic services, support clinical decision-making, and strengthen the sustainability of healthcare delivery in Alaska’s rural and frontier communities.	This project will recruit a board-certified teleradiologist to provide diagnostic imaging interpretation services for rural partner facilities across Alaska. Again, the recruitment of a dedicated teleradiologist will directly address these capacity limitations by expanding Alaska Imaging Associates' ability to support existing rural partners while allowing the practice to onboard additional Alaska facilities currently seeking coverage. This workforce expansion will help stabilize report turnaround times, reduce radiologist workload strain, and ensure reliable radiology support for rural and frontier communities across the state. Recruitment efforts will include: • Competitive compensation aligned with national market benchmarks • Flexible remote work structure • Comprehensive benefits package • Malpractice coverage • Targeted outreach through national radiology job boards and specialty organizations • Engagement with residency and fellowship programs Upon recruitment, the teleradiologist will undergo credentialing, licensing, and onboarding processes to support coverage for rural facilities. Coverage schedules will be expanded strategically to prioritize high-need rural partners and urgent case coverage. This structured recruitment approach will ensure efficient integration into rural service operations with minimal disruption.	\$1M-\$5M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Matanuska-Susitna Borough; North Slope Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Impact Alliance	907 Navigation App Expansion Project	AK	Residents of rural and remote communities in Alaska face significant barriers to accessing health care and related social services. Geographic isolation, limited transportation, workforce shortages, and fragmented information systems make it difficult for individuals and families to identify available services and complete referrals. Many communities lack centralized, easy-to-use tools that connect residents to local providers, statewide programs, and essential benefits that support health and well-being. Many service providers and agencies operate independently, which can lead to duplicated efforts, communication gaps, and missed opportunities to connect people with needed care. Rural residents often rely on word-of-mouth or outdated resource lists to navigate complex systems such as Medicaid, SNAP, behavioral health services, and other supports. The 907 Navigation Expansion Project addresses this challenge by expanding a coordinated navigation system that connects residents, providers, and agencies through a shared platform. By improving service directories, referral pathways, and navigation tools—including phone and text-based assistance—the project will make it easier for residents to find services and for organizations to coordinate care. This project represents an opportunity to strengthen Alaska’s health and social service infrastructure by improving access to accurate information, simplifying referrals, and helping rural communities connect people to care.	The 907 Navigation Expansion Project will address barriers to accessing health and social services in rural and remote Alaska by expanding and enhancing a coordinated community navigation platform that connects residents, providers, and agencies to critical resources. The project will strengthen the existing, but not yet launched, Community Alert platform by improving service directories, referral pathways, and communication tools that allow communities to share timely information about available services, programs, and supports. These improvements will make it easier for residents to identify local resources and for organizations to coordinate care across health, social service, and community systems. A key component of the project will be researching and planning the integration of navigation services that provide real-time assistance to residents through phone and text-based support. Both live navigator models and AI-supported navigation options will be explored to determine the most effective and sustainable approach for rural Alaska, where internet connectivity and service availability vary widely. The project will also explore opportunities to integrate the platform with statewide benefit programs such as Medicaid, SNAP, TANF, and the Permanent Fund Dividend (PFD). Improving awareness and navigation of these programs can help address social determinants of health and improve stability for individuals and families. To strengthen coordination among organizations, the project will research and plan for open and closed-loop referral integration with resource platforms such as FindHelp, Pear Suite and healthEConnect Alaska. This will allow agencies to more effectively connect individuals to services and track whether referrals are completed. The project will also support rural and frontier communities in adopting the platform by providing subsidies for implementation costs, including technical setup, API integrations, training, and outreach. Community convenings and marketing efforts will help ensure local organizations understand how to use the system and residents are aware of available tools. By improving navigation, strengthening referrals, and expanding access to reliable information about services, the 907 Navigation Expansion Project will build a more connected and sustainable system that helps rural Alaskans access the care and supports they need.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Impact Alliance	Alaska 100% Communities: Community-Led Systems for Access to Care	AK	Rural Alaskans face barriers to obtaining and maintaining health care not only because of provider shortages and geography, but because the systems that help people access care are fragmented and difficult to navigate. Many residents miss appointments or delay care due to transportation, childcare, housing, food access, and limited awareness of available services. Although services often exist, communities frequently lack a shared inventory of services, systems, and resources, making it difficult for residents and providers to connect people to appropriate supports. Referrals commonly depend on informal staff relationships. When turnover occurs — a frequent challenge in rural Alaska — knowledge of services is lost, and individuals must again navigate complex systems alone. This fragmentation contributes to delayed care, avoidable emergency department use, and increased strain on rural providers. The 100% Communities model addresses this problem by helping communities map services, organize partnerships, and distinguish between availability and accessibility issues. The model creates coordinated referral pathways and strengthens partnerships that leverage and braid resources. By improving navigation and prevention, the project supports timely access to care and builds sustainable, community-owned systems that help residents access the right services at the right time.	The project begins with capacity building and community outreach to prepare communities for implementing the 100% Communities framework. AIA will introduce the model through discussions with coalition leaders, healthcare providers, tribal partners, local governments, and community organizations. AIA will provide training, technical assistance, tools, and coaching, while local community leads engage partners to ensure the effort remains community driven. Partners will inventory existing coalitions, services, programs, and community resources. This process will identify services for inclusion in the 907 Navigation app platform, highlight successful efforts already operating locally, and identify gaps, duplication, and opportunities for improved coordination across health and social service systems. The Community Access Assessment was developed by AIA with a consultant team as a standardized survey tool to measure barriers to accessing healthcare and vital services. While communities may make limited local adaptations, the core survey will remain consistent to allow comparable statewide data. A deployment plan will be developed and the survey administered to residents to better understand barriers to healthcare, behavioral health, and social support services. AIA will provide technical assistance while local partners lead community engagement. After deployment, results will be shared through community presentations and discussions to guide next steps. Communities will recruit cross-sector action teams aligned with the ten vital service areas. These teams will include providers, community organizations, individuals with lived experience, and decision-makers who will use assessment data to identify practical projects that strengthen access to care and improve coordination. Communities will also develop a community navigator role to strengthen care coordination across agencies. The navigator will serve as a cross-sector systems integrator, supporting targeted case management coordination for individuals with complex needs and helping ensure warm handoffs between providers. The navigator will utilize the 907 Navigation platform to identify services, support eligibility navigation, and coordinate referrals among partners. Together, shared data, coordinated partnerships, and navigation technology support locally led solutions that improve access to care in rural communities.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Ketchikan Gateway Borough	Advance to Planning

Alaska Impact Alliance	AIA Medicaid Support Hub	AK	Many small and rural family serving organizations in Alaska provide essential behavioral health, substance use disorder, and family support services to Medicaid eligible children and families but cannot access Medicaid reimbursement. Through the Alaska FRC Network and the AIA, providers consistently report that the administrative and workforce infrastructure required to participate in Medicaid is beyond their capacity. Barriers include navigating Medicaid provider enrollment, meeting licensing and credentialing requirements, managing billing and claims systems, and providing clinical supervision for behavioral health providers pursuing licensure. Small community based organizations often lack billing staff, electronic health record systems, and licensed supervisory clinicians. As a result, many agencies either limit the services they provide or deliver services without reimbursement, restricting sustainability and reducing access to care in rural communities. We will create a centralized Medicaid Support Hub that transforms how small agencies access Medicaid participation. The hub will provide Medicaid enrollment concierge services, shared billing and documentation infrastructure, claims and denial management, and access to contracted clinical supervisors. By removing administrative and workforce barriers, we will enable rural providers to sustainably deliver Medicaid covered behavioral health and family support services and expand access to care for families.	Our approach is to establish a centralized Medicaid Support Hub that provides the infrastructure, technical assistance, and clinical oversight needed for small and rural family serving organizations to participate in Alaska’s Medicaid system. Rather than requiring each agency to independently build billing capacity and clinical supervision infrastructure, the hub will provide shared services that reduce administrative burden and make Medicaid participation feasible for community based providers. The project will support agencies through several coordinated service components. First, the hub will provide Medicaid readiness and enrollment concierge services. This includes conducting readiness assessments, identifying licensing and credentialing requirements, and guiding agencies through provider enrollment with Alaska Medicaid, the Division of Behavioral Health, and Gainwell Technologies. Agencies will receive individualized roadmaps outlining the steps required to become eligible to bill Medicaid and technical assistance to address barriers during the enrollment process. Second, the hub will operate a centralized billing and documentation infrastructure. Participating agencies will gain access to electronic health record and referral management technology, standardized documentation templates aligned with Medicaid requirements, and operational support for claims submission, denial management, resubmissions, and reporting. The hub will also provide training and compliance support to ensure documentation meets Medicaid standards and audit expectations. Third, the hub will expand workforce capacity by providing access to licensed clinical supervisors. Many rural agencies employ clinicians working toward licensure but lack supervisory staff required for Medicaid service delivery. Contracted supervisors will provide clinical oversight, review treatment plans and documentation, and support clinicians in meeting licensing and Medicaid requirements. The project will launch with a pilot cohort of three to five family serving organizations, prioritizing rural and under resourced communities. Lessons learned from the pilot will inform refinements before scaling to additional agencies statewide.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Impact Alliance	Alaska OCS Health Information Integration Project	AK	The Alaska Office of Children’s Services serves nearly 2,500 children in state custody and is responsible for coordinating their medical, behavioral health, and therapeutic services across Alaska’s rural and frontier communities. Currently, the referral process is fragmented and time intensive. Providers use different referral forms, communication often relies on fax due to privacy constraints, and there is no standardized system for tracking whether referrals are accepted or services are initiated. As a result, referrals may be duplicated, delayed, or lost, creating gaps in care for some of Alaska’s most vulnerable children. Additionally, OCS staff must manually request medical records from multiple providers to compile health histories for intake decisions, court proceedings, and foster placements. This process delays access to critical information and increases administrative burden on an already stretched workforce. The opportunity is to integrate OCS into Alaska’s Health Information Exchange to create a standardized, secure referral and medical data system that improves care coordination, reduces delays, and strengthens rural health access for children in state custody.	The proposed approach is to integrate the Alaska Office of Children’s Services into the Alaska Health Information Exchange to establish a standardized, HIPAA compliant referral and medical data access system for children in state custody. This will be implemented as a phased, multi year initiative coordinated by the Alaska Impact Alliance in partnership with OCS, the Health Information Exchange, and referred providers statewide. In year one, the project team will convene OCS leadership and frontline staff, HIE technical staff, and frequently referred medical, behavioral health, and therapeutic foster care providers to design a standardized referral process and uniform referral forms within the HIE. The team will map current workflows, identify barriers, and develop clear referral status tracking protocols to ensure confirmation of acceptance, denial, or service initiation. During year one, the project will also coordinate with OCS information technology staff to develop requirements for secure APIs between the ORCA child welfare case management system and the Health Information Exchange. This integration planning will allow relevant child information to flow securely into referral forms while maintaining compliance with federal child welfare and health privacy requirements. In year two, the API connection would be established and OCS will begin sending referrals through the HIE using the standardized systems. Caseworkers and providers will receive training and ongoing technical assistance. The project will monitor referral turnaround times, acceptance rates, and system usability, using continuous quality improvement methods to refine workflows and address challenges. Over years three through five, the system will be scaled and optimized statewide, embedding referral coordination and medical data access into routine OCS operations and strengthening rural health access, workforce efficiency, and continuity of care.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Impact Alliance	Alaska OCS Parent Orientation Initiative	AK	Families involved with OCS, particularly in rural, remote, and frontier communities, often enter the child welfare system with little understanding of their rights, court processes, case plan requirements, visitation expectations, or the roles of attorneys, tribes, and OCS staff. This lack of accessible, culturally responsive information contributes to confusion, missed appointments, delayed compliance, prolonged foster care placements, increased trauma, and poorer reunification outcomes. The need for a clear, standardized parent training curriculum has been identified as a top request of the OCS Parent Advisory Committee. Parents with lived experience consistently report they did not receive clear guidance at the start of their case and were left to navigate a complex legal and child welfare system on their own. Rural families face additional barriers including geographic isolation, limited access to legal guidance, workforce shortages, language barriers, and limited broadband. While OCS and community partners provide services, there is no standardized, statewide, ADA-compliant training designed to equip OCS-involved parents with clear guidance on navigating the system successfully.	The Alaska OCS Parent Orientation Initiative will develop and deploy a statewide, ADA compliant, multilingual training curriculum designed specifically for parents involved with OCS. This initiative directly responds to one of the top priorities identified by the OCS Parent Advisory Committee, whose members have consistently requested clearer guidance for parents navigating OCS involvement. Over a one year period, Alaska Impact Alliance will convene key stakeholders including the OCS Parent Advisory Committee, OCS leadership and case managers, tribal representatives, legal experts from the Office of Public Advocacy and the District Attorney’s Office, guardians ad litem, and community based service providers. Through structured design sessions, we will co create a curriculum grounded in lived experience, legal accuracy, and culturally responsive practice. The training will consist of modular, video and audio based content that covers navigating OCS, understanding Child in Need of Aid proceedings, parents’ rights and responsibilities, court protocol, filing motions and appeals, case plan compliance, visitation expectations, permanency pathways, and the Indian Child Welfare Act including the role of tribes. Scenario based vignettes with embedded learning reinforcement will strengthen understanding and practical application. Lived experience parents will be compensated as content experts and featured in training videos alongside OCS staff, legal professionals, and tribal partners. This ensures credibility, relatability, and shared understanding across systems. The curriculum will be housed within the existing OCS Learning Management System and designed for mobile access. A dedicated Child Welfare Training page will be built within the 907 Navigation App to ensure families statewide can easily access the modules. Alaska Impact Alliance will also create a Child Welfare Training page on its website linking to the curriculum and will distribute access through 150 partner agencies and the Alaska Center for Resource Families. The training will also be used to educate OCS staff, foster parents, and kinship caregivers, creating shared foundational knowledge and improving cross system alignment. By leveraging existing infrastructure and statewide partnerships, this approach ensures equitable access for rural and frontier communities while building a sustainable, scalable education platform that strengthens families and improves child welfare outcomes across Alaska.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Impact Alliance	Relative Caregiver Learning and Navigation System	AK	Across Alaska, many children are raised by relatives such as grandparents, aunts, uncles, extended family members, or caregivers connected through Tribal custom when parents cannot safely care for them. These caregivers often step in during crises to keep children connected to family, culture, and community. Many assume responsibility suddenly and without preparation, financial assistance, or access to training. Unlike licensed foster parents, most relative caregivers are not licensed through the Office of Children’s Services (OCS) and do not receive foster care stipends or structured support, despite carrying full responsibility for the child’s health, education, and wellbeing. Nationally, for every one child in foster care, approximately nineteen children are being raised by relatives outside the formal child welfare system. Alaska places about half of children in OCS custody with relatives, while many more families provide care informally to prevent entry into stranger foster care. Relative caregivers must navigate complex systems including medical care, Medicaid enrollment, school enrollment, guardianship and custody processes, court proceedings, and child welfare policies such as Child in Need of Aid (CINA) cases and the Indian Child Welfare Act (ICWA). Without clear guidance, many struggle to access services. This project addresses this gap by developing training and navigation support to help relative caregivers care for children and access essential services.	This project will develop a Relative Caregiver Learning and Navigation System designed to equip relatives caring for children both within and outside the Office of Children’s Services (OCS) system with the knowledge, tools, and support needed to navigate complex health, legal, and education systems. The project will create an interactive training program delivered through the OCS Learning Management System, a publicly accessible web platform, and the 907 Navigation App so caregivers can access training regardless of system involvement or location, including those living in rural and remote communities. The training will use video instruction, audio narration, AI assisted learning features, and interactive scenarios using branching logic to help caregivers understand real life situations and system navigation. Content will be developed with guidance from relative caregivers with lived experience raising kinship children, including participants in the UReCares program, along with attorneys specializing in child welfare and family law to ensure the training reflects real challenges and provides accurate legal guidance. The project will be developed in collaboration with Volunteers of America Alaska and the Kin Support Program, the Alaska Center for Resource Families, the Office of Children’s Services, Guardians ad Litem, and representatives from Alaska’s court system to support consistent guidance across agencies that work with kinship families. Training topics will include understanding OCS and Child in Need of Aid cases, the Indian Child Welfare Act, guardianship and powers of attorney, enrolling children in school, accessing medical care and Medicaid, navigating court processes, supporting children who have experienced trauma, and connecting to peer and community supports. The project will also add a Relative Caregiver Navigator to support families participating in the Alaska Impact Alliance’s Unlicensed Relative Caregiver Stipend and Respite Program funded by the Alaska Mental Health Trust Authority. The navigator will assist caregivers with legal documentation, health coverage, school enrollment, and connections to services and support.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Institute for Justice	Bridging Language, Strengthening Care: Expanding Language Access Services in Rural Alaska	AK	Approximately 34.1% of Alaskans age 5 and older speak English less than “very well,” reflecting significant linguistic diversity across both urban and rural communities in the state (U.S. Census Bureau). Language access is critical for providing care to limited English proficient (LEP) patients. National research shows that LEP patients are less likely to have a regular source of care, less likely to receive preventive screenings, and more likely to delay or forgo needed services. Language barriers are also linked to higher rates of medical errors, misunderstanding of diagnoses and treatment plans, difficulty navigating insurance and referral systems, reduced medication adherence, lower patient satisfaction, decreased trust in providers, and increased use of emergency services. LEP patients are more likely to experience longer hospital stays and higher rates of hospital readmission when communication is inadequate. These challenges compound existing rural health disparities related to workforce shortages, transportation barriers, geographic isolation, limited broadband for telehealth, and reliance on critical access hospitals. Our project addresses these intersecting inequities by providing reliable, culturally responsive interpretation services that improve equitable access, enhance patient safety, strengthen provider–patient communication, support continuity of care across telehealth and in-person settings, and improve overall community health outcomes in rural Alaska.	The Language Interpreter Center (LIC) at the Alaska Institute for Justice operates a well-established platform for professional interpretation services, the only one of its kind in Alaska. The platform connects organizations, businesses, and individuals with qualified interpreters—either in-person or virtually—for critical meetings such as court hearings, doctor visits, social services appointments, and more. To date, the LIC has provided services in many of the languages spoken across Alaska, including Alaska Native languages, reflecting the state’s rich linguistic diversity. This project will leverage that platform to expand high-quality interpretation to rural communities where language access is limited and health disparities are pronounced, particularly in geographically isolated regions with limited provider access. Our multi-pronged approach includes: 1. Strengthen staff capacity to support rural service delivery, including telehealth and onsite interpretation, ensuring rapid response and coordinated scheduling. 2. Engage and mobilize interpreters by communicating remote and rural interpreting opportunities and offering flexible participation pathways. 3. Provide advanced medical interpretation training to ensure accuracy, confidentiality, and cultural responsiveness in clinical settings. 4. Develop rural-focused digital training materials to create sustainable professional development pathways tailored to community contexts and logistical realities. 5. Recruit speakers of priority languages from within rural communities, strengthening local capacity, continuity, and trust. 6. Provide orientation resources for healthcare providers to increase awareness and effective utilization of interpretation services, improving patient access, follow-up care, and overall outcomes. Together, these strategies will strengthen Alaska’s language access infrastructure, connect rural communities to essential providers, and advance the quality, equity, and long-term sustainability of healthcare delivery.	\$50,000- \$250,000	Multi- Community or Participating in Regional Hub-and- Spoke	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Kusilvak Census Area; North Slope Borough	Deferred or Not Advanced

Alaska Jewish Campus	Alaska Friendship Circle All-Inclusive Early Childhood Play Center & Programming	AK	We aim to strengthen maternal and child health as a foundation for healthy families. Alaska Jewish Campus’s (AJC) creation of our Play Center is in response to the need for accessible, inclusive and developmentally appropriate play space for young children, (ages 15 mo - 9 years) especially those with disabilities. Families have voiced a need for an inclusive play space, where children can engage in play that fosters physical growth, emotional well-being, and social connection. To ensure our project meets current needs, we hosted meetings with service providers to gather input on: Existing services available Current gaps and unmet needs Ideas and possibilities for a new, all-inclusive Play Center Ways to partner together to best serve the needs of Anchorage’s children. The Play Center will provide developmentally appropriate play opportunities and programs that welcome children, regardless of ability. For children with disabilities, who already face barriers to inclusion, peer interaction and support, this space will offer something vital: a place to connect, belong and thrive. At the same time, it allows children to build friendships with peers of all abilities—encouraging empathy, curiosity and community values. This Play Center is more than a playground; it removes barriers, fosters inclusivity and creates a place where children grow together through joy and friendship. It will be a safe, fully accessible environment that supports year-round play and connection.	With 30+ years of serving children, AJC identified special needs as an underserved group. In response, we recently completed the outdoor space of the Play Center, designed to bring children and families together with joy, fun, connection and community. Open to the public and free of charge, the Center focuses on young children —especially those with disabilities—offering inclusive access for all. Our program is the first in Alaska to join the global Friendship Circle program—today’s fastest-growing organization dedicated to children with special needs. This proven and innovative model connects teen volunteers with children in purposeful, joyful experiences that build confidence while transforming the lives of the volunteers. Friendship Circle is a movement united by a shared mission: to ensure that no child with special needs feels isolated. Our program advances the mission through programming supported by trained staff who oversee teen volunteer coordination, family engagement, program implementation and safety. In partnership with child and disability service providers, the Center ensures equitable access to play, learning and developmental growth through accessible and sensory-friendly design. Outdoor play center (completed) Performance stage and musical zones Fort-building, playhouse and turf hills Climbing walls, sensory panels Garden, lighting, ADA parking and parent seating Indoor play center & programs (the focus of this grant): Art, dance and story areas Play areas, adaptive toys and sports equipment ADA restrooms, kitchen and coat/equipment storage Sensory and quiet spaces According to KOMPAN Play Institute, “children with disabilities participate far less in active play and physical activity than their peers. Since active play is one of the main contributors to child health, the accessibility to and usability of public playgrounds for children of all abilities is fundamental for their physical and social-emotional well-being and health. And children’s physical, social-emotional, cognitive, and creative development is not only supported by play, it is developed through play. There is evidence that play, apart from being great fun, is fundamental for all areas of child development. The social connectedness of playing together in public playgrounds is an asset in equity and inclusion agendas.”	\$1M-\$5M	Single Community	Anchorage (Municipality)	Advance to Implementation Application

Alaska Legal Services Corp.	Promoting Healthy Rural Communities through Medical Legal Partnerships Project	AK	Public health and preventative services are especially challenging in Alaska due to its rurality, high transportation costs, and limited local infrastructure. Healthy Alaskans 2030 State Health Assessment. Health is determined by complex and interdependent factors like behavior, biology, genetics, and the person’s physical and social environment. The combined impact of these factors drive health outcomes. Id. Social determinants of health (SDOH) are non-medical factors, like physical environment, income, education, family stability, employment, and safety, that influence a person’s health. SDOH, perhaps surprisingly, account for roughly 60% of a person's health—carrying more weight than genetics or healthcare services themselves. “AMA Code of Ethics’ Opinions Related to Medical-Legal Partnerships.” AMA Journal of Ethics, Vol. 26 (issue 8), 622 (2024). Additionally, some Alaska populations “suffer from disparities in health caused by systematic and avoidable social and economic circumstances that create barriers for achieving full health potential and lead to poor health outcomes.” Healthy Alaskans 2030. MLPs address SDOH and health inequities by integrating legal service providers directly into the clinical setting to address the root causes of illness that medicine cannot touch. The MLPs will collaborate with rural medical providers to shift from solely treating symptoms to solving structural problems affecting health.	This project will embed CJWs into hospitals and healthcare centers serving rural Alaskans, thereby making legal aid readily available to advise healthcare teams and provide direct legal assistance to patients and their families. CJWs will be fully supported by ALSC staff and infrastructure. CJWs will: - Assist eligible clients with legal services, including Medicaid and Medicare denials, reductions, or terminations; public benefit denials or delays; wills, powers of attorney, and advanced health care directives; domestic violence protective orders; housing matters; and family stability issues, such as minor and adult guardianships and custody needs. - Provide on-site accessibility for consultations with hospital staff to identify if a patient has health harming or other legal needs. - Provide education and training to hospital staff regarding health harming legal needs and the most common and effective legal interventions. The Project design will overcome potential recruitment and retention challenges, often typical in rural communities, by staffing positions with CJWs. Under ALSC’s CJW program, community members are trained to become legal practitioners providing specific targeted legal interventions addressing routine legal issues. The scope of the CJW program includes community outreach and information; brief legal services; and direct client representation in court for some legal matters under Alaska Bar Rule 43.5. CJWs’ areas of practice align with legal issues directly affecting SDOH. Alaska’s CJWs have proven to provide effective and impactful services. Between 2021 and March 2025, CJW cases resulted in \$23.6M in SNAP benefits recovery for clients and their families, with a \$14.5M additional economic benefit during the same time period. CJWs have a very high return on investment. A study conducted on the effectiveness of CJWs in Alaska found that CJWs generated \$25 of public benefit for every federal grant dollar invested in the program. (“Research Brief: Analysis of the Social and Economic Impact of the Alaska Community Justice Worker Program (2021-2025).” American Bar Foundation Access to Justice Research Initiative.)	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Northwest Arctic Borough	Deferred or Not Advanced

Alaska Library Network	Alaska Health Information Portal (AkHIP). --Trusted information for better health	AK	While the internet is ubiquitous it is not necessarily reliable or easy to understand for the general public. Search results can be based on unreliable health information sources or sponsored by suspicious companies or health organizations. The amount of information retrieved can be overwhelming to the general public. Too often the best reliable health information is unavailable because it is located behind pay walls. RHTP offers the opportunity for the Alaska Library Network to establish a comprehensive health information portal. This portal can transform the delivery of health information by using a single web site to offer a range of health resources not available on the open internet. As a single health information portal, the search results will be retrieved from trustworthy sources with more manageable results to review. The licensed resources will be supplemented with selective government and non-profit websites of particular interest to Alaskans.	The Alaska Library Network has decades of experience in delivering statewide high-quality vetted information to the residents, researchers, and students of Alaska. ALN has negotiated with vendors licensing agreements for statewide resources for academic, health, and school programs. The Alaska Health Information Portal (AkHIP) will approach the health information challenge by offering two windows to high quality vetted information. From the AkHIP webpage individuals would be directed to consumer health information while health care providers and medical students would be offered an additional path to health information resources produced for doctors, nurses, health sciences students, and mental health counselors. AkHIP can also help with workforce development by providing online training and testing materials for health care providers such as nurses or counselors. The consumer health resources will be readily accessible to all residents and students in Alaska and will help individuals gain an overall understanding of key topics across the health care environment from mainstream medicine to complementary, holistic and integrated medicine. Teen health and wellness will be a particular focus. Resources for health care providers and university medical students will be evidence based and up to date providing access to a range of resources. In addition to providing high quality vetted health information, the AkHIP project will transform the retrieval of health information by employing as appropriate AI, API, and discovery search services.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Library Network	Ensuring Long Term Access to Health Information and Research for Alaska's Rural Communities	AK	This project supports the curriculum needs of health science students including access to evidence-based research materials. Expanding access by adding additional journal titles focused on rural health topics will directly support students as they enter the healthcare field in Alaska and work with rural patient care.	In the first two years, ALN will acquire additional online health science journals while supporting existing health science database subscriptions over the next five years. The project also includes hiring two temporary staff members to manage the purchase and processing of the health science collections.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Literacy Program Inc	Community Health Worker Network	AK	In Alaska’s rural and frontier communities, the majority of factors influencing health outcomes occur outside clinical settings. While medical care addresses only a portion of health needs, social drivers such as housing stability, food access, transportation, cultural trust, and care coordination significantly impact maternal and child health, chronic disease management, and preventive care utilization. Community Health Workers (CHWs) are uniquely positioned to address these gaps by building trust, bridging cultural and geographic divides, and connecting families to clinical and community-based resources. When effectively integrated into health systems, CHWs reduce avoidable emergency department visits, improve care continuity, and lower long-term costs by shifting health systems toward earlier, lower-cost prevention rather than expensive crisis care. However, Alaska lacks coordinated statewide infrastructure to identify, support, and sustainably integrate the CHW workforce. Inconsistent role clarity, limited professional development pathways, and underdeveloped payment mechanisms hinder full integration across the Continuum of Care. Without dedicated capacity to implement a strategic workforce plan and strengthen statewide coordination, Alaska cannot fully leverage CHWs to advance rural health transformation, strengthen workforce resilience, and improve fiscal sustainability.	This project will build statewide infrastructure to strengthen and integrate Alaska’s Community Health Worker (CHW) workforce as a core strategy for Rural Health Transformation. In Year One, we will establish dedicated capacity through a full-time Coordinator and Administrative position, supported by an Advisory Council and targeted subcontractors for program design. This structure will implement our strategic plan and align CHW workforce development with State priorities. Key activities include expanding statewide CHW membership; strengthening partnerships with Tribal Health Organizations, community-based organizations, clinical providers, and state agencies; and developing regional CHW hubs by identifying local champions and conducting outreach in rural and frontier communities. These hubs will reduce workforce isolation, strengthen interdisciplinary collaboration, and support culturally responsive service delivery. We will provide professional development, monthly network meetings, and statewide training aligned with clear workforce pathways. Training will improve role clarity, care coordination, shared outcomes, and integration across the Continuum of Care. Shared infrastructure across partners will be critical to this effort. The Network will utilize Pear Suite to increase access to social care resources and standardize documentation, referral tracking, and shared outcome reporting across participating organizations. This will help community-based organizations demonstrate measurable impact, improve care coordination, and bridge trusted community-rooted work with emerging reimbursement pathways for CHW services in Alaska. The project aligns with Rural Health Transformation initiatives by strengthening the rural health workforce; expanding access to preventive, maternal-child, and behavioral health supports; advancing Healthy Communities through community-based care; supporting Pay for Value through quality metrics and reimbursement alignment; and partnering with the Departments of Health and Labor on workforce development and evaluation. Rural, remote, and frontier communities will benefit from improved care navigation, stronger trust between providers and communities, and reduced unnecessary emergency utilization. Populations served include pregnant and parenting families, individuals managing chronic conditions, Elders, youth, and communities facing social and geographic barriers to care.	\$50,000- \$250,000	Multi- Community or Participating in Regional Hub-and- Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

Alaska Literacy Program Inc	Pre-apprenticeship Healthcare Training Academy and Health Education and Support Services	AK	The State of Alaska faces significant healthcare workforce shortages. Existing healthcare professionals are stretched thin, and health systems across the state need sustainable strategies to train Alaskans for healthcare jobs within their own communities. According to the 2024 Alaska Healthcare Workforce Analysis, Alaska needs roughly 1,400 new registered nurses and over 9,400 new healthcare workers annually to keep up with patient demands. Additionally, a lack of health literacy, or understanding appropriate and timely access to healthcare, strains Emergency Rooms and professionals providing care. Alaska Literacy Program (ALP) addresses these challenges by developing targeted educational pathways that prepare Alaskans for entry-level healthcare careers while improving overall health literacy. Many ALP students are under-employed or hold healthcare credentials that are not transferable to the U.S. workforce. Through our Pre-Apprenticeship Training in Healthcare (PATH) Academy in partnership with the Area Health Education Center, participants earn certifications such as CPR and Mental Health First Aid while building workplace readiness skills to enter or Certified Nursing Assistant and similar entry level programs. Additionally, ALP leads our Peer Leader Navigator program, training multilingual community members in healthcare topics and systems navigation to strengthen preventive care awareness, appropriate utilization, and patient advocacy within their communities.	ALP is uniquely positioned to support workforce training that strengthens both individual economic mobility and community health outcomes. Our programming will strengthen Alaska’s healthcare workforce pipeline and alleviate strain on healthcare systems by increasing health literacy to create healthy communities. RHTP funds will be used to build organizational capacity to serve more Alaskans across our state. We are requesting funding for key personnel to expand programming, including a Distance Education Coordinator, a Healthcare Training Coordinator, and an Administrative Assistant to support our Peer Leader Navigator Program. Additionally, funding would go towards trained PLNs to provide health education and health/social resource navigation and services. We also plan to develop Healthcare Career Guides in partnership with Alaska Department of Labor, which would outline training steps, credentials, and advancement pathways, strengthening recruitment and long-term workforce retention. This increase in capacity allows for essential activities in our healthcare training academy as well as increased reach for our PLNs. Allowing for distance-delivered instruction means learners in communities across the state can access high-quality training without relocating and filling personnel gaps in their own communities. Providing Alaskans with strong foundational education in healthcare concepts, digital literacy, and workforce readiness prepares them for additional credentialed training such as CNA and Community Health Worker certificate programs and supports long-term career advancement. Alaska Literacy Program is dedicated to removing barriers to education by providing flexible hours through online and in-person learning options that support adult learners balancing work, family, language access, and transportation challenges in rural Alaska. By providing Alaskans with accessible, high quality education to prepare for additional healthcare certification, we are recruiting strong candidates for full time healthcare careers and decreasing the number of underemployed highly-skilled Alaskans. Expanding our Peer Leader Navigator program’s capacity will increase culturally responsive health education and system navigation support, helping community members access appropriate care and empower individuals in accessing services.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Marine Safety Education Association	Rural Youth Marine Safety Education for Drowning and Injury Prevention Across Alaska	AK	Rural Alaskan youth face a disproportionately high risk of drowning and cold-water injuries due to reliance on boats for subsistence, transportation, and daily life, combined with limited local access to marine safety education. Many schools lack the resources or trained personnel to provide culturally relevant, hands-on drowning prevention and water survival training. This project addresses a critical gap in Alaska’s Healthy Beginnings and Healthy Communities initiatives by providing youth with life-saving skills, including safe boating practices, cold-water survival techniques, and emergency response training. By integrating a train-the-trainer model, local educators gain certification to deliver ongoing marine safety education, ensuring sustainable, community-led programming. These interventions directly advance lifelong health and well-being, strengthen preventive care infrastructure, and align with Alaska’s Rural Health Transformation Plan goals by improving access, building workforce capacity, and reducing preventable injuries and deaths among youth in rural, remote, and frontier communities.	This project strengthens AMSEA’s rural youth marine safety program through four coordinated strategies designed to reduce drowning and cold-water injuries among Alaska’s youth: 1. Dedicated Youth Program Staffing: We will hire and retain trained staff focused on youth outreach and program delivery in rural and frontier communities. Staff will support local schools, community centers, and Tribal organizations to deliver hands-on, high-quality marine safety education. This strategy aligns with RHTP Goal 3 by building workforce capacity to meet rural needs. 2. Expanded Rural Training Access: Programming will ensure youth in off-road and remote communities can participate in hands-on marine safety training. Students will gain skills in cold-water survival, safe boating practices, and emergency response. This improves access to preventive health interventions and supports lifelong well-being, in line with RHTP Goals 1 and 2. 3. Train-the-Trainer Workshops and Peer-to-Peer Instruction: Community instructors, including teachers, health aides, and local youth leaders, will be trained to deliver culturally relevant marine safety curricula. Peer-to-peer instruction will reinforce skills and encourage local engagement, creating a sustainable training program. This builds local capacity, strengthens community partnerships, and ensures long-term program continuity. 4. Curriculum Modernization and Cultural Relevance Updates: We will update the program curriculum to incorporate current best practices in drowning prevention, cold-water survival, and emergency response, while integrating Alaska Native knowledge, and local community practices. Updated lessons will be interactive, hands-on, and designed for multiple learning levels to maximize retention and real-world application. 5. Updated Youth Program Equipment and Supplies: Students and instructors will receive modern, safe, and durable equipment to support experiential learning, including immersion suits, life jackets, training aids, and simulation tools. This ensures effective, safe, and engaging training across rural and frontier settings. By combining workforce development, expanded access, culturally tailored curriculum, and modern training equipment, this approach directly addresses the high risk of drowning among rural Alaskan youth, strengthens preventive health infrastructure, and provides measurable improvements in youth safety and preparedness.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

ALASKA MARITIME PHYSICIAN S	Remote Monitoring and Pre-Employment Screening for Alaska Maritime Crews	AK	Alaska's maritime industry operate for extended periods in remote waters where distance and weather delay medical assessment. Clinical decline may go undetected until symptoms become obvious enough to force diversion to port or late presentation at already-strained coastal facilities. This pattern drives avoidable medical evacuations, unnecessary vessel returns, and operational disruption across fleets ranging from large sophisticated operators to small seasonal co-ops with limited onboard medical capability. Many vessels lack meaningful physiologic monitoring at the point of first concern. Without better data, escalation thresholds trend conservative — generating costly disruption and avoidable burden on rural receiving sites. Some mariners also board vessels with unmanaged health risks that could have been identified and addressed before departure. The solution links two pathways: pre-deployment screening to identify and manage higher-risk individuals before leaving port, and onboard remote monitoring using wearable biosensors, cloud analytics, and exception-based workflows to give clinicians real-time physiologic data at sea. This enables more informed triage, supports safer care in place when appropriate, and drives timelier intervention when escalation is warranted — reducing avoidable medevacs, unnecessary diversions, and pressure on remote facilities while building a more proactive model of maritime care for Alaska.	We will implement an Alaska-rooted Maritime Remote Monitoring Program designed to support care delivery across the maritime industry operating in remote and frontier settings. The program will be operated through a hub-and-spoke model utilizing Alaska Maritime’s physician-led clinical team, with centralized monitoring supported by cloud-based analytics and scalable exception management. This enables limited clinical staff to oversee a large and geographically dispersed maritime population more effectively, while maintaining clear escalation pathways based on operational realities, local protocols, and the availability of transport or port access. The proposed model includes two parallel pathways. Pathway I is pre-employment screening and early risk stratification. Before deployment, mariners can be assessed using structured monitoring workflows to identify elevated risk, support more informed fitness-for-duty decisions, and establish defined treatment or management plans where needed. This creates an opportunity to avoid sending individuals with unmanaged or unstable conditions into prolonged remote maritime settings where reassessment is difficult and intervention options are constrained. In some cases, the pathway may also support ongoing monitoring plans that continue once the mariner is onboard. Pathway II is onboard remote monitoring for mariners working on vessels. This pathway is intended to support earlier detection, more informed triage, and more timely intervention when clinical concerns arise at sea. It will allow Alaska Maritime’s on-call physicians and care team to review physiologic trends and related data, use exception-based workflows to prioritize attention, and determine the appropriate level of response. The model is particularly relevant for vessels without robust onboard medical capability and in situations where early warning could prevent avoidable deterioration or unnecessary use of remote healthcare resources. The program will launch with a beta period, followed by broader operational rollout aligned to the maritime industry timing and vessel operator decision cycles. Year 1 will focus on establishing the maritime operating model, implementation workflows, training, device deployment, and early use cases across both screening and onboard monitoring. Over time, the program can scale across Alaska Maritime’s contracted vessels and become a core part of a more proactive maritime health and risk management strategy for Alaska.	\$1M-\$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah- Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska- Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

ALASKA MARITIME PHYSICIAN S	Opioid Education, Addiction/Overdose Prevention, Monitoring for Alaska Maritime Industry/Communities	AK	Diversion of prescribed controlled medications continues at epidemic proportions in our maritime communities. Residents and workers in these areas face extraordinary barriers to health care. This project directly addresses access to opioid education, overdose prevention tools, and controlled substance monitoring in communities where traditional health infrastructure is limited or nonexistent.	Proposed Approach Alaska's rural maritime communities and industry workers face compounding barriers to opioid prevention and care — geographic isolation, limited health infrastructure, occupational injury risk, and cultural mistrust of outside health systems. This project addresses those barriers through three integrated strategies delivered where people live and work. Education and Training — Culturally responsive opioid education will be delivered through tribal health organizations, canneries, harbormaster offices, and maritime worksites. A maritime-specific curriculum will address pain management risks following occupational injury, recognition of substance misuse, and employer responsibilities. Community Health Aides and local providers will receive targeted clinical training in addiction screening and evidence-based prescribing. Overdose Prevention — Naloxone will be distributed and training provided across remote coastal and river communities and maritime worksites. We will advocate for naloxone as standard equipment aboard commercial vessels, normalizing overdose preparedness within marine safety culture alongside existing emergency protocols. Monitoring and Care Coordination — We will expand provider participation in Alaska's Prescription Drug Monitoring Program and establish telehealth-based pathways connecting at-risk individuals to medication-assisted treatment. A care coordination model will specifically address the mobility of seasonal maritime workers, ensuring treatment continuity across geographic range. A Community Advisory Board of tribal leaders, maritime stakeholders, and individuals with lived experience will guide all program decisions. Local community members will be prioritized as project staff and peer navigators, ensuring trusted, sustainable delivery. This approach meets Alaska's maritime communities on their own terms — practical, culturally grounded, and built to last.	\$1M-\$5M	Family or primary care	Other	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Copper River Census Area; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kuskilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Marriage & Family Therapy Associates	Peer Support Professional Program Transformation	AK	Alaska's Peer Support Professional (PSP) program is a critical behavioral health resource, yet over the years it has produced only about 150 Peer Support Professionals---far fewer than rural communities need. The primary barrier is the Alaska Commission for Behavioral Health requirement that non-degreed applicants complete 1000 hours of employment or volunteer training with a licensed behavioral health facility prior to certification. This is a necessary requirement for PSPs to obtain the experience needed. However, for rural residents, meeting this requirement is extremely difficult. Completing this required employment/training typically requires leaving one's home community to live and work wherever the behavioral health facility is located for six months, disrupting family, cultural, and subsistence responsibilities, and creating significant financial strain. Additionally, behavioral health facilities face their own challenge with this model: they must hire and pay trainees for six months of largely training-focused work without any assurance the trainee will remain after certification. This financial risk limits behavioral health facilities participating. Together, these obstacles sharply restrict participation in the PSP program and prevent rural communities from developing a stable, locally grounded behavioral health workforce. Addressing these opportunities is essential to expanding access to Peer Support Professionals behavioral health support across Alaska.	Our proposed approach integrates the Alaska Commission for Behavioral Health (ACBH) Peer Support Professional (PSP) certification with 1000 hours of structured, humanistic counseling training into a single virtual volunteer training and educational framework. This model directly addresses the problems/opportunities previously identified by streamlining both the required volunteer training and PSP certification into a single virtual process. Alaska Marriage & Family Therapy Associates (AKMFTA) will recruit PSP trainees as remote, work-from-home trainees, with the Rural Health Transformation Program (RHTP) funding supporting all training costs. Over a one-year period, each trainee will complete 1000 hours of virtual, supervised training consisting of entirely skill-building in humanistic counseling, substance abuse recovery support, along with all coursework and supervision required for ACBH certification. By transforming the mandatory 1000 hours of volunteer work into a high-quality, competency-based training experience, this model produces culturally responsive, community-grounded providers who are prepared to meet rural Alaska's behavioral health needs. The virtual structure removes geographic and logistical barriers, enabling rapid training and deployment of 500 PSPs statewide within 5 years. AKMFTA is well positioned to implement this initiative. As a behavioral health training and supervision clinic for more than a decade, we have successfully prepared numerous psychotherapists who have gone on to licensure and meaningful careers across Alaska's behavioral health system. Our existing curriculum, supervisory capacity, and virtual infrastructure provide a strong foundation for delivering this innovative Peer Support Training and employment model.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Mobility Coalition	Rural Health Flexible Transportation Fund (FTF)	AK	The RHTP aims to expand access to healthcare and wellness services for thousands of Alaskans. The scope of the program is immense, and the state is likely to see hundreds of new initiatives or expansion of services from across the state. However, the Alaska Mobility Coalition is uniquely aware of the challenges that Alaskans face, especially seniors and people with disabilities, in accessing healthcare, wellness and nutrition services. Plus, we hope that many other RHTP projects will create pipelines of workers and volunteers into a variety of healthcare related positions, many of whom will need transportation support to participate in those opportunities. While some applicants will anticipate and budget for public and community transportation needs of their clients, consumers, patients, trainees, volunteers and employees, many will not. The FTF will be available to fill in the gaps and ensure transportation is not the barrier to improved health or a job or volunteer opportunity in a health-related field.	This FTF project proposes to be a “catch all”, or broker, for unforeseen, but necessary community transportation services. It is also meant to be a “payor of last resort” to ensure that we are not supplanting other federal funds, be they Medicaid for NEMT, or federal training dollars already provided through Department of Labor and Workforce Development, and other entities that typically pay for transportation services for their clients and/or employees. The FTF will utilize every available option to purchase ground or marine transportation services including but not limited to the following: • Purchase of rides through existing community public transportation providers such as bus and paratransit services, ferry service and tribal transportation providers. • Utilization of taxicab and rideshare vouchers and agreements. • Volunteer programs that pay federal mileage reimbursement or fuel support to neighbors, friends or family members swilling to drive one or more persons to healthy recreational activities, wellness classes, employment training, volunteering and accessing nutritious foods from markets and subsistence opportunities. • Provide stipends for companions if necessary for ground and marine travel purposes. What FTF will not do in the first year of service but may in the future after some assessment and planning: • Provide airline travel purchases for consumers and/or companions in state or out of state. • Provide funds for vehicle purchases, repairs, maintenance or modifications. The purchase of services described above will be done primarily through sponsoring agencies, and not directly to individuals. This is like the concept of mini grants provided through the Alaska Mental Health Trust Authority, whereby a sponsoring agency helps an individual with an application, and a stipend is provided to them if successful. However, some of these purchases could be small, or one time, so we will explore the option for a congregant monthly reports/invoices for multiple trips and persons from partnering entities. AMC will take individual applications as well but then direct them to a partner for processing purchase of services.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Municipal League	Emergency Services Equipment Bundle	AK	Rural EMS agencies face fundamental equipment gaps that limit their ability to provide timely, safe, and reliable emergency response. Many communities lack functional EMS vehicles, specialty rescue equipment, or modern communications systems necessary to stabilize patients, coordinate care, or transport individuals across long distances and difficult terrain. These gaps reflect systemic underinvestment in the EMS equipment modernization required for basic emergency care. Modern EMS vehicles, rescue units, diagnostic tools, and interoperable communications form the backbone of rural mobile healthcare, where stabilization often occurs in the field and communities are hours from definitive care. Without reliable equipment, agencies cannot reach patients, conduct assessments, or communicate effectively, resulting in longer response times, higher medevac reliance, and poorer outcomes. This project provides targeted EMS equipment modernization to address structural barriers and allow communities to: • Reach patients more quickly and safely. • Deliver higher quality on scene care with reliable diagnostic equipment. • Reduce preventable delays caused by outdated or failing vehicles. • Improve coordination via communications that function in rural terrain. • Support treat in place and telehealth-supported decision-making. By addressing long standing deficits, this project advances RHTP goals of improving access, modernizing technology, and enhancing rural emergency care.	This project advances a strategic, community-driven approach to EMS equipment modernization across six rural and frontier boroughs/census areas. The project focuses on acquiring essential EMS equipment that communities currently lack and that is critical for safe, timely, and coordinated emergency care. Each EMS agency identified specific gaps that prevent them from meeting modern emergency response standards. The project will procure and deploy fit for purpose EMS equipment modernization assets, including: • Modern EMS vehicles and specialty response units capable of navigating remote, off road, or weather impacted environments. • Rescue and transport equipment that restores capabilities—such as Denali’s medium rescue truck or Saint Paul’s off road medical response unit. • Interoperable radio/communications systems supporting multi village and corridor-based coordination. • Clinic-based emergency transport and diagnostic tools where no functional unit exists. A centralized procurement structure ensures cost-efficiency, specification alignment, and rapid deployment, supported by AML’s extensive experience managing heavy equipment procurement for Alaska communities. Equipment will be selected to support telehealth-enabled decision-making, hub and spoke coordination, and modern emergency stabilization practices. By modernizing essential EMS equipment rather than conducting routine fleet renewal, this project advances RHTP priorities of expanded access, technology innovation, strengthened mobile care delivery, and improved safety. The approach ensures agencies can reach patients reliably, deliver effective on scene care, and reduce preventable delays tied to outdated or non-functional equipment.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Denali Borough; Kenai Peninsula Borough; Prince of Wales-Hyder Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Municipal League	Alaska Municipal Health Trust Rural Prevention & Care Navigation Initiative	AK	The Alaska Municipal League (AML) is a nonprofit member organization of 165 cities, boroughs, and unified municipalities. In 2020, to meet the health and wellness needs of its members, AML formed the Alaska Municipal Health Trust (AMHT). AMHT allows AML members to provide a flexible health plan for employees, elected/appointed officials, and associated entities. AMHT pools participating municipalities to strengthen purchasing power, stabilize risk, and promote long-term affordability in a challenging health care environment. Municipalities face sustained and accelerating health care costs. Limited primary care availability, fragmented referral pathways, and system complexity lead members to rely on episodic or crisis-based care rather than early intervention. For AMHT, these structural barriers translate into claims volatility, pressure on contribution rates, and long-term actuarial instability. At the same time, this challenge presents a clear opportunity to realign care utilization through preventive incentives and coordinated navigation support. By encouraging early engagement in primary and behavioral health care and proactively guiding members toward appropriate, lower-cost care pathways, AMHT can reduce avoidable utilization while improving outcomes. This strengthens rural health system sustainability without expanding brick-and-mortar capacity, positioning AMHT as both a fiscal steward for municipalities and a strategic partner in broader health transformation efforts.	AML, through AMHT, proposes a scalable rural health initiative focused on incentivized preventive and primary care utilization, supported by a targeted care navigation and early intervention infrastructure. The project is designed to reduce preventable health care utilization[GU3.1], improve health management, expand behavioral health access, and strengthen long-term cost stability for municipal employers across Alaska, particularly communities where access barriers drive higher downstream costs. The project will implement a dual-strategy approach: 1) Incentivizing preventive and primary care engagement: AMHT will design financial and benefit incentives that nudge members toward early, preventive, and primary care—especially via telehealth. Incentives may include, but are not limited to, wellness participation incentives (health assessments, screenings, fitness activities, preventive care visits, etc.), wellness marketplace discounts (gym memberships, nutrition programs, fitness gear, etc.), shared services/participation dividends for employers that meet participation thresholds, telehealth-first incentives, or preventive care credits. 2) Providing centralized care navigation support for high-risk members: To ensure incentives translate into measurable outcomes, the initiative will integrate a care navigation and early intervention component focused on proactive outreach to high-risk members. This support will help members understand their benefits, access appropriate services, and navigate behavioral health and post-acute care pathways. These strategies aim to reduce emergency utilization, stabilize claims experience, improve health outcomes, and strengthen long-term actuarial sustainability for municipal employers. In the first year, AML will focus outreach efforts on AMHT members. In subsequent years (dependent on funding), AML will conduct broader outreach and engagement efforts with all AML members.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Municipal League	Alaska Rural Health Infrastructure Fund (RHIF)	AK	The Alaska Municipal League (AML) is a nonprofit membership organization of 165 cities, boroughs, and unified municipalities. AML seeks to fill a critical gap in funding availability for municipalities to plan and support public infrastructure for health and community wellness. Alaska’s rural municipalities face significant infrastructure gaps that directly affect community health, safety, and overall wellness. Many communities rely on aging or undersized facilities and systems that were not designed for current population needs, climate conditions, or modern service delivery. Priority needs commonly include: • Health care facilities such as clinics, EMS stations, behavioral health spaces, and telehealth-enabled care sites that allow residents to access services locally. • Housing for health professionals is a critical barrier to sustaining essential services, as many rural areas struggle to recruit and retain workforce due to limited housing availability. • Community wellness infrastructure, such as multi-use community centers, recreation facilities, public safety buildings, and spaces that support youth programs, elder services, and behavioral health outreach. Addressing these infrastructure gaps is essential to strengthening rural health systems, supporting workforce stability, improving preventive care access, and ensuring that Alaska’s rural communities remain viable and healthy places to live.	AML proposes to launch the Rural Health Infrastructure Fund (RHIF) to strengthen municipal infrastructure that supports health access, EMS readiness, workforce stability, and community resilience. RHIF is a two-tier system designed to help rural municipalities make sustainable, long-term investments. Tier 1 – Asset Management & Pre-Development Support Infrastructure decisions shape operating costs, resilience, and service reliability for decades. Establishing a shared understanding of asset management is essential to ensure decisions are informed, coordinated, and sustainable. Tier 1 focuses on building foundational capacity through capital asset inventories, facility condition assessments, GIS mapping, lifecycle planning, and revenue modeling. This work creates a disciplined project pipeline and reduces infrastructure and operational risk for rural communities. Tier 2 – Revolving Loan Fund After Tier 1 is completed, eligible projects move into a revolving loan fund. RHIF will use a simple, transparent fee structure to ensure affordability and long-term viability. Modeled after AML’s existing water and wastewater fund, loans will have a 2% fixed rate and a 1% origination fee. Eligible projects include EMS quarters or ambulance bays; modular or renovated workforce housing; retrofits for clinic leases or telehealth; HVAC/air quality/energy systems; and water/sewer systems serving clinics or EMS. Repayment sources include EMS billing, lease payments, user fees, borough support, and energy savings. Integration with RHTP Priorities The project aligns with RHTP by strengthening access, stabilizing health workforce capacity, improving EMS readiness, enabling telehealth and broadband-supported care, and modernizing essential public infrastructure. It supports statewide goals to expand remote care, reduce chronic disease risks, and build community-led resilience. AML will convene an advisory bench—including municipal, tribal, EMS, finance, engineering, and health system partners—to standardize underwriting, documentation, and monitoring. AML will also provide application support, financial analysis, project planning, data collection, reporting, and performance-improvement technical assistance to municipal borrowers.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Municipal League	Municipal EMS Financial Sustainability & Alternative Payment Model Pilot	AK	The Alaska Municipal League (AML) is a nonprofit membership organization of 165 cities, boroughs, and unified municipalities, many of which operate small municipal emergency medical service (EMS) systems that are critical to maintaining healthcare access in rural communities. These systems often operate on thin financial margins, face volunteer workforce strain, and lack the administrative capacity to engage in value based models. Revenue is often left unclaimed due to documentation and coding gaps, and agencies lack infrastructure for reimbursable treat in place or community paramedicine, despite potential system savings and quality gains. Without targeted support, these challenges threaten the financial stability of rural EMS agencies and increase the risk of service reductions or closures Under RHTP, AML will deliver a 3-year, phased project to strengthen the financial sustainability of municipal-owned EMS systems. The project will provide statewide billing and revenue training, individualized financial sustainability assessments for participating municipalities, and technical assistance to build readiness for alternative EMS payment models. The initiative will also support pilot communities in implementing treat-in-place and community paramedicine reimbursement pathways, enabling EMS systems to deliver appropriate care in lower-cost settings while maintaining essential emergency response capacity.	AML proposes a three-year, phased approach designed to strengthen the financial sustainability and operational capacity of municipal EMS agencies while preparing rural systems to participate in value-based care models. The project combines statewide training, individualized financial sustainability assessments, alternative payment model (APM) readiness, and data infrastructure development to help municipalities improve reimbursement capture and expand care delivery models. Core activities include: 1) Training & Technical Assistance: Quarterly virtual trainings and an annual EMS billing summit; recorded modules; toolkits for documentation, coding, denial management, compliance, cost per run, and workflow templates. Objective: increase accurate reimbursement and reduce denials. 2) Agency Level Financial Sustainability Assessments: revenue capture analysis, payer mix, run volume, cost per run modeling, gap analysis, and a sustainability plan. Objective: tangible revenue improvements and days cash on hand gains. 3) APM Readiness & Pilot Implementation: • Education & Design: Overview of EMS APMs, Emergency Triage, Treat, and Transport model lessons, community paramedicine pathways, and compliance. • Infrastructure: Documentation/protocol upgrades, legal review, partner MOUs (hospitals/clinics/tribal health organizations). • Pilot Cohort (5–8 communities): Launch treat in place and alternate destination protocols, shared savings constructs, and cost avoidance tracking. Objective: demonstrate quality, cost, and access gains consistent with RHTP’s voluntary model testing. 4) Data & Reporting: Use standardized dashboards for financial and quality metrics; coordinate with healthEconnect for measure reporting to support value based arrangements and statewide learning.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Municipal League	Volunteer Fire Department Recruitment and Retention	AK	In rural Alaska, Volunteer Fire Departments (VFDs) serve as critical, often sole, first responders to medical emergencies. VFDs face numerous challenges when recruiting new volunteer firefighters. Increasing work demands and urban migration reduce the pool of potential volunteers, especially in rural Alaska. The number of volunteer firefighters across the state has plummeted by 45% since 2014, and Alaska has been experiencing a period of net outmigration for over 10 years, especially with young adults. Adding to the geographic isolation of many communities across Alaska, the recruitment and retention of volunteer firefighters is a significant hurdle for VFDs. Departments in rural and remote areas (including the seven targeted areas for Year 1) cover all emergencies, including medical, fire, rescue, and utility hazards, with small rosters, causing extended response times, unsafe crew sizes, and increased turnover. Current recruitment is ad hoc and under-resourced. The opportunity is to implement a coordinated, multi region recruitment and retention model that: (1) recruits new volunteers with locally tailored outreach; (2) retains members via a Length of Service Award Program (LOSAP) and peer support; and (3) improves readiness through NFPA 1720 compliance planning, regional training access, and community engagement—thereby stabilizing the volunteer workforce that underpins rural emergency access.	1) Recruitment & Marketing. Launch localized “Make Me a Firefighter” campaigns across the seven boroughs; produce region specific stories, social content, and event kits to reach youth, working adults, and culture bearer volunteers. Coordinate earned media and school/college outreach, consistent with RHTP’s emphasis on community based partnerships and workforce pathways. 2) Retention & Incentives. Stand up a multijurisdictional LOSAP that enrolls VFDs in phases and rewards tenure, certifications, and high need shift coverage—evidence based retention aligned with RHTP priorities to stabilize rural workforce via structured incentives and 5 year service commitments where applicable. 3) Training & Compliance. Provide technical assistance to help departments plan toward NFPA 1720 staffing/response objectives; coordinate regional trainings (including community paramedicine, treat in place, and alternate destination workflows) and facilitate shared equipment where feasible—reflecting RHTP’s EMS modernization aims. 4) Regional Coordination. Leverage AML’s statewide municipal network to convene VFDs, Tribal health organizations, regional EMS offices, and clinics/hospitals to integrate dispatch, telehealth consults, and post incident navigation—mirroring RHTP’s hub and spoke and regional planning framework. 5) Measurement & CQI. Track volunteer recruitment, retention, LOSAP participation, compliance gains, and outreach reach; use feedback cycles to refine tactics. Metrics align with RHTP’s statewide evaluation approach.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Haines Borough; Hoonah-Angoon Census Area; Kusilvak Census Area; Lake and Peninsula Borough; Petersburg Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Native Arts Foundation	Alaska Native Arts: A Cornerstone of Community Health and Economic Vitality	AK	The role of Alaska Native arts in rural communities is foundational to health, resilience, and thriving local economies. In many rural areas, Alaska Native peoples comprise a substantial portion of the population, and in some villages nearly 100% of residents participate in or benefit from culturally grounded arts. Recognizing this, arts and culture function as a preventative public health strategy, supporting mental health, physical wellness, and social cohesion, while also sustaining cash flow and local livelihoods. Strengthening arts ecosystems thus strengthens the communities that sustain them. Rural health can be strengthened through Alaska Native arts in the following ways: -Embed arts-based health education within the Alaska Native Artist Directory, linking artists to health agencies, clinics, and schools. -Create community storytelling and intergenerational programs that address behavioral health, nutrition, physical activity, and chronic disease prevention in culturally resonant ways. -Build local capacity by supporting artist-led workshops, signage, and materials that reflect village realities and languages. -Foster partnerships between health providers and artists to co-create outreach campaigns, patient navigation tools, and aftercare support rooted in cultural practices. -Use data-informed approaches to track engagement, outcomes, and community-level well-being, adapting programs to village needs.	The Alaska Native Artist Directory (launched in 2025) and our 2026 outreach tour provide a ‘warm’ entry point into homes and communities where formal health systems often struggle to gain traction. We view this project as an adaptable foundation that can help build community resilience. • Behavioral Health Integration: Our outreach photographers and coordinators can be trained to facilitate ‘Art as Healing’ workshops or distribute health literacy materials alongside artist registration. • Digital Health Navigation: We can expand the Directory’s technical architecture to include features for Social Prescribing, where providers can ‘prescribe’ cultural engagement as a clinical intervention for loneliness or depression. • Data Sharing & Interoperability: Our database of over 1,000 rural Alaskans offers a unique opportunity to test new delivery modalities for health messaging using emerging mobile technologies. ANAF has already demonstrated the technical capacity to manage complex statewide projects, evidenced by our transition to a community-focused model and the successful launch of our digital infrastructure. With the RHTP’s support, we can pivot our 2026–2027 work plan to explicitly measure health-related outcomes, such as increased social connectivity and community-level resilience metrics.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Native Birthworkers Community	Alaska Native Birthworkers Community Training	AK	Our organizing and our commitment to providing this peer support since 2017 stems directly from the expressed needs and wishes of our community - our young women want aunties to guide them through their transition into womanhood, our mothers want support to navigate pregnancy and childbirth, our sisters want someone to sit beside them while learning to care for a newborn and grow their families. For millennia, our social and community structures demanded ceremonial rites of passage, that a new mother be cared for by everyone surrounding her, and that care was offered locally by community members whose wisdom and medicine passed on from generation to generation. This has changed, and we are finding our way back. The care taken during pregnancy and early childhood impacts life-long health for both the child and the birthing parent. Pregnancy is an opportune time to work with families because a pregnant person can be especially motivated and open to healing and positive healthy choices for the benefit of their child. Protective factors identified against negative outcomes are connection to community and to healthy role models. Peer group support, such as the doula model, build upon those protective factors and have demonstrated positive maternal child health outcomes, especially for Alaska Native peoples who have been systemically underserved, and who experience the highest rates of maternal and infant mortality.	We come from the communities we serve, and we approach our work through a three sisters model where each sister focuses on a specific layer of support to uplift sovereignty from first breath. First Sister provides free direct and indirect services to Native birthing families in Alaska. Second Sister is growing a cohort of trained Indigenous birthworkers to serve Native birthing families in Alaska. Third Sister supports systemic change for improved maternal health outcomes and positive birthing experiences for Native birthing families in Alaska. Specific activities related to the role of the second sister include, but are not limited to: Grow a cohort of trained Indigenous birthworkers to serve Native birthing families in Alaska. - We currently have 15 people on our team, 10 of whom were hired after completing one of our trainings, so we are creating a direct pipeline from training to employment, and collectively we have served more than 500 families from across 100 Alaskan communities with our care. Our vision is to keep growing a statewide network to serve even more rural Alaskans. We will continue our individual and collective learning and growth to continuously improve the care we provide to the families we serve. - Build community and call upon the 80+ birthworkers who completed any of our six trainings so far (the Indigenous Full Spectrum Doula training, the Indigenous Breastfeeding Counselor training, the Indigenous Childbirth Educator training, the Sitnasuaq Indigenous Birth Support Gathering, the Indigenous Birth Helper Gathering, and Landback: Lactation Education for Indigenous Birth Helpers) to match them with families requesting support across Alaska. -Commit to hosting at least one free training each year for the statewide community. - Host gatherings for Indigenous birthworkers to meet each other, share knowledge and resources, ask questions, and debrief experiences. This includes peer skill share sessions where birthworkers volunteer to host 2-4 hour workshops to share knowledge and skills with our cohort of birthworkers for continued learning and growth. We do extensive fundraising each year to raise money across diverse funding sources and partners to support these trainings, and receiving RHTP (potential multi-year) funds designated for this purpose would help ensure the security of our training opportunities available to the community.	\$250K-\$1M	Maternal health	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Native Medical Center	ANTHC-UW Emergency Medicine Residency and Faculty Strengthening Program	AK	Alaska is a medical desert for emergency services in many rural areas, where hospital emergency departments and urgent care clinics are often not staffed by residency-trained Emergency Medicine physicians. This results in known disparities in patient health outcomes, particularly in trauma care, and challenges in emergency stabilization and difficult transfer decisions. ● Workforce Shortage: Alaska has a chronic shortage of EM specialists and significantly lacks GME programs to train and retain doctors locally. ● Healthcare Access Disparity: Emergency visits are increasing annually in Anchorage, and the state's rural population lacks consistent access to residency-trained EM expertise, which is essential given ANMC's role as the tertiary care referral hospital for the entire state. The current ANTHC-UW Global Emergency Medicine and Rural Health Fellowship has a near 100% retention rate for fellows who stay in Alaska, demonstrating that early exposure to rural Alaskan practice is a powerful recruitment tool. Expanding this educational pipeline is the most direct solution to strengthen the workforce.	1. Emergency Medicine Resident Physician Elective Rotation ● Objective: To expand resident exposure to rural emergency medicine practice in Alaska, focusing on the care of primarily Indigenous Alaska Native (AN) patients. ● Details: The one-month elective will be offered to senior EM residents (R3 and R4) from the University of Washington (UW) and Oregon Health and Science University (OHSU), as well as EM/FM dual-training residents. Rotations will occur at ANMC under attending physician supervision, with optional travel to critical access hospitals (e.g., Bethel and Kotzebue) and potential support for training community health aides. ● Benefit: Provides residents with unique training in administering remote emergency care and managing complex transfers, honing skills for high-volume, high-acuity care. 2. Emergency Medicine Faculty Exchange Program ● Objective: To strengthen the bilateral partnership through a reciprocal attending physician learning exchange to address clinical gaps and share expertise. ● Details: The exchange will facilitate upskilling of ANMC clinicians in advanced topics (e.g., stroke care, trauma care, ECMO indications, critical care delivery) via educational exchanges and clinical observerships at UW. In return, UW faculty will gain vital experience and knowledge regarding rural EM challenges, the care of Alaska Native patients, and disease processes prevalent in Alaska. ● Benefit: ANTHC faculty supervising and training resident clinicians will receive access to UW Center for Learning Initiatives and Education courses and a stipend for supervision.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Native Tribal Education Consortium	Alaska Tribal Language Rooted Holistic Student Wellness and Behavioral Health Network	AK	Alaska Native students in rural, remote, and frontier communities experience high rates of trauma exposure, suicide risk, and substance misuse, yet access to culturally responsive behavioral health services remains limited. Geographic isolation, provider shortages, fragmented education systems, and inconsistent access to student data create barriers to prevention, early identification, and coordinated care. At the same time, Tribal Education Departments are strengthening governance capacity under 25 USC 2020 to coordinate educational programming better and assert tribal control over matters affecting student success. This project addresses the opportunity to integrate holistic, culturally responsive mental and behavioral health supports within tribally governed education systems. By grounding social and emotional learning, prevention strategies, and referral pathways in each Tribe’s language, cultural teachings, and educational codes, the initiative strengthens protective factors while improving access to care. Rather than relying solely on external providers, the project builds coordinated systems that align education, family engagement, and health partners to improve student well-being and long-term community resilience.	ANTEC will lead a tribally governed, statewide network of Tribal Education Departments to integrate wholistic, culturally responsive mental and behavioral health supports within Alaska education systems. The approach builds on Tribal Education Department capacity under 25 USC 2020 and aligns education governance with coordinated health access. First, participating Tribal Education Departments will embed culturally grounded social and emotional learning frameworks within their educational systems. SEL practices will be rooted in each Tribe’s language, values, and relational teachings, reinforcing identity, belonging, and community responsibility as core protective factors. Language instructors, cultural mentors, and educators will work together to ensure wellness practices reflect local knowledge systems rather than externally imposed models. Second, the project will expand access to school-based and tele-behavioral health services through coordinated partnerships with tribal health programs and regional providers. Clear referral pathways and shared protocols will reduce fragmentation and improve continuity of care, particularly in communities with limited local providers. Third, the initiative will strengthen behavioral health prevention and early intervention strategies addressing suicide risk, substance misuse, and behavioral escalation. Restorative and culturally responsive approaches will replace punitive responses and focus on balance, connection, and healing. Fourth, the project will build rural workforce capacity by training local paraprofessionals, school support staff, and community wellness navigators under appropriate supervision. This creates a pipeline of community-rooted support providers and increases sustainability in areas facing chronic workforce shortages. Finally, ANTEC will coordinate shared learning and data practices across participating Tribal Education Departments while respecting tribal data governance. Outcome tracking will focus on increased access, reduced crisis events, improved school engagement, and strengthened protective factors. Together, this integrated model strengthens access, improves quality through cultural alignment, and builds sustainable infrastructure within tribally governed education systems to support long-term rural health transformation.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Matanuska-Susitna Borough; Nome Census Area	Deferred or Not Advanced

Alaska Native Tribal Health Consortium	Alaska Native Tribal Health Consortium Pharmacy Expansion	AK	The six ANTHC pharmacies are significantly undersized relative to clinical demand, national benchmarks, and the statewide role they serve. Current space limitations hinder workflow efficiency, sterile compounding capacity, storage stability, and the ability to maintain essential medication inventories. The ANMC Inpatient Pharmacy has only 14 DGSF per bed, far below the industry benchmark of 22–25 DGSF per bed, resulting in congestion, delayed medication turnaround, and the need for frequent work around processes. Across all locations, insufficient workspace contributes to delayed medication administration, increased error risk, constrained cold chain capacity, and reduced ability to prepare critical sterile products such as IV antibiotics, chemotherapy, and parenteral nutrition. These limits affect not only ANMC patients but also remote THO facilities that rely on ANTHC for specialty medications, after hours order verification, telepharmacy support, medication review, and statewide vaccine and procurement infrastructure. A comprehensive Pharmacy Needs Assessment is required to determine facility, workflow, and storage enhancements that align with regulatory standards and meet statewide demand. The effort will evaluate functional requirements, map workflows, identify bottlenecks, and define minor renovations or equipment improvements needed to ensure efficient operations. Without this assessment, pharmacy capacity constraints risk safety, reliability and continuity.	ANTHC will complete a structured, multi-phase Pharmacy Needs Assessment to identify the space, workflow, storage, and regulatory upgrades required across all six ANTHC pharmacies. The assessment will evaluate compounding capacity, cold chain infrastructure, inventory management, clinical workflow alignment, medication safety requirements, and statewide telepharmacy support. Findings will guide a prioritized plan for targeted, allowable renovations and equipment upgrades that directly enhance rural access and safety. A dedicated Project Manager will lead the assessment, coordinate stakeholder input, and ensure alignment with ANTHC’s strategic priorities, regulatory requirements, and available space. The project team will partner closely with pharmacy leadership, Facilities, Infection Prevention, Environmental Services, Information Technology, and statewide THO pharmacy teams to document functional requirements and validate recommendations. Key activities include: • pharmacy by pharmacy workflow mapping; • assessment of sterile compounding, hazardous drug handling, and storage standards; • evaluation of medication distribution pathways supporting rural facilities; • analysis of current versus required DGSF benchmarks; • identification of bottlenecks, safety risks, and environmental constraints; • modeling of minor renovations required for safety, capacity, and compliance; • development of a phased plan to implement improvements without disrupting essential operations. In parallel, ANTHC will execute a small, compliance driven renovation within the inpatient pharmacy to address urgent space and compounding constraints. This work will occur without interrupting pharmacy operations and will not duplicate the broader assessment. The outcome of this approach will be a clear, actionable roadmap for right sizing pharmacy services, guiding future investment, and strengthening statewide medication access and safety for rural Alaska.	\$1M-\$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

Alaska Native Tribal Health Consortium	Capacity and Bed Management to Improve Access to Care, Patient Flow, and Care Coordination	AK	Patient transfers and admissions into ANTHC’s tertiary care facility are frequently delayed due to limited real-time visibility into bed availability, unit readiness, staffing constraints, and downstream placement options. These challenges directly impact access to timely, appropriate care for rural and Alaska Native patients, particularly when coordinating medevacs, urgent travel, and scheduled specialty referrals from regional partners. In 2025, more than 60% of patient diversions were attributed to bed availability limitations, driven in part by fragmented, manual processes. Current transfer center and bed management workflows rely on phone calls, multiple messaging platforms, and locally managed tracking tools, limiting systemwide coordination and increasing risk during periods of high demand, weather disruptions, and transportation constraints. This project addresses these gaps by implementing Oracle Health’s Capacity Management tool within the shared EHR, establishing a standardized, enterprise-wide source of truth for capacity, placement, and transfer workflows across the tertiary facility, three rural tribal critical access hospitals, and ambulatory clinics. The solution will streamline patient flow from emergency department arrival through inpatient care and discharge, strengthening care coordination, reducing avoidable delays, and advancing RHTP goals for access, efficiency, and system sustainability.	This project will implement Oracle Health’s Capacity Management tool within the existing shared Electronic Health Record (EHR) used by ANTHC to strengthen access, coordination, and appropriate care availability across Alaska’s tribal health system. The solution will provide a near real-time, enterprise-wide view of inpatient capacity, including beds, unit readiness, isolation status, staffing, and demand such as pending transfers, emergency department boarding, and scheduled admissions. Constraints impacting patient movement, such as transportation availability, weather, and travel disruptions, will be documented within a single system, replacing fragmented, manual tracking processes. The approach enables proactive, data-informed decision-making rather than reactive coordination, improving timeliness, safety, and the patient experience, particularly for rural and Alaska Native patients requiring specialty or higher-acuity care. Standard operating procedures will be updated, governance established, and roles clearly defined across the tertiary facility and referring partners to support consistent use and long-term sustainability. Standardized workflows will be implemented across the full transfer lifecycle, including referral intake, clinical triage and acceptance, bed request and assignment, transport coordination, arrival management, and post-arrival placement updates. Within the shared EHR, three rural tribal critical access hospitals and ambulatory clinics will use consistent workflows, structured documentation, and status updates, reduce back-and-forth communication and eliminating parallel tracking. For referring facilities outside the shared EHR, a standardized external intake process will ensure transfers are entered and tracked end-to-end within the same capacity management workflow. The project includes configuration of beds, locations, service lines, and operational statuses; development of dashboards and alerts for key workflows such as ED boarding, transfer delays, and discharge barriers; and implementation of reporting to support continuous improvement. A phased rollout will begin with internal bed management at the tertiary facility, followed by transfer center workflows with the three CAHs and high-volume clinics. Training, change management, and defined KPIs, such as time-to-accept, time-to-bed, boarding time, transfer delays, and diversion events, will ensure adoption, measurability, and sustained impact aligned with RHTP goals.	\$1M-\$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Native Tribal Health Consortium	Compatibility Assessment for Wireless Wearable Technology for Continuous Vital Sign Monitoring	AK	Alaska's rural and frontier health care facilities rely on intermittent vital sign collection, typically every four to eight hours through manual nursing rounds. This creates blind spots during which clinically meaningful changes in heart rate, respiratory rate, oxygen saturation, or temperature go undetected until symptoms escalate to require emergency intervention. Chronic nursing shortages, high staff turnover, and minimal personnel across isolated sites compound this challenge. When deterioration is missed, consequences include unplanned ICU transfers, preventable adverse events, extended lengths of stay, and patient mortality. Beyond inpatient settings, patients discharged to remote communities lack follow-up monitoring, and pregnant and postpartum women face gaps in continuous blood pressure monitoring between visits. Wireless wearable monitoring technology has potential to close these gaps, but no systematic assessment has determined which solutions are compatible with Alaska's rural health infrastructure, workforce constraints, connectivity limitations, and Tribal Health Organization operating environments. The opportunity is to conduct a comprehensive compatibility assessment of wireless wearable vital sign monitoring technologies, evaluating feasibility across inpatient, home-based, and maternal health use cases and generating evidence-based recommendations for statewide adoption across the Alaska Tribal Health System.	The project conducts a statewide compatibility assessment of wireless wearable monitoring technologies for Alaska's rural health system, completing by September 2027. The pilot phase is conditional on assessment findings. Phase 1, Compatibility Assessment (Months 1-10): Conduct a market scan of available wireless wearable monitoring technologies evaluating capabilities, interoperability, connectivity requirements, regulatory status, and vendor viability. Define clinical, technical, and operational requirements specific to Alaska including intermittent connectivity, extreme climate, workforce constraints, and Tribal Health Organization (THO) governance. Engage THOs to evaluate receptivity, document site-specific infrastructure and EHR systems, and assess readiness for wearable monitoring. Conduct a data flow analysis mapping how patient data moves from device to platform to clinical systems, identifying storage, transmission, and processing points. Evaluate data sovereignty implications, determining whether vendor architectures comply with ANTHC and THO requirements for patient data to remain within controlled environments. Assess total cost of ownership, supply chain reliability, and vendor support for remote environments. Deliver an options analysis report with ranked recommendations, a data sovereignty determination, and a go or no-go recommendation for pilot. Phase 2, Limited-Scale Pilot (Conditional, Months 11-15): Proceed only if Phase 1 confirms data sovereignty requirements can be met and THO receptivity supports continued evaluation. Deploy recommended technology in a limited-scale pilot, focused within the Alaska Native Medical Center (ANMC), to validate performance across inpatient monitoring, post-discharge home monitoring, and maternal blood pressure monitoring pathways. Pilot scope and site selection defined based on Phase 1 findings. Collect data on clinical detection rates, alarm accuracy, staff workflow integration, patient compliance, connectivity reliability, and costs. Compile pilot data into a feasibility report with evidence-based recommendations, including a full cost projection distinguishing assessment investment from statewide rollout.	\$50,000-\$250,000	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Native Tribal Health Consortium	Network Modernization to Increase Capacity and Reliability for Statewide Tribal Connectivity	AK	Across Alaska’s statewide tribal health system, high-value clinical services depend on reliable, secure network connectivity delivered through ANTHC’s Wide Area Network (WAN). These services include telehealth, remote specialty consults, a shared tribal EHR, radiology and imaging workflows, and care coordination. The current infrastructure has the following constraints: A lack of redundancy makes it difficult to manage and update the WAN without causing outages and downtime. This impacts patient care, with network-induced downtime requiring manual workarounds by clinicians and care delivery teams. Legacy network devices do not support modern functionality such as “Out of Band Management.” Without this capability, ANTHC must rely on technicians physically accessing network equipment in the data centers during incidents, creating delays as staff travel on-site to connect to devices and restore service. Decades of budget-constrained growth resulted in a wide variety of systems being deployed over time. This inconsistent architecture makes updates and reconfiguration slower and higher risk; moving to a single platform will make network management more consistent and reliable. All network traffic coming to ANTHC from remote locations across Alaska must traverse a single data center located at the ANTHC campus. This has served Alaskans well, but as the WAN grows we need a redundant, high-availability data center model to increase throughput and provide failover in emergencies.	ANTHC will implement a phased Network Infrastructure Expansion program that provides immediate improvements to system reliability and organizational cybersecurity posture, while establishing the necessary foundation for a “High Availability” network architecture to be implemented in future years. This project modernizes and standardizes key elements of the core campus and datacenter network, enabling statewide partners to safely scale digital health capabilities that depend on ANTHC’s Wide Area Networking (WAN) systems. The work directly supports RHTP Initiative #6 (Spark Technology & Innovation) by strengthening the infrastructure resiliency needed for secure data exchange, modern clinical operations, and expansion of technology-enabled care. Year one funding will focus on establishing a resiliency-focused HA data center and campus switching topology, implementing platforms that enable more supportable, automation-centric network operations that reduce “configuration drift” and software currency. Out of Band network management systems will be implemented, enabling predictable telemetry, platform support and agile recovery during outages and major incidents. HA firewall platforms with scaled processing and throughput capacity will be implemented to support the growth demands of on-campus systems and ANTHC’s rural tribal partners. During this period, ANTHC is committed to using its own capital funding to perform additional networking platform improvements in parallel, including implementation of a resilient fiber optic (FO) interconnect between campus data centers, a redundant FO access layer topology tied to the secondary datacenter, implementation of HA SD-WAN for off campus corporate buildings, and installation of a second HA pair of wireless LAN controllers to support ANMC clinical operations. When combined, this use of ANTHC and RHTP funding to develop a robust network infrastructure supports the development of a truly resilient HA network. Future years will focus on implementing the data center interconnection and aggregation solutions to allow both proactive and (automated) reactive failover and load balancing between data centers on the ANTHC campus.	\$1M-\$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Native Tribal Health Consortium	Ophthalmology Expansion	AK	The ANMC Ophthalmology Clinic has experienced rapid growth, with patient volume increasing by more than 20% in FY24 and staffing expanding to nine board-certified ophthalmologists supported by subspecialty and technical staff. The clinic faces a significant capacity shortfall driven by rising referrals and increasing clinical complexity. Healthcare planning standards require 16 exam rooms to support current provider capacity, yet only 10 are available, resulting in reduced appointment availability and long delays. As of early 2026, more than 2,000 patients are awaiting ophthalmology appointments, with average wait times exceeding seven months. These delays disproportionately affect rural and frontier patients who must coordinate complex travel and may experience worsening of vision-threatening conditions such as diabetic retinopathy, glaucoma, and macular degeneration. Reconfiguring adjacent space to increase exam room capacity offers a timely, cost-effective solution that aligns physical space with provider availability, reduces the backlog, and improves access to specialized eye care for rural Alaskans. This project will enhance care quality, safety, and long term sustainability across the statewide Tribal health system.	To address the clinic’s exam room deficit and restore timely access to specialty eye care, ANTHC completes an enhancement project that modifies and reconfigures existing clinic space and space adjacent to the current Ophthalmology Clinic. This approach does not involve new construction; rather, it focuses on optimizing and upgrading available clinical space to support increased patient volume, improved workflow efficiency, and enhanced patient experience. Space planning and design are underway, optimizing the clinic layout for additional exam rooms with corresponding staff workstations and support areas. The design prioritizes efficient patient throughput and alignment with ophthalmology-specific requirements such as darkening capability, slit lamp placement, and accessibility for elders and mobility-limited patients. A dedicated Project Manager leads the effort, coordinating with Ophthalmology leadership, Facilities, Infection Prevention, Environmental Services, IT, and other stakeholders. The team ensures the project reflects clinical priorities, meets regulatory requirements, and is implemented with minimal disruption to ongoing patient care. Renovation activities implementing the design are planned for fall 2026, with sequencing strategies that allow clinic operations to continue safely during space modifications. In addition to physical space enhancements, the project evaluates opportunities to improve operational efficiency. Scheduling data indicate that current 45-minute visit times contribute to exam-room bottlenecks. The assessment identifies workflow redesign opportunities that reduce visit times to approximately 35 minutes. When combined with additional exam rooms, these improvements significantly increase throughput and reduce appointment delays. Staffing adjustments are minimal. One additional Medical Assistant FTE supports expanded patient flow and maintains efficient provider movement between rooms. All other staffing levels are sufficient to support increased capacity once space limitations are resolved. The project results in an optimized clinic layout, additional exam rooms, upgraded clinical infrastructure, and improved workflows that together allow the clinic to meet current demand, support continued growth, and better serve rural patients who depend on ANMC for specialty eye care unavailable in their home communities.	\$1M-\$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

Alaska Native Tribal Health Consortium	Planning for Patient Lodging Systems Modernization	AK	Each year, thousands of Alaska Native patients and caregivers travel, often on multiple flights to Anchorage, for specialty, diagnostic, surgical, and inpatient care not available in rural communities. Lodging is a critical part of this journey, offering a safe, stable place to rest and prepare for appointments. From 2017–2025, ANTHC lodging supported over 107,000 patients and 320,000 caregivers, underscoring its essential role in the statewide care continuum. Current operations rely on manual processes, spreadsheets, emails, and disconnected systems. These gaps slow room confirmations, create inconsistent communication, and increase data errors. For rural travelers, particularly Elders, pregnant patients, and those with chronic or complex conditions, lodging delays can disrupt travel plans, appointments, and discharge timing. Staff also spend significant time reconciling information rather than directly supporting patients. This project modernizes lodging through an integrated digital platform that streamlines coordination, improves workflow reliability, and enhances the patient experience. It will increase data accuracy, standardize communication, expand visibility into room availability, reduce inefficiencies, and better support staff in meeting patient needs. These improvements advance RHTP goals by strengthening timely access to care, reducing administrative burden, and promoting a more coordinated, accessible system for rural Alaska Native people.	The Patient Housing Modernization project represents the initial phase of a multi-year effort to implement a modern, integrated platform that benefits the tens of thousands of patients who need housing when traveling to the Alaska Native Health Campus to receive care each year. It will improve operational reliability, strengthen coordination across patient care and navigation services, and enhance the patient and caregiver experience. ANTHC has already evaluated the technologies, workflows, and pain points within the existing lodging process and systems. This analysis identified 447 unique steps required to fulfill patient housing requests, including 251 decision points across 13 separate applications. This project will develop a plan to simplify the process, reduce the number of tools required, and automate manual steps. The complexity identified in the initial assessment led ANTHC to determine that a deliberate, well-scoped planning project will increase success of this tool and workflow implementation. This project aims to complete formal planning and scoping efforts to evaluate a modern Property Management System (PMS), identify data integration points and system refinements, and select an implementation service provider that can integrate the PMS with existing medical records systems and travel coordination tools. This planning project includes several key activities. ANTHC will review existing process documentation to ensure accuracy and completeness, prioritizing key pain points in the patient journey to define desired outcomes from new technology and processes. Requirements analyses will be updated to create a comprehensive product assessment and selection guide, incorporating feedback from clinicians, patients, technical experts, and contracting teams to ensure the right system is identified and implemented. System integration points will be identified, looking specifically at ways to streamline the provider experience by integrating with the EHR, improve the patient experience by integrating with existing communications platforms, and reduce “swivel chair integrations” for end users who currently switch between disconnected systems to perform core job functions. Future phases of the Patient Housing Modernization project will result in the purchase, implementation, and integration of a new Property Management System. Proper planning and scoping now will help ensure the success of the larger implementation project in the future.	\$250K-\$1M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Native Tribal Health Consortium	Statewide Tribal Pharmacy Development	AK	Medication access across the Alaska Tribal Health Care System remains a structural barrier to timely, reliable care, particularly for rural and remote communities. Geographic isolation, fragmented pharmacy operations, workforce shortages, and outdated ambulatory pharmacy technology contribute to delays in prescription fulfillment, gaps in therapy, inconsistent follow-up after tertiary or specialty visits, and avoidable emergency department utilization. Pharmacy services rely heavily on manual, disconnected workflows, especially for high-cost and specialty medications. An aging retail pharmacy platform increases claim rejects, reversals, and manual intervention, delaying medication release and reducing efficiency. At the same time, persistent pharmacist and technician shortages, most acute in rural communities, limit access to medication management, chronic disease support, and immunizations, while increasing strain on existing staff. These combined challenges create an opportunity to redesign pharmacy services as a coordinated, statewide access-to-care strategy. By modernizing ambulatory pharmacy infrastructure, standardizing workflows, and investing in workforce development through expanded training and residency pathways, ANTHC can strengthen care transitions, reduce avoidable utilization, expand the clinical role of pharmacists, and build a stable, highly trained workforce capable of sustaining high-quality pharmacy services across rural Alaska.	This initiative redesigns pharmacy services as a coordinated, technology-enabled statewide system that improves medication access, strengthens workforce capacity, and modernizes ambulatory infrastructure. First, patient-centered pharmacy support will follow individuals across hospital, clinic, and home settings. Pharmacists will provide medication reconciliation, education, and follow-up after transitions of care, while a central coordination team will manage high-cost and specialty medications to reduce delays and confusion. Automated multi-dose packaging and structured refill support will simplify complex regimens and reduce travel burden for rural patients. Standardized workflows and shared operating procedures will ensure consistent service delivery across sites, supported by dedicated project management and performance monitoring. Second, the initiative builds a sustainable, Alaska-grown pharmacy workforce pipeline. Training capacity will expand through increased student rotations, residency positions, rural learning experiences, and strengthened technician training programs. Advanced skill development, including board certification, telehealth, and remote verification, will prepare pharmacists and technicians for rural practice. A statewide Tribal workforce consortium will support shared rotations, centralized technician training, and float coverage to stabilize staffing in underserved regions. Technology will be leveraged as a workforce multiplier to extend clinical reach and reduce strain on local teams. Third, ambulatory pharmacy infrastructure will be modernized by replacing the aging retail platform with Liberty Software, beginning with implementation at ANTHC’s tertiary facility and Southcentral Foundation. The project will include structured workflow redesign, claims optimization, EHR integration, data migration, and phased pilot-to-scale deployment. Standardized workflows, rejection management processes, training, and embedded KPIs will support operational stability and measurable improvements in prescription fulfillment reliability. Together, these coordinated strategies create an integrated pharmacy model that improves continuity of care, reduces avoidable utilization, and strengthens long-term sustainability across rural Alaska.	\$1M-\$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

Alaska Native Tribal Health Consortium	Alaska Native Medical Center Nurse Call Modernization and Retrofit	AK	The Alaska Native Medical Center’s nurse call system, installed more than 25 years ago, is experiencing rapidly increasing failures that impact clinical response times, contribute to patient safety events, and create regulatory compliance risks. This aging infrastructure now poses a significant threat to safe, reliable care delivery, particularly as ANMC serves as the statewide referral center for Alaska Native people and rural communities. Modernizing this system directly supports the Rural Health Transformation Project by strengthening the clinical infrastructure that rural patients depend on when receiving higher acuity care in Anchorage. Replacing the obsolete platform with a modern, fully integrated communication system will restore reliability, reduce preventable harm, and enhance coordination between rural referring providers and ANMC clinical teams. This upgrade not only improves immediate patient safety but also advances RHTP’s broader objectives of building resilient health systems, improving access to high quality care for rural residents, and ensuring long term operational sustainability across the statewide tribal health network.	The project will engage a specialty nurse call system contractor to develop detailed shop drawings, furnish modern nurse call equipment, and perform a full-system installation throughout the Alaska Native Medical Center. The contractor will coordinate closely with clinical stakeholders and the Facilities team to ensure system design aligns with patient care needs and current regulatory standards. Following installation, the Facilities team will lead commissioning activities, including system testing, staff training, and integration with existing hospital infrastructure to ensure a seamless transition from the aging legacy system to the new, reliable, fully operational platform.	\$1M-\$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Native Tribal Health Consortium	Central Logistics Loading Dock and Warehouse Modernization — Design and Renovation Planning	AK	ANMC’s central logistics dock and warehouse no longer meet the demands of a growing hospital system. Built for a much smaller operation, the current infrastructure has reached its capacity limit and cannot support existing supply volumes or projected future growth. Dock operations present an immediate deficiency. During peak deliveries, limited staging space forces vehicles to queue in areas that conflict with pedestrian movement and restrict emergency access. The lack of a drive through bay further slows throughput and increases congestion. Warehouse storage is similarly inadequate, preventing ANTHC from maintaining adequate inventory reserves. For sites dependent on barge, air cargo, or seasonal roads, where weather and transport disruptions are common insufficient storage directly increases clinical supply risks. Additional infrastructure systems are also failing to meet needs. The hospital’s San I Pak waste sterilization and compaction unit cannot keep up with demand, creating compliance risks. Safety and security features, including lighting, access control, and vehicle pedestrian separation do not meet current standards. Before investing in renovation, ANTHC requires a comprehensive design effort to define project scope, assess feasibility, provide Alaska specific cost estimates, and develop a phased plan that maintains full logistics operations during construction.	This project delivers complete pre-design planning for the expansion and modernization of ANTHC's central logistics loading dock and warehouse. It will establish the factual and functional foundation for all subsequent design work. The team will conduct a comprehensive site survey covering existing utilities, drainage, structural conditions, vehicle traffic patterns, and geotechnical conditions to inform foundation design at the site. Concurrently, current operational workflows will be formally documented in coordination with ANTHC Logistics, Safety and other affected departments to define validated functional requirements before design begins. With site conditions and requirements established, programming and schematic design options will be developed for expanded dock capacity, solutions for hazardous waste treatment capacity and improved climate-controlled warehouse storage. Each option will be evaluated against operational requirements, applicable code, site constraints, and cost parameters. Program and schematic alternatives will be presented to ANTHC stakeholders and evaluated for feasibility. Pre-application consultations with the Municipality of Anchorage and the Alaska State Fire Marshal will be initiated during this phase to identify permitting requirements early and prevent downstream design revisions.	\$250K-\$1M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Native Tribal Health Consortium	Elevator Modernization & Refurbishment	AK	The elevators in many buildings on the ANMC campus are aging, unreliable, and frequently out of service due to obsolete components. These failures disrupt patient flow, create safety and accessibility risks, and increase staff workload as teams reroute patients or provide manual transport. These impacts are especially significant for rural Alaska Native patients who travel long distances for specialty care and often require mobility assistance and coordinated scheduling. Modernizing this critical infrastructure presents an opportunity to strengthen access, improve care coordination, and support a more efficient statewide health system. Upgraded elevator systems will restore reliability, improve ADA access, reduce downtime, and lower maintenance costs, enabling safe, efficient movement across clinics, inpatient services, and lodging. These improvements will reduce missed or delayed appointments, ease workforce strain, and strengthen ANMC’s operational continuity, ensuring rural patients can access timely, high quality care on each visit.	To advance reliable access and operational continuity at Alaska Native Medical Center (ANMC), this project will apply a structured, multidisciplinary approach that prioritizes patient safety, care coordination, and system sustainability. ANMC will engage a qualified elevator consultant to evaluate existing conditions, document performance and safety deficiencies, and develop modernization recommendations aligned with current codes, ADA standards, and campus operational requirements. This assessment will ensure that proposed upgrades support the needs of patients traveling from rural and remote communities and align with ANMC’s role as the statewide referral hub. The consultant’s findings will inform a coordinated design effort led by architects, engineers, and facilities project managers to develop detailed specifications and phased implementation plans that minimize disruption to patient care. This planning approach emphasizes continuity of access, allowing clinical services, inpatient care, and patient lodging to remain functional throughout the modernization process. Following design, ANMC’s Facilities Project Management team will engage certified and licensed elevator contractors to implement system upgrades, including replacement of obsolete controls, motors, safety equipment, door operators, and communication systems with modern, reliable components. All modernization activities will be closely coordinated with facility operations to maintain safe patient access and continuous service through carefully sequenced phasing. This approach reduces avoidable delays, limits workforce strain associated with manual transport and rerouting, and supports efficient patient movement across the campus. By combining expert assessment, thoughtful planning, and specialized technical execution, the project will deliver a reliable, compliant, and durable elevator system that strengthens ADA accessibility, improves operational efficiency, and supports long-term resilience of the statewide Tribal health system.	Over \$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Native Tribal Health Consortium	Healthcare Furniture Upgrades	AK	ANTHC’s rapid growth over the past three decades has left many patient and staff spaces no longer meeting current standards for ergonomic design, safety, and functionality. Outdated furniture contributes to patient discomfort and increases the risk of strain and repetitive stress injuries for staff, negatively affecting care delivery, workforce wellbeing, and patient experience. Advances in modern, ergonomic, medical-grade furniture present a timely opportunity to address these challenges in alignment with the RHTP’s goals of strengthening health care access, quality, and sustainability, particularly for Alaska Native people who travel long distances to Anchorage for care. ANTHC’s holistic approach to health and safety recognizes that supportive physical environments are essential to delivering high-quality, culturally responsive care while protecting staff health and wellbeing. This project will modernize high-use patient-facing areas and staff workspaces with durable, ergonomic furniture designed to improve comfort, accessibility, and safe movement throughout the campus. These upgrades will reduce physical barriers within clinical spaces, enhance patient comfort and satisfaction, and better support patients and families navigating complex care journeys. For staff, improved ergonomic workstations will reduce injury risk, support retention, and allow employees to focus fully on providing safe, effective care for Alaska Native people and communities statewide	ANTHC will implement a two-part, campuswide furniture modernization initiative that addresses both patient facing areas and employee workstations across the Alaska Native Medical Center. The project will focus on upgrading furniture in waiting rooms, consult rooms, inpatient units, grieving spaces, and other high-use common areas where patients and their families spend extended time, particularly individuals traveling from rural communities who may have limited alternative locations to rest between appointments. Furniture will be selected based on durability, cleanability, comfort, and medical grade performance to support high daily usage, infection control requirements, and frequent turnover. These upgrades will enhance patient comfort, safety, and accessibility while supporting culturally responsive care environments that recognize the importance of family presence, escorts, and community connection throughout the healing journey. Comfortable, functional furnishings will allow patients and their support networks to remain engaged and present without added physical strain, reinforcing ANMC’s role as a home away from home for many Alaska Native people receiving care in Anchorage. In parallel, the project will replace outdated desks, chairs, and workstation components, many more than 20 years old, with ergonomic, adjustable furniture that meets current best practice standards. This approach aligns with ongoing assessments conducted by ANTHC’s ergonomics team and provides long-term, organization-wide solutions rather than addressing only the most urgent individual needs. Improved ergonomics will reduce injury risk, fatigue, and strain for staff, supporting workforce health, retention, and the delivery of safe, high-quality care. Funding will be used to specify, procure, and install furniture that meets safety, infection control, and ergonomic requirements. Upgrades will be prioritized based on demonstrated need, usage levels, and alignment with patient and staff health and safety goals. Through this coordinated approach, ANTHC will advance Rural Healthcare Transformation Program priorities by strengthening access, improving care quality, supporting workforce sustainability, and creating a more durable and efficient care environment for Alaska Native people and communities statewide.	\$1M-\$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Native Tribal Health Consortium	Patient Communication Digital Displays	AK	Across the ANTHC campus, current physical signage is largely static, often outdated, and unable to support rapid updates related to construction changes, parking adjustments, clinic relocations, or emergency incidents. This can create challenges for patients needing to navigate ANMC’s large campus. Expanding ANTHC’s digital signage network will replace these static signs with remotely managed, real-time communication tools that improve patient navigation and enable timely dissemination of critical information. These upgrades will significantly improve communication with patients traveling from rural communities when they arrive at ANTHC Lodging facilities, where they stay while receiving care in Anchorage. Current technology does not allow staff to deliver timely, relevant information on in-room screens upon arrival, limiting the ability to guide patients through appointments, preparation requirements, and campus navigation. This project addresses that gap by modernizing the lodging technology infrastructure and expanding digital signage across high-traffic patient areas. These improvements will strengthen patient communication, reduce confusion, and enhance coordination of care for rural patients for treatment. The project also aligns with Alaska’s Rural Health Transformation Project by improving access to care, strengthening technology-enabled patient communication, and supporting a more responsive and patient-centered health system.	ANTHC will rapidly implement this initiative by procuring commercially available, widely supported display technology and software to ensure timely deployment and long-term supply reliability. Selecting industry-standard hardware and software reduces procurement delays, supports maintenance continuity, and ensures replacement units can be easily sourced in the future. Over the past two years, ANTHC successfully executed a proof-of-concept demonstrating our ability to deploy, manage, and remotely update digital screens across patient and employee environments. This established internal capability confirms both technical readiness and organizational capacity. By leveraging our experienced Marketing and Health Information Technology (HIT) teams, we will integrate new devices with updated software. Content can be centrally updated, multilingual messaging deployed efficiently, and time-sensitive information distributed instantly across lodging rooms and high-traffic campus areas. This approach minimizes implementation risk, reduces project timelines, and delivers immediate benefits to rural patients traveling up to 1,200 miles for care. Patients will receive clear appointment logistics, navigation guidance, and culturally responsive messaging in real time. Using our experience across all communities in Alaska, ANTHC ensures sustainability, scalability, and rapid return on investment while strengthening patient access, communication reliability, and overall care coordination.	\$250K-\$1M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Native Tribal Health Consortium	Surgical Services Capacity Expansion	AK	Demand for surgical services at ANMC continues to outpace the current inpatient, Ambulatory Surgery Center (ASC), and operating room (OR) capacity. This gap significantly limits access to timely care for both acute patients and those traveling from rural communities for scheduled procedures. Although the ASC has strong potential for growth, it remains underutilized, operating at only ~53% during primetime, due to high cancellation rates, block scheduling inefficiencies, equipment limitations, and infrastructure constraints. Without targeted operational and facility interventions, access barriers and system strain will continue to increase. This project presents a strategic opportunity to enhance surgical capacity and performance by optimizing the ASC layout, adding an additional procedure room, and investing in end-of-life medical equipment replacements across Surgical Services at ANMC. Coupled with selective infrastructure upgrades, these improvements will expand access, reduce delays in care, and strengthen the overall surgical service delivery model.	The project will expand the Alaska Native Medical Center (ANMC) surgical services capacity through three coordinated strategies: creating new procedure space, modernizing infrastructure, and replacing end of life equipment to ensure staff have the tools needed to deliver high quality care. These improvements directly benefit rural, remote, and frontier Alaska Native and American Indian patients who often travel hundreds of miles, and sometimes days, to access surgical care in Anchorage. First, the project will reconfigure the ambulatory surgery clinic by relocating the breakroom and changing rooms, allowing construction of a dedicated procedure room with support spaces. This increases capacity from four operating rooms to four operating rooms plus one procedure room. Shifting lower acuity procedures (such as pain management and endoscopy) into the new room frees operating room time for higher complexity cases. This directly improves access for patients traveling from rural villages, who frequently have only one opportunity to receive surgical care during a single, time-limited visit to Anchorage due to weather, travel costs, and caregiver responsibilities. Second, the project will replace end-of-life medical equipment and purchase additional devices needed to support the increased surgical volume. Updated imaging, sterilizers, scopes, monitors, and surgical instruments ensure reliable, efficient operations. For rural and frontier patients who face long delays if procedures are canceled or rescheduled, reliable equipment reduces the risk of missed care, complications, and avoidable emergency visits. Third, the project will complete retro commissioning of the air handling unit system to ensure safe, consistent surgical air quality and regulatory compliance. Modern, reliable environmental controls reduce cancellations and prevent downtime caused by equipment failure. This is particularly important for rural patients who cannot easily return for rescheduled procedures due to transportation barriers, limited flight availability, and weather-related travel disruptions. Together, these improvements expand surgical access, reduce delays, and ensure that rural, remote, and frontier Alaska Native patients receive timely, high-quality procedures during the limited windows when they can reach Anchorage.	Over \$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Native Tribal Health Consortium	Women & Children’s Services Modernization - Planning and Design	AK	ANTHC has identified a critical opportunity to modernize and expand family birthing services at the ANMC through development of a new Family Birthing Services Tower. ANMC is the primary statewide referral center for specialized maternal, neonatal, and pediatric care for Alaska Native and American Indian patients, including services not available in most rural or remote communities. Accessing care often requires families to travel and remain in Anchorage for extended periods, separating them from home, cultural support, and family during pregnancy, childbirth, and pediatric care. These challenges create significant emotional, financial, and logistical strain. At the same time, existing facilities, built to 1980s healthcare standards, limit privacy, family presence, and culturally responsive care, and constrain ANMC’s ability to meet growing demand. This project advances an opportunity to translate years of analysis and community-informed planning into a comprehensive design and operational plan for a modern Family Birthing Services Center. The proposed tower would expand capacity for labor and delivery, NICU, PICU, and surgical services while aligning facilities with modern, family-centered, and culturally responsive standards of care. This planning effort lays the foundation for long-term improvements in access, quality, and sustainability of maternal and pediatric health care for Alaska Native families and rural communities statewide, directly supporting RHTP goals.	The design work for the Women’s and Children’s Tower is anticipated to span approximately three years and will be implemented through a deliberate, two phased approach that ensures readiness, cultural responsiveness, and long term sustainability. In the first year, ANTHC will engage an experienced healthcare design team to complete pre design planning and concept development for the tower at ANMC. This phase establishes the clinical, operational, and technical requirements needed to support high quality maternal, neonatal, and pediatric care for Alaska Native/American Indian (AN/AI) families traveling from rural and remote communities. Pre design activities will include a comprehensive site survey addressing topography, traffic, utilities, geotechnical conditions, and environmental factors. Concurrently, the project team will develop an owner’s program of requirements, a basis of design, and preliminary operational plans reflecting projected demand, family centered care models, and culturally responsive practices. Concept development will include site layout and massing studies, adjacency and functional diagrams, building access planning, life safety analysis, space comparisons, and preliminary cost estimates. Designs will be evaluated against operational needs, code requirements, site constraints, and cost parameters, with a focus on minimizing barriers for families who spend extended periods in Anchorage. Years two and three will advance the preferred concept through design development and completion of design and operational documents, with milestones at 35%, 65%, and 100% design completion. This phased approach builds on more than three years of ANTHC analysis and benchmarking and will position ANMC to meet maternal and pediatric care needs for the next 20 years, supporting future funding, contractor selection, and a smooth transition into construction while advancing RHTP goals.	Over \$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Native Unity	Alaska Native Workforce Development and Training Center	AK	Tribal health organizations in Alaska administer complex federal and state health programs through the Indian Health Service Alaska Tribal Self-Governance Compact and other funding agreements. However, there is a shortage of trained administrative staff who understand how to manage funding agreements, ensure compliance, and support program implementation. This administrative workforce gap creates challenges for Tribal health organizations working to sustain and expand health programs. The Alaska Native Workforce Development and Training Center will address this opportunity by developing administrative workforce capacity to support Tribal health program administration and strengthen the long-term sustainability of Alaska’s Tribal health system.	The Alaska Native Workforce Development and Training Center will provide workforce training focused on Tribal health compact and program administration. The Center will deliver training that prepares workforce participants to support Tribal health program operations, including funding agreement administration, compliance responsibilities, program coordination, and implementation of federal and state health programs. Training will be offered through in-person and hybrid formats from the Anchorage-based center to serve Tribal health organizations statewide. By building administrative workforce capacity, the project will help Tribal health organizations more effectively manage health programs and sustain long-term system operations.	\$250K-\$1M	Statewide	Anchorage (Municipality)	Deferred or Not Advanced
Alaska Natural Resource and Outdoor Education Association	Alaska Rural Outdoor Learning & Health Network	AK	Youth in rural Alaska face significant mental and physical health challenges, including limited access to preventive health resources and growing behavioral health concerns. Research consistently shows that time spent outdoors supports mental health, physical activity, resilience, and overall wellbeing among young people. While rural Alaska communities often have abundant access to natural landscapes, there are fewer structured opportunities for youth to engage in meaningful outdoor learning experiences supported by trained educators and community leaders. Many educators and youth program providers across Alaska are interested in implementing outdoor learning and place based education but lack access to coordinated training, shared resources, and statewide collaboration that would allow these programs to expand. At present, Alaska does not have a coordinated statewide system that connects educators, communities, and organizations working to deliver outdoor and place based education programs that support youth wellbeing. This project seeks to address that opportunity by developing a statewide network that supports outdoor learning as a preventive health strategy for rural youth.	The Alaska Natural Resource and Outdoor Education Association (ANROE) proposes to develop the Alaska Rural Outdoor Learning & Health Network, a collaborative initiative designed to strengthen outdoor and natural resource education as a strategy for improving youth wellbeing and supporting healthy communities across rural Alaska. This project would focus on building the foundational infrastructure needed to coordinate partnerships, develop shared resources, and expand outdoor learning opportunities statewide. The proposed approach includes several key components: Network Development and Partnership Building ANROE will convene educators, tribal organizations, school districts, youth-serving organizations, and land management agencies to develop a statewide collaborative network focused on youth health and outdoor learning. Statewide Needs Assessment The project will conduct outreach and engagement with rural educators and community partners to better understand existing outdoor education efforts, barriers to implementation, and opportunities for collaboration. Professional Training and Resource Development The network will explore opportunities to develop professional training and shared resources that help educators implement outdoor learning programs that support youth mental and physical health. Strategic Planning for Rural Health Impact The project will develop a long-term strategic framework for expanding outdoor learning programs that support healthy communities and youth resilience across rural Alaska. Funding would support ANROE in establishing its first paid leadership position—an Executive Director responsible for organizational development, partnership building, and resource development. This role would provide the capacity necessary to coordinate statewide	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway	Deferred or Not Advanced

Alaska Network on Domestic Violence and Sexual Assault	Addressing Strangulation and Traumatic Brain Injury as a result of domestic and sexual violence.	AK	In Alaska we have some of the highest mortality rates in the US due to traumatic brain injury (TBI) with Alaska Native People having death rates of up to 2 times higher than the national average. According to Alaska Dept of Health the most frequent cause of TBI includes assaults. In Alaska we also rank #1 in Sexual Assaults, #1 in Deaths of Women and our rates of domestic violence are some of the highest in the nation. These rankings are just the crimes that are reported. According to the AVS survey 8.1% of adult women in Alaska had experienced domestic violence and/or sexual assault in the past 12 months meaning that many of these crimes in Alaska go unreported. Most Alaskans who have experienced domestic or sexual violence do call crisis hot-lines and reach out to local organizations for assistance. Many victim's report being strangled or beaten in a way that caused an injury to their head. Often times, while the victim may talk about what has happened to them, they may be working with an organization whose staff may not be aware of the health consequences of these types of injuries. Strangulation is often-times overlooked due to there being no visible external injuries. Sometimes the victim does not remember the head injury due to the trauma that they experienced during the assault. These are just a few reasons why strangulation and traumatic brain injury is often times overlooked. This project is designed to address these two issues.	We would like to address this issue by: 1) Enhancing the knowledge of professionals working with victims of domestic and sexual violence about how to enroll in Medicaid or access insurance on the marketplace and could identify signs of strangulation and traumatic brain injury. a. ANDVSA would partner with a health practitioner to develop training for professionals using existing trainings when available and developing training content that is missing. This training would be created as an on-line training and also one that can be done in person. 2) Improve policy and practice, including building screening tools or incorporating in existing screening tools for all victims who engage with professionals working with victims of domestic and sexual violence who may have experienced strangulation or a head injury. a. ANDVSA would write sample policy and procedure for professionals; would work with statewide partners to review current Traumatic Brain Injury and Strangulation screening tools; would work with statewide partners to develop new or revise existing screening tools; and would train on how to use the screening tool. 3) ANDVSA would build partnerships between advocacy organizations and medical providers to ensure proper follow-up care is provided to victims experiencing strangulation or a head injury, including access to a specialist as needed. a. ANDSA would work to form a network of providers throughout Alaska or other states who could be available to work with victims experiencing head injuries and strangulation even when the victim had no ability to pay. This would include payment of medical fees, payment of behavioral health fees, and travel costs as necessary to access a specialist if none is available in Alaska. We would also explore the use of tele-health in rural areas to ensure access to these services in a confidential location.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Network on Domestic Violence and Sexual Assault	Building a Medicaid/Insurance Billing Hub	AK	Becoming a Medicaid billable agency is a heavy lift and it is not something that organizations serving victims of domestic violence and sexual assault in Alaska have the capacity to do, however, being able to bill Medicaid for the services provided would greatly increase their ability to provide services. This would create a centralized billing hub through the Alaska Network on Domestic Violence and Sexual Assault as a shared service to the 21 agencies who would engage in providing the services.	This would be a hub and spoke model with the Hub being ANDVSA who would obtain a National Provider Identifier and would enroll as a state Medicaid provider – defining our services to be case management and peer support under the current 1115 waivers for clients who qualify; and to provide behavioral health services. We would employ individuals with the necessary credentials to become a certified behavioral health organization. After becoming a Medicaid billable hub, ANDVSA would employ case managers/social workers, peer support specialists and licensed mental health counselors who would be available in rural Alaska to victims of domestic and sexual violence through their work with rural regional organization specializing in serving domestic and sexual violence victims. These services would be provided using an in-person method for professionals hired in a rural community; a telehealth option for professionals hired in an Alaska location other than where they will provide services; and an in-person plus telehealth option to allow for in person connections at least quarterly for all participants. ANDVSA would work with an IT specialist to ensure proper connections between the 21 member programs to keep all records confidential and to adequately document all services as necessary for billing Medicaid and insurance. ANDVSA would provide training to their 21 member organizations on how to enroll participants in Medicaid, how to help participants stay eligible for Medicaid, and how to provide referrals.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Orthopedic Specialists	Cordova Musculoskeletal Access & Recovery (CMAR)	AK	Our goal is to provide subspecialty care with regularly scheduled in-person clinics, on site enhanced training for local providers, telehealth workflows and addition of diagnostic technologies for remote the remote community of Cordova, Alaska as a geographically isolated, off-road frontier community accessible only by air or marine transport. This will help reduce and potentially eliminate barriers to residents requiring orthopedic or musculoskeletal specialty care including but not limited to: High travel costs Weather-related delays Time away from work and family Delays in diagnosis and treatment Fragmented postoperative follow-up care	This project is a scalable rural specialty care model designed to improve access, quality, and continuity of orthopedic services in Cordova, and expand in-person outreach clinics with telehealth-enabled care pathways and advanced imaging technology to support both real-time and asynchronous specialty consultation. Core Components 1. Expanded In-Person Orthopedic Clinics Regularly scheduled outreach clinics in Cordova Evaluation and management of acute and chronic musculoskeletal conditions Fracture care, joint injections, sports injury management, and preoperative planning 2. Tele-Orthopedic Consultation Pathway Real-time telehealth consultations between Cordova providers and AOS specialists Remote review of imaging and clinical findings 3. Standardized Injury & Postoperative Care Pathways Evidence-based protocols with structured postoperative telehealth follow-up model 4. Ultrasound Technology Integration AOS is requesting RHTP support for acquisition of a ultrasound system to enhance musculoskeletal imaging capacity in the rural setting. This system will: Improve diagnostic accuracy at the point of care Support ultrasound-guided injections and procedures Enable remote specialist visualization during telehealth consultations Strengthen local provider skill development Reduce unnecessary travel for diagnostic clarification The ultrasound unit is central to the project’s technology innovation strategy leveraging advanced tools to expand rural access. 5. Workforce Training & Capacity Building On-site training for local clinical staff Telehealth workflow training Imaging protocol standardization 6. Data Tracking & Performance Reporting Access metrics (clinic days, wait times, telehealth utilization) Quality metrics (postoperative follow-up completion, complication-related ED visits) Utilization metrics (travel avoided, referral patterns) Technology adoption and imaging workflow metrics	\$50,000- \$250,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area	Deferred or Not Advanced

Alaska Pacific University	Alaska Pacific University Place-based Workforce Development Initiative	AK	People in rural Alaska want jobs in healthcare. Tuition can be a large concern, but this is often offset by expected salaries upon program completion. A larger concern, for many people living in rural Alaska, is leaving their communities to move to urban areas for healthcare education. In addition to expense, this kind of move creates stress on relational ties, decreases opportunities to participate in traditional subsistence lifestyles, and isolates individuals from cultural practices that have been shown to be beneficial for the health and wellness of rural Alaskan communities. It is also very expensive. Housing and other living costs can be as expensive as tuition. This initiative leverages a highly successful, scalable model to solve Alaska's rural health crisis. Over the past five years, the APU nursing program has demonstrated a unique capacity for growth, expanding from 20 to over 100 students and from a single campus to four active sites across the state. The proposal builds on that momentum to create a permanent, multi-faceted healthcare workforce ladder, specifically designed for frontier practice, and to support rural Alaskans living and working in their home communities. Programs in nursing will be expanded to the graduate level, programs in behavioral health will be reconfigured, and programs in allied health professions will be added to the curriculum. Alaskan communities and local professional groups will be partners in this effort.	APU's experience in successfully delivering high quality nursing programs to rural communities provides a clear model for expansion of additional sites and additional pathways. APU can boast the highest NCLEX pass rates in the state for program graduates over the last 2 years. Current Strengths to be Scaled Up • Instruction includes a combination of on-line, in-person support, and embedded industry instruction that is hands-on. • Partnerships include agreements with clearly understood roles and responsibilities. • Students are allowed to continue to earn-while-they-learn; maintaining employment within the industry helps to fill needed roles while also providing learning experiences. • An industry-assigned instructor or mentor for students is co-selected by APU and the industry partner, ensuring a high-quality in-work learning experience and positive student outcomes. • Training and professional growth opportunities for instructors/mentors creates successful learning that is sustainable. • Curriculum delivery model that utilizes the work environment as an extended classroom- including work embedded projects and enhanced learning through mentors. • Online delivery of didactic instruction that creates relationships and builds cohorts through in-person intensives and/or instructional visits to remote sites. • Online delivery of support services to help students access financial aid, tutoring, registration, cultural connections, etc. – providing a sense of support and connectedness. Strong connections with community partners are at the heart of what we do. New programming will be created based upon industry gold-standards and professional accreditation requirements. Several professional groups and healthcare facilities have been in touch and are ready to move forward with this concept. Creating educational pathways, the initial start-up of a remote site, and quality implementation that leads to high success requires investment. This includes staff and faculty time to dedicate to articulation and accreditation needs, time for partnership agreements and setting up co-instructors from within the industry, creating remote learning spaces with technology set-up, and providing travel and training for on-going excellence. It also includes some campus enhancements to provide suitable housing for intensive learning sessions, technology enhancements, and up to date laboratory and simulation equipment to be used by multiple certificate and degree programs.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Pacific University	APU Connect: Healthy Communities	AK	According to the USDA Natural Resources Conservation Service, approximately 95% of the food consumed in Alaska is imported. For rural Alaska communities—especially those off the road system—this reliance on shipped food means high costs and limited access to fresh, nutritious options. Store-bought foods are often packaged and highly processed to withstand long transport, contributing to diets linked to diabetes, heart disease, and obesity. At the same time, Alaska has strong local food traditions and seasonal abundance. Salmon, berries, potatoes, carrots, and other locally grown or harvested foods are widely available in summer months. However, many families lack hands-on training to grow, prepare, and safely preserve these foods for year-round use. As a result, valuable local foods are underutilized or wasted. Food waste has been identified as a statewide concern. Rural Alaskans want to learn how to grow their own food, preserve seasonal harvests, cook nutritious meals, and pass these skills on to their children. Providing community-based education in farming, food preservation, and healthy cooking increases access to local foods while directly addressing chronic disease prevention. When families can safely dry salmon, freeze berries, store root vegetables, and prepare balanced meals, they reduce dependence on costly processed foods and improve long-term health outcomes. Introducing children to these concepts early creates healthy lifestyle habits that prevent disease.	APU Connect Healthy Communities is grounded in a clear belief: education drives sustainable, community-led health change. Our mission is to partner with rural Alaska communities to co-develop practical, culturally relevant programs that increase access to healthy local foods, strengthen nutrition knowledge, and reduce chronic disease risk statewide. Because each community has distinct strengths and challenges, we work collaboratively to identify local goals and build solutions that are locally owned, sustainable, and replicable across rural Alaska. A key model is our participation in the Alaska Resilience Farms network, in partnership with local Tribal organizations and Alaska Seeds of Change. Through this collaboration, we provide technical assistance in sustainable food production and strengthen regional food systems. Expanded staffing will allow us to deepen on-site support in rural communities, improve agricultural education programming for youth, and implement a train-the-trainer model. Our Alaska Tilth program, in partnership with Mat-Su Health Foundation, rescues surplus produce, distributes it to schools and shelters, and pairs food access with hands-on nutrition and cooking education. Renovations on the Kellogg campus will include a commercial kitchen, classroom and office space, and a cold storage facility, enabling year-round programming and reducing seasonal food gaps. Hybrid technology will connect rural learners statewide in real time. Over time, Alaska Tilth will develop accredited certificate or degree pathways in nutrition and health sciences, strengthening Alaska’s rural healthcare workforce and advancing prevention-focused care. F.I.E.L.D. School and Camp Kellogg further reinforce this ecosystem. With consistent waitlists, these programs provide place-based, experiential education during the school year and summer, fostering lifelong healthy habits tied to nutrition, agriculture, and outdoor learning. Expanded facilities will increase access and support new family learning workshops and camps that engage entire households in behavior change. The campus also serves as a training laboratory for graduate students preparing to lead community health initiatives across the state. Together, these integrated efforts create a scalable, community-driven model that improves food security, builds local capacity, strengthens Alaska’s health workforce, and measurably advances public health—especially in rural communities.	\$1M-\$5M	Statewide	Matanuska-Susitna Borough	Deferred or Not Advanced

Alaska Pediatric Specialties	Alaska Pediatric Specialties Expansion	AK	Alaska Pediatric Specialties (APS) is a private practice with over 10 years of experience providing subspecialty care in Alaska, APS is the sole provider of pediatric surgery, pediatric hematology and oncology, and pediatric gastroenterology in the State of Alaska. By delivering essential services locally, children and their families receive high-quality care in Alaska, reducing the burden and medical expenses for out-of-state travel. To better serve the needs of Alaskan children APS is actively expanding its services, but currently lacks the resources required to sustain and scale this effort to simultaneously meet the increasing demand and stabilize the needs of our current service lines. With additional funding our growth will include renovating our clinic space to increase patient capacity and optimize patient care, conducting a state-wide needs assessment for pediatric specialty services, and recruiting additional specialists and support staff to ensure comprehensive, coordinated care for the children and families of Alaska who have are dependent upon us.	Alaska Pediatric Specialties (APS) is committed to expanding access to high-quality care for children across Alaska. Serving a geographically vast and often underserved population requires thoughtful planning, efficient systems, and innovative strategies to ensure families can access timely pediatric specialty care. APS focuses on increasing patient access, strengthening operational efficiency, improving care coordination, and creating an environment where every child receives compassionate and effective treatment. APS is pursuing a remodeling initiative designed to enhance the clinical environment and improve patient flow. The redesign will create a more functional, adaptable, and patient-centered space by reconfiguring examination rooms, intake stations, and provider workspaces. A streamlined layout will reduce bottlenecks, improve scheduling flexibility, and support coordinated interdisciplinary care. An optimized clinical environment is essential for delivering safe and effective pediatric services. Improved circulation patterns, quiet spaces, and accessible exam areas will help reduce stress for families and allow providers to focus on delivering high-quality care. The updated design will also strengthen APS’s ability to deliver multidisciplinary care for children with complex medical or developmental conditions. By enabling concurrent evaluations, interdisciplinary consultations, and therapy sessions within a single visit, APS can reduce wait times and provide families with more comprehensive, coordinated guidance. Efficiency in provider and patient time is a key priority. Streamlined workflows and improved room utilization will allow clinicians to spend more time in direct patient care and less time navigating operational barriers. For families who often travel long distances for appointments, improved efficiency will reduce wait times and help consolidate services into fewer visits. Expanded telehealth capabilities will further support rural communities by providing access to care without requiring extensive travel. A modern, well-designed clinical environment supports collaboration, improves workflow, and will also help attract top-tier providers. Through strategic facility improvements and continued recruitment of specialized clinicians, APS is building a sustainable model of pediatric care to ensure that children and families across Alaska have access to coordinated, high-quality services that support their health and long-term well-being.	\$250K-\$1M	Private practitioner	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Alaska Peer LWC, LLC	Reclaim Your Roots - Healing Starts at Home	AK	Rural Alaskan communities face critical behavioral health challenges exacerbated by historical colonization, generational trauma, and cultural loss among Alaska Native and American Indian tribes. These factors disrupt traditional healing and contribute to cycles of addiction, overdose, and youth suicide. Geographic isolation and limited resources further restrict access to culturally relevant recovery services. Programs like Alaska Peer LWC, LLC’s Reclaim Your Roots address these unmet needs by building local capacity through peer support training, community engagement, and culturally informed interventions. Emphasizing education and language revitalization, the initiative fosters resilience and sustainable recovery supportive infrastructures, empowering communities to reclaim cultural identity and improve behavioral health outcomes in these underserved rural areas.	The Reclaim Your Roots program offers a comprehensive framework for addressing the behavioral health and wellness challenges faced by Alaska Native and American Indian (AN/AI) communities in rural Alaska. Implementation begins with Community Engagement, inviting key stakeholders, including community leaders, health professionals, and families, to form a diverse coalition aimed at fostering an inclusive approach to community wellness. The Amplifying Voices phase includes interactive events, such as Community Wellness Nights, which facilitate discussions on resource needs and prioritize unique community characteristics to enhance recovery and healing. A critical component is the Peer Support Professional training, which aims to equip a diverse group of community members—including adolescents, Community Health Aides, Elders, and caregivers—with the skills necessary to support behavioral wellness according to established standards. Following data collection and analysis, the program will host hub events designed to engage stakeholders in effective discussions and action planning, ensuring that community members actively participate in shaping their wellness initiatives. The program culminates in collaborative workshops to create tailored implementation strategies, establishing accountability structures to sustain positive change. This holistic approach not only empowers individuals but also strengthens community ties, ultimately enhancing the health and wellness landscape within these challenging environments. Lastly, working alongside and supporting a one year implementation plan to bring change to fruition through the people for the people.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Prehospital Education Consortium	Alaska Rural Healthcare Workforce Continuum Initiative	AK	Many rural and frontier communities in Alaska face persistent healthcare workforce shortages, long transport times, and limited access to training opportunities for local residents who want to enter healthcare professions. EMS agencies, rural clinics, and Tribal health organizations frequently struggle to recruit and retain qualified providers, while geographic isolation and travel costs make traditional education pathways difficult for rural learners to access. At the same time, Alaska has an opportunity to strengthen rural healthcare delivery by expanding locally based workforce training and creating clearer pathways for rural residents to enter and advance within healthcare careers. Hybrid education models, distributed learning technology, and partnerships with local healthcare agencies now make it possible to deliver high-quality training across large geographic areas while allowing students to remain in their home communities. This project addresses these challenges by expanding rural EMS education, strengthening workforce pathways connecting Community Health Aide and EMS training, and creating scalable systems for distributed healthcare education. By building on existing programs and partnerships, the initiative will increase the number of trained providers in rural communities and support long-term workforce sustainability across Alaska.	APEC and Alaska Pacific University propose a collaborative approach that expands rural healthcare workforce training while creating new pathways for rural residents to enter and advance within healthcare professions. The project will expand APEC’s existing hybrid Emergency Medical Technician (EMT), Advanced EMT (AEMT), and Paramedic education programs, which combine virtual instruction with locally supported skills training and clinical experiences. This distributed learning model allows rural students to complete much of their training while remaining in their home communities, reducing travel barriers and improving workforce retention. To support this expansion, APEC and APU will establish a Rural Health Training Center in Anchorage that serves as a statewide hub for distributed healthcare education. The center will support simulation-based training, hybrid classrooms, virtual skills instruction, and digital learning production that enables consistent training delivery across Alaska. The project will also explore development of integrated workforce pathways connecting Community Health Aide training and EMS education. In collaboration with Community Health Aide training centers, Tribal health partners, and APU faculty, the project will develop curriculum that merges EMS and Community Health Aide competencies into an expanded Community Health Worker training pathway. This model supports a continuum of healthcare education extending from Community Health Aide and EMS training through nursing and nurse practitioner programs. Additional project components include development of an Alaska-focused Rural Austere and Wilderness Medicine manual and the creation of two statewide training convenings: a Rural Health Providers Conference focused on integrated rural healthcare delivery and workforce pathways, and a Remote Austere and Wilderness Medicine Basecamp Conference focused on healthcare delivery in remote and austere environments. Together, these strategies expand training access, strengthen rural healthcare workforce pathways, and create scalable systems that support long-term healthcare workforce development across Alaska’s rural and frontier communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Press Club	Building skills for high-caliber rural health news	AK	Journalists throughout the state of Alaska are often working in one or two person newsrooms. Alaska Press Club plays a vital role in building community for these reporters through professional development, networking and other support. It is widely known that newsrooms in Alaska, and around the world, are struggling. Changes in where advertising dollars are spent, legislation and expectations around individual support for news and information are a huge upset to the industry. While newsrooms explore new business models and modes of sustainability, Press Club supports journalists who are working daily for the public good under less than ideal circumstances. In a 2024, Alaska Press Club workforce study, 53 percent of respondents indicated that their journalism work did not offer enough money to cover living expenses. And most respondents indicate a household income lower than the state median. Nationwide solutions to these struggles are being identified and implemented, resources for journalists covering health and other topics are sitting, waiting. Newsrooms and individuals don't have the resources and capacity to take advantage of opportunities that will enhance their abilities to serve their communities. Alaska Press Club would like to do more to help.	We would like to offer opportunities for professional development in the area of strengthening best practices for health reporting. We'd do this through our annual journalism training conference, lunch & learn sessions, internships, community events, and development of the resources hub on our Alaska Press Club website. In order for this to be successful, we'd develop ways for community members and health providers to weigh in about what local health news is lacking as well as where it is working, collaborate with local and national partners (including health professionals) to leverage existing resources and explore barriers to continuing education in the field of journalism. Professional development topic areas may include but are not limited to: Understanding Alaska health data, rural health challenges, language use when covering health topics, ethical reporting on mental health, health investigations, countering misinformation and more.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Chugach Census Area; Copper River Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; Petersburg Borough; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

Alaska Primary Care Association	Alaska Health Center Shared Services Hub	AK	Alaska’s community health centers operate in some of the most challenging environments in the nation. Geographic isolation, workforce shortages, regulatory complexity, fragmented technology systems, and thin operating margins create structural and operational challenges across the network. These pressures limit health centers’ ability to: Recruit and retain clinical and administrative workforce Scale innovations equitably across regions Fully implement integrated primary and behavioral health models Participate effectively in value-based payment arrangements Individual centers often lack sufficient scale and administrative and financial capacity to independently build advanced infrastructure. Without shared investment, transformation efforts remain fragmented and uneven. Health centers have for years requested the types of services APCA proposes to offer under this project. RHTP presents a historic opportunity to build statewide infrastructure that reduces duplication, increases efficiency, and creates long-term sustainability across Alaska’s health center system.	APCA proposes to establish the Alaska Health Center Shared Services Hub to add requested capacity and reduce costs for Alaska’s health center network. The project would include an assessment to prioritize needs across health centers, development of business plans, including sustainability plans, and phased implementation for 1-3 of the prioritized services in Year 1. APCA would offer services at a discount but would plan to include user fees from the start to ensure that services are valuable enough to health centers to sustain them in the future. The Hub will include three domains: 1. Group Purchasing & Strategic Vendor Partnerships APCA will act as a statewide group purchasing entity, identifying qualified contractors, negotiating preferred pricing and shared contracts, reducing both cost and administrative burden for health centers. Some examples of group purchased services may be billing and coding, interpretation, credentialing or IT managed services. 2. Health Center Services Network This domain leverages expertise already present in Alaska’s community health center network to build a system of shared training, technical assistance, and service delivery. APCA would facilitate a system that allows experienced health centers to offer and bill other community health centers for services such as behavioral health integration training, and revenue cycle management consultation. Several health centers have already expressed interest in expanding their capacity to deliver these services through RHTP funding independent of APCA. 3. Health Center Systems Support APCA will engage staff to provide system-wide guidance, infrastructure modernization support, technical assistance, and subject-matter expertise. Potential roles may include a Chief IT Strategist, a financial consultant, and/or a human resources specialist. Additionally, staff could support technical assistance to specific health center RHTP projects such as a proposed project on emergency or urgent care in health center settings. While APCA has funding through its HRSA Primary Care Association Cooperative Agreement to provide general support in some of these areas, RHTP funding would support in depth individual support that HRSA funds are not sufficient to provide.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Primary Care Association	Community Health Led Medicaid Value Initiative	AK	The opportunity is to launch a rural, primary-care led value-based care demonstration that proves how strengthened primary care, coordinated navigation, and improved access can measurably reduce avoidable utilization and total Medicaid spend. This initiative will be led by the Alaska Community Health Network (ACHN), a clinically integrated network of five Federally Qualified Health Centers located in Anchorage, Kodiak, Mat-su, Talkeetna and Seward. This project provides the opportunity to launch a transformative care model across Alaska that serves 8,589 Medicaid members, creating a system-level transformation. Medicaid beneficiaries in Alaska experience high chronic disease burden, fragmented care, and preventable emergency department and hospital use, often worsened by social drivers such as unstable housing, food insecurity, and transportation barriers. Many high-risk and rising-risk members rely on specialty practices rather than comprehensive primary care, leading to missed preventive services and higher per-member-per-month spending. Current Medicaid reimbursement does not support the non-visit-based services required to manage chronic disease, coordinate care, or conduct proactive outreach—services essential to reducing utilization. This demonstration provides a structured, statewide test of how a primary-care-led model can deliver better outcomes at lower cost and generate the evidence needed to drive long-term Medicaid payment reform and system sustainability.	ACHN proposes the Community Health Led Medicaid Value Initiative, a primary-care–led value-based model designed to reduce preventable utilization and improve outcomes through comprehensive, team-based care. The model leverages ACHN’s experience in population-based arrangements (e.g., Medicare Shared Savings Program) and adapts those capabilities to the Medicaid environment. Core elements of the approach include: Comprehensive, team-based primary care: Each patient is aligned with a primary care provider supported by interdisciplinary staff operating at the top of their roles. Enhanced access: Same-day care, telehealth, and flexible visit modalities reduce low-acuity emergency department use. Care coordination and navigation: Targeted support for high-risk and rising-risk members, coordination after emergency department/hospital use, and facilitation of specialist and community referrals. Proactive, data-driven population management: Risk stratification and utilization analyses guide targeted outreach and care planning. Evidence-based quality and performance management: Measures aligned to chronic disease control, follow-up after acute events, and preventive care. Network infrastructure and analytic approach: ACHN will a shared cost and utilization analytics module to integrate Medicaid claims with clinical data, enabling accurate risk stratification and performance tracking. All participating health centers already share common data platforms, enabling rapid deployment. Phased implementation: Planning & infrastructure – data integration, baseline measurement, readiness activities. Rapid testing & targeted capacity building – small tests of change for high-risk populations; staffing adjustments based on data. Scaling & evaluation – expanding successful interventions; assessing impact on utilization and cost. This model is deliberately structured to be both rigorous and scalable, with flexibility for each health center to tailor services such as integrated behavioral health or clinical pharmacy to meet community needs.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Denali Borough; Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Advance to Implementation Application

Alaska Primary Care Association	Rural FQHC Transformation for Alaska Medicare	AK	Alaska’s aging population is driving rising demand for primary care across rural and frontier communities. Resolute Health Alliance of Alaska—an FQHC led, community governed Accountable Care Organization (ACO) and subsidiary of the Alaska Primary Care Association (APCA)—began participating in the Medicare Shared Savings Program (MSSP) on January 1, 2026. This project strengthens capacity at the four FQHCs to support the core components of MSSP that matter most for seniors and for Medicare’s bottom line: • Chronic care management (risk stratified outreach, medication management, care management) • Preventive screenings (Medicare Annual Wellness Visits and closing care gaps for cancer, cardiovascular disease, and diabetes) • Care coordination (data supported pre-visit planning, team huddles, transitions of care, and referrals) By increasing the role of primary care in day-to-day management, MSSP ACOs have demonstrated the ability to improve quality and reduce total cost of care for seniors nationally. RHTP funding will enhance these MSSP foundations and accelerate positive impact for 6,000+ attributed Medicare beneficiaries by supporting rural practice facilitation and coaching, travel for convenings, learning collaboratives, and population health analytics. Pairing MSSP’s accountability with RHTP’s rural capacity building strengthens access, quality, continuity, and fiscal sustainability for Alaska’s seniors.	Resolute Health Alliance of Alaska is a low-revenue Accountable Care Organization (ACO) in the Medicare Shared Savings Program (MSSP). Advance Investment Program (AIP) funds cover essential start-up needs—staffing, compliance, basic analytics, required deliverables—but are not enough for the enhanced staffing, hands-on support, and population-health tools needed for Alaska’s first FQHC-focused MSSP. Rural Health Transformation Program (RHTP) funding will augment, not duplicate, AIP by enabling rural-tailored implementation of MSSP core functions across four Federally Qualified Health Centers (FQHCs): chronic care management, preventive screening, and care coordination. Shared platform, smarter analytics. All four FQHCs use a common population-health platform. RHTP will add non-duplicative functionality—registries, improved risk stratification, Medicare claims integration, payer reporting, and dashboards—to help teams identify rising-risk seniors, close gaps, and improve follow-up. Turning MSSP data into action. MSSP provides robust Medicare data (attribution, utilization, transitions, quality). Resolute will convert these into practical tools: rising-risk lists, post-discharge queues, Annual Wellness Visit and screening lists, and views that show where rural seniors need support. Staff will use these insights in huddles and pre-visit planning. Five integrated components: (1) Practice facilitation & workflow redesign (hybrid onsite/virtual) to activate MSSP workflows. (2) Workforce capability-building: short micro-trainings on VBC, AWW workflows, chronic disease management, and data literacy. (3) Rural travel & cross-organization learning: supported travel for remote site visits and structured sessions that spread effective approaches. (4) Population-health analytics: added platform capabilities—registries, risk stratification, payer reporting, follow-up tracking, run-chart monitoring—right-sized for rural capacity. (5) Accountability & evaluation: quarterly dashboards and run-charts aligned with MSSP measures, an independent evaluator, and feedback loops to guide course corrections. Result: Earlier identification of rising-risk seniors, stronger chronic care management, higher screening completion, smoother care transitions, and fewer avoidable ED visits/hospitalizations. In this budget period, funds focus on practice facilitation, workflow redesign, workforce training, travel, enhanced analytics on the shared platform, and evaluation.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kodiak Island Borough; Matanuska-Susitna Borough	Advance to Implementation Application

Alaska Primary Care Association	Statewide School Based Health Network	AK	School-based health centers provide health and mental health care to children and teens in or near school settings to improve access to timely health care while supporting academic success. School-based health services are more established in other parts of the US, and are a cost-effective way to increase health care access. Research has shown that school-based health supports academic success, and overall well-being of students and families. Providing care in these environments presents unique challenges, and many states have statewide school-based health networks to support program development, share best practices, and coordinate training opportunities. Alaska has an emerging network, without dedicated funding or staff, which has made it more difficult for school-based health centers to establish and to sustain themselves. More Alaska organizations are likely to start or expand school-based health services with Rural Health Transformation Program funds, and a statewide network would facilitate and coordinate their development.	APCA would develop a statewide school-based health network to support emerging or existing school-based health centers in the areas of program development, dissemination of proven or promising practices, and training. An Alaska School Based Health Network would also develop a strategic plan for school-based health in Alaska, and include an annual convening of school-based health centers. Existing school-based health services exist in Juneau, Anchorage, Naknek, Bethel, Sitka, Soldotna, Kenai, Nikiski, Petersburg and other communities. APCA’s mission is to Advance Alaska’s Wellness and its vision is to the ally for all Alaskans to live their healthiest lives. APCA focuses on community based primary care, and many of the organizations engaging in school-based health center services are APCA’s members, Alaska’s community health centers. APCA began a similar project in late 2024 with federal funds passed through the Alaska Department of Health and the national School Based Health Alliance. Unfortunately, those funds were discontinued in Spring 2025, before the project got off the ground, as part of a series of federal funding cuts during that time. But APCA developed a concept and partnerships that are still relevant to this project.	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

Alaska Primary Care Association	APCA Healthcare Workforce Pipeline Expansion	AK	Alaska community health centers and other healthcare employers experience gaps between their workforce needs and available training pipelines for the occupations they want to hire. Rural healthcare providers are often challenged to find training resources that allow staff to learn without leaving their jobs or communities. Smaller health care organizations without specialized training or HR staff can also find it administratively burdensome and expensive to identify training resources and track participation. Similarly, rural Alaska residents can find it difficult to find jobs and training that lead to livable wages and healthcare careers without leaving their home communities and regions.	APCA would expand or continue existing distance-delivered occupational training for paraprofessional roles such as Clinical Medical Assistant, Pharmacy Technician, Surgical Technician, Medical Administrative Assistant, and others, through Registered Apprenticeship Programs and other types of on-the-job learning opportunities. APCA would deliver training directly, or offer it through vetted training programs at no- or low-cost to Alaska employers. Training is distance-delivered so that participants do not need to leave their workplaces or communities to earn new credentials, increasing retention for rural employers. Employers enter into agreements with APCA to agree to identify new or incumbent employees for training, support their training participation, and report data on their job progression. APCA has established these training programs under funding from the US Department of Labor and US Department of Commerce, and has trained and tracked job placement or wage increases for over 900 participants over the past 3 years. The last of these funding sources will sunset by June 2027. This project will continue programs that would otherwise lose funding, and it will also expand the types of training APCA offers to meet Alaska employer and workforce needs.	\$250K-\$1M	Federally qualified health center	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Psychiatric Experts	Mental Health Access and readiness	AK	Currently, hospital outpatient behavioral health services in the region reportedly face waiting lists approaching four months, leaving many residents without timely care. By expanding his model, the project would provide additional outpatient behavioral health capacity, helping reduce waitlists and improving access to treatment. Also, there is mental health crisis care that provides consultation to an inpatient population, or provides therapeutic treatment in a reasonable amount of time. We will also be looking to see patient suffering from substance use disorders.	Provide 24 hour 7 day a week crisis coverage, and consultation to inpatient facilities. Be available and make space for people to have routine follow up, or emergent access to a mental health provider and prescriber.	\$250K-\$1M	Behavioral health/su bstance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Public Health Association	Rural Policy & Implementation Readiness Infrastructure - Phase 1	AK	Public health professionals often receive legislative and regulatory information late or in fragmented form. Rural providers lack a neutral, centralized way to understand how emerging policy may affect local implementation. Delayed awareness increases compliance risk, slows program adaptation, and reduces rural readiness to implement policy-linked funding opportunities. Rural communities frequently experience structural information gaps due to staffing constraints, geographic isolation, and limited capacity to monitor rapidly evolving policy landscapes. Without structured policy translation infrastructure, rural communities face uneven implementation readiness, delayed response to regulatory change, and reduced ability to capture and manage funding opportunities tied to legislative action. Local data at the borough or census area level is essential to understanding health disparities and improving population health statewide. Healthy Alaskans, led through a state and tribal partnership, provides a roadmap for addressing Alaska’s most significant health challenges. However, a persistent barrier is translating statewide public health data into actionable local insight that supports policy change and community-level health improvement. Strengthening rural partners’ ability to interpret and apply local data will improve participation in statewide health initiatives and inform the development of Healthy Alaskans 2040.	ALPHA proposes to establish and operate a Rural Policy & Implementation Readiness Infrastructure aligned with the Spark Technology & Innovation initiative and supportive of healthy communities coordination goals. The focus is on translation, implementation clarity, funding readiness, and structured feedback. Year One (Design & Launch): • Implement a legislative and regulatory tracking platform • Develop standardized implementation-focused policy summary templates • Launch biweekly Policy Intelligence Briefs during legislative session • Transition to monthly regulatory and funding updates outside session • Integrate funding opportunity alerts tied to policy developments • Host monthly statewide virtual Policy Update sessions • Establish a structured rural feedback and barrier-identification loop • Integrate a formal policy alignment and synthesis session into the ALPHA Annual Health Summit To strengthen local decision-making capacity, ALPHA will partner with Healthy Alaskans and the University of Wisconsin Population Health Institute (UW-PHI) to support borough-level data interpretation and application. UW-PHI will maintain curated borough-level datasets, including descriptive trends, interactive website tools, and downloadable summaries that help communities understand local health conditions and connect those insights to evidence-based policies and interventions. Through this partnership, rural partners and care coordination grantees will have access to data-informed summaries and responsive technical assistance to support evidence-based decisions. ALPHA will serve as the coordination hub linking rural partners, Healthy Alaskans leadership, and UW-PHI technical expertise. Over time, this infrastructure will also function as a rural policy early warning system, linking legislative monitoring, local data insights, and rural partner feedback to identify emerging implementation barriers and improve statewide coordination. The goal is not to replicate existing surveillance systems, but to connect policy intelligence with data-informed decision making, helping rural providers, Tribal health organizations, and public health leaders anticipate implementation challenges and respond more effectively to policy and funding changes.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Public Health Association	Rural Public Health Fellowship & Workforce Accelerator - Phase 1	AK	Alaska has strong clinical delivery systems and regional health leadership. However, workforce pathways into rural public health roles are episodic rather than structured. Rural providers and community leaders consistently report recruitment and retention challenges, particularly in frontier communities. As multi-year transformation initiatives are implemented across the state, workforce instability creates operational risk. Vacancies delay implementation, disrupt partnerships, and reduce continuity across funding cycles. High turnover diminishes institutional knowledge and weakens the ability of rural communities to sustain complex funding and reporting requirements. Students and early-career professionals often lack structured entry pathways into rural public health practice, and host organizations lack coordinated support for mentorship and long-term workforce planning. There is no shared, sustained infrastructure dedicated to building a structured rural public health pipeline aligned with statewide transformation efforts. This gap directly affects rural implementation capacity, funding absorption, and long-term system stability. A structured workforce accelerator is necessary to stabilize rural implementation capacity and strengthen workforce continuity during a period of accelerated transformation.	ALPHA proposes to pilot and scale a structured Rural Public Health Fellowship & Workforce Accelerator aligned with the Strengthen Workforce initiative and designed to stabilize rural implementation capacity. Rather than functioning solely as a training program, this initiative will serve as a workforce stabilization and implementation support strategy embedded within transformation efforts. Year One (Planning & Pilot Phase): • Finalize fellowship governance structure • Formalize partnership agreement with Alaska AHEC • Identify and secure 5–8 rural and Tribal host sites • Develop standardized placement and mentorship agreements • Recruit and place first cohort of 3–5 fellows • Establish outcome tracking system including placement completion, host satisfaction, vacancy duration indicators, retention tracking, and implementation support metrics. By the end of Year One, ALPHA will have an operational fellowship model with formalized host agreements, a documented mentorship framework, a defined evaluation structure, and the first cohort placed in rural and Tribal communities. Fellows will: • Support host-site public health and RHTP-aligned initiatives • Provide short-term implementation capacity in settings experiencing workforce gaps • Participate in structured mentorship and peer learning • Contribute to continuity across grant and program cycles Years Two–Five: • Maintain 3–5 annual placements • Expand host site participation across rural and Tribal regions as readiness allows • Track post-fellowship employment in rural Alaska • Explore multi-year rural service commitments where feasible • Initiate graduated host co-investment discussions by Year Three	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Public Media KSKA KAKM	Using Public Media's Digital and Broadcast Reach to Connect Alaskans to Transformative Healthcare	AK	For decades, KYUK and AKPM have worked in partnership with local organizations to raise awareness about community health, wellness, and safety across the Yukon-Kuskokwim (Y-K) Delta and throughout the entire state of Alaska. KYUK maintains strong partnerships with groups such as Tundra Women's Coalition, Yukon-Kuskokwim Health Corporation, Teens Acting Against Violence (TAAV), Yukon Kuskokwim Fitness Center, and Bethel Family Clinic, KYUK has helped connect residents with important resources and vital public health messaging. These collaborations have included public service announcements, interviews with health professionals, community education campaigns, and locally produced programming focused on topics such as domestic violence prevention, behavioral health, youth wellness, cancer screenings, oral health, and access to medical care. AKPM produces and broadcasts "Line One: Your Health Connection," heard live on public radio statewide. "Line One" features Alaskan physicians and national subject experts from the fields of childcare, mental health, nutrition, pharmacology, surgery, and more. Listeners who call in can talk one-on-one with each week's guests or email their questions during the live broadcasts. "Line One" health video tips, featuring show hosts, appear on statewide television. Building on these long-standing relationships and community trust, KYUK seeks to expand its capacity to provide reliable health communication through broadcast and digital media.	This proof of concept public media communications partnership approach would improve and expand rural Alaskans' access to the transformative healthcare services and outcomes that regionally based medical and social services organizations will develop, test, and refine over the next five years. KYUK and AKPM will leverage current partnerships, local programs, and messaging to develop stronger, more collaborative educational programming and messaging. KYUK proposes to strengthen rural health communication and improve access to reliable health information across the Yukon-Kuskokwim Delta through culturally relevant radio, television, and digital content. Y-K Delta communities experience significant health disparities, including higher rates of chronic disease, barriers to preventative care, and limited access to healthcare providers. Geographic isolation, language differences, and infrastructure challenges can limit access to health information and services. Trusted local media can play a critical role in closing these information gaps and supporting healthier communities. Serving a vast and geographically isolated region of western Alaska, KYUK reaches dozens of rural communities where broadband access is inconsistent and travel to medical care can require costly air transportation. In this context, broadcast remains one of the most trusted, universally available, and the only free platform for delivering timely public health information. Current examples of programming and messaging created and distributed by KYUK and AKPM include: Wellness Wednesday Series, What to know about Tuberculosis in the Y-K Delta - Chris O'Hara, Public Health Nurse with the State of Alaska in Bethel, speaks with MaryCait Dolan on the prevalence of tuberculosis in communities across the Y-K Delta and how we can treat and prevent the disease. Wellness Wednesdays Series, Excellent Health with YKHC – Host Nikolai Joekay is joined by YKHC's Chief of Staff, Dr. Ellen Hodges, Exercise Physiologist, Simon Cone, and Manager of Therapy Services, Eliza Ellsworth. Together they take a look at the heart, what it does, how to keep it health, what things to look out for to make sure the heart stay healthy, and exercise. Wellness Wednesdays Series, Mind Over M.A.Y.O.: How Teens Manage Stress – Bethel Regional High School students talk about different ways they manage stress AKPM produces and broadcasts "Line One: Your Health Connection," heard live on public radio statewide.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Alaska Quality Care	Alaska Quality Care (AQC) I & II Modernization	AK	Alaska Quality Care I & II currently need to upgrade the fire protection system in both homes in order to insure continued operations in Anchorage. The homes provide assisted living housing to 31 residents. Annual occupancy exceeds 95%. Therefore, the purpose of this project is to remove a barrier to continuing operating these homes.	When approved, Alaska Quality Care I & II will immediately contract to install a fire protection system meeting or exceeding the Municipality of Anchorage requirements. In order to do installation, AQC will make necessary arrangements for temporary housing for any resident disrupted due to the physical installation of the system.	\$50,000-\$250,000	Home- and community-based services provider	Statewide	Anchorage (Municipality)	Deferred or Not Advanced
Alaska Regional Hospital	Step-Down Services for Expanded Care Access	AK	Alaska healthcare providers face ongoing challenges in safely transitioning patients from acute hospital care to home or long-term care. Limited access to primary care, long wait times for follow-up, workforce shortages, and geographic barriers contribute to preventable readmissions, emergency department use, and costly transfers to Anchorage-area hospitals. These gaps disproportionately affect older adults, patients with complex chronic conditions, and those without reliable home or community support. A significant additional barrier is the lack of an onsite outpatient pharmacy at discharge. Without timely access to prescribed medications, patients often experience delays, incomplete fills, or confusion about medication changes—substantially increasing the risk of post-discharge complications and readmissions. Alaska currently lacks a hospital-operated transitional care clinic to address this high-risk recovery period. This project proposes establishing a Transitional Care Clinic (TCC) operated by Alaska Regional Hospital to provide coordinated, multidisciplinary follow-up care within seven days of discharge. By integrating clinical follow-up, care coordination, medication management, and telehealth-enabled specialty access, the TCC will improve continuity of care, reduce avoidable utilization, lower total cost of care, and strengthen services to Alaskans – all in support of the rural health transformation goals.	The concept approach of this project is to retrofit a dedicated outpatient clinic (former Senior Care Clinic) on the hospital campus designed for comprehensive post-hospital discharge follow up care. The project will also retrofit an onsite pharmacy, which will target providing patients with medications and needed support to provide full outpatient services upon discharge. The space already exists and no construction will be needed to build out the facility. This project is to outfit the outpatient clinic to be able to deliver sustainable services that will significantly improve access for Alaskans. Services Offered: -comprehensive discharge planning and follow-up coordination. -immediate Prescription dispensing. -medication management and patient education. -physical, occupational, speech, and behavioral therapy. -social work/case management services. -telehealth access to specialists not locally available. -stress tests for cardiovascular patients. There is currently one major cardiovascular practice in town with limited availability for access. Stress testing is time-sensitive and specifically targets those with other major co-morbidities such as diabetes and mental health issues. It typically includes monitored exercise, nutritional counseling, and stress reduction to improve cardiovascular health, reduce the risk of future events, and enhance quality of life. These services are critical for the senior care population. The targeted population includes patients that have recently been discharged from acute care settings (emergency department, inpatient unit) who require a follow-up visit within 7 days for medical management and coordination of specialty services. The staff will be a multidisciplinary team including a physician, nurse practitioner and/or physician assistant, behavioral health therapist, a registered nurse, a medical assistant, and front desk staff. We currently measure that 7,000 patients are provided with general primary care provider (PCP) referrals with another 228 that are not established with a PCP. Based on these numbers as well as readmissions, we estimate that we could see an average of 33 complex patients a day, significantly decreasing the time from discharge to the first follow up visit and	\$1M-\$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

providing an avenue to establish care with existing PCPs in their community.

Alaska Remote Medical Staffing	Growing the CHA/P Workforce By Empowering Advanced Practice Practitioners	AK	1 The staffing model in many Alaska Native (AN) village clinics places responsibility on Community Health Aides/Practitioners (CHA/Ps), often without adequate clinical support. The stress placed on CHA/Ps is highly visible within their communities. Potential applicants see the workload, the lack of backup, and the level of responsibility, which discourages people from entering the role. 2 Progression opportunities for CHA/Ps reduce turnover and make recruitment more attractive by showing (potential) staff clear development opportunities. More CHA-IV providers could be empowered to advance to Community Health Practitioner (CHP). However, progression often slows due to inconsistent access to in-village mentorship from APPs and advanced clinical training. 3 Unfortunately, attracting and keeping APPs in remote villages is difficult. Roles are often presented by Tribal Corporations without clearly preparing clinicians for village clinic realities, including limited resources, cultural context, and Cerner EMR systems. High workloads and limited mentorship time further reduce APP capacity to supervise and train CHAs. Rural Health Impact Without strengthening the APP supervisory workforce, the system cannot expand CHA/P training or work conditions. When clinics lack sufficient CHA/P capacity, more patients must be referred or medevacked to regional hubs. Preventable transfers place financial strain on an already fragile rural health system and disrupt continuity of care.	1: Prepare APPs for Village Clinic Practice Through Realistic Orientation and Training We will establish a Village Clinic Practice Preparation Technical Assistance Program. It will provide online training modules, a centralized website, and practical toolkits that prepare APPs for the realities of practicing in village clinics before arrival. Topics will include: --Understanding the medications and equipment available in village clinics --Managing common high-acuity patients --Navigating limited public safety and community resources. --Logistical realities of village life, including access to food, supplies, and housing in remote communities. --Structured guidance on the use of the Cerner electronic medical record system to improve clinical documentation and workflow for new staff. --Advertising campaigns will drive traffic to the site, targeting APPs where they are, and increasing awareness and interest in APP careers within AN villages. By ensuring APPs are aware of AN village openings, and arrive with realistic expectations and practical skills, the program will reduce early turnover, improve provider satisfaction, and stabilize clinical staffing in village clinics. Location: Available online statewide. 2: Strengthen Village-Based Training and Advancement for Community Health Aides We will implement a village-based training support model that expands mentorship and education opportunities for CHA-IV providers within their own communities. The model will support 1 itinerant APP preceptor to deliver structured on-site or remote training focused on strengthening clinical reasoning, critical thinking, and effective use of the Community Health Aide Manual (CHAM). Remote learning tools and virtual mentorship will complement itinerant in-person training to increase access to instruction across rural communities. We hire 1 FTE APP preceptor with expertise in the AN clinics; 1 Office Manager for administration, billing, and scheduling; and engage Applichat, a consulting and recruiting firm, for project management, workforce, and communications support. This approach aligns with RHTP’s workforce strategy to expand training pathways and strengthen the workforce. Recognizing that authority for preceptor designation resides with Tribal and federal oversight bodies, the program will work collaboratively with Tribal partners to ensure alignment with CHAPCB standards and Tribal governance structures. Location: Year 1: Kenai Peninsula Borough AN villages	\$250K-\$1M	Clinic	Statewide	Kenai Peninsula Borough	Deferred or Not Advanced

Alaska Remote Medical Staffing	Recruit quality "Alaska Prepared" RN's, APP's and Physicians for urban and rural Alaska facilities.	AK	Alaska faces significant shortages of physicians, advanced practice providers, and nurses, contributing to heavy reliance on temporary clinicians from the Lower 48 to sustain essential services. We have approximately 24% nursing vacancy rates, and projections estimate a shortage of around 5,000 registered nurses by 2030. At the same time, we train only about 346 nurses each year, while the health system requires approximately 1,400 new nurses annually, forcing providers to rely on expensive temporary staffing. A number of health systems and Tribal organizations have developed national recruitment pipelines, but most rural providers lack the resources to recruit nationally. Relocating staff are unfairly distributed to the wealthiest systems that can afford to source them. Unlike jurisdictions such as British Columbia, which used marketing to relocate more than 1,000 American nurses in 2025, compared to 127 in 2024, Alaska does not operate a coordinated statewide “destination recruitment” campaign promoting the state as a long-term career destination for healthcare professionals. Retention challenges compound the problem. Clinicians recruited from outside Alaska often arrive without sufficient preparation for frontier practice, rural living conditions, or Alaska Native cultural contexts. Without structured preparation and integration support, some clinicians decline offers before arrival or leave shortly after starting, reinforcing the cycle of turnover.	We propose a coordinated recruitment marketing, integration, and retention program designed to attract RN's, APP's and Physicians from the Lower 48 to build long-term careers in Alaska. The initiative supports RHTP goals of strengthening the healthcare workforce, improving access to care, and reducing reliance on temporary staffing in rural and frontier communities. Component 1: Recruitment Marketing Campaign We will create a brand highlighting Alaska’s unique clinical and lifestyle opportunities, including the geographic scale of the state, rural healthcare delivery models, and opportunities to practice within the Tribal Health System. Applicants will be shown the chance to practice in frontier settings, support Alaska Native communities, and experience a unique professional environment. Activities will include development of a recruitment website showcasing statewide opportunities, creation of digital and video content featuring clinicians working in Alaska, and targeted advertising through social media and healthcare job boards to reach nurses, APPs, and physicians in the Lower 48. The campaign will promote relocation incentives and structured five-year service commitments. Priority areas include urban centers of Florida, California, Texas, Oregon and Washington. Component 2: Triage and Employer Connection A centralized triage system will connect interested clinicians with participating Alaska healthcare employers. ARM’s Recruiters and Integration Consultants will work with health systems to list open positions online, and engage applicants generated. Candidates will receive initial screening and guidance before being connected with recruiters and health systems who have signed up to the platform. Participating employers may offer relocation bonuses, signing incentives, and structured five-year service agreements designed to encourage clinicians to relocate permanently and build careers in Alaska. Component 3: Integration and Retention To improve retention, ARMS will lead on supporting incoming clinicians through integration resources and community-building tools. These include pre-arrival guidance on relocating to Alaska, peer mentorship from clinicians already practicing in the state, and online communities where new arrivals can ask questions and build connections.	\$250K-\$1M	Clinic	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Rural Health Deployment & Modernization Network, Division of Apex Auctions LLC	Alaska Rural Health Deployment & Modernization Network	AK	Rural and frontier communities across Alaska face persistent structural barriers that limit their ability to modernize health infrastructure and sustain efficient care delivery. Aging equipment, deferred facility upgrades, limited project management capacity, procurement challenges, and compressed funding timelines make it difficult for rural providers to translate available capital into measurable system improvements. While the Rural Health Transformation Program represents a historic opportunity, many rural entities lack the administrative bandwidth, coordinated logistics, and deployment infrastructure necessary to rapidly scope, procure, and implement modernization projects within federal time constraints. This gap risks slowing equitable transformation across high-need regions. There is a clear opportunity to establish a structured regional deployment backbone that accelerates facility modernization, reduces administrative burden on rural providers, and ensures disciplined, compliant capital deployment. By combining on-the-ground regional coordination with centralized procurement, compliance oversight, and performance tracking, Alaska can convert transformation funding into tangible access, quality, and sustainability improvements during Year One while building a scalable framework for future expansion.	Apex Auctions LLC will launch the Alaska Rural Health Deployment & Modernization Network (ARHDMN), a structured six-region hub-and-spoke model designed to accelerate rural health infrastructure modernization during Year One of RHTP. The project combines two integrated components: 1. Regional Modernization Deployments In collaboration with participating rural health entities across the Bethel, Nome, Northwest Arctic, Dillingham, Kodiak, and Kenai regions, ARHDMN will conduct rapid needs assessments and implement prioritized renovation-lite upgrades within existing facilities. Activities include equipment replacement and standardization, workflow optimization, targeted technology enhancements, and facility improvements that improve operational efficiency and reliability. All work will comply with federal restrictions and avoid new facility construction. 2. Centralized Deployment Backbone A centralized Program Management Office (PMO) will provide procurement coordination, vendor pre-qualification, compliance oversight, segregated accounting, cost tracking, and performance reporting aligned with CMS requirements. A structured online intake and tracking portal will allow rural entities to document infrastructure gaps, submit project requests, and monitor progress, promoting transparency and equitable regional access. Year One will follow a phased 12-month plan: • Months 1–3: Establish Rural Health Division, onboard CPA and compliance systems, launch intake portal, conduct regional needs assessments, pre-qualify vendors. • Months 3–9: Implement prioritized modernization deployments across six hubs. • Months 9–12: Evaluate outcomes, refine standardized deployment model, and prepare scalable framework for subsequent years. The majority of funds will support direct rural modernization activities, with administrative infrastructure maintained within disciplined thresholds. This approach delivers immediate impact while establishing a replicable, performance-driven deployment model capable of supporting long-term rural health transformation.	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Dillingham Census Area; Kodiak Island Borough; Nome Census Area; Northwest Arctic Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Alaska School Nurse Association	Alaska School Nurses Annual Spring Conference Grant Funding	AK	The ASNA Annual School Nurses Spring Conference represents a singular opportunity to bridge the professional gap for school nurses across Alaska’s vast and fragmented geography. As the only statewide, in-person forum dedicated to school nursing, this event transforms professional isolation into a collaborative learning environment. By providing specialized CNEs and evidence-based 'take-home' clinical strategies, ASNA ensures that whether a nurse is in an urban center or a remote village, they possess the standardized knowledge necessary to directly improve student health outcomes and academic readiness.	Our approach centers on removing the financial barriers that prevent school nurses from accessing essential, in-person continuing education. We will utilize grant funding in two primary ways: Registration Offsets: We will provide registration grants to school nurses throughout Alaska, ensuring that professional development is affordable and accessible to all, regardless of their personal finances or school district's budget for professional development. Rural Travel Stipends: To ensure geographic equity, we will offer travel stipends specifically for nurses practicing in rural and remote "off-road" communities. These stipends will help cover a portion of the high costs of airfare and lodging, allowing these often-isolated healthcare providers (school nurses) to join the statewide community for hands-on training. By streamlining the application process through ASNA, we will ensure these funds are distributed efficiently to those with the greatest need, directly bringing relevant clinical knowledge back to students in every corner of the state.	Under \$50,000	Statewide	Anchorage (Municipality); Bethel Census Area; Chugach Census Area; Denali Borough; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Search and Rescue Association	Alaska Search and Rescue Association - Incident Command Trailer	AK	Search and Rescue teams in Alaska have limited tools and equipment for remote incident management capability. The current option with limited success has been to request a fully supported State Emergency Operations Center tractor trailer command center. This semi-trailer is not able to be located at most remote command posts that ASARA teams operate out of. This unit also requires State of Alaska DHS&EM Staff to transport, manage and operate the unit. Utilizing individual SAR team member owned Travel trailers, RVs and cargo trailers has become more common and inappropriate for the scope and need of the service.	Having a custom built incident command trailer for ASARA Affiliated teams to operate, train and function out of during emergency response incidents not only increases the effectiveness of the assignments, safety of the personnel in the field and increase capability of locating, accessing, stabilizing and transporting an injured or loss patient in the remote and rural areas of Alaska to safety. Having the ability to coordinate, communication, document, and direct resources efficiently via an established command post, that can be deployed to the remote areas of the Alaska wilderness increases the safety of all involved. With the increase in technology and mapping capability currently deployed in Alaska having a remote site that can provide updated situational awareness, internet and cellular data uplink along with secondary communication options only enhances the capability and support we can bring to the patients in need of further care and transport out of the wilderness.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Denali Borough; Fairbanks North Star Borough; Haines Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Alaska Search and Rescue Association	Alaska Search and Rescue Association - Patient Transport Equipment Standardization	AK	Search and Rescue teams in Alaska have a wide variety of patient transport and packaging equipment. From the 1980 wire stokes baskets to the upgraded fiberglass litters. The patient packaging can range from foam sleeping mats and responders personal sleeping bags to newer hyperthermia bags that support in the advanced rewarming and critical care in the austere conditions of remote Alaska. With the recent development of a litter wheel allowing patients to be rolled along a trail, road or boardwalk which increases the safety of the patient and the responders during transport. Most teams have limited splinting supplies such as full body vacuum mattress and extremity options to properly support broken extremities. Very few to any of the teams have the same equipment for the stabilizing, packaging and transporting of patients in these remote areas.	The recommendation from ASARA is to provide each affiliated team with the below standardized equipment cache for safe and effective patient transport: Cascade Rescue Two piece fiberglass litter Cascade Rescue Terra Tamer Litter Wheel w/Handles Cascade litter rigging kit MedTech VBS Vacuum full body mattress MedTech Extremity Split set Doctor Down Rescue Wrap Guardian Litter Shield	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Search and Rescue Association	Alaska Search and Rescue Association - Radio Communication Replacement	AK	We have approximately 450 portable radio units, 40 mobiles and 5 repeaters that are in need of replacement. All the current units do not meet the P25 Phase 2 TDMA compliance mandate from the Alaska Mobile Radio Network, are not able to be encrypted for secure radio transmissions with patient medical information, and are not able to communicate with a local Public Safety Dispatch Center. The ability for teams to communicate and have updated information while in route to the location, while accessing the patient, provide direct hospital consult via radio updates and coordinate the most appropriate ground or air transport would significantly increase the survivability and positive outcomes of Alaska’s that are injured or in need of rescue in remote areas of Alaska.	Replacing team assigned radios with current recommendations for interoperability and forward planning for long-term operation capability. Working with Motorola Solutions as the continued recommended vendor and Alaska Public Safety Communication Services along with Municipality of Anchorage Communications Shop to support the implementation, programing and continued services required to ensure longevity and operational capability. The equipment will be interoperable with any other agency approved on the Alaska Land Mobile Radio Network, shared user agreements are in place to create talk groups and continue emergency medical services in the rural and remote areas of Alaska.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Speech- Language Hearing Association (AKSHA)	Feeding and Swallowing Supports for School Aged Children Across Alaska	AK	Bridging the Gap for Pediatric Feeding Disorders in Alaskan Schools: A Critical Gap in Post-Diagnostic Support Despite Pediatric Feeding Disorder (PFD) receiving its own formal ICD-10 code in 2021, a significant disconnect remains between clinical recognition and the delivery of safe, localized care in Alaska. Many families have struggled with a systemic lack of support, particularly when navigating the transition from urban medical centers to their home environments. Currently, the Alaskan landscape creates a "geographic tax" on health: - Centralized Diagnostics: Many families travel to larger urban areas, such as Anchorage, to access specialized care including access to a pediatric Speech-Language Pathologists (SLPs), medical equipment, and instrumental testing. - Post-Travel Isolation: Upon returning home, many of these families rely frequently on teletherapy, often without local supports to manage daily feeding risks. - Educational Voids: The Alaska Department of Education and Early Development (DEED) currently offers no formal guidance on supporting students with PFD. This lack of recognition in the school setting leaves staff under-supported and students at high risk for medical emergencies, such as choking and/or aspiration. In previous communications with DEED, they indicated they are open to the development of resources that can support both rural and urban schools.	Our approach focuses on building a sustainable link between clinical diagnosis in urban hubs and school-based safety measures. By aligning medical standards with educational supports, and consideration of cultural practices, this project transforms Pediatric Feeding Disorder (PFD) management from a medical model to a school based model similar to procedures emerging in the Lower 48. Phase I: Statewide Interdisciplinary Conference The project will initiate with a statewide interdisciplinary conference, hosted in Anchorage and broadcasted virtually to ensure equitable access for remote providers. - Workforce Collaboration: CEUs will be offered to those attending the conference with a common goal to establish improved awareness of PFD. - Available Digital Resources: Following the conference, a suite of free digital resources will be developed and posted (modeled after successful initiatives like the Wisconsin Department of Public Instruction (DPI) publications and webinars) ensuring access is available to every village and school district. Phase II: Culturally Attuned Clinical Resources (IDDSI) To ensure sustainability and safety, clinical standards must reflect the reality of Alaskan life. We will collaborate directly with clinical service providers that are familiar with the Alaskan Native culture to localize the International Dysphagia Diet Standardisation Initiative (IDDSI). - The "Alaskan IDDSI" Guide: We will create a specialized resource guide and "cheat sheet" for families on modified diets. This guide will translate standard diet levels into the context of Alaska Native subsistence foods and traditional diets, ensuring that "Level 4 Pureed" or "Level 2 Mildly Thick" reflects the actual foods found in a rural Alaskan home. Phase III: Institutional Integration (DEED Guidance) To address the current regulatory void, our goal is to collaborate with the Alaska Department of Education and Early Development (DEED) to draft and implement the formal guide: "Pediatric Feeding Disorders in Alaskan Schools." - Bridging the Gap: Similar to frameworks used in other states, this guide will provide the first official roadmap for both urban and rural schools to support students with PFD. - Operational Safety: It will include basic procedural templates that each district can modify, ensuring that when a student returns from an urban medical facility to their home school, the staff has recommended procedures to decrease the risk of choking and aspiration.	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Stroke Coalition	RAPID-AK Phase II: Completing Alaska’s Statewide Rural Stroke Network	AK	ASC’s Phase I RAPID-AK rollout, funded by a prior grant source that is no longer available, brought RAPID.AI advanced stroke imaging to six Alaska hospitals beginning in 2023 and has demonstrated improved image transfer, quicker transfer decisions, improved thrombectomy access, and shorter door-to-procedure times. These original 6 sites have changed stroke protocols and all aim to maintain this advanced stroke imaging RAPID.AI platform. ASC now seeks RHTP support to expand this proven model to six additional hospitals—Mt. Edgecumbe, Norton Sound, Maniilaq, PeaceHealth Ketchikan, JBER, and Wrangell—so patients can access advanced stroke imaging and faster triage times across the state. In Alaska, where geography, weather, limited specialty coverage, and the cost and risk of medevac delay stroke care, this is a rural access strategy, not ongoing software support. The proposal uses time-limited transformation funding to address implementation barriers while building a durable statewide stroke network. Participating sites would also join the statewide Get With The Guidelines SuperUser registry, helping complete Alaska’s currently incomplete epidemiologic and public health picture of inpatient stroke admissions, etiologies, care, and access.	ASC proposes a five-year rural stroke transformation project built around six additional hospital sites: Mt. Edgecumbe, Norton Sound, Maniilaq, PeaceHealth Ketchikan, JBER, and Wrangell. The project would provide RAPID.AI advanced stroke imaging access, one-time installation/optimization/training, CT server hardware at each site, startup support for participation in the AHA Get With The Guidelines Rural Health Care Outcomes Accelerator, and structured work with local teams to update stroke imaging protocols, transfer workflows, and site-specific stroke response plans. To address the way RHTP funding is awarded annually, ASC proposes that the initial project period include enough funding to secure the first three years of RAPID.AI coverage up front through a multi-year vendor commitment, subject to state and CMS allowability. This would lock in rates, reduce future price volatility, and give hospitals a stable implementation runway while they complete system updates, build local proficiency, align imaging protocols, and normalize new stroke workflows. The project is intentionally framed as time-limited implementation and transition support, not indefinite payment for software operations. ASC would coordinate implementation with RapidAI/IschemaView, hospital administration, IT, radiology, ED, and stroke teams. The five rural critical access hospitals would gain local access to advanced imaging and automated decision support. JBER is included because it can strengthen statewide referral pathways and protocol consistency for rural Alaskans who move through military and veteran systems and because its participation improves coordination across Alaska's broader stroke network. Years 1-3 would provide full grant support for technology access and adoption. Years 4 and 5 would use a transition model in which the grant covers 60% and then 30% of recurring software cost, allowing hospitals to absorb increasing responsibility before assuming full cost in Year 6. If Alaska prefers annualized disbursement instead of an upfront three-year vendor commitment, ASC can rephase the same project without changing site scope or sustainability goals.	\$250K-\$1M	Statewide	Anchorage (Municipality); Ketchikan Gateway Borough; Nome Census Area; Northwest Arctic Borough; Sitka (City and Borough); Wrangell (City and Borough)	Advance to Implementation Application

Alaska Stroke Coalition	Statewide Deployment of Clinical AI Decision Support Across Alaska Hospitals	AK	In Alaska, the absence of on-site subspecialty coverage means that for time-critical conditions—stroke, intracranial hemorrhage, pulmonary embolism, and traumatic brain injury—patient outcomes depend on how quickly a scan becomes a decision. Delays of minutes determine survival, disability, and whether a patient ever returns home. Half of Alaska’s hospitals currently use AI for stroke triage; the other half have no AI capability. Even hospitals with stroke AI lack automated triage for other lethal CT findings, leaving these cases in standard radiology queues. The result is uneven access to timely diagnosis across the state, with the greatest burden falling on rural and Alaska Native communities. AIDOC addresses this gap with a single automated, multi-pathology platform that flags critical findings across CT and X-ray studies in real time. Deploying AIDOC statewide completes Alaska’s AI triage network, extending proven technology beyond stroke to the full spectrum of life-threatening conditions where diagnostic delay drives harm.	AIDOC is deployed as a cloud hosted orchestrator providing a resilient, low-impact infrastructure that bypasses rural hardware logistics while supporting all 23 sites through a centralized framework. Implementation requires no new imaging hardware and typically completes within eight to ten weeks per site. Year 1: Deployment. Hospitals are assessed and onboarded by readiness, with priority given to sites already operating AI workflows. The initial hospitals have already invested in AI triage independently; RHTP support completes and standardizes this validated capability statewide. PACS integrations are completed, staff are trained, and baseline performance metrics are established. Year 2: Operations. AIDOC operates statewide. Clinical and transport data are collected through AIDOC platform analytics, hospital transport records, the Alaska Trauma Registry, and mandatory grantee participation in two national quality AHA registries: GWTG-Stroke and GWTG-CAD available free through 2028 via the AHA Rural Accelerator. Site-specific medevac cost avoidance is documented and shared with hospital finance teams. Year 3: Outcomes and Handoff. A statewide outcomes analysis is completed, and each hospital receives a sustainability plan supported by two years of auditable cost avoidance data. RHTP funding concludes with a clean exit, transitioning AIDOC & national outcomes registry subscriptions to hospital operational budgets.	Over \$5M	Other	Statewide	Aleutians East Borough; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Sitka (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Alaska Sustainable Fisheries Trust	Local Food Production and Healthy Eating Through Micro Processing Facilities in Rural SE Alaska	AK	Access to healthy local seafood in rural Southeast Alaska communities is limited due to lack of equipment and facilities for small-scale local fishermen to deliver, process, and distribute or sell their catch in ways that meet regulatory requirements. Abundant fish populations live throughout the waters of the region, but most commercially caught fish is landed and/or sold in bigger communities with more infrastructure. For commercial fishermen to legally sell fish to a consumer, they must land the fish at a facility that meets regulatory requirements. To process whole fish into consumer-ready products such as fillets, the facility must meet additional state requirements. ASFT is working with two rural Southeast Alaska communities, Kasaan and Yakutat, on improving access to local fish. Kasaan does not have a fish processing plant or publicly accessible commercial kitchen. Yakutat has a fish processing plant that sells fresh and frozen whole fish that are transported by barge and plane for wholesale markets, but it is not able to process fish into consumer-ready products or provide local direct-to-consumer sales. For local residents without boats, this makes them reliant on either expensive store-bought protein that has traveled long distances over lengthy times or other community members’ ability to share their harvest. Micro processing units would address these hurdles in a manner scaled for rural communities and serve as pilot projects to disseminate further.	ASFT proposes to work with Kasaan and Yakutat to install portable micro processing units for accepting, processing, distributing, and teaching about locally caught fish and other wild local foods. Increasing access to locally harvested seafood and traditional foods supports improved nutrition and can contribute to prevention of diet-related chronic diseases, including heart disease and diabetes, which disproportionately affect rural communities. Micro processing units are self-contained converted container units that include certified commercial kitchen space, blast freezer space, and storage freezer space. These units are facilities that can meet state commercial fishing and health regulatory requirements for accepting and processing fish. We will purchase insulated container units and renovate them to contain tables, drains, and equipment for processing and teaching about fish in ways that meet regulatory requirements. Each community will install container units to accommodate the space and equipment needs for commercial kitchen, blast freezing, and storage freezing. Rural resident access to healthy food includes learning how to process and prepare the food. Fishermen land whole fish, but someone (commercial or consumer) needs to process the fish into a product form ready for consumer use. The commercial kitchen portion of the micro processing units allows a space for both commercial processing before distribution to consumers as well as expert-led classes for rural residents to develop their own skills in processing fish and other wild local foods into healthy meals. Locally harvested fish and other wild local foods provide nutrient-dense, heart-healthy protein sources that can help replace highly processed foods that are often the most accessible (but expensive) options in remote communities. ASFT will work with local food preparation and nutrition experts to offer community nutrition education classes in these spaces so rural residents can reap the chronic disease prevention benefits of consuming local wild protein. These classes can also be delivered in additional rural Southeast Alaska communities to increase their residents’ access to healthy food. ASFT is working with Kasaan and Yakutat to expand access to local food and has begun outreach to additional rural Southeast Alaska communities. ASFT will develop and disseminate lessons learned from microprocessor units in Kasaan and Yakutat to other communities facing similar food access challenges.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Prince of Wales-Hyder Census Area; Yakutat (City and Borough)	Deferred or Not Advanced

Alaska Telepsychol ogy	Empowering Rural Educators & Students: Behavioral Health Continuing Education in Rural Alaska	AK	In rural Alaska, geographic isolation and workforce shortages limit access to behavioral health professionals and continuing education, leaving educators without the support they need to respond effectively to students’ behavioral and mental health needs. By investing in continuing education that strengthens the skills of Alaska’s educators, this project will build a stronger rural workforce, improve student mental health and school engagement, and promote healthier, more resilient communities across Alaska.	Alaska Telepsychology has served over 1,942 individuals and families in 97 Alaska communities and has provided behavioral support to the Lower Yukon School District for two years. Building on this experience, this project will provide continuing education that equips educators in rural Alaska with practical tools to address student behavioral and learning challenges. Our project offers continuing education that helps educators respond to conditions that interfere with student conduct and learning while introducing practical strategies that can be implemented immediately in the classroom. Continuing education will be delivered in three settings: 1) Project staff will participate in regional in-service training events, such as the Lower Yukon School District’s annual in-service week, to introduce the program, build relationships with educators and community members, and identify priority topics. 2) During the academic year we will offer weekly virtual group consultations combining short didactic presentations with collaborative discussion. These sessions will address common student challenges and how they present across developmental stages and cultural contexts. Educators will participate in case-based discussion and collaborative problem-solving focused on practical classroom responses. 3) We also will provide weekly virtual office hours for individual consultation, allowing educators to seek guidance on specific student concerns. In addition to clinical expertise and instruction, we will emphasize three practical areas that strengthen educators’ ability to support student growth. Educators will learn informal classroom accommodations for students experiencing trauma, executive dysfunction, developmental, anxiety or mood disorders. Teachers will also learn simple mindfulness and regulation strategies that help students calm down physiologically and become ready to learn. Finally, an art therapist and veteran educator will develop an art and writing program that promotes students’ verbal and nonverbal communication skills. Teachers will receive training and materials to implement these activities locally. By equipping educators with practical tools and support, this project positions Alaska’s teachers as frontline partners in prevention, strengthening student well-being and community resilience across the state.	\$250K-\$1M	Behavioral health/su bstance use disorder treatment	Multi- Community or Participating in Regional Hub-and- Spoke	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Kusilvak Census Area; Nome Census Area; Northwest Arctic Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Alaska Therapy Alliance	Telehealth-Enabled Rapid Access Physical Therapy (PT) & Musculoskeletal (MSK) Care	AK	In Alaska, distance and limited appointment availability often make the emergency department (ED) and rural health clinics the only option, including for non-emergent musculoskeletal (MSK) injuries. While EDs can rule out life-threatening conditions, they rarely provide function-restoring care, leaving patients to wait weeks before accessing physical therapy. This delay drives a high-cost care pathway with avoidable downstream utilization, unnecessary imaging, delayed recovery, and increased medication use (including opioids). Military health systems and HMO models already demonstrate a more effective approach. In these systems, physical therapists serve as first-contact providers for MSK conditions within primary care teams. Patients are evaluated immediately by a PT trained to screen for serious pathology, initiate treatment, and coordinate referral when a physician is required. These models are shown to safely reduce imaging, specialty referrals, medication use, and overall healthcare costs while improving access and recovery. Alaska Therapy Alliance (ATA) will expand this proven model to rural Alaska. We will create a statewide network that connects patients to PTs as the first point of contact for MSK care at clinics, urgent care settings, and via telehealth. By placing the right provider at the first point of care, we will reduce unnecessary ED and primary care utilization while improving recovery, access, and health system efficiency across rural communities.	Over the next 36 months, we will design, pilot and scale a “hub and spoke” Rapid Access Physical Therapy (RAPT) model to provide timely, first-contact musculoskeletal (MSK) care across Alaska. Participating clinics in hub communities will reserve same- or next-day RAPT appointments (telehealth or in-person) for initial MSK evaluation, education, self-management planning, and short-course treatment. All encounters will follow standardized red-flag screening and escalation pathways to ensure safe identification and referral of serious and non-MSK pathology. Rural “spoke” communities will connect to hub-based PTs via synchronous telehealth, including low-bandwidth options where needed. Community health partners will assist with patient navigation, technology setup, and care coordination. A centralized access portal and hotline (“Second Door”) will serve as a single entry point for EDs, urgent care, primary care, employers, community partners, and patients—routing MSK conditions quickly to the appropriate in-person or telehealth PT. All participating therapists will complete standardized training through Redefine Health Education to support safe primary access practice. Training includes differential diagnosis, red-flag screening, triage and referral decision-making, imaging considerations, and telehealth examination workflows. This ensures consistent, evidence-informed care delivery across sites. Ongoing episodes of care will incorporate Remote Therapeutic Monitoring (RTM) to track adherence, symptoms, and functional progress between visits. RTM will support patient engagement, early identification of non-response, and optimization of outcomes while reducing unnecessary utilization. Implementation will occur in four phases: Phase 1 (Months 0–6): Finalize hub site selection, execute MOUs, establish data infrastructure, and configure portal and referral workflows. Phase 2: Train clinicians, launch pilot hubs, and activate spoke telehealth services. Phase 3: Scale regionally, refine workflows using utilization and outcome data, and strengthen payer/employer partnerships. Phase 4: Conduct formal evaluation (access, utilization, cost, patient-reported outcomes), develop ROI and sustainability strategy, and produce a replication toolkit for statewide dissemination. This model improves access, reduces downstream imaging and opioid exposure, strengthens rural workforce capacity, and creates a financially sustainable pathway for PT-led primary MSK care.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Urgent Care	Strengthening Work Force by Supporting New Graduates	AK	The problem that we would like to address with this project is lack of access to healthcare in Alaska due to a shortage of Providers. Currently, we have a lack of Providers in Alaska. This is putting a strain on accessibility for all Alaskans. We believe that providing a New Graduate program for Providers would incentivize Providers to stay and get relevant experience to help them be better prepared to serve Alaskan communities.	Our approach is to this problem is to increase the support for our New Graduate Providers in Alaska, thus incentivizing more to stay in Alaska and serve all of Alaska. We would do that by Providing a peer-supported New Graduate Program. New Graduates would have one-on-one support from more experienced Providers for a minimum of one year. This would increase competency and confidence in New Graduates. This would also familiarize New Graduates more with serving Alaska specifically. New Graduates who complete the program would be more qualified and comfortable serving Alaska communities in more rural settings.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Advance to Implementation Application
Alaska Urgent Care	Equipment to Increase Quality Care and Urgent Need Access	AK	We are two locally owned and operated Urgent Cares who also provide Primary Care services. We have been serving the Anchorage and Mat-Su communities for over 25 years. We operate at break-even because we provide low-cost services to patients. Our priority is that patients receive kind, caring, and compassionate medical care. We do not have excess funding to update our equipment or buy new equipment. This has limited some of the services that we can provide for patients. It has impacted individuals, especially on nights and weekends when we are the only clinics who are open in these areas. We are requesting funding to purchase new equipment and update equipment.	Our approach to the above problem is to request funding for a new and updated equipment for our facilities. We would be able to provide more and prompt care. This would keep patients out of the ER, provide better outcomes, provide timely care, and decrease the financial burden on our healthcare system and on patients.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced
Alaska Urgent Care	Expanding Access for Uninsured	AK	We would like to bridge the gap for healthcare accessibility for those without insurance. So many cannot afford healthcare and will avoid going to the doctor if they get sick. Many will opt to go the Emergency Rooms instead of out-patient clinics because they do not have to pay at the time they are seen and they hope that the hospitals will write-off or give more assistance for their ER trips, but often they do not receive relief and end up in debt. For those who avoid care because they cannot afford it, they are at risk for worsening conditions that require much more intensive care and workups than they would have if the had been able to receive timely care.	We offer a Medical Membership program for individuals who do not qualify for Medicaid or Medicare and are without insurance. It is offered at \$50 (five visits per year) or \$100 per month (12 visits per year) and allows patients to receive primary care services, including labs and x-rays, injury, illness, and preventative care seven days a week. We would like to expand this program to be able to make it more widely known to individuals in our communities as well as expand what services can be included in this program. We see patients seven days a week and believe that we can make a large and meaningful impact on those without insurance or without access.	Under \$50,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Alaska Vein Care, LLC	Rural Vein & Interventional Radiology	AK	Rural Alaskans face significant barriers to accessing vascular and interventional radiology services due to geographic isolation, workforce shortages, and the recent closure of several specialty vein practices in Alaska due to declining reimbursement and the high cost of operating in Alaska. Many patients have already lost access to services they previously relied on, creating an urgent risk that rural Alaskans will have even fewer options for diagnosis and treatment of vascular disease. Without access to timely screening and treatment, conditions such as deep vein thrombosis, peripheral arterial disease, uterine fibroids, chronic venous insufficiency, May-Thurner syndrome, and pelvic venous disorders can go undiagnosed or untreated, leading to serious complications, hospitalizations, or preventable deaths. Many rural patients must already travel long distances by air to regional hubs or even outside Alaska for care. This project addresses both a critical gap and an opportunity to stabilize and expand specialty care access. By leveraging Alaska Vein Care’s existing clinics and physician expertise, the project will expand vascular screening, minimally invasive interventional procedures, and telehealth-supported specialty services. This will help preserve access to care that is disappearing in Alaska while improving early detection, reducing travel burdens, and increasing the availability of high-quality specialty care for rural and frontier communities.	Alaska Vein Care (AVC) will address the growing loss of vascular specialty services in Alaska by expanding access to vascular screening, minimally invasive interventional radiology procedures, and specialty care coordination across its existing clinic network in Mat-Su Valley, Kenai Peninsula, Fairbanks, Juneau, and Anchorage. These locations serve as regional hubs where rural patients already travel for care. The project will expand access through three primary strategies. First, AVC will recruit and train vascular ultrasound technologists who can provide vascular imaging services both in AVC clinics and through scheduled outreach visits to additional rural communities. These technologists will help expand screening for conditions such as deep vein thrombosis, peripheral arterial disease, and chronic venous disease, among other conditions. Imaging studies will be interpreted by AVC physicians, with telehealth consultation used to coordinate care with referring providers and ensure rapid diagnosis and treatment planning. Second, AVC will expand minimally invasive interventional radiology procedures that treat vascular disease and women’s health conditions that frequently go untreated in rural areas. These include treatments for uterine fibroids, pelvic congestion syndrome, May-Thurner syndrome, and other vascular disorders. These procedures can often be performed in outpatient settings, providing effective alternatives to surgery while reducing hospital utilization and patient travel. Third, AVC will expand additional interventional radiology services that support early diagnosis and treatment of disease, including biopsies, vascular procedures, and image-guided treatments that help prevent more serious complications and hospitalizations. Because AVC already operates clinics across multiple regions of Alaska and has completed many preparatory steps for expanding interventional radiology services—including clinic infrastructure, physician staffing, vendor relationships, and (legal) referral networks—these services can be implemented quickly. By building on existing infrastructure and workforce capacity, this project will preserve and expand access to specialty vascular care that is currently disappearing in Alaska while improving early detection, reducing travel burdens, and strengthening rural health care delivery.	\$250K-\$1M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Weight Managemen t and Diabetes Counseling, LLC	Measure What Matters: InBody Community Screening for Metabolic Health Education	AK	Most people lack a fundamental understanding of what drives chronic disease. The focus on scale weight and BMI has obscured true drivers of risk: low lean body mass and high visceral fat. Body composition analysis provides precise data on skeletal muscle mass and visceral fat. Health psychology shows people act on personal data. When individuals see their numbers, they work harder to gain lean mass and reduce visceral fat — numbers transform abstract concepts into concrete personal understanding. A sustainable health system cannot be built through clinical intervention alone; it requires informed communities making better daily decisions. Personal body composition data creates exactly this kind of engaged, health-literate population. One in eight U.S. adults now takes a GLP-1 medication, and most expect to discontinue, facing weight rebound compounded by muscle loss. Most are unaware that up to 40% of weight lost on GLP-1s can be lean mass. Without monitoring, this muscle loss goes undetected by patients and providers alike. This project requests one-time funding to purchase an InBody 380. By offering free community access, the project will provide the personal data that motivates people at risk for diabetes to take action. We will also make them aware of preventive nutrition counseling available at no cost to people with metabolic risk. If even a handful of diabetes cases are prevented, this investment in health system sustainability will pay for itself many times over.	AWMDC will purchase an InBody 380 body composition analyzer with carrying case and will conduct body composition screening and education during normal business hours. The InBody 380 provides clinical-grade bioelectrical impedance analysis measuring skeletal muscle mass, body fat mass, percent body fat, visceral fat area, and basal metabolic rate. The approach includes three core components. Free walk-in body composition assessments will be available on an ongoing basis at the AWMDC office, requiring no appointment. This ensures consistent, convenient access for any Mat-Su resident who wants to understand their metabolic health beyond scale weight. AWMDC will publicize the service through outreach to local medical offices and signage in front of the office in the high-traffic Koslosky building. Participants pursuing weight loss or taking or considering GLP-1 medications will be encouraged to return for monthly follow-up assessments to monitor lean mass preservation. This data will empower patients and their providers to make informed decisions about resistance exercise, protein intake, and nutrition strategies that protect muscle mass during weight loss. Every participant will receive immediate nutrition education based on their analysis and will be made aware of preventive nutrition counseling available for patients with obesity at no out-of-pocket cost. Participants without insurance coverage will be referred to the State of Alaska Fresh Start program, which provides free nutrition and lifestyle support. Each participant will receive a printed results sheet and a brief one-on-one consultation explaining the significance of muscle mass versus fat mass and the importance of visceral fat as a metabolic risk marker. The device portability allows AWMDC to participate in community health fairs and wellness events as opportunities arise. Simply making this assessment available has the power to inspire lasting changes in food choices and physical activity. When people see their own skeletal muscle mass and visceral fat data, they are no longer relying on an abstract understanding of risk — they are looking at a personal picture of their true vulnerability to diabetes, cardiovascular disease, and other chronic conditions. That moment of clarity moves people from awareness to action. It is the cumulative effect of these personal changes that builds a sustainable health care system.	Under \$50,000	Private practition er	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Alaska Weight Management and Diabetes Counseling, LLC	Prevention Over Placement: Telehealth Lifestyle, Nutrition & Clinical Help to Stop Cognitive Decline	AK	A breakthrough is underway in Alzheimer’s research that has not yet reached clinical practice. Peer-reviewed studies — including a soon-to-be-published randomized controlled trial — show that personalized, multi-factorial lifestyle interventions can slow or even reverse cognitive decline in patients with mild cognitive impairment and early-stage Alzheimer’s. Across several published case series and open-label trials (N≈10, 100, 255), a precision-medicine/ReCODE-style protocol has shown cognitive stabilization or improvement in most patients with MCI or early Alzheimer’s disease. Nothing in the history of dementia treatment has produced results like these. Yet virtually no one in clinical practice is aware that these interventions even exist. Research takes an average of 17 years to move from publication to clinical implementation. Rural Alaska, where specialist access is the scarcest in the nation, will be the last place this science arrives — unless we take this opportunity to act. This project will bring personalized metabolic and lifestyle interventions for cognitive decline to rural Alaskan seniors via telehealth, delivered by licensed nutrition professionals ideally skilled to deliver this care. The economic case is clear: one year of institutional dementia care in Alaska exceeds \$100,000. If this project prevents even one person-year of institutionalization, the investment pays for itself — and every additional patient reached multiplies that return.	This project is designed to move breakthrough research into real clinical delivery for rural Alaskan seniors. While stunning cognitive improvements have been demonstrated in research settings - where participant selection, caregiver support, and clinical resources were ideal — delivering this care across rural Alaska will present unique challenges that this project is built to navigate. The program will begin by training two licensed nutrition professionals in the ReCODE precision-medicine protocol for cognitive decline, building Alaska’s first clinical capacity to deliver these interventions. This training will establish the foundation for every patient interaction that follows. We will prioritize patients based on their level of cognitive decline, in consultation with their caregivers and medical providers. We will coordinate with each patient’s healthcare providers to request labs, recommend medication adjustments, and align care plans. For patients with tribal health benefits, we will work directly with their tribal health dietitian to discuss protocol implementation. All personalized medical nutrition therapy will be delivered via telehealth at no cost to patients. Each consultation will address the metabolic, inflammatory, and nutritional contributors specific to that patient’s cognitive decline — including physical activity, cognitive exercises, dietary frameworks, targeted micronutrient protocols, and insulin resistance management. We will develop standardized clinical workflows adapted for Alaska, and coordinate with primary care providers and Community Health Aides/Practitioners to facilitate the lab testing and metabolic assessments that drive personalized treatment. We will collect cognitive scores, metabolic biomarkers, functional status, and utilization data to the greatest extent possible. This multi-year dataset will build the evidence base needed to advocate for Medicaid State Plan Amendments and value-based payment models that could establish reimbursement pathways beyond the grant period. We will also collaborate with ANTHC to introduce this research and present findings at the annual diabetes conference, reaching Community Health Aides/Practitioners, dietitians, and rural healthcare providers statewide - accelerating awareness across Alaska’s provider network. We will also publish the ReCODE protocol information on the Alaska-focused NutriScape subdomains, making services easily discoverable by clinicians and consumers.	\$50,000-\$250,000	Private practitioner	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Wellness Group, LLC	Integrated Preventive Health Access and Multidisciplinary Care Hub for Alaska	AK	Alaska continues to face rising rates of preventable chronic disease, metabolic dysfunction, obesity, cardiovascular risk, chronic pain syndromes, nervous system dysregulation, and delayed intervention caused by fragmented access across disconnected care settings. Many patients currently navigate separate systems for primary care, rehabilitation, metabolic support, recovery services, and chronic disease prevention, often without coordinated care until conditions progress into higher-cost disease states. Our long-term goal is to develop an integrated preventive health model that brings proactive medical care, recovery therapies, movement, education, and lifestyle support into one coordinated environment, allowing patients to address root causes earlier, improve health outcomes, and reduce avoidable chronic illness. As part of this program, we also intend to develop an internal access pathway for individuals with chronic illness or complex metabolic conditions who face financial barriers to preventive care. This would allow qualifying patients to receive subsidized consultations, telehealth follow-up, and individualized metabolic support when earlier intervention may help prevent further decline. The project is built on the principle that preventive care is most effective when metabolic, musculoskeletal, nervous system, lifestyle, and primary medical care are delivered collaboratively rather than in isolation.	Our proposed approach begins by expanding services that are already operational or actively being developed, including direct primary care, telehealth, individualized metabolic programming, and multidisciplinary preventive care designed to address chronic disease drivers earlier and more collaboratively than traditional fragmented models allow. The project follows a phased development strategy that prioritizes immediate healthcare access first while building toward a larger integrated preventive care environment. In Phase 1, direct primary care and telehealth are used to improve continuity, expand statewide access, and support patients who need metabolic guidance, chronic disease prevention, diagnostics interpretation, treatment planning, and follow-up care without repeated travel. This phase also includes continued development of individualized metabolic programs, strategic staffing expansion, and strengthening rural reach through coordinated care for Alaska Native patients and individuals traveling from rural communities. In Phase 2, expansion into adjacent clinic space will allow gradual growth of service capacity while maintaining current operations. Planned additions include additional offices for primary care and collaborative provider consultations, expanded lab and diagnostic capacity, a small movement studio for guided mobility and rehabilitation-based programming, a larger public contrast therapy room, and additional treatment space for therapies that support metabolic recovery, nervous system regulation, and chronic disease prevention. Phase 3 includes the long-term development of an integrated preventive health facility where medical care, movement, recovery therapies, education, diagnostics, and lifestyle support operate under one coordinated model. This future facility is designed to house multidisciplinary provider collaboration, preventive medicine, recovery infrastructure, and community-centered health education while allowing future expansion as demand grows. Across all phases, the project maintains a hub-and-spoke model in which an Anchorage-based health hub extends care outward through telehealth, selective in-person services, and a limited subsidized access pathway for individuals with chronic illness who face financial barriers to preventive care.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Workforce Alliance/Alaska Safety Alliance	Alaska Health Workforce Convening & Development of Alaska Health Workforce Development Plan	AK	Alaska's healthcare workforce shortages - particularly in rural and behavioral health - are well-documented, yet efforts remain scattered across agencies, education providers, employers, and regional initiatives. Valuable reports and convenings have happened, but the state still lacks a current, coordinated Health Workforce Development Plan that connects investments, identifies priority occupations, and sets shared goals. Without that kind of plan tied to Rural Health Transformation funding cycles, workforce strategies risk staying on paper rather than driving real change. The reestablished Alaska Health Workforce Coalition offers a natural home for statewide alignment - but getting there requires structured facilitation and solid data. Bringing the right people into the same room matters. In-person convenings create the conditions for relationship-building and unexpected connections that virtual meetings rarely replicate - and those moments of trust and serendipity are often what turn fragmented efforts into genuine collaboration across healthcare stakeholders. This project is an opportunity to bring cross-sector healthcare leaders together in fall 2026 and turn emerging workforce research and findings into a practical, coordinated Alaska Health Workforce Development Plan, one aligned with the Alaska Workforce Investment Board and Rural Health Transformation priorities.	This project will facilitate a structured, action-oriented statewide convening and produce an Alaska Health Workforce Plan aligned with Rural Health Transformation priorities and the Alaska Workforce Investment Board. The work will occur in three coordinated phases. Phase 1: Preparation & Data Synthesis (Months 1–2) The project team will synthesize existing workforce intelligence, including findings from the Health Workforce Data Visualization Tool, behavioral health workforce assessments, employer insights, and labor market data. Priority occupations, regional shortages, pipeline gaps, and projected demand trends will be translated into concise briefing materials designed to support informed decision-making. Stakeholder mapping will ensure representation from rural providers, Tribal health organizations, education institutions, employers, state agencies, and Workforce Investment Board leadership. Clear objectives, decision points, and expected outputs for the convening will be defined during this phase to ensure the event produces actionable outcomes. Phase 2: Statewide Convening (Month 3) A professionally facilitated fall convening will bring cross-sector leaders together to align around workforce priorities. Structured facilitation methods - regional breakouts, small group discussions, live polling, and consensus-building exercises - will move participants beyond dialogue toward defined commitments. Participants will: • Identify priority healthcare occupations for coordinated investment • Clarify regional distinctions and shared statewide strategies • Align on measurable three- to five-year workforce goals • Identify policy, funding, and operational barriers Phase 3: Plan Development & Alignment (Months 4–6) Convening outcomes will be synthesized into a formal Alaska Health Workforce Plan. The plan will include: • Priority occupation targets • Recommended training capacity adjustments • Employer engagement strategies • Regional considerations • Performance metrics for tracking progress • Assigned lead entities responsible for advancing each strategic priority • A proposed annual public progress review mechanism through the Alaska Health Workforce Coalition The draft plan will be reviewed with the Alaska Workforce Investment Board and key partners to ensure policy and funding alignment before final release. The result will be an implementation-ready workforce roadmap grounded in shared data and collective commitment.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Workforce Alliance/Alaska Safety Alliance	Alaska Post-Secondary Education Non-Completers Survey	AK	Alaska faces persistent healthcare workforce shortages, particularly in rural communities. Alaska has the highest dropout-to-undergraduate ratio in the country, with dropouts outnumbering currently enrolled undergraduates by more than 4-to-1. Health systems rely heavily on out-of-state recruitment, traveling staff, and short-term contracts, driving high costs, turnover, and reduced continuity of care. Many Alaskans, especially rural residents, Alaska Native community members, and working-age adults, do not complete postsecondary credentials and remain underrepresented in healthcare training pathways. Growing the in-state healthcare workforce from this population represents one of the most sustainable long-term rural health stabilization strategies under RHTP. However, we lack actionable data on what would enable these Alaskans to enter and complete healthcare training. Barriers may include childcare, financial constraints, geographic isolation, scheduling rigidity, cultural misalignment, or lack of career navigation. Without understanding these barriers, workforce investments risk reinforcing inequities and failing to stabilize the rural healthcare system. This project grows and retains an Alaska-based healthcare workforce by identifying and redesigning training pathways to meet the realities of rural Alaskans' lives. By building a data-driven understanding of untapped local talent, Alaska can shift from reactive recruitment to sustainable, homegrown workforce development.	This project will use structured, statewide market research to identify what would motivate Alaskans who have not completed postsecondary credentials to enter high-need healthcare careers, particularly in rural and frontier communities. Phase 1: Statewide Polling & Targeted Market Research We will conduct statistically valid polling of working-age Alaskans who have not completed postsecondary education, with intentional oversampling in rural, frontier, and Alaska Native communities to ensure representative and equity-centered findings. The research will: • Assess barriers to healthcare training participation, including financial constraints, childcare, transportation, geographic isolation, housing instability, technology access, and cultural alignment • Evaluate perceptions of healthcare careers (wages, stability, advancement, community impact) • Test specific motivators such as stipends, paid training models, hybrid or tele-education delivery, employer-sponsored pathways, guaranteed job placement, local cohort models, and modular credentialing • Segment responses by region, age, employment status, community type, and prior education experience to identify distinct participation profiles Phase 2: Recommendation Development & Implementation Strategy Findings will be translated into actionable, evidence-based pathway redesign recommendations tailored to Alaska’s healthcare labor market. This phase will: • Identify training delivery adjustments such as flexible scheduling, distributed learning hubs, paid clinical placements, stackable credentials, and rural-aligned cohort models • Prioritize high-shortage healthcare roles with strong return on investment for rural system stabilization • Develop an implementation roadmap for piloting redesigned pathways in 1–2 regions • Align recommendations with existing workforce, Tribal health, and education investments to ensure feasibility and sustainability Deliverables will include a market research report, segmentation analysis, and an implementation-ready pilot roadmap. By grounding workforce strategy in direct input from untapped Alaska residents, this project ensures healthcare training investments align with lived experience, rural realities, and long-term workforce retention goals.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Workforce Alliance/Alaska Safety Alliance	Evaluation of Non-Degree Behavioral Health Educational Programs ROI & Statewide BH Workforce Survey	AK	Alaska faces persistent behavioral health workforce shortages, particularly in rural communities. Behavioral health paraprofessionals play a critical role in service delivery, yet training pathways, costs, supervision capacity, and retention outcomes vary significantly across regions. Given the high cost of contracted behavioral health staffing and the financial strain of prolonged vacancies, optimizing paraprofessional workforce training represents a direct cost-containment and fiscal sustainability strategy under Rural Health Transformation. If the state wants to invest in greater behavioral health services, the State should know more about the return on investment and the effectiveness of different types of its training programs. This should include an understanding of the cost of training by role, major cost drivers, how many individuals move from recruitment to training to employment, where and why candidates exit the pipeline, or how training output compares to statewide workforce demand. Additionally, employer experience in recruiting, preparing, supervising, and retaining paraprofessionals is not systematically documented. Without this analysis, investments to expand behavioral health services risk fragmentation, inefficiency, or misalignment with workforce realities. This project presents an opportunity to optimize training investments, strengthen rural workforce capacity, and ensure behavioral health workforce expansion is both cost-effective and sustainable.	This project will conduct a structured, statewide Behavioral Health Paraprofessional Workforce Assessment that integrates financial analysis, pipeline evaluation, employer voice, and external benchmarking to strengthen Alaska’s behavioral health workforce. Phase 1: Internal Training & ROI Assessment This phase will conduct a detailed financial and operational review of behavioral health paraprofessional training programs across regions. The assessment will: • Analyze training costs, including cost per trainee, completer and successful hire • Identify major cost drivers such as instructional delivery models, supervision requirements, travel, stipends, and administrative overhead • Map the full workforce pipeline from recruitment → enrollment → completion → hiring → early retention • Quantify completion-to-hire conversion rates and identify where candidates exit the pipeline • Assess regional variation in costs and outcomes to determine relative return on investment This analysis will establish a clear baseline for cost-effectiveness and system efficiency. Phase 2: Employer & Workforce Voice Recognizing that labor data alone cannot explain workforce instability, this phase will engage behavioral health employers across rural and urban communities through structured surveys. The engagement will: • Identify recruitment challenges and persistent vacancy drivers • Assess job readiness gaps among new hires • Evaluate supervision capacity and workload constraints • Document retention barriers and turnover patterns • Capture how paraprofessional responsibilities are embedded within broader roles (e.g., schools, clinics, community health centers, public safety settings) Findings will clarify how training aligns or fails to align with real-world workforce demands. Phase 3: External Benchmarking & Best Practices To provide a comparative perspective, the project will develop 2–3 case studies from peer rural or frontier states. These case studies will examine training cost structures, credential pathways, supervision models, and measurable ROI outcomes. Lessons learned will inform the identification of scalable practices adaptable to Alaska’s geographic and workforce context. Deliverables will include a comprehensive ROI and cost driver analysis, a pipeline gap assessment, an employer insights report, and a prioritized, implementation-ready roadmap for optimizing behavioral health paraprofessional training statewide.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Workforce Alliance/Alaska Safety Alliance	Fall 2026 AHCW Steering Committee Strategic Planning Meeting & Special Topics Sprints	AK	Many challenges within Alaska’s healthcare education and training system are too complex for any single institution or organization to solve alone. While AHCW broadly engages healthcare stakeholders across the state, it has intentionally brought together 13 regional, institutional, and organizational leaders to co-develop the priorities and foundation of the newly relaunched Coalition. By coordinating efforts to address structural barriers, AHCW gives Steering Committee members the opportunity to speak with a unified voice - and the collective ability to drive meaningful improvements that benefit the entire healthcare system, including future healthcare workers, employers, communities, and individual Alaskans. The same principle applies to specific shared challenges that no single institution or trainer can easily tackle alone. These might include improving the Peer Support Specialist training and certification process, developing articulation and affiliation agreements between educational institutions, or streamlining professional licensing. To address these issues, AHCW proposes working with AHCW steering committee members to first identify challenges, priorities, or barriers and then following the strategic planning session, host 3 individual Special Topic sprints using an entrepreneurial sprint framework - a structured approach that guides participants through identifying, developing, and testing practical solutions to real-world problems - to build testable solutions.	AHCW is brand new and has intentionally tapped 13 healthcare-connected community leaders to assist with overall health workforce strategic planning and to help guide the development of the newly re-established organization. These leaders represent a broad cross-section of Alaska's healthcare community and now form the Steering Committee: 1. Terissia Bell - University of Alaska Southeast 2. Gloria Burnett - University of Alaska Anchorage 3. Lisa Cauble - University of Alaska Anchorage 4. Kim Champney - Alaska Association of Developmental Disabilities 5. Dr. Travis Hedwig - University of Alaska Anchorage 6. Vandana Ingle - Mat-Su Health Foundation 7. Elizabeth King - Alaska Hospital and Healthcare Association 8. Dr. Victoria Kildal - Alaska Behavioral Health Association 9. Mike Kruzinski - State of Alaska, Division of Public Health 10. Dr. Eric Murphy - University of Alaska Anchorage 11. Katharine Pagani - Alaska Pacific University 12. Samantha Ponts - Alaska Mental Health Trust Authority 13. Keja Whiteman - Nokomis Strategies While some of these leaders know and work with one another professionally, many do not, and three members live outside Southcentral Alaska. At present, AHCW has no resources to bring everyone together for a full-day in-person planning session - one that would allow the group to discuss and commit to long-term, ambitious strategic goals and priorities, including identifying the Special Topics that will drive the second phase of this initiative. This project has two distinct components. The first is a full-day strategic planning session bringing together the 13 community leaders to establish a shared vision, set long-term priorities, and identify the specific Special Topics to be addressed. The second is a series of three separate Special Topic sprints, each focused on one of the topics identified during the planning session. These convenings will use a design framework to guide participants through developing and testing practical solutions for each identified problem. Alaska has good community networks and professional connections: bringing people together is one of the most effective ways to further build relationships and forge a shared identity that can move beyond individual and organizational interests to collectively address common challenges. Working together also means faster results. Participants will leave with concrete next steps, not just good intentions. Use of project management will ensure solutions move forward	Under \$50,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Workforce Alliance/Alaska Safety Alliance	Health Workforce Data Visualization Tool	AK	Alaska’s ability to “grow its own” healthcare workforce is central to stabilizing rural health access and reducing reliance on out-of-state recruitment and temporary staffing. However, Alaska currently lacks a centralized, shared system for collecting, integrating, and translating healthcare workforce education and training data into actionable insights. Enrollment, completion, credentialing, and training pipeline data are dispersed across institutions, state agencies, industry groups, and employers, often using inconsistent metrics. As a result, RHTP workforce investments risk being made without visibility into cumulative impact, duplication of effort, or alignment with high-cost vacancy areas. Without a unified view of workforce supply, pipeline progression, and regional variation, policymakers and industry leaders cannot determine whether investments are aligned with workforce demand, where shortages persist, or whether training programs are producing sustainable workforce growth. This fragmentation limits strategic decision-making and risks inefficient allocation of public and private resources. This project presents an opportunity to establish a neutral, statewide Health Workforce Data Visualization Tool that transforms fragmented data into clear, comparable, and actionable workforce intelligence to guide workforce investment and support long-term rural system stabilization under RHTP.	This project will develop and launch the Alaska Health Workforce Data Visualization Tool - a centralized workforce intelligence platform operated by the Alaska Health Workforce Coalition (AHWC) under the Alaska Workforce Alliance. Alaska's ability to "grow its own" healthcare workforce is central to stabilizing rural health access and reducing reliance on out-of-state recruitment and temporary staffing. Yet Alaska lacks a shared system for collecting and translating workforce education and training data into actionable insights. Enrollment, completion, credentialing, and pipeline data are dispersed across institutions, agencies, and employers using inconsistent metrics. A February 2026 Department of Labor report found one in four Alaska workers is a nonresident and that healthcare employs fewer nonresidents than other industries - yet it excluded traveling positions, a critical workforce segment. When workforce data is scattered, policymakers lack the visibility needed to assess whether investments match demand, where shortages are growing, or whether training programs are delivering results. This makes it difficult to use public and private resources as effectively as possible. This project will establish a neutral, statewide tool that transforms fragmented data into clear, actionable workforce intelligence to guide RHTP investment and support long-term rural stabilization. Phase 1: Data Mapping & Standardization The project will take stock of existing data sources - including enrollment, completion, credentialing, labor market projections, and wage data - and develop standardized templates so that information can be meaningfully compared across sources. Phase 2: Dashboard Development An interactive platform will bring this data to life, displaying enrollment and graduation trends, regional workforce comparisons, and how training output aligns with labor market demand. The tool will be designed with policymakers, employers, and educators in mind, keeping usability front and center. Phase 3: Validation, Testing & Training Before launch, the tool will be tested with stakeholders and refined based on their feedback. Training will be provided to ensure that agencies and coalition members feel confident using the platform to inform strategic planning and RHTP implementation. The result will be a durable workforce intelligence infrastructure that enables data-driven decision-making across Alaska’s healthcare system.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska Works Partnership, In.	Rural Healthcare Industry Building Maintenance Technician Outreach and Training Project	AK	Alaska has a large challenge for operating and modernizing rural healthcare infrastructure today. Currently healthcare providers are trapped in a costly cycle of Building Maintenance Technician (BMT) vacancies and emergency repairs that places patient safety and infrastructure investments at risk. Alaska’s healthcare infrastructure is valued at \$4.8B, with an estimated \$32B replacement cost. Persistent BMT labor shortages threaten these investments. These workers support and maintain facilities and operate essential life-support systems. Without BMTs, facilities face high risks of system failure and costly emergency repairs. Healthcare employs >1,600 BMTs today. A survey of twelve major healthcare employers on March 1, 2026, shows >200 BMT job openings. In rural Alaska it takes an average of 145 days to fill a BMT position, 3 times longer than nursing vacancies (45 days). Statewide, > 4,000 general maintenance workers are employed across all industries. Occupational growth is expected to be 8.6% by 2032 with 413 openings annually. About 90% of future demand is due to retirement as 65% of BMTs are over the age 45 and 20% 60 years or older. BMTs have a 36% turnover rate for many reasons besides retirement and the ability to move into higher pay construction, oil, mining and other facility maintenance jobs. These factors make it clear the healthcare industry needs a dedicated BMT career outreach, training and upskill pathway program. RHTP offers that opportunity.	AWP has successfully recruited and trained entry-level Building Maintenance Technicians (BMTs), and provided ongoing incumbent BMTs upskill training for 25 years. Our BMT training has led several hundred rural residents into jobs and careers as BMTs with a variety of industry employers including AVCP Regional Housing Authority (RHA), Bristol Bay RHA, Bering Straits RHA, and the North Slope Borough Public Works Department and Alaska Housing Finance Corporation contractors. The main goal of this project is to narrow and ultimately close the healthcare BMT labor gap. With RHTP resources AWP can serve as a healthcare workforce intermediary and create an industry specific BMT training program and career path in partnership with employers and industry associations. Applying a pilot and demonstration approach will ensure measurable inputs and outputs, results and performance of the project can be assessed and evaluated. Utilizing AWP’s existing BMT training platform and a hub-and-spoke training delivery system like other proven rural healthcare workforce programs will offer an efficient and cost-effective means for recruiting and training new BMTs and incumbent BMTs. By working closely with employers, the program’s design will meet real industry needs and allow for single- and multi-employer participation. AWP can quickly pivot current BMT training into a healthcare industry specific program to build the BMT talent pipeline and training track. BMT training combines classroom and hands-on learning in 40-hour stackable modules in essential areas such as carpentry, drywall, basic electricity, plumbing, HVAC, and occupational health and safety certification courses. The RHTP project will use our existing training centers and mobile training modules. Employers will be informed about upskill and cross-skill training opportunities for their employees and can choose additional training to meet their needs. AWP will assign a current BMT instructor and hire an additional instructor to coordinate and conduct training sessions. Our experienced case managers are ready to provide individual needs assessments and help recruits create an Individual Career Plan (ICP) to support participants during and after training. This RHTP workforce project will quickly expand the pool of healthcare BMTs, reduce vacancies, improve retention, and strengthen facility maintenance capacity.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alaska's Midnight Sun Therapy Services, LLC	Marine-Based Mobile Therapeutic Services for Remote Coastal Alaskan Communities	AK	Remote coastal regions often face limited access to specialized therapy services due to geographic isolation, workforce shortages, and inconsistent healthcare infrastructure. This project aims to address the lack of accessible and consistent speech, occupational, physical, and emotional/substance abuse therapy for individuals living in these areas. By developing a scalable delivery model—using mobile clinics, the project seeks to improve continuity of care, reduce travel barriers, and ensure residents receive timely, high-quality therapeutic support regardless of location.	Weather conditions in coastal Alaska frequently prevent aircraft from accessing rural communities for extended periods of time. Whether relying on wheel planes or float planes, low ceilings, high winds, fog, and severe coastal storms regularly ground flights, sometimes for days or even weeks at a time. When flights are delayed or canceled, scheduled visits must often be postponed, creating a backlog of communities needing services. This frequently results in a cascading effect that disrupts the entire service schedule and limits our ability to provide consistent and timely support. Consistency is critical for effective service delivery in rural communities. When providers are unable to return regularly, care may be delayed, continuity of services is disrupted, and additional strain is placed on already limited local healthcare resources. Over time, these interruptions make it difficult to establish dependable service models that communities can rely on for ongoing care and support. To address these challenges, we propose utilizing a marine-based vessel that will serve not only as transportation but also as a fully functional floating clinic, while providing accommodations for visiting specialists in four private staterooms. Many of the communities we serve are located along Alaska’s extensive coastline and are naturally accessible by water. A marine-based service model offers greater flexibility and reliability compared to aviation alone, particularly during periods when aircraft cannot safely operate due to weather conditions. The vessel we plan to use was custom built by one of the most respected commercial fishing boat builders in the world and was specifically designed for the demanding marine environments of Alaska. It has a proven track record of operating safely in challenging coastal conditions from Kodiak to Southeast Alaska. Its size, durability, and seaworthiness make it well suited for extended travel and operations in remote coastal regions. By utilizing this vessel as a mobile clinic, we can bring both transportation and clinical space directly to the communities we serve. Most importantly, this model will allow us to establish a more predictable and consistent service schedule. By reducing dependence on aircraft availability and narrow aviation weather windows, we can improve reliability, expand access to care, and ensure that rural coastal communities receive regular, dependable services.	\$1M-\$5M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Chugach Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Kodiak Island Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Aleutian Pribilof Islands Association, Inc.	APIA Facility Renovation and Community Wellness Enhancement (Anchorage and Unalaska)	AK	Our remote communities in the Aleutians and Pribilof Islands face limited access to integrated primary care, behavioral health, and wellness services due to small, under-optimized facilities and geographic isolation. The Anchorage office lacks fully functional, HIPAA-compliant workspaces, while the Unalaska office has insufficient space for community outreach, wellness programming, and elder food box preparation, including limited freezer/refrigeration capacity. This project will renovate and reconfigure existing facility to improve staff workflow, expand preventive health programming, and strengthen rural food security and diabetes prevention for underserved communities, elders, and individuals at risk for or living with diabetes.	To address limited access and facility constraints in Anchorage and Unalaska, the Aleutian Pribilof Islands Association (APIA) will renovate / reconfigure existing offices to improve integrated health services. In Anchorage, workspace will be reorganized to create a more functional, efficient, and HIPAA-compliant environment for primary care, behavioral health, and community health staff, enhancing workflow, collaboration, and patient privacy allowing for increased services to clients through victim services, behavioral health, Elder case management and Veteran suicide prevention services with clients. In Unalaska, renovations will expand space for community outreach, wellness programming, diabetes prevention, and elder food box supply storage, supported by chest freezer and refrigerator capacity to strengthen rural food security and safe distribution of perishable items. With no freezer or cooler space within the airlines or airport in Unalaska, it requires a large logistical effort to ensure Elder Food Box supplies shipped from Anchorage make it to outlying communities while still frozen. The approach maximizes existing infrastructure to improve access, quality, and sustainability of care. Dedicated clinical and programming areas, along with shared spaces for confidential telehealth visits and virtual trainings, will allow staff to deliver coordinated services efficiently. Wellness and outreach spaces will host small group programs, preventive health education, and culturally responsive services, enhancing community engagement. By targeting both offices, the project ensures rural residents and elders have reliable access to integrated primary care, behavioral health, and preventive services, while strengthening operational efficiency and the long-term sustainability of health and wellness programs in remote communities. These two projects will allow for increased capacity to serve more clients.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality)	Advance to Implementation Application

Aleutian Pribilof Islands Association, Inc.	Strengthening APIA Rural Diagnostic Capacity through Laboratory Expansion	AK	Current lab services within APIA PCS clinics are limited to CLIA-waived testing. Patients who present with symptoms that require additional laboratory testing may need to be transported off island or experience delays while samples are sent to more advanced laboratories in Anchorage, AK. These delays can impact patient outcomes and increase clinical risk in emergency situations. Having additional point of care labs such as the ability to test for troponin will help us identify cardiac arrest and potentially eliminate the need for a medevac.	RHTP funding will support the expansion of laboratory capacity within the APIA primary care system. The project will include the expansion of laboratory capability at the regional hub clinic, the Oonalaska Wellness Center (OWC) and deployment of point-of-care diagnostic equipment in rural clinic. APIA will strengthen laboratory services at the subregional hub clinic OWC by expanding diagnostic capacity in our CLIA Waived labs. This will allow providers to perform a broader range of diagnostic tests locally and support clinical decision-making for patients throughout the region. Key equipment investments will include: • Piccolo Chemistry Analyzer for the Nikolski health center to support testing capabilities • Point-of-care diagnostic systems capable of measuring troponin to support evaluation of potential cardiac events across APIA clinic sites • Additional laboratory equipment and training needed to support expanded diagnostic services at the regional hub clinic, OWC. These upgrades will strengthen the ability to diagnose and manage conditions locally, reducing the need to travel and reducing delays in treatment.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality)	Advance to Implementation Application

Aleutian Pribilof Islands Association, Inc.	Strengthening Rural Care Coordination through Expansion of Community Health and Social Work Services	AK	Communities served by APIA PCS experience significant health disparities driven by geographic isolation, workforce shortages, and barriers to accessing health and social services. Patients often require assistance navigating referrals, specialty care coordination, and eligibility for insurance programs such as Medicaid. Many patients often first present to APIA’s health system through our primary care clinics. Without dedicated staff embedded within the interdisciplinary clinical care team to support outreach, patient navigation, and care coordination, providers end up absorbing these responsibilities in addition to their clinical duties. Current staffing levels limit our ability to provide comprehensive outreach, care coordination, and assistance navigating complex health and social service systems. This limits the health system’s ability to proactively address social determinants of health, connect patients with available services, and support individuals who have not recently accessed care. Expanding workforce capacity within the primary care team will allow APIA to better coordinate services across departments, strengthen connections between health care and social supports, and improve patient engagement in care across the region.	RHTP funding will support the recruitment of one Social Worker and two Community Health Workers within APIA Primary Care Services. These positions will function as part of the interdisciplinary care team supporting providers and case management staff. The Social Worker will focus on clinical care coordination and patient support including assisting patients in navigating social services and behavioral health resources, and focusing on interdepartmental collaboration to ensure continuity of services across programs. The CHW will focus on outreach and enrollment activities including: • Conducting outreach to individuals not recently seen by primary care • Providing culturally appropriate health education and prevention activities • Assisting with Medicaid and insurance enrollment • Supporting screening for social determinants of health and connecting patients identified as having a need with the Social Worker to connect patients to available resources The CHW will also support community health awareness efforts and participate in local events to improve awareness of available health resources. These roles will strengthen coordination between primary care, behavioral health and social service programs while expanding the health workforce serving APIA PCS communities. As part of this initiative, APIA commits to maintaining these positions for a minimum of five years, ensuring long-term workforce stability and sustained impact in the communities of Atka, Nikolski, St George and Unalaska.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality)	Advance to Implementation Application

Aleutian Pribilof Islands Association, Inc.	Creating Cultural Connections to Promote Healthy Communities	AK	Our project proposes to build resilience and create positive social connections through cultural gatherings. These gatherings will foster the health and well-being of community members by providing a safe gathering place and a healing space that brings our people together to learn and share traditional knowledge, create traditional art pieces, and make healthy, meaningful connections within an intergenerational community. The program aims to improve health by fostering social connections that promote a healthy mind and body through the following RHTP goal and initiatives: Goal 1: Promote Lifelong Health and Wellbeing ~Healthy Beginnings: our project will offer wellness activities that can help youth build healthy habits. ~Healthy Communities: our project aligns with evidence-based approaches to support a healthy lifestyle by providing opportunities for community members to make positive social connections, encourage family engagement, and strengthen mental health resilience.	The project will be administered by APIA’s Cultural Heritage Department (CHD). APIA’s Cultural Heritage Director and Cultural Heritage Coordinator will plan and implement program activities. CHD staff are ready to execute the project immediately upon receipt of award. Six cultural instructors will be hired to share traditional knowledge. One cultural instructor will travel from our tribal community of Akutan to teach afternoon sessions in traditional foods preparation during a week-long gathering for children and youth. Project staff will also assist the Qawalangin Tribe with planning and implementation of community gatherings in Unalaska. CHD has a long history of implementing culturally relevant community projects and events. The department has historically managed grants and provided implementation support for initiatives aimed at strengthening the community. Formed in 1998, APIA’s Cultural Heritage Department promotes Unangaġ (Aleut) heritage through preservation and education programs, including teaching cultural values to new generations. It supports cultural healing practices, art, and language, and facilitating projects that ensure the Unangaġ people and culture flourish. Weekly events will be held at APIA’s headquarters in Anchorage where a large meeting space is available to host the event in collaboration with mutual support groups. We will hire elders and culture bearers who will teach/share traditional knowledge such as drum making, drumming, dancing, sewing, beading, language, carving, and more. This unique combination offers mutual support in a multifaceted dynamic approach where people have a shared cultural identity. Peer support by Unangaġ people for Unangaġ people: results from an APIA 2022 Community Needs Assessment, demonstrate the profound need to provide access to healing modalities that have a foundation in cultural relevance and are facilitated by Unangaġ people. This is also echoed through the ongoing communications with our board of directors, comprised of representatives from each tribe in our Region. The need to increase access to cultural healing activities facilitated by Unangaġ people for participants seeking support is urgent. Part of that urgency stems from the fact that the Aleutian Pribilof Islands Region is comprised of thirteen tribal entities spread across ten remote geographical locations, separated by great distances and the hindering cost of travel.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality)	Deferred or Not Advanced

Aleutian Pribilof Islands Association, Inc.	Expanding Access to APIA Behavioral Health Services	AK	The remote nature of APIA’s service area is the primary problem we face. Travel is difficult and unpredictable, there is a lack of a workforce pool, and costs can be prohibitive. By hiring dedicated telehealth providers to serve our region, APIA Behavioral Health Services sees opportunity to improve access to culturally appropriate behavioral health services, help ensure continuity of care for rural residents, and provide evidence-based and cost-effective services to our region.	Remote clinicians will be incorporated into current outpatient workflows, including centralized scheduling with the APIA Registration Team, standardized virtual intake appointments, and EHR-based documentation. Collaboration between onsite and remote staff will ensure continuity of care, coordinated referrals, and clear escalation pathways if in-person services are required. Since our office-based clinicians are already remote one day per week, using existing workflows will be seamless for clinicians who would be remote full-time. Technology Infrastructure Remote services will utilize HIPAA-compliant telehealth platforms with end-to-end encryption, supported by secure broadband connectivity. Clinicians will access fully integrated EHR Cerner systems to maintain documentation standards, scheduling efficiency, and care coordination. Remote Workspace Requirements All remote staff will maintain private, secure, and professional home office environments, meeting standards for confidentiality, device security, and patient privacy. Remote clinicians would provide a detailed description of their home office, with approval from both APIA IT Support and BH Department Managers regarding space approval standards. Clinical Roles & Competencies Remote Outpatient Therapist (LCSW/LPC/PsyD/ PhD) Remote therapists will conduct virtual assessments, develop individualized treatment plans, provide evidence-based therapy, and collaborate with onsite teams and community resources. Core Virtual Competencies Clinicians must demonstrate proficiency in digital professionalism, virtual rapport building, recognizing non-verbal cues in video sessions, and adapting therapeutic techniques for remote delivery. Crisis Management Remote Crisis Protocols will be established, including documented safety plans, identification of local emergency resources near each client, and structured communication pathways with onsite leadership. Clinicians will receive training in remote risk assessment and escalation procedures. By integrating up to three remote clinicians into existing workflows, this project supports patient access, employee retention, and operational efficiency while maintaining clinical quality and regulatory compliance.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality)	Deferred or Not Advanced

Aleutian Pribilof Islands Association, Inc.	Improving Emergency Medical Transport Capacity in Nikolski by Acquisition of a Dedicated EMS Vehicle	AK	Nikolski, AK is an isolated rural community in the Aleutian region with limited transportation infrastructure and severe weather conditions that frequently delay emergency response. The local clinic currently does not have a dedicated Emergency Medical Services transport vehicle. In medical emergencies, clinic staff and responders must rely on improvised or shared vehicles to move patients between the clinic, airstrip, and other transfer points. These limitations can delay stabilization and transport for patients requiring urgent medical care, particularly during events when alternative vehicles are unavailable. The lack of appropriate transport capacity increases clinical risk and complicates coordination of transporting patients from the clinic to the airfield where medevac flights land. This project addresses a critical infrastructure gap by strengthening emergency medical response capacity in Nikolski and improving the reliability, safety and timeliness of patient transport.	RHTP funding will support the acquisition and deployment of a dedicated EMS transport vehicle for the Nikolski Health Center operated by Aleutian Pribilof Islands Association. The project will procure a reliable all-terrain EMS transport vehicle suitable for the severe weather and rural road conditions common in the Aleutian region. The vehicle will be equipped to safely transport patients and allow trained responders to move individuals experiencing medical emergencies between the clinic, community locations, and the airstrip where patients are transferred to higher levels of care. The vehicle will also support emergency preparedness activities and community response. Implementation activities will include: • Procurement of a reliable EMS transport vehicle suitable for rural terrain and weather conditions • Outfitting the vehicle with essential patient transport equipment and safety features • Integration of the vehicle into existing clinic and community EMS response protocols • Training clinic staff and local ETT responders on vehicle operation and emergency transport procedures This project will strengthen emergency preparedness and response capacity while improving coordination between clinic staff, local responders, and regional medevac services.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality)	Deferred or Not Advanced

Aleutian Pribilof Islands Association, Inc.	Rural Health Facility Safety and Technology Infrastructure Enhancement	AK	APIA operates a network of health and behavioral health facilities serving communities across the Aleutian region. Many of these locations are remote and rely on small clinical teams working in isolated environments to deliver essential health services. In rural clinic settings, staff frequently provide care independently while responding to a wide range of medical and behavioral health needs, including patients experiencing behavioral health or substance use related crises. Limited facility monitoring infrastructure can reduce situational awareness within clinical environments and make it more difficult to quickly identify and respond to safety concerns involving patients, visitors, or facility access. This project will strengthen the safety and operational resilience of APIA facilities by implementing standardized CCTV monitoring systems across regional clinics and behavioral health facilities while expanding monitoring coverage at the Anchorage headquarters. Improving situational awareness will support staff working in remote locations and enhance the ability to respond to safety incidents when they occur. This project strengthens the infrastructure supporting rural health care delivery by improving safety, situational awareness, and operational coordination in facilities where essential health and behavioral health services are provided.	This project will deploy standardized CCTV monitoring systems across APIA regional clinics and behavioral health facilities while expanding monitoring coverage at APIA’s Anchorage headquarters. The systems will consist of secure network-based cameras positioned at building entrances, hallways, exterior access points, and other public operational areas to improve situational awareness and support facility safety. These systems will improve situational awareness within clinical environments, support facility safety monitoring, and provide documentation of incidents when needed. Each clinic location will receive a system scaled appropriately to the size and operational needs of the facility. Systems will allow secure access for authorized clinic staff as well as designated personnel at APIA headquarters. This approach will support operational awareness across facilities and improve coordination between rural clinics and administrative teams. Expansion of the Anchorage headquarters monitoring system will strengthen oversight of entrances, public spaces, and operational areas where staff and clients interact. All systems will utilize secure video management technology compatible with APIA’s existing IT infrastructure and selected for reliability in remote environments.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality)	Deferred or Not Advanced

Aleutian Pribilof Islands Association, Inc.	St George Health Center Facility Exterior Repair Project	AK	APIA operates the St George Health Center, which provides primary care, emergency stabilization, and public health services to residents of St George Island in the Pribilof Islands. The facility is exposed to extreme maritime weather conditions including extremely high winds, salt exposure, and prolonged moisture that accelerate deterioration of exterior building materials. The facility’s roof and siding have experienced significant wear due to these environmental factors. Without timely replacement, the building is at increased risk of water intrusion, structural damage, and deterioration that could disrupt healthcare operations. Because St. George Island is a remote community only accessible by air, maintaining resilient healthcare infrastructure is critical in ensuring residents have access to healthcare. Damage to the facility could interrupt access to essential medical care and emergency stabilization services for local residents. This project will replace the aging roof and exterior siding of the St George Health Center to restore the integrity of the building, improve resilience against severe weather, and ensure continued delivery of healthcare services in this rural Alaskan community.	This project will focus on rehabilitation of the St George Health Center exterior structure through replacement of the facility’s roof and siding with durable materials designed for harsh maritime climates. The project will include: • Removal and replacement of the existing roof • Removal and replacement of deteriorating exterior siding • Installation of weather-resistant materials designed to withstand high winds and moisture exposure common in the Pribilof Islands • Transportation of construction materials and equipment to St George Island • Coordination with qualified contractors experienced in rural Alaska construction The work will restore the building envelope and protect the interior clinical spaces, medical equipment, and patient care areas from environmental damage. This project supports the long-term sustainability of healthcare services in the community by ensuring the facility remains structurally sound and capable of supporting ongoing clinical operations.	\$250K-\$1M	Other	Single Community	Aleutians West Census Area; Anchorage (Municipality)	Deferred or Not Advanced

Aleutian Pribilof Islands Association, Inc.	Supporting Atka Island Health Services with Reliable Fuel Supply	AK	Healthcare facilities in remote communities like Atka Island rely on consistent fuel deliveries for heat and power. Weather, shipping delays, or limited supply can disrupt clinic operations and housing for medical staff. This project aims to improve health system reliability by establishing a community-managed fuel transport and delivery system, ensuring timely fuel access for both the clinic and provider housing. Reliable fuel access enables: • Continuous clinic operations • Safe, comfortable housing for healthcare providers • Enhanced emergency preparedness • Reduced risk of service interruptions	The project will establish a local fuel transport solution to support healthcare infrastructure in Atka. Key activities include: 1. Acquisition of a small fuel transport truck or tanker trailer - o Suitable for local road conditions - o Equipped with safety features and pump system 2. Fuel delivery system setup - o Transport fuel from bulk storage to the clinic and provider housing - o Maintain consistent delivery schedules 3. Operator training and safety compliance - o Safe fuel handling and transport - o Spill prevention and response - o Equipment maintenance 4. Operational planning - o Designate trained local operators - o Develop fuel inventory monitoring and delivery schedules	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area	Deferred or Not Advanced

Aleutian Pribilof Islands Association, Inc.	Supporting Unangan Elders at Home	AK	Elders living in Aleutian communities face significant barriers to health and social services. Geographic isolation, limited transportation, workforce shortages, and complex administrative requirements for Social Security, Medicare, and Medicaid make it difficult for elders to access preventive care, chronic disease management, and supportive services. Many older adults in these communities' experience falls, mobility challenges, and social isolation, yet local resources to address these issues are limited. By improving the health, safety, and quality of life for older adults through hiring local Elder Care Services staff to deliver evidence-based programs, including Bingocize and Stepping On for chronic disease prevention and exercise. Staff will provide case management, assist with benefits paperwork, and connect elders to home and community-based supports such as congregate meals and transportation. By embedding trained staff within the community, this initiative strengthens local capacity, ensures culturally and geographically appropriate services, and reduces barriers to care. By leveraging community networks to deliver preventive programs and supportive services directly where elders live it addresses both health and social needs. This approach improves access, enhances quality of care, and builds sustainable local systems to support older adults, ultimately reducing risks associated with falls, chronic disease, and social isolation in rural and frontier communities.	The proposed approach focuses on hiring additional Elder Care Services staff from local communities to expand access to preventive health programs and supportive services for older adults in rural and frontier areas. Hiring locally ensures staff have cultural knowledge, community trust, and an understanding of geographic and logistical challenges, which improves engagement and sustainability. With the lack of funding for additional staff, this fills a large gap within serving Elders in the Aleutian communities. Staff will implement evidence-based programs to address key health risks: Bingocize, a fall prevention program, and Stepping On, a chronic disease prevention and exercise program. Programs will be offered in community settings and adapted for home-based or small-group delivery when transportation or isolation limits access. Staff will be trained in program delivery, outcome tracking, and trauma-informed engagement with older adults. In addition to program facilitation, staff will serve as a central point of contact for elders, assisting with Social Security, Medicare, and Medicaid paperwork, case management, and connecting participants to home and community-based supports such as congregate meals, transportation, and other local resources. This integrated approach ensures that both preventive health and social support needs are addressed in a coordinated manner. Ongoing training, supervision, and technical assistance will support staff retention and program fidelity. By embedding these positions within the community, the project strengthens local capacity, increases access to health and social services, and creates a sustainable framework for ongoing elder care, preventive programming, and support services in frontier communities.	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality)	Deferred or Not Advanced

Aleutian Pribilof Islands Association, Inc.	Supporting Victims through Widespread Training and a Home Visiting Program	AK	Aleutian communities face significant barriers to identifying and responding to domestic violence and its related health impacts. Victims often have limited access to healthcare and victim advocacy due to geographic isolation, transportation challenges, provider shortages, and concerns about confidentiality in small communities. As a result, many survivors do not receive timely screening, support, or referrals for the physical and emotional effects of abuse, including traumatic brain injury, mental health challenges, and parenting difficulties following violence. This project addresses these gaps by strengthening early identification and support through trauma-informed training and screening programs. Implementing Confidential, Universal Education and Support (CUES), H.E.L.P. screening for domestic violence–related traumatic brain injury, and the B.A.S.K.E.T.S. advocate-driven screening model will help healthcare providers and advocates recognize signs of abuse, provide universal education, and connect victims to appropriate resources. In addition, many families affected by domestic violence in rural communities lack access to parenting support and home-based services. Implementing the Hearts and Hope: Parenting After Domestic Violence program and the Family Spirit home visiting model will provide trauma-informed parenting education and family support directly in the home, helping reduce barriers to care while promoting safety, resilience, and healthy child development.	This project will build local capacity by training healthcare providers, community health aides, and victim advocates to implement trauma-informed screening, education, and response strategies within the services already available in each community. Training in Confidential, Universal Education and Support (CUES), H.E.L.P. screening for domestic violence–related traumatic brain injury, and the B.A.S.K.E.T.S. advocate-driven screening model will equip local professionals to recognize signs of abuse, provide universal education, and connect survivors to confidential support and resources. The project will also strengthen the work through the APIA Victim Services team, who will provide direct advocacy, coordination of services, and ongoing technical assistance to local partners. These staff will help ensure survivors have access to confidential support, safety planning, and referrals, while also helping sustain training efforts and strengthen collaboration among healthcare providers, advocates, and community organizations. To overcome transportation and access barriers, the project will expand home-based services through the Hearts and Hope: Parenting After Domestic Violence program and the Family Spirit home visiting model. These programs allow trained advocates or home visitors to provide parenting education, safety planning, and family support directly in the home or through telehealth when travel is not possible. By strengthening local skills, expanding advocacy support, and integrating services within existing systems, this approach will improve access to care and promote long-term health and safety for survivors and families in the Aleutian and Pribilof Islands region.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Anchorage (Municipality)	Deferred or Not Advanced

All Alaska Pediatric Partnership	All Alaska Pediatric Partnership: Readiness for a Coordinated Pediatric System of Care	AK	Since launching HMG-AK in 2018, we have seen increased demand for the program’s care coordination and resource navigation services. This trend aligns with the persistent barriers facing families seeking coordinated pediatric health and behavioral health care, including geographic isolation, limited provider capacity, and fragmented referral systems across health, education and community services. In the Behavioral Health Roadmap Project for Alaska Youth, DOH recommends expanding awareness and utilization of HMG-AK to increase support for parents and guardians navigating the system and identifies HMG-AK as a strategy to optimize utilization of existing resources. In response, A2P2 proposed a multi-phase initiative to develop new service tracks and referral pathways that will strengthen Alaska’s pediatric system of care by improving referral coordination, expanding service mapping, and supporting earlier identification and connection to services. This grant is needed to strengthen A2P2’s organizational readiness to implement the work proposed in the initiative and successfully meet anticipated rising demands for our services. Through targeted internal planning, organizational development activities and technical assistance, A2P2 will design implementation strategies, develop staffing and operational models and strengthen internal leadership, governance and funding structures needed to support expanded statewide coordination and to further sustain these system improvements.	This project seeks Administrative Readiness funding to prepare A2P2 for the anticipated implementation of a multi-phase expansion of Help Me Grow Alaska’s service tracks and referral pathways in service of a more coordinated system of care for children and families across Alaska’s rural communities. The readiness effort will support two complementary activities: 1. Project Design and Implementation Planning A2P2 will engage a contractor to further develop and operationalize Phases 1–3 of the proposed Coordinated System-of-Care initiative. This work will include refining referral pathways, defining implementation milestones, strengthening data infrastructure requirements and aligning project activities with state systems, priorities and partners. Planning will also focus on structural enhancements to HMG-AK’s Centralized Access Point (CAP) and resource directory to better identify service gaps, increase coordinated referrals, and provide actionable data to the State and health system partners. This work will also support development of infrastructure needed for enhanced data integration and interoperability with existing systems such as Alaska’s Health Information Exchange, enabling better coordination among providers and agencies. 2. Organizational Readiness and Workforce Planning To successfully implement this initiative at scale, A2P2 must expand its organizational capacity. A second contractor will support leadership development, organizational planning and staff expansion strategies to prepare A2P2 for overall program growth. Activities will include defining future staffing models, strengthening internal systems and governance structures, supporting leadership development and establishing operational processes needed to sustain expanded services. Together, these readiness activities will position A2P2 to launch a more coordinated and sustainable system of care that improves early identification of needs, strengthens provider partnerships, and ensures families, especially those in rural and remote communities, can access the services and supports necessary to keep children healthy and thriving as close to home as possible.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Planning

All Alaska Pediatric Partnership	Alaska Family Journey Mapping: Visualizing Access to Early Childhood Services	AK	In 2024, All Alaska Pediatric Partnership (A2P2) launched The Early Childhood Partnership (ECP) coalition to promote a coordinated and unified early childhood system for Alaska’s young children, prenatal to age eight, by advancing cross-sector leadership and providing trusted information on the early childhood system and the programs within it. Throughout the first year of planning, ECP members recognized a transformative opportunity to bridge the gap between service provider data and the actual lived experiences of Alaskan families as they utilize available services. While there is substantial information available from service providers about needs and gaps in the systems of care, similar information from families on the barriers they encounter is anecdotal and indirectly reported by programs. State leadership, policymakers and funders lack access to concrete data showing precisely where parents experience gaps and barriers as they navigate specific processes, as well as which factors facilitate their successful movement through complex health care delivery systems and public assistance programs with specific eligibility criteria. Through a proposed process of Family Journey Mapping, the ECP will reveal and visualize the hidden work families and providers who serve them perform to navigate eligibility criteria and service delivery and the nuances of the barriers that stand in their way.	The ECP proposes to lead parent journey mapping activities in collaboration with members of the Early Childhood Network (ECN) - a network of early childhood coalitions and advocates across the state, co-hosted by A2P2 and the Alaska Department of Health. These activities will be co-designed to provide information on the processes involved in accessing various family needs. • We will contract with an Alaska-based research and consulting agency to complete 18–25 Family Journey Maps across 5-7 participating public health regions, prioritizing rural areas most impacted by system barriers. • At least 50 percent of the mapping will be conducted with families who are living in off-road communities, and 75 percent with Medicaid-reliant families. Most families will have multiple needs. • Participation stipends will be provided to community members to recognize the value of their input and expertise and to compensate them for their time and effort. Maps will be analyzed by thematic area, and we will create graphic representations of each of the core topic areas explored to visually represent the unique journeys of parents and/or caregivers across several critical areas: • Developmental Milestones: Navigating the path from initial concern to accessing early intervention services. • Remote Maternal Health: Accessing consistent prenatal and postpartum care for high-risk pregnancies in off-road communities. • Family Recovery: Seeking treatment for substance use as a single parent. • Economic Resilience: Accessing the child care necessary to maintain employment or return to work. • Complex Care Coordination: Managing care for a child with complex health care needs. Once completed, the ECP will utilize the maps to propose and support additional projects and initiatives that address needs and gaps in the systems of care and are aligned with the key initiative areas of the RHTP and recommendations in documents such as the Early Childhood Alaska Strategic Direction for 2025-2030 and Alaska’s Comprehensive Integrated Mental Health Program Plan. The maps will help translate statewide goals embedded in these plans into clear understanding of how families actually experience the system of care. Finally, the maps will also be made widely available to other program partners and state agencies to support their own work of transforming care for Alaskans.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

All Alaska Pediatric Partnership	All Alaska Pediatric Symposium - strengthening Alaska's Pediatric Workforce	AK	This project addresses the unique challenges of pediatric care in Alaska by using the All Alaska Pediatric Symposium as a central platform to strengthen collaboration, readiness, and coordination among pediatric providers and partners while delivering Alaska-specific education. Many providers now choose online CMEs or conferences outside Alaska, which often lack content relevant to Alaska’s healthcare realities and opportunities for peer collaboration. The symposium offers a valuable opportunity for providers to network and build relationships, improving care continuity as children often receive care from multiple providers across regions. The symposium features high-quality presentations on rural healthcare delivery, care coordination, and emerging technologies. This project will support development of a dedicated technology vendor track to encourage dialogue between Alaskan providers and technology vendors seeking a footprint in Alaska with the goal of increasing coordination and to offer education and assistance on decisions around appropriate use of technology. Participation stipends will help reduce financial barriers and support attendance from key partners across the pediatric care continuum, ensuring diverse perspectives are represented. By strengthening networks, promoting Alaska-focused education, and supporting statewide collaboration, this project will help build a more connected and specialized pediatric workforce to meet the needs of Alaska’s children.	This project will leverage the All Alaska Pediatric Symposium as a platform to strengthen the pediatric workforce, enhance collaboration, and introduce technology-focused education tailored to Alaska’s care environment. Re-branding The symposium’s messaging will be refreshed to emphasize the value of Alaska-specific training and collaboration. This will highlight how the conference addresses the realities of pediatric care in Alaska, including geographic isolation, limited access to pediatric sub-specialists, and the need for coordination across a widely dispersed workforce. Messaging will also emphasize peer-to-peer networking among providers caring for children across the state. The symposium supports Alaska’s itinerant model of care, where specialty providers are often based in Anchorage but serve multiple regions, by promoting coordination across the statewide pediatric care network. Targeted Outreach and Communication Expanded outreach will increase participation from providers across Alaska, particularly those serving rural and remote communities. Efforts will focus on engaging providers from tribal health organizations, rural clinics, regional hospitals, and urban systems to ensure broad statewide representation. Communications will highlight the symposium’s Alaska-specific training and the opportunities it collaboration and shared learning. Participation stipends will help reduce financial barrier for those who may otherwise be unable to attend. Ensuring important voices and roles within the pediatric care system are represented. Technology-Focused Sessions The symposium will introduce a technology-focused component to help providers better utilize digital health tools in Alaska’s unique care environment. A session will be provided that addresses things like responsible and effective use of telehealth, digital communication platforms, and remote consultation technologies that support pediatric care across long distances. Opportunities for partners and stakeholders to coordinate around technology engagement and discuss practical strategies for implementation in rural and resource-limited settings will be provided. Through these efforts, focused messaging, targeted outreach, and technology education, the project will expand participation in the symposium, strengthen connections across Alaska’s pediatric workforce, and support collaboration and innovation in pediatric care delivery statewide.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alpenglow Women's Health	The Alpenglow Initiative: Bridging critical gaps in Alaska rural maternity care.	AK	The Mat-Su Borough and other surrounding Alaskan rural communities, faces significant barriers to maternal and child health, including high rates of morbidity and mortality among women and children due to limited access to prenatal care, education, and ongoing support. . Alaska's RHTP allocates \$272 million annually to states like ours to transform rural health systems, emphasizing initiatives such as Healthy Beginnings under Goal 1: Promote Lifelong Health and Wellbeing for Rural, Remote, and Frontier Alaskans. Our project aligns precisely with this priority by providing comprehensive pregnancy and parenting education, which evidence shows can reduce adverse outcomes like preterm births, low birth weights, and maternal complications—critical needs in Alaska's interconnected health system where hub communities like Mat-Su serve remote populations.	We propose the The Alpenglow Initiative: Bridging critical gaps in Alaska rural maternity care., a scalable initiative ready for the Project Implementation funding pathway, with potential to advance to Targeted Innovation as it evolves. Key components include: • Hiring a Full-Time Registered Nurse: The RN will serve as a dedicated case manager, conducting home visits, coordinating care with local clinics, and linking clients to telemedicine for rural residents, stabilizing the workforce in line with RHTP's Strengthen Workforce initiative. • Pregnancy and Women's Health Education: Weekly group sessions and one-on-one counseling on prenatal nutrition, mental health, substance avoidance, and postpartum recovery, tailored to Alaska Native and rural families, fostering Healthy Communities. • Comprehensive Case Management: Holistic support from preconception through early childhood, including transportation assistance, family planning, and parenting classes to prevent morbidity and mortality, directly supporting Health Care Access and reducing costly medevacs. This project supports RHTP's statewide application by addressing geographic challenges in Mat-Su, a hub for rural Alaskans, and avoids duplication of existing services by focusing on integrated education and navigation not currently scaled in the borough. Our clinic also serves many communities outside of the Mat-Su Borough as far as Ketchikan and Fairbanks. Initial rollout targets up 1000 high-risk women in Year 1, expanding based on outcomes like reduced emergency visits (tracked via metrics aligned with RHTP reporting).	\$250K-\$1M	Maternal health	Statewide	Copper River Census Area; Dillingham Census Area; Ketchikan Gateway Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; Petersburg Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced
Alpine Physical Therapy LLC	Bringing and keeping specialized physical therapy services to SEAK	AK	- New parents do not get the support they need on many fronts. I can provider the movement, mobility, strength and ergonomic side to pregnancy and being a new parent. Any support for new parents and families can assist in improving early childhood outcomes and decrease PPD risks. I also work a little for Early Learning and can help screen clients to get into early learning - Movement and strength screens: prevention of injury and movement limitations. Just like getting dental cleanings we should have a movement screen by a PT every 6-12 months to learn what we need to do for our body and our movement. To get folks active, moving, exercising and health. For all ages and to prevent the frequent mid and low back pain that occurs in new parents. - Avoid high cost of out of state travel for specialized PT care for pelvic health and vestibular health	- Offer 1:1 movement and mobility screens for all ages get people moving and active. Teaching for and technique specific to them for exercise and strength. - Offer coming to the home of new parents to look at ergonomics, movement, mobility and initial post partum exercise. Screen for other medical conditions PPD, HTN etc that can occur early post partum. - Keep up date with specialized education and course work and board certification to bring the highest quality PT care to SEAK and any community via telehealth.	Under \$50,000	Other	Other	Sitka (City and Borough)	Deferred or Not Advanced

Altair Community Health, Inc	Alaska Rural Tele-Rehabilitation Access Network (ATRAN)	AK	Alaska continues to face significant health challenges that underscore the need for expanded access to rehabilitation and preventive health services, particularly in rural and remote communities. According to the Healthy Alaskans 2030 Scorecards, the state’s unintentional injury mortality rate remains extremely high, measured at 92.9 deaths per 100,000 in 2023 and 90.6 per 100,000 in 2024, far above the state target of 56.5. Drug-induced mortality remains a major concern as well, rising from 51.0 per 100,000 in 2023 to 47.1 per 100,000 in 2024, still more than triple the Healthy Alaskans target of 14.2. Mental health indicators show similar strain, with adults reporting an average of 4.9–5.0 mentally unhealthy days per month. At the same time, access barriers persist: 11.5% of adults in 2023 and 12.9% in 2024 reported they could not afford to see a doctor within the past year. These data highlight a growing need for accessible rehabilitation, injury recovery support, and preventive wellness programs. Rural Alaskans face additional barriers due to limited provider availability, high travel costs, and geographic isolation. Expanding tele-rehabilitation and digital wellness services can help close these gaps by providing guided exercise, rehabilitation programs, and health coaching directly to individuals in their communities, helping reduce long-term disability, support recovery after injury, and strengthen health outcomes statewide.	Altair Community Health proposes a statewide online rehabilitation and wellness program designed to address the high burden of injury, substance misuse, and mental health challenges across Alaska, particularly in rural and frontier communities where access to care is limited. The program will provide residents with remote access to personalized rehabilitation plans, guided exercise programming, nutrition education, and ongoing coaching from trained rehabilitation professionals through a secure online platform. Participants will begin with a virtual assessment to identify injury history, functional limitations, and wellness goals. Based on this assessment, each individual will receive a customized rehabilitation and strengthening program delivered through a mobile and web-based platform. Programs will include guided exercises focused on improving strength, mobility, balance, and injury prevention, along with nutritional guidance and lifestyle strategies that support healing and long-term health. A key component of the program is ongoing support from a dedicated rehabilitation coach who will monitor progress, provide accountability, and adjust programs as needed. This coaching model is particularly valuable for rural communities where individuals often lack consistent access to rehabilitation providers and may struggle with isolation or limited follow-up care after injury. Beyond injury recovery, the program also addresses broader health challenges linked to Alaska’s high rates of injury, substance misuse, and mental health concerns. Regular physical activity, structured coaching, and improved nutrition are proven to support mental health, reduce stress, and improve resilience. By helping individuals rebuild strength, restore physical function, and regain confidence in their health, the program can reduce long-term disability and support healthier lifestyles. For rural communities, this digital model removes barriers related to travel distance, cost, and provider shortages by delivering rehabilitation support directly to individuals in their homes. By combining rehabilitation care, nutrition education, and coaching through an accessible online platform, the project creates a scalable solution that improves recovery from injuries, supports mental well-being, and strengthens long-term health outcomes for Alaskans statewide.	\$50,000-\$250,000	Clinic	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Altair Community Health, Inc	Mat-Su Traumatic Brain Injury Recovery & Rehabilitation Program	AK	The Matanuska-Susitna Borough faces a significant burden of injuries and preventable deaths closely associated with traumatic brain injury (TBI), including accidents, overdoses, and suicide. In 2024, leading causes of death in the Borough included accidents (112 deaths), drug-induced deaths (58), and suicide (35). Drug-induced deaths reached 53.6 per 100,000 residents and overdose deaths 52.6 per 100,000. Injury-related hospitalizations remain high, with 693 cases reported in 2023, including 333 from falls and 103 from motor-vehicle occupant injuries. Local TBI hospitalizations are rising rapidly, increasing from 83 cases in 2022 to 136 in 2023. Statewide data reflects an even broader crisis: Alaska has the highest traumatic brain injury mortality rate in the United States, more than double the national average. Despite this urgent need, many Alaskans with concussion or brain injury cannot access coordinated assessment and rehabilitation. Patients frequently lose insurance coverage after injury, face denied claims, or encounter therapies that are not reimbursed. This gap is particularly severe for working-age adults. Alaska Medicaid generally does not cover chiropractic services for individuals ages 21–65 unless they are also Medicare recipients. As a result, the population most likely to be working, supporting families, and attempting to return to duty or employment after brain injury often cannot obtain the comprehensive neurological rehabilitation necessary for recovery.	This project expands traumatic brain injury (TBI) treatment capacity in the Mat-Su Valley through an access-first clinical model designed to begin care immediately rather than delaying treatment while patients wait for insurance authorization or referrals. The program will launch a Rapid Access TBI Clinic supported by a Coverage Gap Fund so patients can receive timely evaluation and rehabilitation even when insurance coverage is absent, delayed, or incomplete. Within the first 30–60 days, the Rapid Access TBI Clinic will establish a single referral pathway and standardized intake process serving emergency departments, urgent care clinics, primary care providers, schools and sports programs, first responder agencies, VA and veteran networks, workers’ compensation referrals, and self-referrals. Patients will receive clinical triage appointment and a comprehensive TBI evaluation within seven days, with expedited evaluation available for urgent neurological concerns. This rapid-access approach allows patients to begin treatment during the critical early recovery window following concussion or brain injury. All patients—regardless of insurance status—will follow the same evidence-informed care pathway. Initial assessments will include injury history, symptom inventories, vestibular and ocular screening, cervical and neuromusculoskeletal evaluation, autonomic regulation indicators, cognitive and behavioral health screening, and return-to-work or school readiness assessment. Based on these findings, patients will enter an individualized 6–12 week episode-of-care plan integrating vestibular and vision rehabilitation, cognitive therapy, graded exertion progression, cervical and musculoskeletal care, sleep and pain regulation strategies, and behavioral health support when indicated. Care coordination will support return-to-work or return-to-learn planning, family education, and transition to community providers when appropriate. When insurance coverage is unavailable or essential services are not reimbursed—including limitations affecting adult Medicaid beneficiaries—the Coverage Gap Fund allows treatment to proceed. The project will also develop standardized care pathways, documentation templates, and outcome tracking to demonstrate functional recovery, reduced downstream healthcare utilization, and improved long-term access to TBI rehabilitation in Alaska.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Alterity	Alterity Solutions Managed Learning Services -Consulting & Continued Workforce Training	TX	Alaska’s Rural Health Transformation initiative prioritizes strengthening the workforce by growing local talent, improving retention, and expanding access to training across rural and frontier communities. Alterity Solutions’ Managed Learning Services (MLS) directly supports this goal by helping health organizations train, and retain a skilled, resilient workforce. Alterity MLS enables scalable, technology-enabled learning that overcomes geographic barriers through virtual onboarding, role-based clinical and non-clinical training, and continuous upskilling aligned to rural care models. By building structured career pathways, competency-based learning, and leadership development programs, Alterity helps organizations grow local pipelines and reduce reliance on costly temporary staffing. With data-driven learning analytics and change management support, Alterity ensures training investments improve performance, engagement, and retention which will help with outcomes of Alaska’s Strengthen Workforce initiative. This approach supports culturally responsive care, accelerates readiness for new models of care, and builds a sustainable workforce that can deliver high-quality care close to home. MLS will help create a culture of learning and help reduce the gaps in management and leadership training to help retain top talent.	Alterity proposes addressing this challenge through its Managed Learning program, a scalable workforce training solution designed specifically for rural, remote, and resource-constrained healthcare organizations. The program strengthens the workforce by embedding continuous, role-based learning directly into daily operations, allowing staff to build skills without disrupting patient care. Managed Learning provides end-to-end learning management, including program design, delivery, administration, reporting, and ongoing optimization. Training pathways are aligned to specific workforce roles—clinical and non-clinical—supporting faster onboarding, cross-training, and skill development tailored to local operational needs. This approach is particularly well-suited to rural settings where staff often perform multiple functions and workforce flexibility is essential. The program uses a remote-first delivery model, offering self-paced digital learning, virtual instructor-led sessions, and on-demand content that accommodates shift-based schedules and eliminates the need for travel. Continuous learning replaces one-time training events, supporting sustained competency, adaptability, and confidence across the workforce. By removing the administrative burden of managing training internally, Alterity enables rural healthcare organizations to access high-quality workforce development without adding staff or diverting clinical leaders from care delivery. Managed Learning also supports workforce retention by connecting training to professional growth and career pathways. Through this approach, Alterity’s Managed Learning program directly advances Rural Health Transformation Program goals by expanding access to training, strengthening recruitment and retention, and building a resilient, adaptable healthcare workforce capable of supporting long-term care transformation in rural and remote communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alzheimer's Association - Alaska	Dementia Capable Communities in Rural and Frontier Alaska	AK	As of 2020, 8,400 people aged 65 or older have Alzheimer's disease in Alaska. There are 25,000 caregivers across the state who dedicate a total of 39 million hours of unpaid care valued at \$887 million annually; 53.7% of them have chronic health conditions. Rural communities face a disproportionate burden of Alzheimer's disease and related dementias (ADRD), yet remain critically underserved in terms of awareness, early detection, and access to care. Geographic isolation, limited healthcare infrastructure, and workforce shortages create significant barriers for rural residents at every stage of the cognitive health continuum — from prevention and risk reduction to diagnosis, care, and end-of-life support. Community health workers (CHWs) and rural healthcare professionals, who are often the first and only point of contact for these individuals, lack the dementia-specific training and resources needed to identify risk factors, provide guidance, and connect people to appropriate dementia services. Meanwhile, rural employers, public health agencies, and community organizations have limited access to brain health education tools tailored to their populations. Without targeted investment, rural residents living with dementia, their caregivers, at-risk, and other individuals will continue to fall through the gaps of an already strained system.	This project seeks to address that gap by building a comprehensive, community-centered approach to cognitive health that spans awareness, access to resources, and workforce development across rural communities with three primary activities. 1. Brain Health Awareness and Community Mobilization: The Association will develop and launch a targeted Brain Health public awareness campaign tailored to rural and frontier audiences. Campaign messaging and collateral will promote risk-reduction strategies for healthy aging. The program will also convene rural community members and train public health leaders through structured learning collaboratives with local Health Departments. Additionally, the Brain Health At Work program will be expanded to rural employers, equipping them with tools and resources to support employees' cognitive wellness. 2. Empowering Rural and Frontier Community Members: The Association will promote its suite of consumer-facing tools, including ALZNavigator, My ALZ Journey mobile application, the Community Resource Finder (CRF), Brain Health Habit Builder, and the Association's 24/7 Helpline — to rural residents and caregivers. The Association will ensure these tools are current and accessible, reflecting all the relevant resources. 3. Building a Dementia-Capable Rural Workforce: ALZPro, the Association's central training hub for professionals, will be promoted and serve community health workers, primary care providers, hospital staff, long-term care workers, and other rural health professionals. Tailored training pathways, new courses and microlearnings, and expanded Project ECHO programs for community health workers and primary care providers will be leveraged to support Alaska's rural and frontier workforce. The Association will build on and integrate with the existing Alaska ECHO network, using these established programs to strengthen the workforce and fill identified gaps where opportunities exist. Lastly, the Provider Direct Referral Program will be established, allowing providers to refer patients directly to the Association's Helpline and telehealth partners for clinical care navigation, creating a seamless, coordinated care experience for rural patients. Together, these strategies form a continuum of support, from building awareness and self-empowerment to strengthening the clinical and community workforce, designed specifically for the realities of rural health systems.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alzheimers Resource of Alaska	Statewide Client Management System for ADRD, Care Coordination, and Reimbursement Infrastructure	AK	ARA does not currently have an integrated client management system (CMS) or dedicated data management capacity to support statewide ADRD services, Medicaid waiver care coordination billing, mini grants, and CCH based Medicare reimbursement. Referrals, intakes, care coordination notes, education contacts, support group participation, mini grant administration, and billing documentation are tracked across multiple tools and paper-based processes. This fragmentation creates staff inefficiencies, inconsistent reporting across all programs, and heavy manual grant reporting and billing burdens. In rural and frontier communities, where continuity depends on timely handoffs and limited staff capacity, these gaps directly affect access, service quality, and financial sustainability. Partnering with a consulting firm like Gartner will help ARA to better assess these challenges, identify an integrated CMS capable of supporting Medicaid and Medicare billing, eliminate manual and time-consuming grant reporting, implement dashboards and measurable KPIs, mitigate migration risk, and compensate for the lack of internal CIO-level technology leadership. This project is not a software upgrade; it is a statewide infrastructure redesign that will give ARA the operational backbone to deliver coordinated ADRD services, generate actionable data, and participate in sustainable reimbursement models across Alaska.	ARA will implement a CMS that supports Medicaid waiver care coordination, mini grant administration, and CCH workflows and billing statewide. Core functions will include intake and consent, standardized assessment and care planning, scheduling and follow up, documentation of education and support activities, referral tracking with closed loop status updates, outcomes reporting, and improved workflows. Selection will prioritize ease of use for dispersed teams, strong reporting capacity, privacy and security, low bandwidth practicality, and interoperability with systems including HIE. This is not a hospital EMR replacement. It is community based care coordination, navigation, and reimbursement supporting infrastructure designed to strengthen rural access, referral accountability, and sustainability across multiple programs. ARA will onboard a Data Manager and engage implementation support for workflow mapping, vendor selection, data governance design, and system deployment. ARA also plans to leverage Gartner as a strategic advisory partner for executive guidance, migration planning, KPI and dashboard design, change management, and technology decision support. A key design principle will be using a single platform across ADRD services, Medicaid waiver care coordination, mini grant administration, and CCH participation so staff are not maintaining parallel systems. ARA is the pilot project partner with Envoy Health for the CCH. This work creates an opportunity to support Medicare billing through the hub for eligible services that can appropriately move from medical providers to community based organizations, increasing access to care while helping reduce system costs. Implementation will include configuration of documentation standards, care coordination workflows, referral tracking, and billing related functions, followed by phased staff training supported by peer leads, management data review, and structured feedback. The platform will expand reporting, dashboards, and partner coordination while strengthening shared referral pathways and data exchange with HIE and CCH partners. Ongoing optimization, refresher training, and data quality management will support consistent statewide use and long term sustainability.	\$250K-\$1M	Home- and communit y-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Planning

Alzheimers Resource of Alaska	ADRD Workforce and Caregiver Training and Support	AK	This training is an on demand, statewide platform, combining workforce development, caregiver education, and simulation-based learning. Alaska also has a time-sensitive opportunity to deploy this ADRD curriculum that was developed with support from Alaska Senior Disability Service funding. Currently proposed legislation, SB 103 and HB 244, may require ADRD training for CNAs. This project improves access to quality, culturally relevant training for rural Alaska. Replacing episodic travel-dependent training with an online Learning Management System (LMS) that delivers standardized, Alaska-specific ADRD education statewide. The LMS will support mobile access, asynchronous participation, completion tracking, and certificate of completion. It will also provide immediate, on-demand tools for providers and caregivers, including Teepa Snow Positive Approach to Care (PAC) training videos. Making ADRD training available at no cost through an online statewide platform strengthens rural health system capacity by equipping providers, frontline workers, and caregivers with skills to recognize symptoms and deescalate crises, helping people with ADRD remain safely in their homes and communities longer. By reducing the need for costly travel across Alaska for training, the program lowers expenses, reduces workforce and caregiver burnout, and decreases reliance on crisis driven interventions while improving outcomes.	ARA will lead this project in partnership with the University of Alaska Anchorage Center for Human Development (UAA CHD). Building on 18 months of SDS funded development, the partnership will implement the ADRD core-competency framework, complete modular course content, deploy a scalable LMS optimized for mobile access, and launch a pilot within 45 days followed by rapid statewide rollout with priority outreach to rural and frontier providers, tribal partners, and caregivers. Courses will be organized as short, stackable modules aligned to key caregiving tasks across home and community-based care, assisted living, and facility settings. The LMS will support asynchronous participation, knowledge checks, completion tracking, certificate issuance, and hosted on-demand content so learners can access practical ADRD tools when challenges arise rather than waiting for scheduled instruction. Before launch, the LMS and associated training content will be reviewed with input from key stakeholders, including the Alaska Board of Nursing, Alaska Commission on Aging, assisted living homes and tribal healthcare providers to strengthen relevance, usability, and alignment with culturally relevant workforce and community needs. ARA will serve as applicant and will lead the caregiver engagement, provider outreach, in-person training options, implementation support, and statewide coordination. The UAA CDH will partner with ARA on in-person training, curriculum alignment, evaluation design, and outcome review. For professional providers seeking deeper skill development, the project will offer optional two-day in-person advanced training centered on Mental Health First Aid for Older Adults and PAC. The training will focus on practical provider and caregiving skills in ADRD communication, stress response, safety, caregiver partnership, and person-centered support strategies that can be applied across care settings. It will also include an in-person immersive experience, including Dementia Live, to deepen empathy and reinforce the training. Dementia Live may also be used separately for community outreach sessions that build understanding among family caregivers, community partners, and the broader public. Quarterly reviews of participant survey findings will inform content refinement, strengthen rural uptake, and guide course correction.	\$50,000-\$250,000	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alzheimers Resource of Alaska	Innovating ADRD Consumer Directed Supports for Aging in Place	AK	Alaska’s long-term care system depends heavily on family caregivers, especially in rural and frontier communities where ADRD capable respite, direct care workers, and home safety services are limited. When families cannot get timely relief or basic support, preventable crises follow: falls, wandering incidents, caregiver burnout, emergency transport, hospitalization, and earlier institutional placement. For 20+ years, ARA has successfully operated the AMHTA ADRD mini grant program. The data collected by the program has proven the ROI of these grants in helping Alaskans with ADRD to age in place for as long as possible. The opportunity is not simply to add more dollars to an existing program, it is to redesign a proven 20+-year platform, so it better reflects current costs, rural realities, and RHTP priorities. The project shifts the model to a strategic rural support platform with tiered awards tied to documented need and return on investment, technology enabled workflow and reporting through the client management system, low tech access for rural families, and stronger outcome data to guide future investment. By supporting practical home-based services, the model helps people age in place longer, improves quality of life, and reduces long term care costs. This redesign creates a more responsive and evidence-driven ADRD support model that advances health care access, healthy communities, fiscal sustainability, and spark technology and innovation.	ARA will redesign and expand its existing statewide mini grant program by supplementing the current annual AMHTA per-person cap of \$2,500 with additional tiered awards of \$5,000 to \$10,000 based on documented need, safety risk, and rural cost factors such as travel, contractor availability, and remote pricing. Eligibility will continue to require an Alzheimer’s disease or dementia diagnosis. Funds will support practical, prevention-focused needs that help a person remain safely at home and improve quality of life, including ADRD capable respite, adaptive or durable equipment, technology-enabled and safety supports, supplies, and small home modifications that reduce falls, wandering risk, and bathing or mobility barriers. Because this is a consumer-directed model, families can use local providers, vendors, and contractors, or purchase through hub communities when local options are limited. The redesign is also operational and technological. ARA will integrate online applications with clear eligibility requirements, eligibility review, approvals, payments, reporting, and outcome tracking into the proposed client management system and online portal, while maintaining paper applications, phone support, and staff-assisted submission so rural households are not excluded by limited broadband or digital literacy. In Year 1, ARA will finalize tiering criteria, update guidance, strengthen internal controls, build technical support, and implement the new workflow. In Years 2 through 5, ARA will operate continuous award cycles with quarterly review of timeliness, spending by geography and category, rural reach, caregiver stability, crisis prevention, delayed placement, and ROI indicators. Findings will be used for course correction, stronger reporting, and sustainability planning.	\$1M-\$5M	Hospital	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alzheimers Resource of Alaska	Statewide ADRD Data Collection	AK	Alaska lacks a consistent, statewide data picture of ADRD. Current estimates vary across sources and are often based on different definitions, timeframes, or datasets, leaving state agencies, providers, tribal organizations, and community partners without a shared baseline. This fragmentation is a foundational obstacle to resource allocation, policy development, workforce planning, and coordinated care across Alaska’s geographically dispersed health system. The gap is especially urgent because rural communities face persistent barriers to diagnosis and follow-up. Without reliable information on how many Alaskans are diagnosed versus likely living with undiagnosed ADRD, stakeholders cannot accurately project costs, identify where caregiver burden is concentrated, anticipate safety and guardianship needs, or evaluate whether current ADRD supports are reaching the people they are intended to serve. A shared data infrastructure is the necessary first step to align investments with need, strengthen rural access, and support fiscal sustainability through evidence-based decision-making.	ARA is willing to serve as lead applicant or as a partner with another stakeholder to develop a collaboration with a data collection and research organization, selected in coordination with the State of Alaska, to build a rigorous and sustainable statewide ADRD data infrastructure. The data partner will provide research design, data governance, and analytic capacity; ARA will provide statewide ADRD subject-matter expertise, trusted community relationships, and rural outreach capacity through its network of caregivers, providers, tribal health systems, and community-based organizations. The partnership will standardize ADRD definitions, select defensible data sources, and implement a repeatable methodology to produce consistent prevalence estimates, regional distribution analyses, demographic breakdowns, and patterns of service utilization and unmet need. The approach will be designed for feasibility in rural and tribal settings by combining administrative data with practical field methods, including structured surveys distributed through clinics, tribal health programs, and caregiver support networks that will be supported by validated estimation methods including undercount adjustment. Privacy protections, appropriate aggregation for small communities, and culturally responsive engagement practices will be built into the governance framework from the outset. The project will also explore secure integration and interoperability opportunities with existing statewide systems, including the HIE, using a phased, pilot-first approach before any broader scaling. Deliverables will include a shared baseline dataset, a documented and repeatable collection protocol, and regular reporting products that can be used by state agencies, health systems, tribal organizations, and community-based planners to plan services and evaluate impact.	\$50,000-\$250,000	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alzheimers Resource of Alaska	Statewide Alzheimer’s and Dementia Anti-Stigma Awareness Campaign for Rural Alaska	AK	ADRD is one of the most expensive and rapidly growing public health challenges in Alaska. Despite the growing prevalence, stigma remains a barrier to prevention, early diagnosis, seeking caregiver support, and planning. In the Alaska Mental Health Trust Authority’s (AMHTA) 2025 statewide stigma survey, ADRD had a stigma score of 6.49, almost as high as alcohol misuse (6.99) and drug misuse (6.74) and higher than mental illness (4.89), traumatic brain injury (3.36), or developmental disability (2.75). Stigma has worsened over time: 8 of 12 attitude measures moved in a more negative direction from 2023 to 2025, 79% believed a person with ADRD would act in unpredictable ways, and 63% believed the person would pose a danger to self or others. Research shows stigma delays help seeking, reduces participation in education and prevention programs, and increases social isolation. In rural communities, where services are limited and informal networks are essential, delays result in crises requiring emergency response or sudden relocation from home communities. Addressing stigma encourages earlier intervention, stronger prevention engagement, and improved readiness among families and communities to support aging populations. A statewide public education campaign allows Alaska to address these challenges at the population level by improving dementia health literacy, encouraging brain health screening and planning, and normalizing conversations about cognitive change before crises occur.	ARA will partner with an Alaska-based communications firm to design and implement a statewide anti-stigma awareness campaign grounded in Alaska-specific data and best practices in public health communication. Campaign development will be guided by findings from the AMHTA stigma survey so messaging responds directly to the beliefs and concerns that drive stigma in Alaska. The campaign will combine stigma-reduction messaging with clear pathways to prevention, support, and services. Outreach will highlight the evidence-based “10 Keys to Dementia Risk Reduction,” an educational program shown to improve brain health, and will connect audiences to ARA support and referral services. The strategy includes several coordinated components: • Message strategy and creative development informed by stigma research and audience segmentation • Cultural adaptation of messaging for rural and Alaska Native audiences • Multi-channel dissemination including radio, print, digital media, social platforms, and community events • Continuous monitoring using media analytics, community feedback, and engagement metrics Campaign activities will include production of promotional and collateral material, broadcast radio placements, digital advertising, social media storytelling, educational materials, tradeshow and conference displays, and participation in community events. Messaging will evolve over time from general awareness toward encouraging cognitive screening, early detection, and proactive care and financial planning. Because Alaska’s communications environment varies widely across regions, the campaign will intentionally combine high-reach broadcast channels with targeted digital strategies. Radio remains one of the most reliable communication tools in rural Alaska, while digital advertising allows the campaign to reach individuals privately when they search for information about memory changes or caregiver support.	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Alzheimers Resource of Alaska	Transforming Rural ADRD Access Through Regional Navigation and Case Management	AK	Across Alaska, ADRD care and caregiver support are fragmented across primary care, hospitals, behavioral health, long-term services and supports, and community programs. In rural and frontier communities, distance, weather, transportation barriers, limited provider availability, and workforce turnover make that fragmentation more severe. Families often become the default coordinators of diagnosis follow-up, safety planning, respite, benefits, and long-term care decisions with little ADRD capable guidance. Concerns about cognitive change may go unaddressed too long, referrals stall, and practical barriers such as respite, transportation, or in-home supports can push families into crisis. ARA has demonstrated demand for Resource Specialist and Care Navigator support, but the current staffing model is a structural mismatch for Alaska’s geography. It does not allow ARA to build dependable regional referral relationships or consistent local follow-through. The opportunity is to transform that test-piloted model into a multi-region rural access and case management system that supports earlier identification of concerns, stronger referral pathways to primary care and community supports, connection to mini grants when appropriate, and sustained follow-up that helps Alaskans remain safely at home longer while reducing unnecessary travel, crisis-driven care, and premature placement outside their communities.	ARA will implement a region-based ADRD access and case management model built around two complementary functions in each region. Resource Specialists will serve as the front door by completing intake, urgency and safety screening, offering non-diagnostic cognitive screening when appropriate, and connecting individuals back to primary care providers or other qualified clinicians for further evaluation when concerns are identified. Care Navigators will function as case managers and provide ongoing support for Alaskans through care planning, referrals, caregiver coaching, follow-up, and coordination across systems. This is a redesign of how services are delivered, not simply an expansion of current staffing. The project will translate what ARA has learned from its Anchorage test pilot into a statewide multi-region model with standardized intake and triage workflows, consent-based information sharing, shared documentation, and closed-loop referral tracking so families do not have to repeat their story and referrals do not stall. Each region will maintain a living resource map, providing connections to tribal and local health care, respite, transportation, benefits, housing, legal planning, and other supports relevant to ADRD. Resource Specialists and Care Navigators will connect families to mini grants when modest flexible assistance can address immediate barriers such as respite, transportation, or in-home safety needs.	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Amahealth LLC	NewDate - Bringing Personalized Maternal Care with AI and Wearables	AZ	Predicting when natural labor will begin remains one of the most significant unmet needs in obstetric care. Only 5% of women deliver on their expected due date. Term pregnancy spans 37–42 weeks and is associated with better maternal and neonatal outcomes than preterm or post-term birth. However, clinicians currently have no reliable way to predict spontaneous labor onset. As a result, providers and families must make decisions under uncertainty, balancing potential complications—like hypertensive disorders, abnormal fetal growth, or stillbirth—against the unknown timing of labor. This uncertainty often leads to conservative clinical decisions such as precautionary relocation closer to hospitals, increased monitoring, or medically induced labor. These approaches can increase healthcare costs, place strain on hospital resources, and create logistical and emotional burdens for families. The problem is amplified in regions with limited maternity care access, like in rural communities. In Alaska 30.1% of births occur among women living in rural census areas while only 14% of maternity care providers practice in those regions. Improving prediction of labor timing could reduce uncertainty in care planning, help avoid unnecessary interventions, and support better maternal health outcomes while lowering logistical and healthcare burdens.	Research has shown that a woman's body prepares for labor well before physical symptoms commonly associated with labor (e.g., contractions, cervical dilation, water breaking, etc.). Notably, the estrogen dominance during pregnancy and functional withdrawal of progesterone are reflected in the underlying physiologic signals of body temperature and heart rate variability (HRV), and could be used to infer accurate timing of labor onset. During pregnancy, progesterone increases respiratory drive and ventilation, estrogen causes upper airway vascular congestion, and mechanical changes such as diaphragmatic elevation and relaxin-mediated rib cage expansion alter thoracic mechanics—physiological changes that can be reflected in measurable signals such as respiratory rate, heart rate, and cardiorespiratory variability. Recent advances in wearable sensors and artificial intelligence create an opportunity to identify subtle physiological shifts and address this challenge. Physiological signals such as skin temperature, HRV, heart rate, respiratory rate, sleep patterns, and activity change during late pregnancy and contain predictive information about labor onset. Amahealth has developed NewDate, an AI-driven platform that analyzes wearable physiological data to predict when labor is likely to begin. In an initial clinical study of 119 pregnant women, the system demonstrated promising ability to detect patterns associated with labor onset. NewDate showed a 79% accuracy with a 5-day labor prediction window. The proposed approach of this project is to collect physiological data collection from 100 pregnant women in rural Alaska using additional smart wearables (E.g., wrist watches) to further train, validate, and test NewDate. Amahealth will conduct at least 15 usability interviews and at least 15 ethnographic interviews to identify user and product requirements to ensure NewDate fits in existing care pathways within rural communities.	\$250K-\$1M	Statewide	Kenai Peninsula Borough	Deferred or Not Advanced

AMC Health Alaska Inc.	Alaska Remote Monitoring Partnership: Caring for Communities at Home	AK	Alaska’s RHTP highlights the urgent need to expand access to high-quality care across rural and remote communities where long distances, weather, workforce shortages, and fragmented services contribute to preventable emergencies and rising Medicaid and Medicare costs. The six initiatives point to major gaps in chronic disease management, maternal health, behavioral health, workforce stabilization, and technology modernization, areas where virtual care and remote monitoring can deliver immediate value. AMC Health can help Alaska close these gaps by scaling proven RPM models that reduce travel burdens, support early intervention, and bring care as close to home as possible. With eight years of Alaska-tested experience supporting Veterans through the VA Home Telehealth Program, AMC Health has demonstrated that remote monitoring can reliably serve patients even in areas with limited broadband. Our project will help reduce avoidable medevacs and hospitalizations, improve maternal and chronic disease outcomes, and support rural and Tribal care teams through low-burden digital workflows. By combining cellular-enabled devices, satellite-capable connectivity, interoperable data exchange (FHIR/HL7), automated triage, and rapid deployment capability, AMC Health can help Alaska advance all six RHTP initiatives with a scalable, community-aligned, and financially sustainable RPM model.	AMC Health proposes a phased, Alaska-tailored approach to expand access, reduce avoidable emergency utilization, strengthen rural and Tribal workforce capacity, and deliver measurable outcomes aligned with Alaska’s RHTP goals. Our model emphasizes rapid deployment, community partnership, and technology readiness to support care “as close to home as possible”. Phase I: Readiness & Co-Design Collaborate with Tribal Health Organizations, FQHCs, Critical Access Hospitals, rural hospitals, and village clinics to assess connectivity, workforce capacity, priority populations, and current workflows. Alaska’s focus on community-led design guides our culturally aligned approach. Rural-ready solutions including cellular, satellite, and multi-connectivity devices, modems, and app-free workflows are configured for remote regions. FHIR/HL7 interoperability supports secure data exchange across Tribal and non-Tribal systems. Phase II: Rapid Deployment & Hub-and-Spoke Monitoring Deploy statewide hub-and-spoke RPM network anchored by CAHs and regional hospitals. Hubs manage vitals review, escalations, and post-acute follow-up. Spoke sites (Tribal and village clinics, FQHC satellites) enroll patients using CHW-friendly tools that route alerts back to hub clinicians. This model draws on AMC Health’s eight years supporting the VA Home Telehealth Program in Alaska’s frontier communities, demonstrating reliability in limited-bandwidth and weather-impacted environments. Priority groups include patients with heart failure, hypertension, diabetes, COPD, behavioral health needs, and high-risk pregnancies. Phase III: Workforce Extension & Capacity Building Automation supports symptom detection, triage, and follow-up, reducing burden on CHWs, Tribal providers, and rural clinicians in alignment with RHTP workforce goals. AMC Health’s Virtual Medical Group provides backup triage and complex-care support to extend clinical reach without adding staff. Phase IV: Value-Based Performance & Sustainability Our platform captures outcomes tied to Alaska’s focus on fiscal sustainability - reductions in medevacs and hospitalizations, improved maternal stability, and better chronic disease control. CMS-aligned RPM reimbursement models establish a durable funding pathway beyond RHTP grants. Phase V: Statewide Scaling With early success, RPM expands to other specialties. AMC Health increases Alaska-based staffing and strengthens local partnerships to build a long-term infrastructure.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

American Cancer Society Alaska, Inc	American Cancer Society: Cancer Prevention & Screening Technical Assistance for RHTP Grantees	AK	Cancer has dominated Alaska's mortality statistics since 1993. This is despite significant national progress, with 70% of people surviving at least five years after a cancer diagnosis (2015 – 2021). Despite oncology advances over the past 30 years, new research requires roughly 17 years to clinical implementation. Alaska faces the compounding challenge of geographic distance from oncology research hubs and limited access to local training opportunities. Improved outcomes for Alaskans relies on cancer prevention and screening serving as a core feature of rural transformation, not an optional add-on. The American Cancer Society (ACS) partners with clinics to bring research more quickly into practice, implementing proven strategies across the health care ecosystem to improve outcomes and accelerate innovation. Our Alaska-based staff hold statewide relationships through our participation in the Alaska Cancer Partnership (facilitated by DOH) and the Alaska Tribal Cancer Advisory Network (facilitated by ANTHC). Cancer prevention and screening align directly with RHTP's Health Care Access initiative and supports Healthy Communities through education on lowering cancer risk. We propose a cancer prevention and screening technical assistance (TA) program to help grantees design, implement, and sustain cancer screening interventions that will help drive progress toward the RHTP outcome of improving age-appropriate cancer screening rates across the health care spectrum.	This LOI seeks funding for ACS staff capacity to deliver scalable cancer prevention and screening TA within the RHTP grantee cohort. Early investment in cancer TA supports implementation, reduces duplication, and aims to produce measurable improvements in Alaska's cancer screening rates. TA will be structured around three activities. 1)Quality Improvement: “Quality improvement (QI) is the framework used to systematically improve care. QI seeks to standardize processes and structure to reduce variation, achieve predictable results, and improve outcomes for patients, healthcare systems, and organizations" (CMS). ACS Alaska is trained to support health systems in QI. Grantees and ACS will use evidence-informed tools, training, and the latest research for improving cancer screening outcomes. TA will be delivered virtually to grantee sites, with an emphasis on serving grantees in remote boroughs that may lack dedicated resources or staff for cancer QI programming. At minimum, QI sessions will take place at grantees’ project kick-off, at the midpoint, and at the end of the annual grant cycle. Pending the volume of relevant project partners, ACS staff bring experience in both group learning collaboratives and clinic support coaching models. 2)Workforce Training: ACS will facilitate at least two educational activities in grant year one focused on increasing colorectal, breast, cervical, and/or lung cancer screening strategies. Attendees should include any grantee with projects tailored to cancer or projects that could benefit from the integration of cancer screening. Unlike the clinic QI TA activity, cancer screening workforce training will take place in virtual statewide webinars for all relevant grantees. This could include presenting cancer screening strategies at RHTP grantee convenings or other relevant meetings. We cannot guarantee availability of Continuing Medical Education (CME) credits but will strive to make CMEs available at workforce trainings as an incentive for attendance. 3)Data Support: A crucial part of TA is coaching partners to make data-informed decisions about their cancer screenings. ACS will prompt grantees to revisit their cancer screening data and assess if their interventions are impacting patient outcomes. Typically, this includes a baseline, mid-point, and year-end data review. We will also collaborate with DOH to increase awareness of statewide and regional cancer screening benchmark data available through the BRFSS Data Center.	Under \$50,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

American Cancer Society Alaska, Inc	American Cancer Society: Readiness to Address the Alaska Native Cancer Disparity	AK	Cancer is the leading cause of death in Alaska and does not affect all people equally. For Alaska Native people, the disparity is profound: compared to White people in Alaska, Alaska Native people have incidence rates at 1.5x higher for lung cancer, 2.5x higher for colorectal cancer and 4x higher for stomach cancer. The American Cancer Society is preparing to stand up an Alaska Native Cancer Fund to meet this urgent need. By funding culturally and geographically relevant research projects that advance cancer prevention, screening, treatment and survivorship outcomes for Alaska Native people, the Fund will directly address the unique genetic, environmental, and socioeconomic factors driving these inequities. As a nationwide leader both in cancer research and in philanthropic fundraising, the American Cancer Society has the experience to implement and sustain population-specific cancer research. What we need support for is the planning and project design phase to ensure the Alaska Native Cancer Fund will meet Alaska’s unique needs and realities. This LOI seeks funding to support payroll expenses for American Cancer Society staff time spent building out the project design and implementation plan for the Fund. Short-term funding support now will act as a catalyst to ensure the viability and sustainability of the project and move us all towards longer-term outcomes of reducing the cancer burden in Alaska.	The first aim of the Alaska Native Cancer Fund is to establish a Cancer Health Research Center (CHeRC) specifically focused on addressing the Alaska Native cancer disparity. The CHeRC model currently exists in eight sites around the country with research focused on other populations facing a cancer disparity. We believe this model is needed to address the profound burden of cancer experienced by Alaska Native people. A Cancer Health Research Center is not a building; it is a \$1.65 million, 4-year grant to support community-led research. This research grant mechanism is designed to bring multidisciplinary teams together to co-develop actionable solutions to improve health outcomes, ensuring that innovations reflect local culture, needs and values. CHeRCs are implemented by an academic or non-profit institution with a strong track record in community engagement and health equity research. This CHeRC will undergo Tribal review and a competitive peer review process within the American Cancer Society’s well-respected framework, to include national coordination, best practice sharing and scientific oversight. To adapt this innovative model to Alaska, investment in readiness and planning is needed to build capacity and establish a framework for assessment, implementation and evaluation with partners. Having this solid framework will ensure sustainable health innovation through the CHeRC grant period and beyond. Readiness includes deeper integration with Tribal and community health partners to assess evolving barriers to cancer screening, treatment and care, and adapting the American Cancer Society’s nationwide model to fit the unique types of entities that may be part of the CHeRC’s community-focused hub framework in Alaska. Developing procedures for the coordination between local Tribal review and nationwide peer review is also necessary to prepare for implementation. Once the Cancer Health Research Center is launched, the second aim of the Alaska Native Cancer Fund is to create an endowment with raised funds to ensure Alaska Native voices and experiences are sustainably represented in cancer research now and for generations to come. The endowment will allow the most promising concepts from Alaska Native-focused CHeRCs - and innovative ideas from new investigators – to receive continued or new funding and drive progress.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

American College of Lifestyle Medicine	Strengthening Alaska’s Health Workforce Through Statewide Lifestyle Medicine Training	MO	Chronic disease is a leading driver of poor health outcomes and healthcare costs across Alaska, with rural and frontier communities disproportionately affected. Type 2 diabetes, cardiovascular disease, and obesity are compounded by geographic isolation, limited specialty access, workforce shortages, and the time and cost of travel for care. Too often, care focuses on managing progression rather than addressing the lifestyle and behavioral drivers of these conditions. verse and geographically dispersed populations. This project strengthens Alaska’s healthcare workforce by expanding access to evidence-based lifestyle medicine training for clinicians and care teams statewide. Lifestyle medicine provides practical clinical tools to treat root causes of chronic disease through therapeutic lifestyle interventions (nutrition, physical activity, sleep, stress management, social connection, and avoiding risky substances). By providing scalable training and practical implementation resources to teams serving rural and frontier communities, the project builds local capacity to deliver more effective prevention-oriented chronic disease care within existing clinical settings. Over time, this workforce investment can help reduce avoidable disease escalation and support a more sustainable healthcare system for Alaska’s diverse and geographically dispersed populations.	This project will expand the capacity of Alaska’s healthcare workforce to prevent, treat, and reverse chronic disease by delivering statewide training and practical implementation resources in evidence-based lifestyle medicine. The approach equips clinicians and care teams serving rural, remote, and frontier communities with actionable tools to address key drivers of cardiometabolic disease within existing care settings, helping reduce reliance on travel and hard-to-access specialty services. A central component is establishing a shared clinical language and framework across Alaska’s diverse health systems. Standardized, evidence-based training improves consistency in how chronic disease is understood and treated and strengthens interdisciplinary collaboration. The scalable format is designed for geographically dispersed teams, combining flexible virtual learning, connection to a national peer network, and ready-to-use tools. Participants build practical skills in therapeutic lifestyle interventions (nutrition, physical activity, sleep, stress management, social connection, and avoiding risky substances) and can tailor approaches to local strengths, cultural traditions, and food systems across Alaska’s diverse populations, including Alaska Native communities and subsistence-based lifestyles. Participating organizations also receive guidance and planning resources to integrate lifestyle medicine into workflows and team-based care models, including Lifestyle Medicine Shared Medical Appointments (LMSMAs). These approaches can help teams reach more patients efficiently while reinforcing social support and sustained behavior change. By building a statewide network of clinicians trained in a shared, culturally adaptable model of care, the project strengthens the sustainability of chronic disease care delivery in rural and frontier communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

American Lung Association	Alaska Lung Cancer Screening Project	AK	Lung cancer is the leading cause of cancer death, yet screening rates remain low among eligible populations in Alaska. Many individuals at high risk are not referred for screening due to limited awareness of screening guidelines, lack of provider engagement, and barriers to accessing culturally and community-appropriate information. Although Alaska Medicaid began covering lung cancer screening in 2023, many eligible patients and providers are still unaware of this benefit, creating a missed opportunity to increase early detection. This project aims to address these gaps by increasing awareness, strengthening referral pathways, and improving systems that support quality lung cancer screening. The Lung Association will work with healthcare systems and community organizations to develop and disseminate culturally appropriate education materials, promote implementation of evidence-based lung cancer screening guidelines, and build stronger partnerships within target communities. The project seeks to reduce barriers to care and increase the number of high-risk individuals who are referred to and receive screening. Increasing lung cancer screening can lead to earlier detection, improved treatment outcomes, and reduced cancer disparities. This initiative presents an opportunity to leverage recent Medicaid coverage changes, strengthen community partnerships, and implement best practices that will improve lung cancer prevention and early detection efforts across Alaska.	The American Lung Association will implement a multi-pronged strategy to expand access to lung cancer screening for high-risk populations in Alaska, with a focus on rural and remote communities where access to preventive care is often limited. This effort will strengthen referral pathways, increase provider engagement, and improve health system practices to ensure more eligible patients receive recommended screening. The Lung Association will leverage partnerships with health systems serving rural and underserved communities to improve identification and referral of patients eligible for low-dose CT (LDCT) lung cancer screening. By strengthening coordination between primary care providers and screening facilities, the project will help ensure eligible patients—particularly those living in geographically isolated areas—are identified and referred for screening. Health systems participating in this project will receive technical assistance and financial support to implement quality improvement initiatives that strengthen screening referral workflows and improve patient follow-through. These efforts will support sustainable systems changes that increase screening referrals beyond the project period. To further reduce barriers faced by patients in rural communities, the project will establish a referral pathway connecting health systems with the Lung Association’s Lung Health Navigators. Navigators will provide one-on-one education and support to help patients overcome barriers related to screening, follow-up care, and treatment, including challenges related to travel, awareness, and access to services. The project will also address tobacco use by supporting health systems in implementing the Ask–Advise–Refer (AAR) model. This evidence-based approach encourages providers to assess tobacco use, advise patients to quit, and refer those interested in quitting to evidence-based cessation services. A similar model implemented by the Lung Association in Illinois integrated lung cancer screening referrals into the state Quitline, increasing both screening awareness and completed referrals. Patients may also be referred to the American Lung Association’s Freedom From Smoking® program or cessation services within participating health systems. Together, these strategies will strengthen rural health system practices, reduce barriers to lung cancer screening, and increase early detection among high-risk Alaskans.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Anchorage (Municipality); Bethel Census Area; Copper River Census Area; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Sitka (City and Borough)	Deferred or Not Advanced

Amerita Inc.	Improve and expand access to pharmacy services by investing in workforce and facility improvements	AK	Rural and frontier communities in Alaska face significant barriers to accessing medication therapy and home infusion services. Geographic isolation, limited healthcare infrastructure, and shortages of qualified nursing and pharmacy staff contribute to delays in treatment initiation, extended hospital stays, and frequent patient transfers to distant facilities. These challenges affect both patients served locally at our branch and those in remote communities statewide. Patients in isolated areas often experience limited access to specialized care, including timely medication administration and home infusion training. Staffing shortages create bottlenecks in service delivery, increasing the risk of delayed therapy and higher reliance on hospital-based care. Telehealth and remote care services are inconsistently available or underutilized, leaving patients in remote communities without adequate support for managing therapy at home. Collectively, these factors create inequities in access to safe, timely, and high-quality care, highlighting a critical need for interventions to improve medication therapy and home infusion services in Alaska’s rural and frontier communities.	Our approach focuses on strengthening workforce capacity, modernizing pharmacy infrastructure, and implementing telehealth-enabled care to expand access to medication therapy and home infusion services for patients in rural and frontier communities across Alaska. A primary component of this project is workforce development. To address regional healthcare staffing shortages, we will recruit, train, and retain qualified pharmacy and clinical staff who can support patient education, therapy initiation, and ongoing care coordination. Offering competitive compensation and professional development opportunities will help us attract and retain skilled staff who are essential to supporting home-based therapies. Increasing staffing capacity will allow for more timely initiation of therapy, enabling patients to begin treatment sooner and facilitating earlier discharge from hospitals when appropriate. Expanded staffing will also allow our team to provide comprehensive patient education and support for individuals managing complex therapies in the home setting. Staff will be available to guide patients and caregivers through medication administration, therapy management, and safety protocols, helping ensure treatments are delivered correctly and confidently. The project will also include improvements to our sterile compounding area to enhance environmental controls and ensure proper temperature stability for medications. Upgrading compounding infrastructure will help maintain the highest standards for sterility and medication quality, ensuring that patients receive safe and effective therapies. To further expand access for patients in remote communities, we will implement telehealth resources that allow pharmacists and clinical staff to provide virtual training, education, and follow-up support. Telehealth tools will enable patients and caregivers to receive guidance on medication administration and therapy management without the need for extensive travel. Remote monitoring and virtual check-ins will also allow care teams to track patient progress, address questions, and intervene early if concerns arise.	\$50,000-\$250,000	Pharmacy	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Anchor Point Safe Water Corporation	Rural Water Infrastructure Data & Control System (SCADA) Upgrade	AK	Anchor Point Safe Water operates an aging rural water treatment plant that currently relies on manual monitoring and control. This limits the ability to detect system issues quickly and creates operational challenges for a small utility with limited staff. Upgrading the plant with a SCADA system would allow for real-time monitoring of water quality, system performance, and equipment status. This modernization would improve reliability, support regulatory compliance, and strengthen the sustainability of safe drinking water infrastructure that supports the health of the rural Anchor Point community and local health providers such as SVT Health & Wellness.	Anchor Point Safe Water proposes to modernize its rural water treatment plant by installing a SCADA (Supervisory Control and Data Acquisition) system to enable real-time monitoring and automated system alerts. The project will include installing sensors and controllers to track key indicators such as water levels, pressure, flow, and chlorine residual, along with a secure communications system that allows operators to monitor the plant remotely. Using a hub-and-spoke approach consistent with RHTP goals, the system could connect to regional technical support partners who can assist with monitoring, troubleshooting, and data management. This approach will strengthen system reliability, reduce response time to operational issues, and support long-term sustainability of safe drinking water infrastructure serving the rural Anchor Point community.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Anchorage Community Land Trust	Investing in Mountain View's Nonprofit Hub	AK	Anchorage Community Land Trust (ACLT) seeks funding to complete critical structural repairs to the roof of the Mountain View Service Center, ensuring long-term safety and sustainable operations for tenants. During the winter of 2023–2024, record snowfall in Southcentral Alaska exposed structural vulnerabilities in many buildings constructed in the 1980s using a “gang-nail” truss system. As snow accumulated, roofs of buildings with these trusses began collapsing across Anchorage, particularly in older neighborhoods and warehouse districts, including Mountain View. The Municipality identified structures requiring heightened monitoring due to potential roof failure; the Mountain View Service Center was among them. Structural engineers have determined that repair and redesign of the building’s truss system are necessary to ensure long-term safety and stability. The estimated cost for design and construction is \$1.5 million. Until ACLT secures funding, we must pay to clear the facility's 10,000-square-foot roof whenever it snows to avoid a hazard. The average cost per winter is \$150,000, and the building must shut down for 10-12 days each winter for emergency snow removal, disrupting important beneficiary services. These improvements are necessary to eliminate safety risks and ensure operational stability for tenant partners and the thousands of clients and beneficiaries they serve across Alaska.	With the proposed funding, ACLT will finalize engineering design for truss repair and reinforcement, complete roof reconstruction and structural improvements to ensure long-term safety, coordinate temporary tenant relocation if needed to avoid service disruptions, and absorb short-term rental income loss during construction. If funded, repairs are anticipated during winter 2026–2027, with completion in spring 2027. The project will eliminate the need for ongoing emergency snow mitigation and prevent catastrophic structural failure, securing the building for decades of continued service. The project has already secured significant investment, including \$750,000 in federal support championed by Senator Lisa Murkowski. This funding would help leverage these public investments and ensure timely completion. Completing the roof repair will produce three key outcomes: 1. Preservation of Affordable Space for Behavioral Health and Early Intervention Organizations For more than 20 years, ACLT has invested in Mountain View’s commercial corridor through a rent stabilization strategy that provides below-market space to nonprofit tenants. The Mountain View Service Center leases space to 5 organizations at approximately \$1.70 per square foot—20–25 cents below market rate. Without grant support, repair costs or ongoing snow mitigation could force rent increases. By preventing cost escalation and preserving affordability, ACLT effectively acts as a downstream funder of behavioral health & early intervention services—reducing tenants’ overhead costs so they can direct more resources to direct services to beneficiaries. 2. Long-Term Tenant Stability The Service Center has operated as a nonprofit hub for nearly two decades, with long-term tenants including The Foraker Group, Camp Fire Alaska, and Programs for Infants & Children. Maintaining the facility ensures continued stability for these organizations and protects decades of community investment. 3. Strengthened System of Care Infrastructure The building functions as a centralized nonprofit hub where hundreds of clients access services daily and hundreds of staff work. Stabilizing the facility ensures uninterrupted early intervention services, supports youth and families experiencing developmental disabilities and mental illness, strengthens nonprofit capacity statewide, and protects a vital piece of Alaska’s behavioral health infrastructure.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Anchorage Fire Department	AFD Training Center: Neonatal Advanced Life Support (NALS) Rural Training Initiative	AK	This letter expresses the Anchorage Fire Department Training Center’s intent to develop a regional Neonatal Advanced Life Support (NALS through American Red Cross) education initiative to strengthen neonatal emergency response capacity for rural and remote communities across Alaska. Alaska’s geography, limited specialty care access, and extended transport times create significant challenges for neonatal stabilization in rural settings. Community health aides, rural clinic providers, and EMS personnel are frequently required to manage high-risk neonatal emergencies with limited resources. Improving neonatal resuscitation and stabilization capacity is critical to supporting safe maternal and newborn care across the State of Alaska. This project aligns with Alaska’s Rural Health Transformation goals to promote lifelong health, build sustainable systems, and strengthen the rural healthcare workforce. It advances the “Healthy Beginnings,” “Strengthen Workforce,” and “Spark Technology and Innovation” priorities by ensuring frontline providers have the training, simulation experience, and clinical decision-making skills to manage neonatal emergencies until definitive care is available.	The project will establish a coordinated training partnership between healthcare and EMS agencies in the Anchorage Bowl, the Matanuska–Susitna Borough, statewide EMS providers, and nonprofit EMS education organizations to support providers serving rural Alaskan families. The initiative will leverage existing training infrastructure and regional expertise to extend neonatal emergency education to road-accessible and off-road communities. The program will focus on three core components: • Regional Neonatal Emergency Training Network: Create a collaborative training network with EMS organizations, including Alaska Prehospital Education Consortium, Chugiak Volunteer Fire Department, Girdwood Fire Department, Mat-Su Borough EMS, Alaska Medical Transport and other EMS training organizations throughout the State. • Simulation-Based Neonatal Stabilization Education: Deliver NALS training in a hybrid format. Initial online instruction followed by high-fidelity simulation and scenario-based learning tailored to rural environments and long-distance transport challenges, informed by established neonatal resuscitation education models. • Sustainable Rural Instructor Development: Train rural clinicians and EMS personnel as certified instructors to expand long-term capacity and ensure continued access to neonatal emergency education beyond the grant period. Through these strategies, the project will increase provider readiness, strengthen regional coordination of neonatal care, and improve early stabilization of newborns prior to transport to higher levels of care. By leveraging partnerships with established EMS education organizations and regional healthcare systems, the program will create a scalable, hub-and-spoke model capable of serving providers across Alaska.	\$1M-\$5M	Statewide	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Anchorage Fracture and Orthopaedic Clinic	Improving Access to Orthopedic Trauma and Microvascular Reimplantation in Alaska	AK	Alaska currently faces a critical shortage of highly specialized orthopedic trauma services. Specifically, there is only one orthopedic trauma surgeon in the state and no surgeons trained in microvascular limb or digit reimplantation. Consequently, patients with severe injuries such as pelvic fractures or traumatic amputations must often be transported to hospitals in the Lower 48 for definitive treatment. These transfers can result in prolonged transport times, increased medical risk, higher healthcare costs, and poorer clinical outcomes. In cases of pelvic fractures, patients may experience fatal hemorrhagic shock before reaching definitive care. In cases of finger or limb amputations, the delay in surgical intervention often eliminates the possibility of successful reimplantation. This project presents an opportunity to close a major gap in Alaska’s trauma care system by recruiting two highly specialized surgeons and establishing the infrastructure necessary to deliver these services locally.	AFOC proposes a multi-phase approach to address this critical need: Recruitment and Retention 1. Recruit and provide competitive compensation packages for: - A fellowship-trained Orthopedic Trauma Surgeon with expertise in acute and pelvic trauma. - A fellowship-trained Orthopedic Microsurgeon capable of performing complex limb and digit reimplantation. 2. Infrastructure Development Utilize RHTP funding to support tenant improvements and necessary equipment purchases for clinical and surgical facilities in the U-Med District in Anchorage. 3. Operational Support - Recruit and train the clinical support staff necessary to support these surgeons, including surgical assistants, nursing staff, and administrative personnel. 4. Integration with Alaska’s Trauma System - Collaborate with regional hospitals, medivac providers, and rural health systems to ensure rapid triage and transfer protocols so patients can receive definitive care in Anchorage.	\$1M-\$5M	Specialist	Statewide	Matanuska-Susitna Borough	Deferred or Not Advanced

Anchorage Neighborhood Health Center	Clinical Equipment Modernization	AK	The Clinical Equipment Modernization project is a one-time capital investment designed to transform rural health care delivery by equipping ANHC with reliable, modern clinical tools and diagnostics. Upgrading essential medical, dental, pharmacy, laboratory, and digital equipment will strengthen ANHC’s ability to provide safe, efficient, and integrated care for Alaska’s most medically vulnerable residents. This investment ensures all clinical spaces meet ADA standards, creating a more inclusive environment while supporting whole-person care. Many of ANHC’s core tools, including dental surgical units, microscopes, vitals monitors, lab analyzers, ultrasound devices, and point-of-care testing systems, are outdated, unreliable, or at end-of-life. Replacing this equipment is critical for maintaining essential services, meeting current patient demand, and adapting to emerging payment models and care-team redesign. By stabilizing clinical operations and supporting modern data and diagnostic requirements, this project establishes a durable foundation for long-term sustainability and future program improvements, ultimately advancing high-quality health care.	ANHC has completed a comprehensive inventory and condition assessment of all medical, dental, laboratory, diagnostic, and digital equipment across the organization. This assessment identified end-of-life items, current operational gaps, and the infrastructure requirements needed to support modernized systems. With this groundwork complete, ANHC is prepared to implement a structured procurement and deployment process for the full equipment modernization effort. This project aligns with goals 1, 2, and 3 of RHTP. During the first year of the project, ANHC will work directly with established medical, dental, laboratory, and IT vendors to finalize specifications, execute contracts, and place orders for all required equipment and technology. The organization has existing vendor relationships and purchasing workflows that allow for timely obligation of funds. Ordering equipment in the first year also ensures alignment with supply-chain lead times for specialized diagnostic tools, associated EHR integration and clinical devices. Once procurement is underway, ANHC will begin phased installation, configuration, and onboarding. This approach allows clinical areas, dental suites, laboratory services, and IT infrastructure to be upgraded without disrupting ongoing patient care. Equipment requiring facility modifications, integration with Epic, or network configuration will be scheduled in coordination with biomedical technicians, IT staff, and departmental leads. All equipment will be fully operational by the end of the project period. To support this work, the project funding for a dedicated project manager to oversee timelines, procurement coordination, vendor communication, and cross-departmental implementation. The project also includes funding for an additional biomedical technician to support equipment installation, testing, preventive maintenance planning, and long-term asset management. These roles ensure that the modernization process is implemented efficiently, and that new equipment is properly deployed, tracked, and supported throughout the project period.	\$1M-\$5M	Federally qualified health center	Multi- Community or Participating in Regional Hub-and- Spoke	Anchorage (Municipality)	Advance to Implementati on Application

Anchorage Neighborhood Health Center	Digital Infrastructure and Systems Transformation	AK	Alaska’s rural, remote, and frontier communities rely heavily on Anchorage-based providers for specialty services, after-hours support, and coordinated care. Anchorage Neighborhood Health Center (ANHC) is a key part of this network, but its digital infrastructure has not kept pace with increasing care complexity across long distances. Although ANHC shares an Electronic Health Record with Providence, tools needed to integrate workflows, streamline communication, and support advanced care management remain limited. Opportunities exist to expand interoperability, add integrated modules, and align Dental and Pharmacy on the same platform. Additional auditing, compliance, and AI-enabled documentation tools would improve accuracy, efficiency, and patient safety—critical for rural residents who depend on ANHC for coordinated, time-sensitive care. Aging hardware, limited telehealth capacity, and outdated audiovisual systems also restrict ANHC’s ability to collaborate with rural FQHC partners, including those supporting obstetric care coordination. These gaps delay information exchange and hinder workflows needed to manage patients across distance. Lack of modern disaster-recovery infrastructure also creates risk during earthquakes, severe weather, or outages. By modernizing ANHC’s digital backbone, this project will strengthen care coordination and support earlier intervention—aligning with Goal 3 of the Rural Health Transformation Project to improve health outcomes for Alaskans.	ANHC will implement this project over 18 months using a phased, vendor-supported deployment strategy that strengthens digital systems, expands interoperability, and increases operational resilience. Work will be coordinated among ANHC staff, external vendors, Providence, and ANHC’s managed services provider (MSP). Staffing may be temporarily adjusted to support implementation, testing, and training while maintaining continuity of care. The project begins with enhancements to the shared Electronic Health Record (EHR) with Providence. ANHC will work with Providence and the vendor to configure integrated tools, expand care-management functionality, and improve information exchange. ANHC will also evaluate integrating Dental and Pharmacy into the same EHR platform. Additional auditing, compliance, and AI-enabled documentation tools will improve workflow accuracy and efficiency. Vendor-led design sessions, testing cycles, and training will support a smooth rollout. Next, ANHC will upgrade aging hardware and endpoint devices across clinical and administrative areas. The MSP will manage procurement, imaging, deployment, and security configuration. Replacements will occur in waves, beginning with departments that rely on high-performance devices for telehealth, care coordination, and daily operations. Conference room audiovisual systems will also be modernized. ANHC will work with AV integrators to install updated equipment, improve connectivity, and configure rooms for multi-site communication, with scheduling designed to minimize disruption. To strengthen resilience, ANHC will establish a new disaster-recovery co-location with real-time failover. Working with the MSP and hosting vendors, ANHC will build secondary infrastructure, implement data replication, configure automated failover, and conduct testing to ensure continuity during earthquakes, severe weather, or outages. ANHC will also upgrade its accounting platform and administrative tools through vendor-guided configuration, workflow redesign, and structured staff training. Throughout implementation, ANHC will use a formal project-management framework with clear timelines, vendor coordination, risk mitigation, and ongoing monitoring. Staffing roles may be adjusted or supplemented to support change management and system stabilization. This phased approach ensures effective implementation with minimal disruption to patient care.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Advance to Implementation Application

Anchorage Neighborhood Health Center	Integrated Primary Care Expansion	AK	Demand for integrated primary care in Alaska has outpaced ANHC’s current facility capacity, creating an urgent opportunity to expand and meet the state’s growing need for accessible, comprehensive and integrated services. ANHC has experienced a 34% increase in unique patients since 2021, driven by rising demand for chronic disease management, behavioral health integration, pharmacy support, and team-based care. Space limitations restrict co-located care teams, delay timely consultations, and contribute to gaps in follow-up for medication management, behavioral health, and patient education. Anchorage’s critical shortage of Medicare-accepting and primary care providers further intensifies pressure on ANHC, which serves as a key access point for both urban and rural residents. By converting the existing third-floor medical shell into a full medical pod with integrated team spaces, ANHC can expand primary care capacity, strengthen behavioral health and pharmacy services, and modernize IT systems to support scalable telehealth and population-health management. This redesign closes critical access gaps, improves continuity for rural patients, shortens wait times, reduces avoidable emergency visits, enhances chronic disease management, and increases ANHC’s capacity to accept referrals and provide integrated whole-person care—positioning the organization to meet the current and future primary care needs of Alaska’s rapidly growing and aging population.	Today, physical space is the primary limitation preventing Anchorage Neighborhood Health Center (ANHC) from meeting growing demand for primary care, behavioral health, and chronic disease management services. ANHC will convert the fully built but undeveloped third-floor medical shell—currently used as administrative space and therefore unavailable for clinical care—into a comprehensive medical pod that directly increases patient capacity. To enable this transition, administrative staff will relocate to leased off-site office space so the main facility can be prioritized for patient care. By transforming this administrative area into clinical space, ANHC will add exam rooms, shared care-team workspaces, co-located behavioral health offices, medication education rooms, group visit and care-transition areas, and dedicated telehealth rooms. This redesign supports integrated, team-based care and allows same-day chronic disease co-management, improved workflows, and expanded access for patients with complex conditions such as diabetes, hypertension, cardiovascular disease, and behavioral health disorders. Expanded clinical space will allow providers, behavioral health clinicians, and care coordinators to work together more effectively, improving care coordination, patient engagement, and long-term disease management. Group education and care-transition areas will support patient self-management programs and medication counseling that help reduce preventable complications and hospitalizations. In parallel, ANHC will undertake targeted IT modernization to support reliable clinical operations and care coordination. Improvements include expanded Virtual Desktop Infrastructure, increased network capacity, stronger cybersecurity protections, and improved EHR interoperability. Redeveloping the third floor and relocating administrative offices will allow ANHC to significantly expand clinical capacity while optimizing the facility for patient care, directly supporting goals 1, 2, and 3 of the Rural Health Transformation Project. With existing architectural test fits, phased procurement, and established project governance, ANHC is positioned to move efficiently into design, permitting, and construction while maintaining uninterrupted services.	Over \$5M	Federally qualified health center	Multi- Community or Participating in Regional Hub-and- Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Anchorage Neighborhood Health Center	Patient Environment Modernization	AK	Anchorage Neighborhood Health Center (ANHC) serves as a critical healthcare access point for both urban and rural populations across Alaska. While most patients live within the Municipality of Anchorage, about 7% travel from rural communities including Eagle River, Girdwood, Wasilla, Palmer, Kodiak, Kenai, and Utqiagvik (Barrow). ANHC also maintains service agreements with the Girdwood, Talkeetna, Glenallen, and Seward health centers, making the facility environment especially important for patients who travel long distances for care. Many patient-facing areas are aging and no longer aligned with modern infection-control, safety, trauma-informed, and accessibility standards. Worn flooring, outdated seating and finishes, limited antimicrobial surfaces, unclear wayfinding, and insufficient translation resources create barriers to comfort, safety, and efficient patient flow—particularly for rural patients who may not easily return for follow-up visits. Aging staff breakrooms also contribute to fatigue that can affect patient experience and care delivery. This project will modernize patient and staff spaces by improving infection control, safety, accessibility, trauma-informed design, communication systems, and staff wellness areas. These improvements align with the first goal of the Rural Health Transformation Project by strengthening access to safe, coordinated care for Alaskans who rely on ANHC as a key access point within the state’s health system.	ANHC will implement the Patient Environment Modernization Project over a 18 month period using a coordinated, phased approach designed to minimize disruption to patient care while modernizing the physical environment for long-term safety, accessibility, and sustainability. The project will be completed through close coordination with facilities contractors, infection-control specialists, design consultants, safety experts, and ANHC’s internal operations team. The first phase will focus on planning, design, sequencing, and procurement. ANHC will engage architectural and environmental design partners to finalize specifications for flooring, paint, wall coverings, antimicrobial materials, seating, safety glass, trauma-informed elements, and other surface upgrades. Wayfinding, translation signage, and digital check-in kiosk placement will also be identified during this stage. Safety enhancements—including duress buttons, grab bars, and overhead paging improvements—will be designed in collaboration with security and workflow experts. During this phase, ANHC will develop staff-impact mitigation plans and determine when night or weekend work is necessary to maintain clinical operations. Construction and installation activities will occur in phased zones the second half of the proposed period. Patient-facing areas such as waiting rooms, hallways, dental and medical pods, and behavioral health spaces will be renovated in a staggered schedule to ensure continuous access for patients, including those traveling from rural and remote communities. Infection-controlled construction protocols will be used to isolate work areas, reduce dust and noise, and maintain safe circulation routes. Environmental upgrades will be followed by technology enhancements, including installation of digital check-in kiosks, updated overhead paging equipment, and refreshed wayfinding systems. Multilingual signage and trauma-informed visual design updates will be rolled out concurrently. Staff breakroom renewal will be scheduled during lower-impact operational periods to support workforce wellness without service disruptions. Throughout the project, ANHC will coordinate timelines with contractors, communicate updates to staff and patients, and continuously evaluate workflow impacts. Adjustments will be made as needed to ensure patient safety, efficient movement, and uninterrupted access to care.	\$1M-\$5M	Federally qualified health center	Multi- Community or Participating in Regional Hub-and- Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Anchorage School District	Anchorage School District – Integrated Systems Stabilization & Sustainability Project	AK	Alaska faces persistent statewide behavioral health capacity gaps that limit access, weaken outcomes, and strain system sustainability. Schools increasingly serve as the primary entry point for youth mental health support, identifying crises, stabilizing students, and coordinating referrals, yet education funding is not designed to sustain health service delivery. This structural mismatch leaves districts responsible for services essential to learning without durable financing to embed clinicians and infrastructure that ensure student safety and readiness. Since 2022, ASD has partnered with community mental health providers to implement an interconnected, tiered system of care embedding clinicians within school teams. Through screening and referral pathways, more than 1,200 students across 20 schools have been identified as needing behavioral health services, and over 600 have received early intervention through integrated school-based clinicians. ASD now includes 20 full-time embedded clinicians in 2026. Integration into school teams and governance structures has strengthened triage, referral coordination, prevention, and crisis response. However, core components, including clinician funding, mental health promotion, and data infrastructure, remain largely dependent on short-term grants. This grant period provides a structured runway to transition time-limited positions into a financially sustainable model.	ASD will focus on systems stabilization and sustainability rather than expansion of headcount. The project will transition and fully integrate 25 grant-supported Integrated Clinicians whose current funding ends 9/30/26 into a durable district-aligned structure. During this period, ASD will strengthen the systems that enable clinician effectiveness and long-term viability. Districtwide universal screening (SAEBRS) will serve approximately 30,000 students annually, strengthening early identification and progress monitoring. Threat assessment systems will be reinforced to ensure consistent crisis response. An Integrated Mental Health Supervisor and dedicated Data Coordinator will support fidelity, clinician oversight, and integrated outcome tracking. ISF technical assistance will deepen Tier I–III implementation quality across participating schools. In parallel, the project will build the financial and governance infrastructure necessary for sustainability. Year 1 will emphasize reimbursement pathway development, clinician-to-school staffing standards, integrated dashboards linking behavioral and academic indicators, and formalized cross-sector agreements. The purpose of this runway is to convert short-term grant-supported roles into sustainable, braided funding structures aligned with district and healthcare financing mechanisms. With clinicians already embedded and governance systems operational, ASD can immediately execute this transition without launching a new pilot. Together, these efforts position the project to focus on operationalizing a durable district-community aligned system through: Hiring key infrastructure, including an Integrated Mental Health Supervisor to provide integration oversight and fidelity monitoring and a Data Coordinator to support integrated data management and outcome tracking. Add 5 clinicians across all high school sites with the greatest need to ensure appropriate coverage across secondary settings while funding all 25 positions for prevention and early intervention support. Establish clear outcome criteria to measure program effectiveness, including indicators related to student mental health, attendance, disciplinary events, and academic engagement. Secure comprehensive technology infrastructure to provide integrated tools for supporting student success with data, workflow, and reporting automation.	Over \$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Anchorage School District	From Classroom to Care: Project Alaska Health Pathways (AHP)	AK	Alaska's Rural Health Transformation Program identifies workforce shortages as a central barrier to access, service stability, and system sustainability. Alaska's 2024 Healthcare Workforce Analysis estimates 9,430 additional healthcare workers are needed annually, with healthcare support occupations projected to grow most rapidly. While 76% of the nation's healthcare workforce holds at least a bachelor's degree, Alaska's most persistent vacancies are in credentialed, entry-level roles that are essential to stabilizing care teams and reducing burnout. The education pipeline is not meeting this demand. Only 33% of Alaska graduates enrolled in postsecondary education in 2024–2025. Yet 83.7% of ASD students completing two or more years of CTE transitioned to postsecondary education, advanced training, or employment demonstrating that structured, credential-aligned pathways significantly improve persistence and workforce readiness. Alaska does not lack expertise; it lacks sustained investment to scale proven local models. ASD, serving 40,000 students and operating established industry councils and statewide virtual delivery systems, is uniquely positioned to expand credential-aligned health pathways at scale. By moving workforce preparation upstream, integrating simulation, paid internships, employer alignment, and dual credit ASD can increase the annual flow of credentialed entry-level workers statewide, strengthen staffing stability, and reduce reliance on external recruitment.	The Anchorage School District proposes From Classroom to Care: Project Alaska Health Pathways (AHP), a statewide workforce development initiative expanding credential-aligned health and behavioral health pathways across six ASD high schools, with virtual and summer access. Project AHP builds on ASD's established Academies of Anchorage (AOA) model, now in Year 2 of districtwide implementation. Under AoA, students begin career exploration in Grade 9 through College and Career Exploration coursework, career expos, industry engagement, and early work-based learning. Project AHP advances into Phase 2 by launching Grades 10–12 Health and Behavioral Health Career Academies with a sequenced progression: Grade 10: Applied health sciences (Anatomy & Physiology, biomedical science) with workplace readiness. Grade 11: Credential preparation in pathways (Pharmacy Technician, CCMA, Dental Assisting, or EMT) supported by simulation. Grade 12: Credential completion (e.g., Pharmacy Tech, EMT-1, CCMA, NOCTI, RBT preparation, Teen Mental Health First Aid) with paid internships and postsecondary articulation. Delivery is intentionally multi-modal to maximize statewide access: • In-person academies • Dual credit alignment with postsecondary institutions • Virtual pathways through AKChoice for rural students • CTE Summer Healthcare Intensives: Students complete a coherent sequence integrating credentials, simulation-based training, paid internships, structured work-based learning, and stackable advancement options. This is a proven model. In 2024–2025, 83.7% of ASD students completing two or more years of CTE transitioned to postsecondary education, advanced training, or employment. Industry-recognized credential attainment increased from 1,392 to 1,555 in one year, with strong growth in Healthcare pathways. Ninth-grade on-track rates have also improved. Project AHP scales this Alaska-developed framework while removing structural funding barriers that have limited cross-district collaboration. By supporting instructional capacity directly rather than relying solely on enrollment-based thresholds, ASD functions as a shared statewide workforce asset. Anchorage houses approximately 64% of Alaska's healthcare workforce, enabling direct alignment with employer demand. Through established industry councils, simulation infrastructure, and cross-sector partnerships, ASD is uniquely positioned to deliver both immediate local impact and scalable statewide workforce capacity.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kusilvak Census Area	Deferred or Not Advanced

Anesthesia Care Associates	From Locum Dependence to Strong Workforce Sustainability: Strengthening Local Anesthesia Services	AK	The Mat-Su represents one of Alaska’s fastest-growing regions. While procedural demand continues to rise, our practice faces: • Recruitment competition with Anchorage health systems • Increasing call intensity with limited staffing depth • High locum tenens utilization to cover workforce gaps • Early-career attrition within 1–3 years • Housing and childcare barriers for relocating providers • Revenue volatility tied to workforce instability Locum anesthesia rates in Alaska commonly range between \$2,500–\$3,000 per day, excluding travel and housing expenses. A practice utilizing 3-4 locum providers per month may incur annual costs exceeding \$1,750,000. This financial volatility limits reinvestment in workforce development and increases burnout among core providers. The opportunity is to use time-limited grant support to transition from reactive locum dependence to a stable, multi-year workforce model aligned with the Mat-Su’s long-term surgical growth.	This project will stabilize anesthesia services in the Mat-Su through targeted recruitment, structured retention incentives, flexible workforce scheduling, and scope of practice optimization. 1) Targeted Anesthesia Recruitment Grant funds will support national recruitment efforts for anesthesiologists and CRNAs, emphasizing independent practice, lifestyle advantages, and scheduling flexibility in the Mat-Su. Recruitment will align with projected procedural growth and support staffing for a flexible 6-, 8-, and 10-hour shift model that matches anesthesia coverage to daily and seasonal surgical demand. The strategy will also address rising healthcare, housing, and cost of living pressures by incorporating targeted stipends and relocation support to improve long term recruitment success. 2) Structured Five-Year Retention Incentives To support long-term workforce stability, incentives will include signing bonuses tied to five-year service commitments, repayment provisions for early departure, and incentive payments weighted toward Years 3–5. Time limited housing, childcare, and healthcare stipends during the first three years will help offset relocation and family costs while supporting long term retention. 3) Flexible and Seasonal Workforce Model Our practice uses a structured scheduling system that includes 6-, 8-, and 10-hour shifts and seasonal workforce scaling. Recruitment supported by this project will expand the provider pool, distribute call responsibilities more equitably, improve schedule predictability, and reduce reliance on high-cost locum coverage. 4) Scope of Practice Optimization The project will support advanced regional anesthesia training, expanded CRNA clinical competencies, Enhanced Recovery After Surgery (ERAS) protocols, and collaborative care team models. Enabling providers to practice at the top of licensure will improve operating room efficiency, patient throughput, and quality outcomes without increasing provider workload.	\$1M-\$5M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Angoon Community Association	Healthy Food = Healthy People: Promoting Healthy Lifestyles in Culturally Relevant Ways	AK	For the past several decades, many in Angoon have believed that the unusually high incidents of cancers in our community might be related to heavy metals and toxins that concentrate in the tissues of the plants and animals that every household consumes. Greens Creek Mine, located 30 miles from Angoon has been in operation since 1989 and as of December, 2023 has created over 11 million tons of fine tailings stacked adjacent to Hawk Inlet, a traditional food gathering area for the people of Angoon. The U.S. Forest Service estimates over 100 tons of tailings blow from the stack into Admiralty Island and Hawk Inlet annually as fugitive dust. The tailings are high in heavy metals especially lead. Local waters around Angoon also risk contamination from passing cruise ship discharge, as well from the Angoon landfill's burn-box, and the boat harbor that may be leeching chemicals into the air and watershed. The people of Angoon and specifically those who are hunting, fishing, and gathering to fill their freezers and smokehouses do not have reliable information on whether the food they are eating and the areas where they have traditionally gathered this food, is free from contamination. Baseline and ongoing food chain data needs to be collected. And it is the responsibility of the people in Angoon to gather this data, send it out to laboratories for analysis, and then make decisions on what they should be feeding their families, and where they should be gathering their food.	The approach to addressing the problem of determining whether the way-of-life food that is being consumed in Angoon is healthy and free of cancer causing toxins and heavy metals, will be to support the development of a local crew of youth and adults who are trained by SE Alaska scientists to properly gather, label, store, and transport plant and animal specimens and tissues to a certified laboratory for analysis. Test results will be compiled, interpreted and reported to the community and to the U.S. Forest Service so that decisions can be made about where subsistence foods should and should not be gathered in the future. This project will create baseline data in year one - 2026, and then repeat data collection efforts over the remaining four years to measure changes and trends, and to test additional gathering sites. List steps for year 1: - Work with SE Alaska scientists and the community of Angoon to identify what plant and animal tissue will be gathered, and collection locations. - Design data collection protocols and methods - Recruit and hire a field crew of at least three local youth and three local adults - Coordinate with Angoon's Alaska Youth Stewards program coordinator to schedule two, 5-day gathering events in Hawk Inlet - Provide field training on data specimen handling, labeling, storage, and chain of custody - Schedule up to 15 collection events around Angoon - Purchase all needed supplies and materials - Conduct field events and send specimens to selected laboratory for analysis - Work with scientist team to interpret lab results - Schedule one or more community events to share findings from Year One field season. Future year activities will include repeating the data collection efforts to track any changes over time, and identifying new subsistence gathering sites that could be used in the future, and conduct testing at these sites as well.	\$50,000-\$250,000	Single Community	Hoonah-Angoon Census Area	Deferred or Not Advanced

Ankau Billing Services Inc	Rural Healthcare Reimbursement Program	AK	The most persistent financial challenge Rural Clinics, providers and vendors face has been timely reimbursements for services rendered. Many RCM companies operate on a high-volume, low-time model, where only a limited number of labor hours are allowed to each claim. Their practice of offshoring the billing process creates communication barriers and reduces accountability when complex reimbursement issues arise. Close coordination between the billing team and Rural Clinics is necessary. Once RCMs see a diminishing return-claims that require additional follow-up, such as appeals, payer clarification, or documentation corrections receive minimal attention or are abandoned. As a result, claims could remain unresolved or written off prematurely. Rural clinics struggle with medical billing and coding. 1. Shortage of Trained Billing & Coding Staff. 2. High Claim Denial Rates. Denials create cash flow problems. 3. Complex Government Program Billing. Many rural facilities have unique billing rules, cost reporting requirements, and reimbursement models that can be confusing without specialized knowledge. 4. Outdated Technology or EHR Systems increases the likelihood of mistakes and rejected claims. 5. Cash Flow Delays. With small patient volumes, a few denied or delayed claims can impact operations. 6. Limited Compliance Knowledge, Healthcare billing must follow compliance. 7. Lack of Denial Management. Many rural clinics submit claims but don't actively manage denials.	To address billing and coding challenges faced by rural clinics, Ankau Billing proposes launching a pilot revenue cycle support program serving one rural clinic initially. The program will leverage the expertise of our current experienced billing and coding specialist to improve claim accuracy, reduce denials, and stabilize the clinic's cash flow. The program will be led by an experienced billing and coding specialist with extensive knowledge of healthcare reimbursement processes. That person will work directly with the clinic to manage billing operations and ensure accurate medical coding. Responsibilities will include: • Reviewing provider documentation • Assigning accurate codes • Submitting insurance claims • Monitoring claim status and payments This dedicated expertise helps compensate for the clinic's lack of trained in-house billing staff. We will implement a pre-submission review process to ensure claims are complete and accurate before they are sent to insurers. This process will focus on: • Verifying patient eligibility • Confirming documentation supports the coded services • Identifying common coding errors This approach is expected to reduce denial rates and improve first-pass claim acceptance. Because rural clinics often rely heavily on reimbursement from programs such as Medicare and Medicaid, a specialist will ensure that claims meet the specific requirements for these programs. They will also assist with documentation and reporting requirements related to rural healthcare reimbursement models, helping the clinic avoid billing errors and compliance risks. Instead of allowing denied claims to go unresolved, we will implement a denial tracking and follow-up process. This includes: • Identifying reasons for denied claims • Correcting and resubmitting claims • Appealing denied reimbursements when appropriate This process can recover revenue that might otherwise be lost. To reduce compliance risks, we will help ensure billing practices follow healthcare regulations, including the requirements of the Health Insurance Portability and Accountability Act. We will also provide guidance to clinic staff on improving documentation so that medical services are properly supported for billing purposes. This program will allow the team to evaluate the effectiveness of dedicated billing support in a rural clinic environment.	\$250K-\$1M	Other	Anchorage (Municipality); Yakutat (City and Borough)	Deferred or Not Advanced

If successful, the model could later expand to support additional rural clinics using the same structure.

Aprexis, LLC	Aprexis - Medication Management, Optimization & Risk Reduction Program	VT	Adverse drug events are now the third leading cause of death in the US. This includes prescribing errors, prescription drug overdoses, drug-drug interactions, allergic reactions, and adverse drug reactions. RHT presents an opportunity for Alaska Medicaid to address one of the most common—and costly—clinical challenges in routine care: improper medication use. Comprehensive medication management remains underutilized, particularly outside traditional clinical settings. As Alaska experiences accelerating pharmacy closures and consolidation, the downstream effects include a reduction in community access to the professional guidance historically provided at the point of care and distribution. Aprexis is seeing a widening of this gap in care which, in turn, is driving up Pharmacy and overall Medical costs unnecessarily. Medicaid costs in Alaska are predicted to rise by an average of 4.7% per year and over \$7M in new annual pharmacy costs. Medication Optimization reduces overall medical costs significantly. As medication complexity increases, especially among the Medicaid population (who are diagnosed with chronic conditions at a significantly higher per capita rate than the commercial population), the absence of consistent medication oversight elevates preventable risk, avoidable utilization, and total cost of care exposure for the state. Proactive, data-driven, pharmacy care for aging and rural communities is an innovation that will yield ROI and save lives.	Aprexis proposes a statewide, pharmacist-led Medication Optimization & Risk Reduction Program for Alaska Medicaid designed to advance rural health transformation goals. The program will: Target high-impact medication risk. Leverage daily pharmacy claims and advanced clinical algorithms to proactively identify members with hazardous polypharmacy, poor adherence, and unmet therapy needs (gaps in care). Extend primary care through licensed pharmacists and clinicians. Conduct comprehensive medication reviews (CMRs), develop collaborative care plans with prescribers, and deliver personalized patient engagement via telehealth and community-based channels. Strengthen Alaska’s healthcare workforce. Establish structured clinical roles for Alaska-licensed pharmacists, supporting rural economic development, expanding in-state career pathways, and reducing reliance on out-of-state vendors. Provide real-time insight and accountability. Deliver actionable reporting that enables state oversight, performance measurement, demonstrated cost avoidance, and measurable clinical impact. This model is purpose-built to scale statewide, overcoming geographic isolation and ensuring access to pharmacist-led care even in communities where traditional facilities or pharmacies are limited, closing, or geographically inaccessible. As program administrator, Aprexis provides the full infrastructure required to operationalize and sustain the initiative, including: A comprehensive technology platform for member identification, gap-in-care analytics, clinical workflows, provider communication, and robust reporting. Development of a local clinical care network of Alaska-licensed pharmacists and nurses to conduct outreach and consultations with training and career advancement to perform at the top of their license. Centralized billing administration and payment management for all participating providers. The result is a fully-integrated, locally-anchored model that delivers measurable clinical improvement for Medicaid Members, as well as cost containment, and sustainable return on investment for Alaska Medicaid.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Arctic Access Inc	Environmental Modifications, non waiver persons not only a legal obligation, but a human obligation	AK	Environmental modifications for those who are not on waivers and don't have access to basic services allotted to able bodied humans. Physical adaptations to individuals homes are necessary to an individuals health and selves, keeping humans from becoming dependent on the State of Alaska via Assisted Living homes and staying on the homes and villages of their choice. Creating an environment which enables functioning with greater independence. Modifications including but not limited to are widening doors for access, modifications to bathrooms, installations of specialized electrical and plumbing systems that are necessary for an individual who may live alone or with others who are not in the home 24/7, giving full independence to those who choose to live in their own home and not in assisted living facilities, costing a much greater cost not only in daily obligations of funding but the cost to the human and their civil rights.	Environmental modifications will be provided in the least expensive manner possible required by the individual yet providing long term supports needed to stay in the home of ones choice, creating independence and access to both health care and social constructs. Arctic Access visits 33 villages including Nome and Kotzebue. Within our weekly visits and in home evaluations we have determined there is more of a need for people in the rural of Alaska than the over tasked waiver programs can provide. We will work with contractors and legal businesses to provided modifications for those in need. There will be a priority process for those most threatened by placement or by those needing modifications to divert from going to Assisted Living facilities. We are working with providers who have previously made environmental modifications, whose work has been completed satisfactorily in order to ensure adequate construction. Documentation by recommendation of a professional will be required, I.E Assessment Professionals, Occupation therapists, aging in place specialists, accessibility specialists and physical therapists. A recommendation for cost effective options to meet the persons accessibility needs, Assess the project to determine the bid and assess if the bid meets the persons accessibility needs and project requirements. Assessing that the request meets the persons modification needs and makes the persons home sage and accessible, ensure the bid covers the entire cost of need, and includes all items needed to include all items needed to ensure the bid meets the entire need of the human and will complete and ensure the upgrade meets the entire need for the project requested. This will ensure that all projects requested do not need future funding and will be completed and access will be ensured at end of project.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area; Northwest Arctic Borough	Advance to Implementation Application

Arctic Access Inc	Keeping The Norton Sound and Arctic North Communities/Villages Living Healthy and Safe	AK	The problem is the disposal of human waste. The lack of disposal for those not having in home infrastructure, complete waste disposal process preformed and not preformed by communities for those not having running water. During the winter months as well as non winter months the disposal of human waste for many villages is a major problem. No running water and lacking of infrastructure causes waste disposal detrimental to human health, community health and environmental health, both wild and domestic animals. Therefore we are proposing to provide incinerating toilets with solar power and battery backup systems. Power for the incinerator toilets will be subsidized with solar panels and back up batteries that will be used 10 or more months of the year. The only time The incinerators might be used from the power grid will be during the darkest days of winter. The back up batteries will improve usage from the already taxed community power systems, generators and grids, as well as keeping the power bills at a minimum for the home owners. Currently human waste builds up around the communities, both inside the homes and outside the homes. When and if it is collected the paper products are incinerated (if one is available for community) and the human waste is left for the environment to dispose of naturally. This system over time has started to take a toll on the community and its inhabitants.	Arctic Access has lists of consumers who are dealing with lack of running water and infrastructure adequate to deal with human waste. Communities dumping their human waste in the ocean, landscape and airborne is affecting the sea life, hunting and gathering sites, which they then eat. Human waste littering the landscape, filling the landfills and being spread across the landscape by both domestic and wild animals, environmental natural processes and lack of human intervention to solve the problem. Arctic Access has been gathering this information for years trying to find ways to deal with the issues, finding small funding sources to make very minimal impacts. The RHTP funding will give the region an opportunity to make a larger impact on this issue. We will focus on 20 toilets to start use those 20 systems as examples to help convince and show improvement for the home owners and the communities overall. We have been working with a solar panel company, an incinerator toilet company and a back up battery system that will set the home owner up with a complete system that will consist of being mindful of waste, power and health factors. The target communities are on the Nome Road system making the project available to train staff and home owners on use and make sure they are being used properly, as well as system functionality.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area; Northwest Arctic Borough	Deferred or Not Advanced

Arctic Angels, LLC	Arctic Angels Nursing Services - Home Health Skilled Nursing	AK	The Kenai Peninsula Borough (KPB) spans 16,017 square miles and is the fourth largest borough in Alaska, with an estimated population of approximately 60,413 residents. The Borough’s population over age 65 continues to grow, increasing demand for skilled nursing, chronic disease management, and end-of-life support delivered in the home. Older adults, including those dually eligible for Medicare and Medicaid, face higher rates of hospitalization, chronic disease burden, and difficulty accessing coordinated care. Existing home health agencies report limited capacity in outlying communities such as Seward, Cooper Landing, Seldovia, Nikiski, and other rural areas. In addition, direct referrals from patient’s Primary Care Providers may help avoid unnecessary or preventable hospitalizations. Arctic Angels Nursing Services proposes a nurse-led, team-based care model to expand skilled nursing access in the home, improve continuity of care, reduce preventable utilization, and support aging in place across the Kenai Peninsula Borough. In addition, we will plan to partner with local Tribal entities, including the Kenaitze Indian Tribe, to help transform parts of rural healthcare.	Implementation of a technology-enabled transitional and chronic care management model aligned with RHTP initiatives: • Skilled nursing visits within 48 hours of hospital discharge • Medication reconciliation and chronic disease stabilization • Remote patient monitoring (RPM) for high-risk seniors • Individualized nursing care plans shared with primary care providers • Telehealth consult capability • Workforce pipeline partnership with Kenai Peninsula College, additional partnerships with local PCP offices from all areas, and tribal affiliations.	\$250K-\$1M	Home-and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced
Arctic Chiropractic	Bethel Community Musculoskeletal Care Access Initiative	AK	Musculoskeletal pain and injury are among the most common reasons people seek medical care. In rural Alaska, access to timely treatment for these conditions is often limited due to geographic isolation, workforce shortages, and long wait times for specialty care. In the Bethel region and surrounding Yukon-Kuskokwim Delta communities, many residents rely on physically demanding work and subsistence activities such as fishing, hunting, and gathering. When musculoskeletal injuries or chronic pain are not treated early, they can significantly impact mobility, quality of life, and the ability to work or participate in subsistence activities. Expanding access to conservative musculoskeletal care represents an opportunity to improve health outcomes and support the daily functioning of rural Alaskans.	This project would explore ways to strengthen access to musculoskeletal care in Bethel and the surrounding Yukon-Kuskokwim Delta region. Arctic Chiropractic currently provides chiropractic care, therapeutic massage, and rehabilitation support for patients experiencing musculoskeletal conditions. The proposed project may include expanding clinic capacity, strengthening workforce availability, and improving coordination with other healthcare providers in the region. By increasing access to conservative musculoskeletal care, the project aims to help patients receive earlier treatment for pain and injury, improve mobility and function, and reduce the need for more costly or complex medical interventions.	\$50,000-\$250,000	Clinic	Single Community	Bethel Census Area	Deferred or Not Advanced

Arctic Chiropractic and Physical Medicine Ketchikan	Housing and office repairs	AK	We would like to make improvements and repairs to our office and to our employee housing including a leaking ceiling in the office and windows at the employee housing. Arctic Chiropractic and Physical Medicine Kodiak	Building Resilient Communities: Establishing multi- disciplinary physical medicine on Unalaska Island	AK	As a frontier Alaskan location, residents have limited availability to access specialized care in physical medicine. Many residents work in physically-demanding vocations which are more prone to injuries of various types and are often times treated off island at physical rehabilitation facilities in Anchorage after medical procedures. Many times for more minor injuries people return home with no specialized follow up care often leading to more time off work, longer recovery times, and increased financial hardship.	Provide specialty services allowing for faster evaluation and treatment of injuries while also decreasing the need for prolonged rehabilitative stays in Anchorage. Establishing specialized physical medicine care locally will allow all members of the community to have access to treatments allowing many with injuries that did not need to be addressed by clinicians in Anchorage to work while receiving care and avoiding unnecessary financial hardships. We will also be providing continued preventative care for acute and chronic physical medical conditions allowing community members to have a better quality of life and the ability to enjoy the island in which they live and work.	\$50,000- \$250,000	Specialist	Multi- Community or Participating in Regional Hub-and- Spoke	Aleutians West Census Area	Deferred or Not Advanced

Arctic Chiropractic Barrow	Strengthening Rural healthcare by equipping our clinic with enhanced equipment	AK	Rural communities in Alaska face significant barriers to accessing healthcare due to geographic isolation, harsh weather conditions, and limited transportation infrastructure. Many villages are only reachable by small plane or boat, making routine medical visits time-consuming, costly, and sometimes impossible during adverse conditions. These challenges are compounded by a chronic shortage of healthcare professionals, meaning residents often wait weeks or months for appointments with primary care providers or specialists. As a result, many individuals in these communities struggle to manage chronic pain, inflammation, and mobility issues, which can limit their ability to work, care for family members, or participate in daily activities. Without timely intervention, these conditions can worsen over time, leading to decreased independence, higher rates of disability, and increased reliance on emergency care. The lack of accessible treatment options contributes to a cycle of poor health outcomes and diminished quality of life for rural Alaskans.	To address the significant healthcare barriers faced by rural Alaskan communities, this project will combine hands-on treatment with education to improve mobility, reduce chronic pain, and enhance overall wellbeing. We provide regular chiropractic care and massage therapy sessions tailored to residents’ needs, focusing on relieving inflammation, improving joint function, and supporting musculoskeletal health. The funding requested for new equipment will play a critical role in delivering these services safely, efficiently, and effectively. Advanced treatment tables, therapeutic devices, and massage tools will enable providers to administer care at a higher standard, expanding both the range and quality of services available locally. In addition to treatment, we will increase educational opportunities for community members on self-care strategies, healthy lifestyle choices, and techniques to maintain mobility and reduce pain between sessions. By combining treatment and education with state-of-the-art equipment, this approach empowers residents to take a proactive role in their health, mitigates the effects of limited access to traditional healthcare, and fosters stronger, healthier rural communities.	\$50,000- \$250,000	Specialist	Single Community	North Slope Borough	Deferred or Not Advanced

Arctic Encounter	Arctic Encounter: Rural Health Solutions Convening & Policy Acceleration Initiative	AK	Rural Alaska faces a persistent and compounding crisis in health care access, workforce sustainability, and system coordination. Geographic isolation, infrastructure gaps, workforce shortages, and fragmented policy frameworks leave communities without adequate care — and leave the professionals who serve them without the peer networks, technical resources, or policy leverage to drive change at scale. Despite the urgency, the mechanisms for structured, cross-sector dialogue on rural health solutions remain underdeveloped. Critical stakeholders — tribal health directors, rural providers, state and federal health officials, community leaders, and innovators — rarely occupy the same room with enough time, structure, and follow-through to move from conversation to commitment. Arctic Encounter exists to close that gap. As North America's largest Arctic policy convening organization, we have spent over a decade mastering the art of bringing the right people to the table around the North's most complex challenges. The Rural Health Transformation Program represents a timely opportunity to focus that infrastructure directly on rural Alaska's health system — convening experts, moderating high-stakes professional debates, facilitating intensive working sessions, and producing impact reports that translate dialogue into durable, implementable policy and partnership outcomes.	Arctic Encounter proposes a targeted convening and facilitation program in direct support of RHTP goals. Our approach has three integrated components. First, we will convene dedicated rural health intensives — structured, invitation-only working sessions that bring together rural health professionals, tribal health entities, state and federal health officials, technology innovators, and community stakeholders to tackle defined problem sets within RHTP's six initiative areas. These are not passive conferences; they are professionally moderated, outcome-oriented sessions designed to produce specific deliverables. Second, we will facilitate cross-sector network building — connecting rural providers with peer organizations, subject matter experts, funding partners, and implementation resources they cannot easily access from remote communities. Third, we will produce and disseminate impact reports that synthesize session outcomes into clear policy recommendations, implementation frameworks, and decision-support tools for state and federal health leadership. Arctic Encounter's platform is uniquely suited to this work: we have established trust with Indigenous leaders, federal agencies, state government, academic institutions, the private sector, and international partners operating across the circumpolar North. We operate as a neutral convener with the credibility to bring competing interests into productive alignment — and the discipline to move from dialogue to documented outcomes within compressed timelines.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Nome Census Area; North Slope Borough; Northwest Arctic Borough	Deferred or Not Advanced

Arctic Slope Community Foundation	Payanaigsaigvik, A Place to Build Support for Motherhood	AK	The Payanaigsaigvik project addresses the critical need to improve maternal and child health care access, quality, and sustainability in the eight remote communities of Alaska's North Slope. These communities face significant barriers, including geographic isolation, limited local health services, and the emotional and financial strain of requiring pregnant women to leave their villages for care. This initiative leverages a regional approach to build local capacity and provide culturally connected, family-centered support for new and expecting parents. The project will use the Circle of Security training, an evidence-based intervention that helps new parents build secure, nurturing relationships with their children. By embedding trained facilitators within the communities, the program ensures long-term sustainability and cultural relevance. Additionally, the initiative will expand access to essential prenatal services, such as local sonograms, and provide culturally aligned support for new and expecting mothers. Through partnerships with medical service providers, the project will ensure seamless care and continuity before and after childbirth, empowering families to prepare for the best day of their lives. This initiative not only addresses immediate health care gaps but also builds a foundation for sustainable, community-led maternal and child health care, ensuring that families in the North Slope have access to high-quality, culturally appropriate care close to home.	The Circles of Security, Mothers Helping Mothers program aims to create a culturally responsive, community-based support network for new and expecting mothers across Alaska’s North Slope. The Arctic Slope Community Foundation (ASCF) will recruit and train 15 local facilitators in the Circle of Security Parenting (COSP) curriculum, maternal nutrition, and sonogram operation. These facilitators will be trained in culturally grounded practices to ensure services align with the traditions and values of North Slope communities. Training will be conducted in Anchorage in collaboration with regional health providers, including the Samuel Simmonds Memorial Hospital (ASNA), Maniilaq Association, and Chief Isaac Andrew Health Center. Once certified, facilitators will return to the eight North Slope villages to provide direct support to participants. In the first year, 24 new mothers will be enrolled, with an additional 24 participants added annually in subsequent years. Services will include localized care, regular sonograms, resource navigation, appointment scheduling, and travel coordination to address the challenges of geographic isolation. The program will provide comprehensive maternal and child health services from pregnancy through the first two years of the child’s life, ensuring continuity of care during this critical developmental period. ASCF will work with partners and analyze HIPPA-compliant data to monitor program performance and improve outcomes. This approach ensures that mothers in remote Alaskan communities receive culturally attuned, continuous support while building local capacity and fostering long-term family well-being. Program Highlights: Facilitator Recruitment: 15 facilitators trained in COSP, nutrition, and sonogram operation. Training Location: Centralized in Anchorage with regional health partners. Deployment: Facilitators return to eight North Slope villages. Participant Enrollment: 24 mothers in Year 1, and 24 annually thereafter. Support Services: Localized care, Circle of Security classes, sonograms, resource navigation, family visits, and travel support. Service Duration: Pregnancy through the child’s first two years. Data Collection: Ongoing tracking of performance and family well-being. This program builds a sustainable, culturally aligned maternal health network to improve outcomes for mothers and children across the North Slope of Alaska.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Implementation Application

Arctic Slope Native Association	Center for Supporting Healthy Families Project	AK	Because a patient’s earliest life events and experiences have the greatest impact on their long-term health and overall wellbeing Arctic Slope Native Association (ASNA) will make a strategic investment in improving service delivery and coordination for children and their parents. ASNA has the opportunity to expand health and social services to families with children, as well as to young people that may become parents in the near future. By repurposing underutilized space at the ASNA West Campus, we have an opportunity to develop a dedicated service center for teaching proactive positive health strategies, parenting classes, early childhood nutrition, and providing other health care and social services supports that are not readily available at the main hospital campus. This center will also serve as a springboard for future delivery of these services into the surrounding communities of Atkasuk, Kaktovik, Nuiqsut, Point Lay, and Wainwright.	We will develop a master planning document to comprehensively update the West Campus facility and create appropriate spaces for delivering health care education, parenting classes, and other foundational training for helping children and families live healthy lifestyles. Using the campus master planning document we will remodel space at the West Campus to provide additional training and supervised parenting space, offices for social services workers and case managers to serve patients from Utqiagvik and the surrounding villages, and appropriate storage for resources. As space becomes available, we will collaborate with our community partners to identify families with the greatest need for services and begin a targeted outreach campaign. The campaign will encourage them to utilize the space as “VIP guests” and take advantage of the classes and trainings available. Each family will be connected case managers that can address their specific needs and make referrals to the necessary medical or social services provider. The ultimate objective is to connect a symptom or a problem in the child’s life to an underlying health issue and treat the health issue rather than just addressing the immediate symptom (i.e. lack of attention in school may be due to poor vision/inability to see the course material rather than a “bad attitude”). Parents will be trained and equipped with appropriate education to recognize common childhood medical needs and current information for accessing resources that can help their child. ASNA staff will be available at the center to deliver services and assist parents in identifying and accessing additional community resources to help them and their children. This approach will create a single, integrated point of contact for parents and families that are seeking services from ASNA. It will also reduce the risk of families “falling through the cracks” when making referrals or connecting people with resources. We are requesting \$1,000,000 in financial support to complete the space planning, including architectural and engineering support, and complete the remodeling of the space. The project will be completed in phases, with the master planning completed by September 2026 and the remodeling efforts completed by June 2027. We will order all of the materials and have all of the funds encumbered by September 30, 2026 and will fully liquidate the encumbrances within the performance period.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Implementation Application

Arctic Slope Native Association	Pre-maternal Care Project	AK	On the Arctic Slope, as with many rural location, lack of access to on-going pre-maternal care is a significant issue. Studies indicate that babies born in the rural communities are more likely to be pre-mature and suffer from numerous health problems. Many mothers do not have adequate pre-maternal care. One of the causes is the amount of travel that is required when the mothers are in communities which are only connected to the hub communities by daily small aircraft flights. Instead of a few hours spent for a pre-maternal visit, the mothers in these communities must spend two days traveling to and from their pre-maternal appointments. Approximately 40% of the mothers in rural communities are advised to give birth in Anchorage, at least partly due to lack of pre-natal care increasing their chances of being high risk pregnancies. This has led individuals in these communities to believe that this is their only and best option. This increases the cost on the patient, the community, and the state via Medicaid funded travel. Specialty care in the villages is limited to rotating providers and frequently the appointment slots are full. Pre-natal visits, nutrition counseling and pre-maternal care are lacking due to the rural and remote nature of our communities.	ASNA will double the number of village clinic trips by our OBGYN, Women’s Health, Diabetes Educators and other specialty providers and expanding the days and hours of the clinics, to include weekends, to allow expectant and new mothers to see their providers on a more routine basis. In addition, should these visits not be possible, trips to the hub community could be paid for to encourage the on-going relationship with their providers. In addition to nurses and OBYN providers, we would schedule regular community visits by nutrition staff and others so we can offer wrap around services to all mothers, including those simply planning to become mothers. This will also help us provide additional training to the Community Health Aides so that even when our providers are not present, the community has someone to answer questions and provide referrals. Addressing the lack of pre-natal care in the outlying and remote communities in our region begins with nurses and providers developing relationships with the mothers in their communities. Offering pre-natal visits in their community and having nurses performing home visits has been shown to increase compliance with pre-natal care plans and the comfort of the mothers in giving birth closer to home. Encouraging routine and regular contact between the nurses, OBGYN providers and others on the care team will enable the patients to increase their trust in their team, provide them with the pre-maternal and post-partum care they need and encourage them to give birth closer to home. All these efforts will lead to better outcomes for both the mothers and babies.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Implementation Application
Arctic Slope Native Association	Pre-maternal Equipment and Training	AK	Pre-maternal and post-partum care in the region suffers from several disconnects in the way services are provided. Mothers in the outlying villages often do not receive adequate pre-maternal care despite the efforts of our providers to be in the outlying communities. The lack of ultra-sound equipment and other equipment in the community clinics often requires that expectant mother travel to Utqiagvik to be seen by their providers. As the pregnancy progresses, these trips away from their family and support systems become more and more difficult. The CHAPS in the villages are unable to provide the required services as both the equipment in the community and the required training for the CHAPS is inadequate.	ASNA, in partnership with the North Slope Borough Health and Social Services Department, is proposing a multi-phase approach to addressing this issue. The first step would be the purchase of ultrasound equipment for each of the 5 village clinics in the North Slope. The ultra-sound equipment would be purchased, certified, and maintained by ASNA. The second step which could occur concurrently would be the training of the NSB CHAPs to work with the SSMH medical providers on helping conduct ultrasound exams and providing follow up care. Patients who need Samuel Simmonds Memorial Hospital (SSMH) services will have travel cost for village to Barrow paid for.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Implementation Application

Arctic Slope Native Association	Surgical Suite Renovation	AK	As noted in a 2025 Study by University Alaska Anchorage, “Rural women with more high-risk pregnancies may be directed to travel to cities or hub communities to give birth. ”This project, the surgical suite renovation at Samuel Simmonds Memorial Hospital, will provide the option for higher risk pregnant parents to remain closer to home by providing them with the necessary supports and options should complication arise during their pregnancy up to and including c-section deliveries in an advanced medical suite. The lack of the ability to perform even routine surgeries on patients means that patients requiring even procedures that would be considered routine, such as a simple tonsillectomy, orthopedic interventions, or even placement of tubes in their ears, need to be transported to Anchorage for these very routine surgical interventions. SSMH is designated as a Level IV trauma center and is equipped to stabilize and transfer patients with severe injuries or critical illness to tertiary care facilities in Anchorage or Fairbanks. Depending upon aircraft availability, this can require 4 to 6 hours of standby and travel time before a patient can have surgery. In poor weather conditions, medevac operations may be suspended, which jeopardizes the health and life of the patient. This time constraint places pressure on patients and providers to make quick care decisions and lowers quality of care.	ASNA will renovate existing conference room and office space into two fully equipped medical suites capable of addressing the needs of high risk pregnant mothers while they remain in our region as well as trauma patients. The surgical suite will also allow us to provide care to other patients including orthopedics, cardiac, and other trauma and emergency situations without having to transport the mother, child, or patient to Anchorage, increasing access to services avoids aggravating injuries. In a emergency care situation, a hand injury to a young child, the delay in care to the patient resulted in a much longer recovery time and a much worse outcome. This projects timeline is very aggressive with 35% design completed in March of 2026 and construction beginning in Fall of 2026, Completion is currently scheduled in the Summer of 2027.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Implementati on Application

Arctic Slope Native Association	Virtual Intensive Care Unit Project	AK	Samuel Simmonds Memorial Hospital (SSMH) does not have the infrastructure needed to provide intensive care (ICU) level services for patients. This limitation requires medically fragile or unstable patients to be transferred to Anchorage facilities, which can delay their care. This limitation also prevents delivery of specialty care services such as dialysis or oncology where a patient may have an adverse reaction and need immediate access to ICU care. We will partner with the larger hospitals (Alaska Native Tribal Health Consortium, Providence, and/or Alaska Regional) to develop a virtual intensive care unit. Three existing inpatient rooms can be retrofitted with telehealth equipment and appropriate monitoring devices to allow intensive care providers at the urban hospitals to monitor patients in real time at SSMH. The doctors and nurses at SSMH will collaborate with the ICU staff at the partner hospitals to respond to any patient needs and deliver care on site. Patients that recover can be moved to the regular inpatient facilities at SSMH. If higher levels of care are needed, the patients can be safely held and monitored in the virtual ICU while waiting for transfer. We are requesting \$500,000 in financial support to purchase and install the equipment and \$100,000 in financial support for training the clinical, facilities, and IT teams on implementing and maintaining the new virtual ICU. The equipment will be ordered immediately with a target for installation in June 2026. Training will be implemented concurrently, with a goal of starting virtual ICU operations in September 2026. Full accreditation and commissioning of the virtual ICU will be completed within 12 months of the equipment installation.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Implementation Application

Arctic Slope Native Association	Community AODA Health Assessment/planning	AK	The North Slope Borough is a rural and remote region of Alaska roughly the size of the state of Wyoming. In our region, Alcohol & Other Drug Abuse (AODA) is a serious issue with 42% of households reporting being impacted by alcohol or drug use. The North Slope Borough operates an Integrated Behavioral Health program which offers outpatient treatment and recovery services for AODA issues, however inpatient treatment is only available at facilities that are out of Alaska. Lack of a stable, alcohol and drug free living environment can be a serious obstacle to sustained abstinence, especially when the environment is the only environment choice available due to the chronic lack of housing in the region. Additionally, there is no available detox environment in the region. Currently individuals who are in need of this service are medically cleared at the Emergency Room at Samuel Simmonds Memorial Hospital before being transported to the North Slope Borough Police Department jail facility to complete their detox. The North Slope Borough operates an Integrated Behavioral Health program which offers outpatient treatment and recovery services for AODA issues, however inpatient treatment is only available at facilities that are out of Alaska. Lack of alternative housing, due to the overall lack of housing in the region, often requires that the individual who has achieved sobriety in an inpatient facility be returned to the same home and environment that contributed to their AODA issue.	The Arctic Slope Native Association, in partnership with the North Slope Borough's Health and Social Services Department, will complete a study for the feasibility of building and operating a sober living environment and potentially a detox arrangement. This study would assist in determining if such environments are feasible in the area and if they would be able to be sustained with future funding under this program. Sober living environments have been studied and found beneficial by the National Institute of Health and been found to be beneficial in maintaining sobriety, especially for individuals who are newly sober. Though these environments are often funded by the individuals who reside in them, that is likely not an option in the North Slope Borough due to the high cost and general lack of housing. It is hoped that such an assessment will assist the region in determining what solutions might be available and what a self-sustaining model would require. This information would not only assist our region but potentially provide a model for the other regions of the state to increase the effectiveness of existing AODA treatment. Detox services in urban areas of Alaska are typically handled in medically supervised environment such as the Anchorage Recovery Center. These services are simply not available in rural areas of the state. There are many barriers that must be overcome in providing these types of services including the volume of patients, the physical location, accreditation, and cost. A study of these issue will help fully identify what the barriers are, what additional services might be offered and how to overcome any barriers in the system. This project will also be shared with the NSB Police Department and the Alaska Court System to see how to best mitigate the impacts to the corrections system. Access to this resource will also support therapeutic courts and their services. This project is estimated at \$500,000 for a planning and feasibility study as well as architectural concepts and renderings.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Advance to Planning

Arctic Slope Native Association	ADA Accessibility Needs for West Campus Project	AK	Frequently patients that need to travel for a higher level of care have specialized or complex medical needs (i.e. cancer treatment, orthopedic surgeries, etc.) and need a lot of support to successfully travel. The best outcomes happen when these patients are able to meet in person with travel staff, review their appointment schedules, and carefully plan their trips. Due to the growth in medical services at Samuel Simmonds Memorial Hospital, patient travel services have relocated to new workspace at the West Campus. The work area has been updated to create a modern, comfortable area for patients and staff, but due to the age of the building there are very few accessible entrances for patients. This creates a negative feedback loop where patients that have the greatest complexity and need the most staff support to successfully travel may be the least able to access ASNA resources to help them. Because of the specialized nature of the needed medical care, appointments at Anchorage and Fairbanks facilities can be hard to get and any travel mishap that leads to a broken appointment has a very high cost. This does not account for the potential for the underlying medical condition to deteriorate because of the delay in rearranging the new appointment and the associated increase in medical costs. Arctic Slope Native Association (ASNA) proposes to directly address this obstacle by creating a new ADA accessible entrance to help patients access services.	ASNA carpenters will work with a qualified building contractor to create a new wheelchair access ramp with appropriate lighting and safety features to remove barriers for patients with mobility challenges. Separate from the interior improvements, ASNA electricians will install additional exterior lighting and an intercom system to allow patients to safely access services from the parking lot if patients prefer not to come in the building. We are requesting \$200,000 in financial support to remodel the building entrance and make it easier for patients to access the space. The project has a narrow scope and can be fully completed by September 30, 2026.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Arctic Slope Native Association	Community Medical Provider Housing for RHCTP	AK	Due to isolation and other obstacles rural Alaska has significant challenges to recruit and retain qualified staff. The North Slope has had a housing shortage since the 1980s, with the growth in families vastly exceeding the rate of new housing construction. A community survey conducted by TNHA in 2015 indicated a shortage of 400 housing units and the deficit has expanded since that time. The Housing Authority has an existing inventory of apartments and rental homes across the North Slope, but due to funding constraints, has been unable to invest in the upkeep and modernization of these units. The ASNA as well as the North Slope Borough Health Department are very reliant on TNHA for housing key personnel: approximately 80 units are occupied by North Slope Borough Health Department staff, medevac/EMS personnel, community health aides, and other essential medical and support staff. The current housing shortage creates pressure on all of the stakeholders in the region and it can turn into a self-reinforcing “downward spiral”: lack of housing funds limits TNHA’s ability to complete maintenance and upkeep, lack of maintenance creates higher facility operating costs, and poor housing quality increases ASNA and North Slope Borough Health Department staff turn-over and program staffing costs. Staffing instability makes it harder to complete other health care quality improvement initiatives and increases the burnout levels of the remaining staff.	ASNA will partner with TNHA to create a comprehensive plan to address deferred maintenance needs, energy efficiency improvements, and an interior upgrade (floor/wall coverings, ventilation and lighting upgrades, etc.) to create 25 updated and attractive units for use by health care staff. We are requesting \$1,500,000 in financial support to conduct the planning project and fund the modernization of the rental units. TNHA will perform the modernization work and prioritize healthcare workers for future occupancy of the updated units. Depending upon the community healthcare needs, units could be occupied by North Slope Borough Health Department employees (community health aides, behavioral health counselors, etc.) or ASNA medical staff. The planning work can be completed and all funds fully obligated by September 30, 2026. The modernization work is expected to take place in phases with the project taking 16-24 months to complete.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Arctic Slope Native Association	Healthcare Provider Retention Project	AK	Hospital labor costs are the single highest expense category at our facility. Each provider is difficult to recruit, must be relocated to the community, and is a highly valued resource for the organization. Isolation, darkness, extreme weather conditions, and the regular stresses of healthcare delivery create frequent provider burnout and increase staff turnover at the hospital. Each time this happens the hospital goes through a costly cycle of recruiting, orienting, and training replacement staff and the patient continuity of care is interrupted, which makes positive clinical outcomes harder to achieve. Departing staff share concerns around lack of recreational activities, inability to go outside during winter months, and a lack of opportunities to socialize or interact outside of the clinical environment. Because the hospital is in a very small community, there is a high likelihood that using the high school gym or city basketball court will involve interactions with patients or their family members. In these settings, staff are frequently interrupted during their off time with questions about medications, medical concerns, etc. This makes it very difficult for staff to fully relax and disconnect from the stresses of hospital operations. Similar barriers exist if staff go out to eat in local restaurants or attend community events. The community perceives them as “always on duty” and there is no place available for them to completely disengage from their work.	We will remodel and update two existing spaces (Main Campus & West Campus) to create a modern, attractive, and inviting work out area for staff to utilize when not on their work shifts. All of the equipment and amenities will be fully compliant with hospital infection control and safety standards. We will also create three dedicated spaces in the staff quarters where staff can exercise on weekends, holidays, and other non-work periods. The Facilities maintenance team will take responsibility for maintaining the equipment, oversee cleaning, and overall operations of the exercise spaces which will ensure that the space is available 24 hours a day without creating any additional burdens on staff for upkeep. These areas will be secured and exclusively used by staff, so people can exercise and socialize in a comfortable environment. We are requesting \$600,000 in financial support to purchase and install exercise equipment and upgrade the existing space (lighting, paint, floor coverings, etc.) to create five employee exercise areas for staff use. A portion of these funds will also be used to purchase spare parts and training resources for the Facilities maintenance team, so all of the equipment can be serviced in house. The project will be completed in phases, with two areas completed by September 2026 and three areas completed March 2027. We will order all of the materials and have all of the funds encumbered by September 30, 2026 and will fully liquidate the encumbrances within the performance period.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Arctic Slope Native Association	Sim-Lab equipment refresh	AK	This project is seeking to improve and refresh the simulation lab that ASNA utilized during the training of “home grown” nurses who are participating the APU Associate in Nursing program. A cohort of that program is based at our facilities. The sim lab also is utilized to provide training to the nursing staff at SSMH reducing the amount of time our nursing staff need to spend traveling to urban communities to receive the training they require. The sim lab was originally equipped in 2020 and has been very successful, however, the equipment has a limited lifespan and requires replacement. The equipment is of an age that the simulations can no longer be shared with the APU campus or other training programs as it is no longer supported. Students who can not use the same equipment as that found in other state of the art facilities may be less equipped and less able to fulfill the requirements of the program.	ASMA will develop a replacement plan will Ilisagvik College and APU to upgrade the entire lab. Refreshing the technology in the simulation lab will encourage students to remain in our communities and thereby develop our nursing workforce. The refresh will allow ASNA and APU to continue to provide state of the art training opportunities in our community which will in turn encourage more individuals to remain in the community once they graduate. This project is expected to coms \$1,000,000 including the purchase of new equipment, set-up, and instructor training.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Arctic Slope Native Association	Surgical Suite Equipment	AK	As noted in a 2025 Study by University Alaska Anchorage, “Rural women with more high-risk pregnancies may be directed to travel to cities or hub communities to give birth.” This creates hardships for the patient, distances them from family supports, and creates increases the overall cost of care. We propose adding surgical equipment as part of an integrated surgical suite renovation project at Samuel Simmonds Memorial Hospital to support higher risk deliveries closer to home. This project leverages the earlier Labor and Delivery Procedure room expansion and the growth in prematernal services by creating the capability for emergency surgeries at the hospital. The hospital is currently designated as a Level IV trauma center and is primarily equipped to stabilize and transfer patients in need of higher levels of care to Anchorage or Fairbanks. Depending upon emergency aircraft availability, this can require 4 to 6 hours of standby and travel time before a patient can have surgery. In poor weather conditions, medevac operations may be suspended, which jeopardizes the health and life of the patient. The surgical equipment we propose to utilize for supporting complex deliveries can also be deployed for handling emergency surgeries and trauma response for all SSMH patients. Having the capability immediately available reduces the potential for crisis level events and reduces the pressure on medical providers to make immediate treatment decisions.	ASNA will renovate existing conference room and office space into two fully equipped medical suites capable of addressing the needs of high-risk pregnant mothers while they remain in our region as well as trauma patients. The RHCTP would invest \$1,000,000 to purchasing the equipment for the Surgical Suite including but not limited to headwalls, medical gas connections, anesthesia equipment, lighting, gurneys, sterilization equipment, and surgical equipment. The project construction costs will be funded separately. The hospital has already completed upgrades to the medical gas and oxygen generation systems to support adding services. Current hospital staff include OB/GYN, Cardiology, and other specialty doctors with surgery qualifications. The hospital currently employees support staff including anesthesiologists, CRNAs, surgical nurses, and sterile processing technicians. The staff would complete the credentialing process to add surgery privileges and then begin providing care in the newly renovated space. Because the scope is limited, we expect to rapidly address the need. The 35% design will be completed by the end of March 2026 and with construction beginning in Fall of 2026. The project is expected to be completed, fully commissioned, and placed in service by September 30, 2027. All RHCTP funds will be fully obligated by September 30, 2026 and fully spent within the performance period.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Arctic Slope Native Association	Technology Refresh at SSMH	AK	Medical Care, especially in rural areas, continues to move towards technological solutions to address the vast distances involved. This technology including telehealth and wearable technology, to be effective, needs to have a knowledgeable and trained provider at it’s end point to analyze the information and provide effective care as the devices themselves only provide the metrics or information. Providers that direct the actual care need to have access to the information and metrics in an equal or/in some cases more detailed manner requiring equally advanced equipment. In rural Alaska, where hub and spoke health care is prevalent, the need for the hub of that care to have the advanced technology to support the spokes is critical as is the ability to deal with the issues at the local or regional hubs instead of having all the information flow to state or out of state sources which makes them more difficult to access. New standards of care including providing CT scans for head injuries, Cardiac CT scans for diagnostics, halter monitors for cardiac health monitoring, tele neurology for stroke response, and AI enabled interpretations of MRI requiring substantially more capacity than when the hospital was built. Each solution implemented at SSMH requires more advanced technology and connectivity and have strained our IT infrastructure impacting our ability to fully implement these solutions.	ASNA proposes a technological refresh hospital infrastructure to support new service delivery . This would begin with the development of a Technology plan that allows for the exponential growth in the need for IT infrastructure with an estimate of \$100,000 The plan combined with an existing electrical engineering study would will give the facility the necessary electrical capacity to support the upgrades. This is estimated at \$250,000 The implementation of communication upgrades and upgrades to the routing, and switching hardware is estimated at \$650,000 The long term goal is the implementation of a “rack of the future” which we are currently studying and piloting that will allow for the replacement of physical servers with virtualized environments and cloud based systems with local backups for essential systems. These upgrades will allow us to fully adopt CT scans for head injuries, Cardiac CT scans for diagnostics, halter monitors for cardiac health monitoring, tele neurology for stroke response, and AI enabled interpretations of MRI in a more comprehensive manner with faster results and better patient outcomes.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Arctic Slope Native Association	Trauma Bay Equipment	AK	This year, Samuel Simmonds Memorial Hospital (SSMH) has utilized trauma services 98 times, with 18 individuals requiring medi-vac services for additional care and two fatalities. We expect the demand for services to increase as the community grows and more vehicles, subsistence activities and travel occur. We have the staffing in place to operate the expanded space and expect it will be financially self-sufficient and not require ongoing financial support from the State. Depending upon the nature of the trauma cases this project may create cost savings by reducing some of the demand for medevac services and potential charges to Medicaid. In urban areas, there is seldom a concern that the space needed to provide care is available when there is an emergency or trauma. In rural settings such as ours, the design of the spaces was often done based on statistical analysis with little regard to how life is lived in our region. In this case, one trauma bay that has been divided into two extremely small trauma bays was designed into the facility disregarding that in rural areas, there is higher occurrence of multi-occupant car accidents, that ATV accidents are also seldom single occupant occurrences and that a single boating accident could result in multiple traumas at a time. Due to the design of the current space, two traumas occurring at the same time results in very cramped conditions where equipment must be moved around to accommodate the treatment of trauma patients.	This project will purchase the medical equipment needed to complete the trauma bay that will be constructed and completed in 2027. The new trauma bay is a remodel of underutilized space to perform trauma care. The morgue space at SSMH has been moved to west campus and the space is ready for the mechanical and construction work that will begin this year and which is being funded from other sources. The equipment for the space including the headwall, lighting, trauma, and other equipment for the space is not part of the existing package. The addition of a third larger trauma bay will address the deficiencies in the current two trauma bay set up at SSMH. The space, the former morgue, has been identified as the space that will be renovated into the new trauma space. The equipment for this space would include the headwall (medical gas connections, monitoring equipment, and lighting), Trauma lighting, gurneys, specialized monitoring equipment, and trauma equipment such as trauma carts. This project will result in the completion of a third trauma bay at SSMH, providing additional trauma capacity and an increased ability to deliver emergency medical care.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

Arctic Slope Native Association	Village Medical Provider Housing - Nuiqsut Demonstration Project	AK	Due to isolation, extreme weather conditions, limited amenities, and other obstacles rural Alaska has significant challenges to recruit and retain qualified staff. The North Slope has had a housing shortage since the 1980s, with the growth in families vastly exceeding the rate of new housing construction. A community survey conducted by Tagiugmiullu Nunamiullu Housing Authority (TNHA) in 2015 indicated a shortage of 400 housing units and the deficit has expanded since that time. Lack of quality housing for families is the number one factor that recruiting efforts fail or staff choose to leave employment. ASNA has been very successful in attracting specialty doctors to care for patients on the North Slope, but the lack of quality housing contributes to high turnover. It is very difficult to persuade a cardiologist or other highly trained medical professional to sleep on the floor in the village clinics. In the village of Nuiqsut, Kuukpik Corporation has developed a “house in a box” concept, where the entire building package can be purchased and delivered to Nuiqsut at a relatively low cost. The North Slope Borough also has limited cash subsidies to reduce the freight costs associated with shipping materials for home building. Each resource is valuable, but there is no coordinated effort to mobilize all the resources to address the community need.	ASNA will work with a professional planning firm to identify the community stakeholders and develop a master planning document to capture all of the resources and requirements for building provider housing in the village of Nuiqsut. Using the master planning document, ASNA will partner with Kuukpik Corporation to build a demonstration house. The building will be used as housing for medical providers working in Nuiqsut and serve as a template for future projects in different communities. Arctic Slope Native Association (ASNA) proposes to directly address this problem by creating a coordinated community plan for all of the Nuiqsut stakeholders to pool resources and construct a housing unit as a demonstration project. The success of the demonstration project is intended to serve as a catalyst for future adoption in surrounding communities. We are requesting \$700,000 in financial support to complete the planning project, purchase the materials for the demonstration phase, and pay for the initial leasing and operating costs for the demonstration project. Kuukpik is expected to own the property and the finished home and provide ASNA a long-term lease for occupancy by medical providers. RHCTP funding would be utilized for materials purchases, furnishing the house, setting up utility services, and providing lease payments for the initial term. The actual construction costs would be funded separately from RHCTP. Depending upon the community healthcare needs, ASNA would sublease the new unit to a provider or the North Slope Borough Health Department would sublease the new unit to a community health aide as part of their employment agreement. This structure limits reserves the use of the unit for health care workers and their family members, while still allowing for Kuukpik to handle the maintenance needs. The planning work can be completed and all funds fully obligated by September 30, 2026. The demonstration unit can be fully assembled and placed in service by September 30, 2027.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough	Deferred or Not Advanced

ArcticEdge Innovations LLC	Project RuralConnect: Resilient IT Infrastructure for Frontier Health	AK	Rural Alaska health clinics face a "tech gap": intermittent connectivity, aging hardware, and a total lack of dedicated on-site IT personnel. Cybersecurity threats are also rising, targeting smaller facilities that lack enterprise-grade protection. Without a professional managed services partner, these clinics operate on "break-fix" cycles that lead to costly downtime and data vulnerabilities.	We will implement a centralized "Managed IT Ecosystem" for rural healthcare partners. This includes: 1) Proactive 24/7 network monitoring to prevent outages; 2) Deployment of hardened, HIPAA-compliant hardware; 3) Secure cloud-backups for patient data; and 4) A "Human-in-the-Loop" help desk designed for rural staff. We are specifically targeting a partnership with the Eastern Aleutian Tribes to stabilize their multi-site clinic networks.	\$250K-\$1M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

Arete Family Care, LLC	Direct Primary Care Program Refinement and Community Outreach Initiative	AK	Direct Primary Care removes the insurance intermediary from routine primary care, enabling physicians to offer comprehensive services at dramatically lower cost. For a predictable monthly membership fee, DPC patients typically receive: • Unlimited office visits with no copays or per-visit charges. • Same-day or next-day appointments with their personal physician. • Extended visit times allowing thorough, relationship-based care. • Direct phone, text, and telehealth access to their provider. • Significantly discounted labs, imaging, and medications through direct vendor agreements. Research consistently demonstrates that DPC reduces emergency department utilization, improves management of chronic conditions, increases patient satisfaction, and lowers total healthcare costs. For uninsured and underinsured populations, DPC paired with a low-cost catastrophic insurance plan provides comprehensive coverage at a fraction of the cost of traditional insurance. Arete Family Care currently operates a DPC model and has demonstrated the viability of this approach in Alaska. This grant will strengthen that foundation and dramatically expand its reach to the Alaskans who need it most.	Funds will support a systematic review and improvement of Arete Family Care’s existing DPC program across the following areas: • Membership structure and pricing: Review and optimize membership tiers to ensure affordability for uninsured and underinsured Alaskans, including a reduced-rate options for low-income patients. • Service scope expansion: Assess and expand the range of services included in DPC membership, potentially adding chronic disease management protocols, preventive care bundles, behavioral health coordination, and telehealth services. • Operational workflows: Streamline scheduling, patient communication, care coordination, and documentation workflows to improve efficiency, reduce administrative burden, and maximize time available for patient care. • Technology infrastructure: Evaluate and upgrade patient-facing technology including the patient portal, telehealth platform, and direct messaging systems to improve accessibility and engagement. • Care gap identification: Implement systems to proactively identify and address care gaps among existing DPC members, particularly those with chronic conditions. • Policy and procedure documentation: Develop or update comprehensive policies and procedures to support program scalability and consistency as membership grows. Component 2: Community Outreach & Marketing Campaign A well-designed, accessible DPC program is only impactful if the people who need it most know it exists. Grant funds will support a targeted, multi-channel outreach and marketing campaign focused on reaching uninsured and underinsured Alaskans statewide. Campaign activities will include: • Digital marketing: Website refresh, search engine optimization (SEO), social media campaigns (Facebook, Instagram, community groups), and targeted digital advertising reaching working-age adults in Alaska. • Community outreach: Presentations and informational sessions at community centers, libraries, Alaska Native organizations, workforce development programs, and small business associations. • Employer outreach: Direct engagement with small and mid-size Alaska employers to promote DPC as a low-cost employee health benefit alternative to traditional group insurance. • Printed materials: Patient-friendly brochures, flyers, and FAQ sheets explaining DPC in plain language — distributed through community partners, clinics, pharmacies, and community health aides. • Earned media: Press outreach to Alaska media to build public awareness of the DPC model	\$50,000-\$250,000	Family or primary care	Statewide	Anchorage (Municipality)	Advance to Implementation Application

Arete Family Care, LLC	Point-of-Care Ultrasound & PACS System Acquisition	AK	Without on-site ultrasound, Arete Family Care faces the following documented challenges: • Delayed diagnosis: Patients with time-sensitive conditions such as suspected DVT, appendicitis, or ovarian pathology must wait for external appointments rather than receiving same-visit evaluation. • Referral attrition: A meaningful proportion of patients referred for external imaging do not complete the study due to transportation barriers, cost, or scheduling difficulties, resulting in unresolved clinical questions. • Fragmented care: Results from external facilities arrive through separate systems, creating documentation gaps and communication delays between imaging and treating providers. • Patient burden: Patients bear additional costs and time demands associated with traveling to separate facilities, which is particularly burdensome in Alaska's climate and geography.	Arete Family Care proposes to acquire two integrated systems: (1) a high-quality diagnostic ultrasound unit capable of performing the full range of point-of-care imaging studies needed in a primary care setting, and (2) a cloud-based or on-premise Picture Archiving and Communication System (PACS) to store, manage, retrieve, and share all diagnostic images generated at our clinic. Together, these systems will create a complete on-site imaging infrastructure — from image capture through long-term archival and provider access. Key ultrasound equipment specifications will include: • Multi-frequency transducer array supporting linear, curvilinear, and phased array imaging modes. • High-resolution digital imaging with DICOM compatibility for PACS and EHR integration. • Doppler capability for vascular assessment including color flow and spectral analysis. • Portable or cart-based design suitable for use across clinic exam rooms. • Vendor-provided training, warranty, and technical support. Key PACS specifications will include: • DICOM-compliant image storage with support for ultrasound and future imaging modalities. • Secure, HIPAA-compliant storage with role-based provider access from clinic workstations. • Integration with our electronic health record (EHR) system for seamless image linking to patient records. • Remote viewing capability to support telehealth consultations and specialist image sharing. • Scalable storage architecture to accommodate growing image volume over time.	\$50,000-\$250,000	Family or primary care	Single Community	Anchorage (Municipality)	Advance to Implementation Application

Arete Family Care, LLC	Portable Digital Radiography Acquisition for Point-of-Care Diagnostic Imaging at Arete Family Care	AK	Despite being Alaska's largest city, Anchorage faces significant gaps in healthcare access. Many residents — including low-income families, uninsured and underinsured individuals, elderly patients, and those without reliable transportation — face substantial barriers to obtaining timely diagnostic services. When primary care providers must refer patients elsewhere for basic imaging, a meaningful percentage never complete those referrals, leaving conditions undiagnosed and untreated. Arete Family Care currently serves a diverse patient population in Anchorage, providing comprehensive primary and family care services. However, the clinic lacks on-site radiological imaging capability. This gap creates the following problems: • Patients with suspected fractures, pulmonary conditions, or other imaging-indicated presentations must be sent to external facilities, adding days or weeks to the diagnostic timeline. • Referral fragmentation increases the likelihood of lost follow-up and patient non-compliance, particularly among vulnerable populations. • Clinical staff must make treatment decisions with incomplete information or wait for outside imaging reports, reducing care quality. • External imaging referrals increase overall healthcare costs for patients and payers, including Medicaid and Medicare.	Arete Family Care proposes to acquire one portable digital radiography (DR) system, including a wireless flat-panel detector, mobile X-ray generator, and integrated imaging software compatible with the clinic's existing electronic health record (EHR) and picture archiving system (PACS). The unit will be housed within the clinic and operated by trained clinical staff under the supervision of a licensed provider. Once operational, the portable X-ray system will enable Arete Family Care to provide: • Musculoskeletal imaging (fractures, joint assessments, injury follow-up) • Chest X-rays (pneumonia, TB screening, COPD monitoring, cardiac assessment) • Abdominal imaging (obstruction, foreign body, acute abdomen evaluation) • Pediatric imaging for common conditions managed in a family care setting • Occupational health imaging for workers' compensation and DOT physicals	\$50,000-\$250,000	Family or primary care	Single Community	Anchorage (Municipality)	Advance to Implementation Application

Arete Family Care, LLC	Adult Weight Management Program with Body Composition & Bone Density Screening	AK	Obesity is among the most significant and costly public health challenges facing Alaska today, contributing to diabetes, cardiovascular disease, joint disease, and diminished quality of life. Yet access to structured, medically supervised weight management programs remains limited — particularly outside major urban centers. By combining clinical-grade body composition measurement with a comprehensive weight loss program, Arete Family Care will deliver a level of care rarely available in community-based settings, with outcomes that are measurable, meaningful, and sustainable.	The AFC Adult Weight Management Program will be a structured, medically supervised program for adults with obesity, delivered at our clinic with telehealth support for patients unable to attend in person. The program will integrate body composition scanning, individualized medical assessment, evidence-based nutrition and behavioral counseling, and exercise guidance into a cohesive, clinician-led experience. The program will be grounded in evidence-based frameworks including the American Academy of Obesity Medicine (AAOM) guidelines, the Obesity Medicine Association clinical protocols, and applicable CDC chronic disease prevention models. Equipment: Body Composition & Bone Density Scanner Grant funds will support the acquisition of a clinical-grade body composition and bone density scanner — most likely a DEXA (Dual-Energy X-ray Absorptiometry) system. Key specifications will include: • Full-body and regional body composition analysis: fat mass, lean mass, visceral adipose tissue, and fat percentage by region. • Bone mineral density assessment: lumbar spine, hip, and whole-body measurements with fracture risk scoring. • DICOM compatibility for EHR integration and image archiving. • Automated reporting with normative comparisons for patient-friendly result interpretation. • Vendor-provided training, warranty, and technical support. Program Components The weight management program will include the following core components: • Initial comprehensive assessment: Medical history, physical exam, laboratory workup, and baseline body composition and bone density scan. • Individualized treatment plan: Clinician-developed plan incorporating nutrition goals, physical activity recommendations, behavioral strategies, and medication management where appropriate. • Structured group and individual sessions: Weekly or biweekly sessions covering nutrition education, behavioral change techniques, physical activity, stress management, and long-term maintenance strategies. • Telehealth follow-up: Virtual check-ins between in-person visits for accountability, symptom monitoring, and plan adjustments. • Progress scanning: Repeat body composition scans at regular intervals (e.g., 3, 6, and 12 months) to objectively track fat loss, muscle preservation, and bone health changes. • Behavioral health integration: Referral pathways or embedded counseling support for participants with emotional eating, depression, or anxiety contributing to weight challenges.	\$250K-\$1M	Family or primary care	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Arete Family Care, LLC	Statewide Nutritional and Diabetes Education Program — Program Development Grant	AK	To develop a complete, evidence-based, launch-ready Statewide Nutritional and Diabetes Education Program that is accredited, reimbursable, and sustainable — delivering accessible education to all Alaskans through multiple modalities upon grant completion. Measurable Development Objectives • Complete full curriculum development across all content areas within 12 months of award. • Develop and produce printed educational materials suitable for statewide distribution within 12 months of award. • Establish functioning telehealth and video conferencing infrastructure within 6 months of award. • Hire or contract a credentialed diabetes educator (CDE) and/or registered dietitian (RD) within 90 days of award. • Complete a pilot cohort of participants across all five delivery modalities by Month 12. • Submit applications for DSMES accreditation and CDC DPP recognition by Month 12. • Achieve a pilot participant satisfaction score of 80% or higher to validate program readiness for full launch.	The program will reach participants through five complementary delivery channels: • In-person classes: Structured group education sessions held at Arete Family Care and partner community locations, covering nutrition fundamentals, blood sugar management, medication adherence, physical activity, and self-monitoring skills. • Teleconference sessions: Audio-based group education for participants in remote communities without reliable video access, enabling real-time interaction with educators without requiring travel. • Video conferencing: Live interactive group and individual sessions via secure video platform, supporting visual demonstrations, Q&A, and small-group learning for participants statewide. • Telehealth consultations: One-on-one virtual appointments with Arete Family Care clinicians and diabetes educators for individualized assessment, goal setting, and follow-up support. • Printed educational materials: Plain-language, culturally informed materials covering nutrition, diabetes self-management, healthy cooking, label reading, and local food resources — mailed to participants and distributed through community partners. Core curriculum topics will include: • Understanding diabetes: types, causes, risk factors, and progression. • Nutrition fundamentals: macronutrients, portion control, carbohydrate awareness, and meal planning. • Healthy eating in Alaska: incorporating traditional and subsistence foods, reading nutrition labels, and navigating food access in rural communities. • Blood glucose monitoring: interpretation, targets, and self-management strategies. • Physical activity: safe exercise recommendations tailored to varying ability levels and Alaska seasons. • Medication management: understanding prescriptions, adherence strategies, and recognizing side effects. • Preventing complications: foot care, eye health, kidney protection, and cardiovascular risk reduction. • Mental health and diabetes: stress management, motivational support, and preventing burnout.	\$50,000-\$250,000	Family or primary care	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

AscendRural	De-Risking Tech Solutions for Alaska’s Spark Tech & Infrastructure Initiative via AscendRural	MN	Rural, remote, and frontier communities in Alaska face persistent barriers to accessing high-quality health care, including geographic isolation, workforce shortages, limited broadband infrastructure, and high travel and service delivery costs. Providers, community-based organizations, and public agencies often lack the technical capacity to evaluate and implement emerging technologies. The Spark Technology and Infrastructure Initiative presents an opportunity to invest in telehealth expansion, consumer-facing digital tools, interoperable platforms, analytics, and value-based care infrastructure. However, without structured support, these investments can carry significant financial and operational risk. AscendRural bridges the gap between Spark Technology and Infrastructure Initiative investments and sustainable implementation. Through structured technology sourcing and selection, pilot scoping and planning, hands-on facilitation, and rigorous outcome evaluation, AscendRural systematically de-risks adoption. Solutions are aligned with local infrastructure, workforce capacity, reimbursement pathways, and community context to ensure feasibility and long-term viability. By validating effectiveness before scaling, AscendRural strengthens sustainability and ensures the Spark Technology and Infrastructure Initiative investments translate into resilient and sustainable opportunities across rural Alaska.	Our approach is to ensure investments under the Spark Technology and Infrastructure Initiative translate into sustainable, effective implementation across rural, remote, and frontier Alaska. AscendRural systematically de-risks technology adoption for health providers, community-based organizations, and public agencies through structured evaluation, pilot implementation, and measurable validation. Rather than introducing stand-alone tools, we apply a proven methodology to source and select credible, scalable solutions aligned with Alaska’s infrastructure realities, workforce capacity, reimbursement environment, and community context. We begin with technology sourcing and selection support, helping partners assess readiness, evaluate vendors, and identify solutions—such as telehealth platforms, interoperable systems, and digital tools—that are financially and operationally sustainable. Structured pilot scoping and planning follow, defining clear objectives, participant criteria, engagement strategies, timelines, and measurable success indicators aligned with Spark Technology and Infrastructure Initiative priorities and rural health transformation goals. AscendRural provides hands-on pilot facilitation, coordinating logistics, maintaining consistent communication, and ensuring strong stakeholder alignment. Community onboarding, paired with locally grounded curriculum and tools, prepares partners to integrate technology directly into clinical workflows and operational processes—strengthening care coordination, data exchange, and value-based care readiness. To support scaling and long-term sustainability, we conduct rigorous quantitative and qualitative evaluation of pilot outcomes, including utilization, cost implications, provider experience, and patient impact. Findings are synthesized into actionable reports to inform future Spark Technology and Infrastructure Initiative investments. By validating effectiveness before broader deployment, AscendRural reduces financial and operational risk while building a replicable model for resilient, technology-enabled health systems across rural Alaska.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Assets Inc.	I/DD Remote Monitoring Feasibility Study	AK	Assets Inc is a 501(c)(3) community-based agency with a 45-year history of consistently improving employment opportunities, home environments, and community connections for its target population of individuals with intellectual and developmental disabilities (I/DD), mental illness, or a dual diagnosis of both conditions. These individuals require substantial support to live independently, especially in rural Alaska. I/DD individuals often lack the freedom to choose where they live with service options limited to urban congregate facilities. However, the federal government’s investment in Alaska’s rural broadband offers an opportunity to optimize telehealth for remote, in-home monitoring and support for rural consumers, thereby increasing their independence, outcomes, quality of life, and reducing the cost of care. Assets, Inc., requests RHTP funding to conduct a feasibility study to determine if remote monitoring of I/DD consumers in rural communities could provide cost-effective services that do not rely on institutional care and keep Alaskans in their homes. The study would analyze connectivity with rural communities and calculate the cost of equipment, technology, staffing, and training against potential savings. Assets, Inc., is well qualified by experience and expertise to develop a study that defines the needs of rural consumers; evaluates connectivity; ensures data security; and identifies vendors who offer the most sophisticated devices and competitive pricing.	Assets’ feasibility study for remote support of I/DD Alaskans residing in distant communities would include an assessment of rural connectivity, staff capacity, and equipment that is user-friendly for the target population. Regulatory compliance would be assessed to ensure that implementation is safe, effective, and HIPAA-compliant. A successful study would determine if technology can reduce caregiver turnover and improve independence without compromising safety. Assets’ study would be structured to determine rural consumer needs; availability of high-speed internet; and data collection for specific outcomes. Assessing connectivity would require selection of a pilot project location to ensure consistent cellular or Wi-Fi connectivity in each home to be served. Consumer-facing technology would be evaluated to ensure ease of use with non-intrusive sensors, wearables, or environmental monitors (e.g., door sensors, motion sensors). The study would also review 24/7 response plans to ensure the best fit for rural areas of Alaska. During the study, staff would visit the selected rural area to conduct interviews with potential users to measure comfort, trust, and perceived invasion of privacy, as well as digital literacy and potential training requirements. The eligibility of prospective users would be assessed to determine if Medicaid waivers or other reimbursement sources cover remote support. DSPs (Direct Support Professionals) would be interviewed to determine if they are open to adopting new technology. At the end of the feasibility study, Assets would apply for funding to conduct a 3-month pilot project followed by full implementation during the second project year.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Advance to Planning

Association for Professional s in Infection Control and Epidemiolog y - Midnight Sun Chapter	Training To Increase Certification of Healthcare Environmental Services Staff throughout Alaska	AK	The Midnight Sun Chapter of The Association for Professionals in Infection Control and Epidemiology (APIC) wants to establish and sustain a training program for Environmental Services (EVS, previously called Housekeeping) and Infection Prevention (IP) workers throughout the state of Alaska. EVS is often described as an entry-level job and seen as low-skill, however EVS workers are crucial to the success of any healthcare system’s Infection Prevention program as they are the staff cleaning rooms, disinfecting surfaces, and handling laundry and biohazardous waste. Any degree of failure while performing the tasks required of an EVS job increases infection risk to staff, patients, and visitors, which can impact the health of entire communities. The day-to-day work of an EVS employee requires integrity, specificity, and technical knowledge. This project would address the lack of subject matter experts (SMEs) on EVS knowledge in Alaska, and the certification that comes with it will increase job satisfaction and fulfillment for staff in a field that often has low satisfaction and high turnover. The training will reflect current evidence-based best practices for cleaning and disinfecting the environment of care and standardize training for EVS technicians across Alaska. Our proposed project will increase job satisfaction and employee retention and will demonstrate the value of EVS workers in health care settings by improving patient outcomes.	Our chapter will use RHTP funding to initially contract with the Association for the Health Care Environment (AHE) so their team can travel to Alaska and host an initial train-the trainer program, called Certified Health Care Environmental Services Technician Train-the-Trainer Program (T-CHEST). This initial event will train 15 Environmental Services (EVS) or Infection Prevention (IP) workers in Alaska to become trainers in the Certified Health Care Environmental Services Technician (CHEST) program, and will build the foundation for a sustainable training program in our state. Following the initial training event, the program can snowball and the initial group of T-CHEST trainers can disperse to their communities throughout AK and train others. The training can be blended into our pre-existing Alaska Infection Prevention conference, held annually in Anchorage and supported by the Alaska Department of Health and the Alaska Hospital and Healthcare Association (AHHA). The structure of a learning conference is already in place and scheduled for October 2026, and usually brings around 50 Infection Preventionists from around Alaska to one location for training. Adding EVS workers to the conference will allow them to participate in this T-CHEST program and will expand the scope of our conference in a positive manner. Association of Alaska School Boards	Busy Hands, Big Conversations: A Collaborative Approach to Health and Nutrition	AK	In recent decades, many students have become disconnected from the subsistence activities and traditional activities that once provided both physical exertion and stress regulation. This shift has led to: Sedentary Lifestyles: A move away from functional, land-based movement toward more stationary routines. Nutritional Insecurity: Increased reliance on expensive, processed imported foods rather than nutrient-dense traditional diets. Erosion of Agency: A school system that often operates independently of family expertise, overlooking the historical role of parents and Elders as the primary architects of a child’s wellbeing. This project presents a unique opportunity for restorative planning. By hosting Busy Hands, Big Conversations, AASB will facilitate a partnership where schools and families co-design a wellness framework. This is not only about adding more gym time; it is about: Aligning school PE, health curriculum, afterschool programs, and science with the community’s seasonal subsistence cycle, Restoring the traditional decision-making authority of families in determining what health looks like for their children and Using local activities (from sled building to fish processing) as high-quality, sustainable PE and nutrition interventions that carry intergenerational significance.	Our approach restores the traditional role of families as health architects through a structured, community conversation and planning process. With oversight from the Alaska Family Engagement Center's Family Advisory Board, convened by AASB, this project will meet state requirements and incorporate a community approach to planning. 1. We begin by identifying and developing bright spot examples of existing Alaskan programs where subsistence, movement, and traditional values are already successfully integrated into the school day. To ensure these models can be replicated. 2. We will train school staff, students, and family members as Co-Hosts using our "Big Conversations, Busy Hands" training sessions. This is a train, collaborate, maintain model. Where family members, advisory school board members, and school staff will get host-trained and then co-host with AASB staff or experienced conversation hosts. "Big Conversations, Busy Hands" sessions are low-stress, culturally safe spaces where the community can provide genuine input on values, nutrition and movement. 3. Once trained, these teams will host 3-5 local conversations to inform district health and nutrition planning. By centering these dialogues around busy hands activities like traditional crafts or food processing we lower barriers to participation and ensure the resulting health plans are rooted in local reality. 4.AASB will act as the bridge between family input and systemic change with their school and district leadership, creating platforms to represent family input. 5. Whenever possible, Tribal Health entities will be invited to be involved and at the very least family input will be shared with Tribal Health entities to align school wellness with broader community health goals. 6. Policy Reform: AASB will analyze and adjust policy recommendations, including supporting food program waivers that allow for the inclusion of traditional, locally harvested foods in school meals. There are several examples in the state. We will also work with school boards and administrators to formalize Family-School Health Teams within existing or emerging family decision-making bodies. 7. Finally, we will identify ways to adapt key curricula or identify opportunities that support these expanded definitions of health education that can be through the Alaska Family Engagement Center training, website, and resources.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Association of Alaska School Boards	Project UpLift Alaska: School-Based Youth Mental Health Prevention and Early Intervention	AK	Alaska has one of the highest suicide rates in the U.S., with approximately 28.1 to 28.2 deaths per 100,000 people as of 2023, nearly double the national average of 14.7. The rate is particularly high among Alaska Native populations, in rural areas, and among teens, with the highest teen suicide rate in the nation. For four consecutive years, student participants of AASB’s annual Youth Leadership Institute have strongly raised the need for more support for youth mental health. Specifically, they have requested more training, supports, and skill-building for the caring adults in their life, especially the adults they interact with every day at their school. Alaskan youth are also reporting that schools, rather than serving as positive, supportive environments, have become stressors that negatively impact their mental well-being and sense of connectedness. This recurring feedback highlights an opportunity for intervention that can have lasting impacts on generations of Alaskans. AASB will develop and test a replicable, scalable model to serve as a proof of concept of school-based training to support youth mental health. Through partnership with at least 3 school districts including the remote districts of North Slope and Lower Yukon and rural Southeast district Annette Island (Metlakatla), AASB can compile the lessons learned and develop tools and support all school districts in Alaska to address youth mental health needs with limited resources.	Our youth have issued a clear call to action: they do not just need more clinicians; they need the caring adults already present in their lives to be better equipped. This project serves to create systems of support, school environments of care and connection, and youth empowerment and skills for mental health. Key activities: Training for school staff and after school providers (“caring adults”): This training equips non-clinical school-based staff to create "Healing-Centered Environments." It prioritizes the development of high-quality student-teacher relationships, which research identifies as a core protective factor against adverse long-term health outcomes. The training is built on a curriculum currently being used with school staff in a randomized control trial, “Project Transform.” Ongoing support and coaching for school staff and after school providers: Monthly virtual coaching sessions and at least 1 in-person site visit per school year. Coaching is designed to build long-term educator practice changes. Mental Health and Leadership Training for Youth: AASB will pilot a meaningful two-day intensive workshop at each site for students utilizing AASB’s youth institute’s tools and an adapted curriculum based on lessons learned and best practices from Project Transform. AASB has successfully integrated highly engaging tools and strategies over two decades of hosting youth institutes. Project UpLift will blend these engagement strategies with a youth companion training of Project Transform and test this model in new settings. Peer Educator and Student-Led Safety Projects: Students will plan and carry out school safety projects that support mental health. A smaller cohort of students will be supported to inform curriculum adaptation, school climate building tools to improve mental health habits, and referral processes within each school. Family Wellness Circles: These sessions will create continuity between the home and school. Using Project Transform’s new family-facing workshops, we will build meaningful conversations, shared language and tools for stress management and emotional regulation that can be used at home and school. Early Intervention and Referral Structures: Work with each participating school site to identify and establish written mental health intervention and referral protocols that align with the resources available in each region. Evaluation: A program evaluation will identify replicable best practices to inform scale up.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Prince of Wales-Hyder Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Association of Alaska School Boards	Strong Start: A Strong Start to Kindergarten and Beyond	AK	Supporting children through the early years requires a team approach. Strong Start supports schools, families, and other service providers to make sure that each child is ready to be fully present, engaged, and ready to learn. Because the school is often the most consistent and well-resourced institution in remote Alaska, it presents a unique opportunity to serve as a gateway for holistic wellness. The project captures this opportunity by:creating a warm-hand off and moving away form one-day orientation to a year-long relationship building process between families, key school staff, and service providers. AASB has piloted this work in a few sites, within a Full Service Community School grant, and has built a range of tools, events, opportunities, discussion prompts, and protocols to support this early support structure. This would allow an opportunity to expand the reach and impact of a Strong Start Kinder program. Strong Start relies on universal kinder transition strategies, early intervention and wrap around supports. Using the kindergarten window, families and schools can coordinate several key behavioral/social emotional, health, academic, and basic need support. This can include a medical point of contact, basic needs support to address housing or food security, and academic and social emotional team support.	Strong Start is the foundation for building relationships between schools and families. Stong Start Families are invited to initial transition family and student events, families get one on one time with key staff, school staff serve as a liaison between the school, student needs, and community/tribal/or tele-health or local services. All transition grade staff (enter and exiting elementary school) participate in trauma informed training, and Strong Start training that builds on the efforts of nationally recognized programs such as City Connects and Building Assets and Reducing Risks. Over the course of this pilot, partners will help to develop forms, data systems, relationship-building practices, coordination tools, and referral protocols. A Strong Start Coordinator, who is focused solely on this early childhood transition, serves as a support to transitioning students. They work closely with the teachers and other school personnel to serve the whole student and family. Each school will have a Strong Start Coordinator, A Strong Start or Comprehensive Multi-tiered Systems of Support Team (school and community team), and Strong Start activities that works with a cohort of students and families. Phase I: Asset Mapping: Before the first student walks in, the Strong Start Coordinator maps community assets, from tribal elders and local clinics to the nearest reliable internet hub.Customized Training: Staff undergo training that blends the BARR (Building Assets, Reducing Risks) model, City Connects model, with local rural realities and statewide support. Phase II: The Warm Welcome this can include a range of fun family transition activities and personalized supports with some examples developed through a Full Service Community Schools grant. This also includes Individual Family Meetings: Instead of a generic orientation, one-on-one meetings are held in locations comfortable for families (the school, a community center, or via mobile-friendly video). Phase III: The Multidisciplinary huddle: The Strong Start Team (Teachers, Coordinator, Community Partners) meets bi-monthly to review the cohort, referral forms, and data. They don't just look at grades; they look at food security, behavioral issues, attendance and emotional well-being. The Coordinator acts as a Single Point of Contact. If a student needs tele-health or tribal services, the Coordinator handles the logistics so the family doesn't have to navigate a complex bureaucracy alone.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Ketchikan Gateway Borough; North Slope Borough; Sitka (City and Borough)	Deferred or Not Advanced

Association of Alaska School Boards	Transforming Schools A Health-Centered Approach to School Safety	AK	The Problem: Fragmented Safety in Rural Alaska Currently, school safety in rural Alaska is in silos. Physical security audits, behavioral health, and trauma-informed initiatives operate independently, creating a check-the-box culture that fails to address the root causes of risk. In many remote communities, safety is viewed through a lens of "hardening" (locks and cameras), which does little to mitigate the impact of the high rates of Adverse Childhood Experiences (ACEs) , establish strong emotional regulation, or reduce the bullying, absenteeism, and long-term health disparities. This fragmentation means that at-risk students, particularly those with internalizing behaviors, often fall through the cracks until a crisis occurs. The crisis becomes evident when we look at Alaska's high rates of suicide, substance misuse, intimate partner violence, chronic disease, and unmet mental health needs. Many of these health issues are preventable within a comprehensive approach to safety and well-being in the schools. AASB's proposed Transforming Schools model bridges the gap between trauma-informed approaches, healthy habits, strong connections, early interventions and physical security. This project addresses the social determinants of health directly within the educational landscape, turning fragmented protocols into a unified, culturally responsive system that improves attendance, staff retention, connection, referrals and student well-being across rural Alaska.	Using a three-year cohort structure, Alaskan schools will integrate a comprehensive safety and well-being framework. This project addresses risk at the root through four strategic pillars. Pillar 1: Expanding the Relational Foundation: Building on the success of the trauma-informed tools and resources developed in Alaska we can help schools to Incorporate a) Neuro-sequential classroom: Staff training in Tier 1 approaches to regulation includes breathing, movement, sensory corners, cultural practices into the classroom and the school day. This lowers cortisol for students. b) Attachment-Based Instruction: Prioritizing student-staff bonds to foster emotional co-regulation and mitigate external stressors. Pillar 2: Establish multidisciplinary Behavioral Assessment and Management (BAM) teams using an "Observe, Connect, Refer" Framework a) Holistic Review: Administrators, counselors, and tribal liaisons review student data through a non-punitive lens. b) Behavioral Decoding: Teams shift from "threat" to decoding withdrawal, bullying or grade drops as early health signals for trauma or suicidality. c) Referral Pathways: Formalizing "warm hand-offs" to health providers before crises escalate. Pillar 3: Climate & Student-Led Prevention Data Utilization: Analyze peer climate and risk data with districts. Peer-Led Initiatives: Empower students to define and lead culturally grounded safety projects. Pillar 4: Systemic Integration & Policy a) Codification: Provide AASB recommended board policies to institutionalize exclusion reduction and long-term policy alignment. b) Resource Development: Develop self-guided learning and data-tracking tools that can be shared through existing and new channels within the state, districts and by AASB. c) Capacity Building: School staff, board members and out-of-school providers to ensure local expertise survives staff turnover. Year One Activities: 1) The Assessment Matrix: Develop an Integrated Assessment Matrix mapping safety , well-being and climate data 2) Finalize the Observe, Connect, Refer Playbook; draft policies, and audit templates. 3) Expert Input: Host design sprints at statewide summits (MTSS, AASB's); and input circles (students through the Youth Institute and youth leadership events to define safe and healthy schools). 4) Core Team Training: Pilot intensive coaching, focusing on BAM transitions in 4 schools. Refine and finalize training and coaching protocols with statewide trainers.	\$250K-\$1M	Statewide	Aleutians East Borough; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Association of Village Council Presidents (AVCP)	Elluarrluteng Ilakutellriit Healthy Families	AK	Elluarrluteng Ilakutellriit works because its regional origins make it understandable to our residents. Families referred to the program often get so much out of the workshops that they voluntarily attend again, wanting to continue to do better by their children. But we need capacity to report data meaningfully to partners and funders. Year 1 RHTP funding can help AVCP accomplish two immediate needs: (1) funding what other federal funding does not, allowing us to implement the full model while we work toward a long-term sustainability plan; and (2) plan for building data collection capacity, which will help us better track and communicate outcomes that measurably demonstrate the model’s success. We have built a crucial model for improving health outcomes for the children and families of our region. The 48 communities served by AVCP are predominantly Alaska Native/American Indian (AN/AI), the population with the highest rate of child maltreatment. In 2023 in Alaska, more than half of victims were AN/AI, making them vastly overrepresented (Child Maltreatment 2023, US DHHS). Compounding the problem, prevention and early intervention resources are scarce and especially difficult to access in rural Alaska. Statewide, only half of child victims in Alaska received post-response services, a situation that Elluarrluteng Ilakutellriit works directly to improve. These efforts will have a ripple effect across physical and behavioral health outcomes and social indicators of health.	Per the CDC, prevention of ACEs could also reduce other health risk factors, including smoking by 33%, heavy drinking by 24%, dropout by 5%, and unemployment by 15% (https://www.cdc.gov/vitalsigns/aces). Health conditions impacted by prevention of ACEs range widely, from reduction in depression (by as much as 78% for adults) and suicide attempts (up to 89% for youth) to heart disease up to 22% and misuse of prescription pain medication up to 84% (https://www.cdc.gov/aces). Families and children fare better if they retain a connection to their culture, community, and identity. Removing families from their home communities, even to access services, is harmful, and Tribal families have been particularly subject to this kind of trauma. All families deserve to be able to access services where they live. We also cannot overstate the importance of Elder involvement, key to our workshops; they are the bearers of traditional Yup’ik knowledge. Time with Elders guarantees absorption of traditional teachings, which improves outcomes for families. Elluarrluteng Ilakutellriit acknowledges and incorporates all of these truths, providing a framework for improving family and child well-being and health outcomes. In Year 1, AVCP will: • conduct five Elluarrluteng Ilakutellriit workshops: one per month, except in July when subsistence activities are at the peak, for at-risk families and assess the results using existing workshop evaluation tools. • hire a project manager for this next technology and data capacity phase rather than use existing staff, which we did for Phase 1 and has proven to spread staff thin with their other ongoing duties. The project manager will assess the new system, identify gaps needed for Elluarrluteng Ilakutellriit, and develop solutions that improve capacity to collect, track, and share data. This will allow us to better measure outcomes and also allow Elluarrluteng Ilakutellriit to better collaborate and share data with Tribal Child Welfare and the Alaska Office of Children’s Services to improve targeted services and outcomes for children and families. AVCP is requesting funding for the components of this project that are not federally funded. For instance, a key aspect of the Elluarrluteng Ilakutellriit model are Qasgiqs, gatherings with Elders and AVCP staff to offer ongoing guidance in the adaptation of the model for prevention work with at-risk families; these are currently federally funded and are not part of the RHTP budget request.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area	Advance to Implementation Application

AstraDx	Alaska Against Sepsis: Saving Lives with the AstraDx Atawa Rapid Diagnostics System	MA	The problem we address is sepsis: specifically, the sepsis-related morbidity and mortality that can be prevented through rapid diagnosis and antibiotic testing (“antimicrobial susceptibility testing” AST). Sepsis is the second-leading cause of hospitalization in Alaska behind childbirth and the leading cause of hospital death nationwide. Sepsis is directly responsible for an estimated 200-300 deaths in the state each year. Sepsis is also an economic problem for Alaskans, costing \$150-250 million annually. The median charge per hospitalization in Alaska is \$49,000—substantially higher than the nationwide average of \$29,000 due to remoteness and transport costs. Neonatal cases are proportionally more expensive. The main obstacle is the time it takes to diagnose the patient, identify the pathogen, and determine the appropriate antibiotics. Together, these take days, even with state-of-the-art diagnostic equipment at well financed, fully staffed medical centers. Our technology reduces this to hours—the first in the industry to provide all three of detection, ID, and AST so rapidly—via a compact benchtop instrument, the AstraDx Atawa, that is affordable and simple to operate. Consequently, the opportunity is to place Atawas in every clinic and medical center in the state, including those of the Alaska Native Tribal Health Consortium and the Alaskan Native Medical Center. This would largely eliminate the wait for sepsis diagnosis, enabling appropriate treatment as soon as possible.	We will progress the AstraDx Atawa system from its current technology-readiness level to a field-validated, deployable diagnostic instrument in three phases that fit the RHTP timeline. In Phase 1: Initial Production, we will produce a limited run of instruments and establish regulatory readiness with an ISO 13485-compliant quality system and a draft FDA 510(k) package. Deliverables will be updated drawings, a bill of materials, a production-test report showing ≥95% repeatability, detection limit, ≤8 hour assay time (with positive results sooner), and the regulatory documents. In Phase 2: Multi-Site Clinical Evaluation, we will conduct a prospective, multi-site clinical evaluation at rural Alaska clinics—including ones associated with the Alaska Native Tribal Health Consortium (ANTHC)—as well as the Alaska Native Medical Center (ANMC; a leading tertiary care center) comparing Atawa results to reference methods for sepsis diagnosis (blood culture, ID, AST) to demonstrate agreement and a reduction in time to appropriate therapy. We will submit the approved protocol, IRB approvals, an interim safety report, a final validation report meeting the statistical endpoints, and an updated 510(k) filing. Phase 3: Rollout, will roll out Atawa to priority clinics and hospitals in two waves, providing hardware, SOPs, a train-the-trainer curriculum, warranty, remote technical support and EHR integration. Acceptance will be documented with a test report for each site, and the Contractor will deliver a sustainability plan covering consumable supply, local maintenance contracts and reimbursement pathways, followed by a final report quantifying mortality reduction and cost avoidance. A Project Director at AstraDx will submit reports to the appropriate RHTP oversight body and other in-state partners on an agreed-upon schedule, and independent clinicians will review quarterly progress and authorize phase transitions. Risks such as component supply disruption, regulatory delays, and weather-related site access will be mitigated with inventories, early regulatory meetings, and travel and transportation timed to seasonal forecasts. This phased, deliverable-oriented approach ensures verifiable progress and positions Atawa to markedly improve access, quality and sustainability of sepsis care for Alaska’s rural, remote, and frontier communities.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Attending AI	ATTENDING AI: AI-Powered Clinical Decision Support for Rural, Remote, and Frontier Alaska	CO	Rural Alaska providers face a structural clinical workflow problem that limits care quality, drives burnout, and threatens health system sustainability. Physicians spend approximately 80% of each encounter gathering information—histories, labs, imaging review, documentation—and only 20% on clinical reasoning that determines outcomes. In Alaska this is amplified: providers often work alone, without specialist backup, managing complex presentations across vast distances. The consequences are measurable—preventable emergency transfers, diagnostic uncertainty, documentation burden driving providers out of rural practice, and care quality varying widely across facilities. Alaska's 160+ RFI respondents identified technology modernization as a top priority. The Spark Technology and Innovation initiative calls for fostering appropriate AI use, improving interoperability, and deploying consumer-facing digital health tools. Yet most rural facilities lack the resources to evaluate, procure, and implement AI clinical tools independently. ATTENDING AI was built by a practicing physician specifically to solve this problem—not as a generic tech product, but as a clinical intelligence platform designed from the exam room out.	ATTENDING AI deploys a physician-designed, two-component platform that automates clinical information gathering so providers focus on decision-making: 1. COMPASS (Patient AI Assessment): Before or at visit start, patients complete an AI-guided symptom assessment using voice input. The 18-phase workflow captures presenting complaint, history, review of systems, medications, allergies, and social/family history. It detects 14+ emergency red flags in real-time with 911 integration and GPS facility finding. Structured data flows directly to the provider—no redundant intake. 2. ATTENDING (Provider CDS Portal): Providers receive pre-organized patient data with AI-generated differential diagnoses, evidence-based treatment recommendations, integrated ordering for labs/imaging/medications/referrals, real-time drug interaction checking, and auto-generated SOAP notes. Deployment follows a 90-day, 5-phase model: - Weeks 1-3: Site assessment, EHR mapping, stakeholder alignment - Weeks 4-6: FHIR R4 adapter deployment, clinical catalog customization for Alaska-specific protocols - Weeks 7-9: Provider training (4 hours), staff training, super-user certification - Weeks 10-12: Supervised go-live with remote or on-site support - Months 4-6: Performance optimization, outcomes reporting, expansion planning The platform integrates with existing EHR systems (Epic, Oracle Health, Athena) through FHIR R4 APIs—no rip-and-replace. Cloud-native Azure infrastructure means no on-site hardware needed. Year 1 pilot: 10-15 facilities across 2-3 regions, expanding statewide in subsequent years. We are actively seeking Alaska-based clinical partners to co-deploy and validate.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Audacious Inquiry, PointClickCare	GrantOps & Performance Hub to Support Awardee Oversight & Accountability	UT	Alaska’s RHTP is a significant statewide investment delivered through subrecipient awards. To ensure measurable impact, the Alaska Community Foundation (ACF) needs strong fiscal oversight, standardized KPI monitoring, and consistent reporting across all awardees. The gap is the absence of a unified operating and reporting backbone to support ACF’s responsibilities at the portfolio scale. Without a centralized system, fragmented submissions, inconsistent definitions, and manual reconciliation can reduce transparency and make it harder to link funding allocations to measurable improvements in access, quality, and sustainability. The opportunity is to implement an RHTP GrantOps & Performance Hub that integrates funding tracking, activity reporting, and KPI monitoring in a single governed framework. This enables consistent KPI definitions, standardized templates, automated validation, and dashboards that improve data quality, reduce administrative burden, and support targeted technical assistance where rural access challenges are most acute.	The RHTP GrantOps & Performance Hub will be delivered through a phased approach that provides rapid operational value while supporting continuous improvement. The strategy prioritizes establishing a core capability quickly and refining it through structured feedback from awardees and ACF administrators until steady-state operations are achieved. Phase 1 (Months 1–6): Minimum Viable Product (MVP) Goal: Enable ACF to administer award workflows, collect standardized KPI submissions, and monitor program performance through centralized dashboards. Scope includes: • Structured award and funding workflow management with status tracking and audit trails • KPI template library aligned to RHTP initiatives with standardized definitions and reporting formats • Automated validation rules to improve submission completeness and reduce reconciliation effort • Role-based access controls for awardees and ACF administrators • Portfolio dashboards providing visibility into reporting status, performance summaries, and operational monitoring • Audit-ready documentation for funding allocations and reported performance data Phase 1 emphasizes configuration over custom development so workflows and reporting templates can evolve as program needs mature. Short configuration cycles allow ACF to review and refine templates early, reducing rework. Phase 2 (Months 7–12): Operational Maturation Goal: Transition the Hub to steady-state operations through structured feedback and incremental improvements. Activities include: • Expanded validation rules and data quality checks based on early reporting cycles • Enhanced dashboards supporting deeper portfolio insight and targeted technical assistance • Structured onboarding and training to reinforce consistent usage across awardees • Managed reporting cycles, including submission windows, reminders, exception handling, and completeness monitoring The Hub is technology-agnostic and can be implemented using configurable cloud platforms or existing systems, depending on ACF preferences. The design emphasizes configurable workflows, standardized templates, governed access, and reporting dashboards rather than custom software development. By linking funding transparency to measurable outcomes, ACF will	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

gain clear visibility into how RHTP investments advance technology modernization, fiscal sustainability, and rural health care access.

Audiology Associates	Expanding Health Access: Medical Treatment of Hearing Loss of Rural Medicare Beneficiaries in Alaska	AK	The proposed project seeks to address this critical gap by expanding access to medical treatment for hearing loss and tinnitus among Medicare beneficiaries living in rural Alaska. By providing accessible diagnostic services, evidence-based treatment, and longitudinal cognitive monitoring, this program aims to improve communication, enhance quality of life, and reduce risk factors associated with cognitive decline among older adults living in underserved rural communities. By intervening early with accessible hearing healthcare, this project has the potential not only to improve individual health outcomes but also to generate substantial long-term cost savings for the healthcare sytem through reduced demand for institutional care and dementia-related services.	The proposed project will establish a scalable rural hearing healthcare delivery model designed to reach Medicare beneficiaries living in rural communities across Alaska. The program will utilize a hybrid model of community-based outreach, portable diagnostic technology, and telehealth-enabled care. The initiative will focus on identifying and medically treating hearing loss and tinnitus among underserved rural Medicare beneficiaries. Patients will be identified through community outreach, primary care referrals, and partnerships with regional healthcare organizations serving rural populations. Once enrolled, participants will undergo a comprehesive audiologic examination using portable diagnostic equipment suitable for remote environments. Individuals diagnosed with hearing loss or tinnitus will receive evidence-based treatment, including prescriptive hearing technology and tinnitus management interventions. Participants will also undergo baseline and follow-up screening, using FDA-cleared computerized cognitive assessment tools. These screenings will allow the project team to measure potential risks of cognitive decline, while measuring potential improvements in cognitive function associated with improved auditory input and reduced neural strain. The project aims to treat approximately 300 medicare beneficiaries per year over a 5 year period, resulting in treatment for approximately 1500 individuals. Telehealth audiology services will be incorporated to provide follow-up care and ongoing support for participants living in geographically isolated areas. Portable diagnostic equipment and telehealth infrastructure will allow the program to deliver services directly within rural communities without requiring patients to travel long distances for care. This approach combines clinical treatment and community-based service delivery to create a sustainable model for improving hearing healthcare access across rural Alaska.	\$1M-\$5M	Clinic	Statewide	Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Kenai Peninsula Borough; Kodiak Island Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; Yukon-Koyukuk Census Area	Advance to Implementati on Application

Aunt Bertha, a Public Benefit Corporation dba Findhelp	Better Care for Rural Alaska with an Integrated CLRS	TX	Rural Health Transformation funding offers AK a timely opportunity to address rural health challenges like delivering care across vast geographies, isolated communities, and diverse populations. The State’s rural and frontier areas face persistent barriers including limited clinical access, fragmented referral processes, and significant gaps in transportation, behavioral health and care coordination. A rural health Closed-Loop Referral System (CLRS) powered by Findhelp will be a forward-thinking, innovative, and maximally effective solution that will result in fast, measurable improvements to rural health outcomes in AK and put the State on a fast track to achieving its goals. The foundation for an integrated rural health network in AK already exists. Findhelp’s public portal has long been a trusted resource for 104,000+ residents, who have used Findhelp to conduct 334,800+ searches for support, helping them receive enhanced and easier access to hospitals, other health care providers, and health care items and services furnished to rural residents. This network provides a launchpad for implementation, reducing risk and accelerating impact. Findhelp’s proven CLRS technology, deep rural health initiative experience, and collaborative approach will integrate existing elements into a unified health and social care ecosystem that is responsive to AK’s unique needs, and that supports long-term sustainability, community empowerment, and measurable impact across the State.	AK’s RHTP application identifies a core goal of developing community-based system navigation applications and investing in applications that connect rural and frontier community members with nearby clinical and social services. The plan also emphasizes in-person support and scheduling assistance, care navigation, care coordination, and digital support. Findhelp’s closed-loop referral platform directly aligns with this strategy. Our tools empower care teams and community navigators to seamlessly connect individuals to trusted nearby services, whether through digital self-navigation or in-person support. We also maintain robust accessibility features to ensure usability across populations and geographies. Findhelp will provide Alaska with a closed-loop referral system that complements the Statewide HIE, tailored to AK’s unique geography, populations, and health delivery ecosystem. Findhelp’s platform includes the following: CLRS infrastructure bridges the gap between clinics, tribal organizations, care navigators, community-based organizations and frontier providers, providing closed-loop tracking for care and social service referrals. Mobile-enabled public portal allows residents to find and self-refer to services, even in low bandwidth areas, using any device. Provider access and analytics enable care navigators to coordinate services and track outcomes across programs, supporting real-time reporting and referral engagement insights. In-person supports and care scheduling workflows help Alaska meet its goal of reaching residents with digital and on-the-ground care navigation, and enhances in-person care navigation with digital documentation and outcomes tracking. Agency-branded sites offer consistent trusted access points for State departments and local health entities. Benefits and eligibility enrollment with Findhelp’s new benefits enrollment engine, rural residents can more easily access programs and aid they are already eligible for, providing a boost to help them get back on their feet. The system intelligently screens individuals for state and federal benefits programs (like SNAP, WIC, or Medicaid) and simplifies the complex application process. Our platform is designed for standards-based data exchange, including SMART on FHIR APIs, making it an ideal companion to Alaska’s efforts to advance interoperability. Findhelp’s flexible integration framework is designed to complement Alaska’s existing health IT infrastructure including HealthEConnect AK.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Aurora Holistic Arts LLC	Coaching and guiding for a healthier tomorrow.	AK	Many people have the need to connect with a life coach that can guide, mentor, and help promote health that is non drug based and will work with the whole being. Weather this is a spiritual need, physical need such as deep breathing work, emotional need where the client can talk through the area of concern and can have the help to resolve issues that need to be addressed to reduce stress. This type of work with an individual or a group can have a profound impact on quality of life for all of those involved.	With a one on one approach the client can reveal and work toward resolution of an issue with ease and simplicity of integration as they process the concern with love, support and breathing or stress reduction techniques that can be done. As a group this has a great impact with breathing techniques or processing therapies, and with stress reduction techniques that will meet and assist with the overall health of the peoples that are treated with respect. This process will be fact based and allowed to be integrated at a pace that will meet the clients needs.	\$1M-\$5M			Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced
Aurora Integrated Oncology Foundation	Evidenced Based Quality Cancer Survivorship for All Alaskans	AK	Much of the current attention of cancer care focuses on the 3,401 annual newly diagnosed cases each year in Alaska. For most, quality cancer services to treat their primary tumors are available. Yet the group at greatest risk of developing cancer are those 38,000 Alaskans as reported by the Alaskan Department of Health, who are living with a history of cancer. The risk includes recurrent local disease, metastatic disease, and a twice likely of developing a new primary tumor elsewhere. By development of a survivorship/OMD type service, we can provide Alaskans with evidence-based care to monitor and catch disease early, when still treatable. We would do so by providing technology with mid-level providers who work independently of centers and serve any Alaskan with a history of cancer. Community partners like the Alaska Men’s Run can help facilitate messaging in combination of the awareness campaign to the wider medical community to refer. Telemedicine would be utilized to consult and monitor enrolled Alaskans. Equicare Health would provide the necessary technology platform to autonomously organize the data from medical records and self-reports to create a summary of care and care plan is defined by the IOM to provide the patient and primary care provider, so each party is aware of the prescribed follow up for lab, imaging, and physician follow ups. Short term and long-term side effects of both disease and treatments are managed while monitoring new OMD tumors.	The evidence is clear on what a person diagnosed with cancer should receive following active cancer treatment & is supported by ASCO, NCCN, American College of Surgeons, and the IOM. Yet, much of cancer care is focused only on the active acute care treatment phase, ignoring the ongoing chronic care management. It is the intent of this proposal to change that model and provide structured services in a way that recognizes cancer as a chronic care illness; assuring side effects of disease & treatment as well regular labs & imaging are followed. Funding will provide the launch of a regional footprint that will develop into a wider model. A mid-level Physician’s Assistant or Nurse Practitioner will be recruited and supported by a dedicated administration support staff member. Equicare software tool will be implemented & integrated with partner organizations. eHealth will serve as the underlying software architecture that provides connectivity to various 3rd party EMR’s that reside in clinics or hospital. These two products will automate much of the process by developing a comprehensive summary of care and ongoing care plan. The treatment summary & care plan will be provided to the patient, but also the primary care provider, if there is one. This provides all participants equal & evidenced based information. Recognizing cultural elements, Equicare was selected in part to their ability to convert all patient facing information into preferred language. This will greatly help address the barriers and acceptance to care in reaching Alaskan Native Tribes (ANT). In addition, the tech platform allows most consultations to be conducted via telemedicine & includes the means to message their care team electronically while also providing care team a means to monitor patients remotely. AIOF will allocate the space & support needs. Anchorage Neighborhood Health Center (ANHC) is a Federally Qualified Health Center that provides primary health care services for everyone in their community, with a special focus on those who face extra barriers to care. ANHC is a partner organization that will be the first to integrate services for purposes of assuring this proposal reaches a wide range of Alaskans to include those that may be socially	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and	Advance to Implementati on Application	

	economically disadvantaged. ANHC provides a remarkable service, & it is our intent that we provide ANHC patients with a level of service currently only found in the largest urban-based cancer-focused facilities in the lower-48.	Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area

Aurora Integrated Oncology Foundation	Paying for Value in Radiation Oncology	AK	Radiation Oncology is a key modality in the treatment of many cancers. It is a rapidly changing field with the emergence of new technologies and treatment options. At present, Radiation Oncology Services in Alaska are paid fee-for-service based on the number of treatments a patient receives. This method of payment theoretically creates a disincentive to adopt newer technologies and treatment approaches which utilize fewer treatments. This phase of the project is intended to develop and assess the feasibility of an alternative pay-for-value payment methodology that will shift payment away from fee-for-service. Implementation would occur in a second phase to be proposed in 2027. When implemented, the result will be more rapid adoption of new technologies and shorter treatment protocols. Shorter treatment protocols mean Alaskans living in rural areas who travel to receive daily treatment will spend less time away from home. Fewer treatments result in reduced travel expenses, family disruption and time away from work without sacrificing quality of care! A second aspect of the project will be to assess the needs and opportunities for new technologies which can either shorten treatment duration and/or expand services to more rural locations. Aurora Integrated Oncology Foundation, the submitter of this proposal, owns or provides professional staff to five of the eight Radiation Oncology Centers in Alaska and shares a common billing company with the sixth.	To develop and test a pay-for-value model we will convene a project “Core Group” comprised of expert radiation oncologists from Alaska and elsewhere led by healthcare consultants and AIOF staff with intimate knowledge of Alaska and radiation oncology. The Core Group will be supplemented by an array of additional experts, including physicians, actuaries, attorneys, claim payment and revenue cycle management experts and others as identified through the project. As a first step, this group will research pay-for-value models in use or in development elsewhere, tapping into national resources such as ASTRO, (American Association of Radiation Oncology) and others. Existing models will be analyzed for their applicability in Alaska and consistency with the goals of this project. From there the group will determine the most promising options for further development and begin to develop the required detail sufficient to account for the variety of diagnoses and treatments which radiation oncology encompasses. A critical component of this project will be developing consensus/agreement amongst the stakeholders, so they are willing to agree to change from fee-for service to pay-for value. Building consensus will require all parties to understand the model and how it was developed along with the pros and cons of the transition to value-based payment. They must be willing to accept the inevitable tradeoffs to achieve the benefits. Another crucial factor for success is to build the model in a way that can be administered by claim payers without prohibitively costly modifications to their systems, perhaps by changing how services are billed. Building out the detailed clinical payment model, achieving consensus amongst the stakeholders and making the approach administratively feasible will be much of the work and time required for this project.	\$250K-\$1M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Aurora Integrated Oncology Foundation	Address Cultural and Acceptance Barriers to Life-Saving Cancer Services	AK	Alaska’s cancer burden falls most heavily on the communities least served by existing cancer education and communication systems. Alaska Native people experience cancer incidence and mortality rates significantly above state averages; cultural mistrust, language barriers, and unfamiliarity with the health system drive delayed screening, late-stage diagnosis, and lower treatment engagement. Currently, cancer information available to patients is fragmented, inconsistent, and predominantly available only in English. A patient diagnosed with cancer in a rural Alaska community receives different information from their clinic, their oncology provider, their navigator, and whatever they find independently, none of it in their preferred language, none organized around their actual questions. Community services exist, including navigation assistance, lodging support, and financial aid, but patients are left to piece together their own understanding from sources never designed for their language or culture. The result is confusion, mistrust, and disengagement at the moment when clear information is most critical. This project consolidates that scattered landscape into a single, authoritative, multi-format educational campaign in preferred languages across Alaska Native and immigrant communities, establishing one source of truth for Alaskans diagnosed with cancer and the providers and navigators who serve them.	AIOF will partner with C3 — Crystal Clear Creative to develop, produce, and distribute a comprehensive, multilingual cancer education campaign that addresses cultural and acceptance barriers to life-saving cancer services across Alaska. C3 brings existing relationships with Alaska Native communities and cultural liaisons, making community-informed development not just translation central to the project model. The campaign will be developed in multi-format: print materials for clinical and community distribution, digital assets for web and mobile access, and video content in preferred languages that can be shared through community networks and deployed at CAPS events and screening sites statewide. Languages will include Alaska Native languages (including Yup’ik, Inupia̋q, and Athabascan) and immigrant community languages, prioritized based on C3’s community needs assessment conducted during the development phase. Content will cover two parallel tracks. The clinical track curates and adapts existing oncology education materials covering diagnosis, treatment options, surveillance, and survivorship into culturally grounded, language-accessible formats. The community services track consolidates existing but fragmented resources navigation assistance, transportation programs, financial support, lodging options, and community-based services into a single, organized reference that AIOF Patient Navigation, CAPS, and the survivorship clinic can deploy as a standard patient-facing tool. Community review panels will validate all materials before distribution, ensuring cultural accuracy, language appropriateness, and community trust. AIOF will own the campaign and maintain it as a living resource updating content as services, programs, and community needs evolve. Upon completion, the campaign will be distributed through AIOF’s statewide program network and made available to any Alaska health organization, clinic, or community partner at no cost.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Aurora Integrated Oncology Foundation	Bringing Rural Patients and Providers Together for Cures - Peninsula & Valley OncoWheels, (POW/VOW)	AK	The intent of this proposal is to provide any Alaskan who requires transportation for cancer related appointments, be assured reliable ADA compliant transportation will be provided at no cost. To understand the challenge, in 2024, Alaska rated 46th in the USA for adherence to eligible mammography. Poor screening rates contribute to late-stage diagnosis and higher mortality. Access is a significant barrier but only addresses the problem if it provides for screening, treatment, and follow-up. In the most recent reported year, the Nation Cancer Institute reported that 352 people were newly diagnosed cancer cases in Kenai and 485 Alaskans in MatSu Valley regions. Of those in the Kenai Peninsula, 47% are defined as more rural, while 42.4% in MatSu Valley. In many cases transportation is being arranged for these patients which may cause issues with reliability, especially for treatments that are prescribed on a regular schedule of days as part of the protocol. Unfortunately, there are limited resources available for those individuals who need ADA compliant transportation. Public transportation is not conducive to cancer patient’s needs. Oncology patients typically have compromised immune systems where they shouldn’t be exposed to large crowds or are managing side effects such as nausea or diarrhea, both not desirable to have on public transit. This would address a common barrier to allow easy, convenient scheduling, ADA compliant ride, by a known driver.	The RHTP funds would allow for two ADA compliant, winter capable vehicles to be purchased and staffed to serve patients of the Kenai Peninsula and MatSu Valley. From Homer to Cooper Landing and Sutton to Talkeetna this would serve patients needing rides for cancer screening, daily cancer treatments (chemotherapy or radiation), and important follow-up visits with their cancer team. The drivers would be CPR certified, and the van would be outfitted to support cancer patients’ needs. The funds would also allow schedulers to assist the drivers with scheduling patients for their cancer screenings or cancer related appointments. Dispatcher services would include augmenting with local transportation if services are available. ‘POW’ and ‘VOW’ ‘OncoWheels’ vehicles will also be available for any residents who wish to attend health fair screening events in their regions. To generate awareness, a promotional campaign will be developed that targets both the community, local communities, and area clinical providers. A coordinated campaign would be executed in the Kenai Peninsula and MatSu Valley through appropriate media outlets to reach the right audiences. From advertising in print to a boosted Facebook messaging that this service is at no cost to patients and open to all providers Alaskans may be receiving treatment. Along with a media campaign the van would be wrapped for visibility and to raise awareness about the importance of cancer screening.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Aurora Integrated Oncology Foundation	Cancer Patient House for Access to Screening, Testing, and Cures in SE Alaska	AK	This project aims to address the critical shortage of temporary housing for patients traveling to Juneau for cancer-related care, including long-term treatment, short-term procedures, diagnostic testing, and preventive screenings. In recent years, Juneau has become an important regional hub for medical services, providing specialized care for patients from surrounding and remote communities. However, access to these services is often limited not by the availability of care itself, but by patients’ ability to secure safe, reliable, and affordable lodging while they undergo treatment or testing. Currently, there are no dedicated short-term housing options in Juneau designed specifically for individuals seeking cancer screenings, diagnostic procedures, and options for treatment housing are limited. Patients must rely on hotels or short-term rentals, which can be costly and unpredictable in availability. Because these options operate largely on a first-come, first-served basis, patients often face uncertainty about whether housing will be available when they arrive for scheduled medical appointments. Establishing a reliable and affordable patient housing option would reduce these barriers, alleviate stress for patients and families, and help ensure equitable access to the cancer care services available in the region.	The proposed cancer house will serve as a centralized, patient-centered facility providing temporary housing for individuals traveling to Juneau for cancer treatment, diagnostic testing, screening, or follow-up care. By consolidating support services in a single, accessible location, the facility will reduce geographic, financial, and logistical barriers that often prevent patients from seeking timely care. Phase One of the project, scheduled to begin in 2026, will focus on planning, community engagement, partnership development, preliminary site selection, and establishing the operational framework for the facility. This foundational work will ensure that construction in 2027 and operational launch in 2028 are guided by evidence-based practices, community input, and sustainable operational models. The cancer house will be designed to serve multiple patient groups, including individuals undergoing active treatment, those traveling for screening or diagnostic testing, and those attending follow-up appointments. By providing dedicated spaces for each group, the facility will ensure privacy, accessibility, and comfort while accommodating the unique needs of patients and families. Shared areas will allow families to stay together, facilitate community engagement, and provide access to on-site resources such as counseling, nutritional support, and social services. The centralized nature of the facility will make it easier for patients to attend appointments on time, access support services, and engage in preventive care, directly addressing barriers that often delay early detection and treatment. By improving access to housing and supportive services, the cancer house will play a critical role in promoting early screening and timely interventions, which are essential for improving outcomes in cancer care. Removing the burdens of travel, lodging, and logistical challenges allows patients to prioritize preventive screenings and follow-up care, increasing the likelihood of early detection and effective treatment. The facility’s patient-centered design, combined with strong community partnerships, will not only enhance the patient experience but also strengthen the overall healthcare system in Southeast Alaska. By addressing these barriers early, the cancer house aims to improve survival rates, reduce complications, and ensure that patients and families have the resources and support needed to navigate the cancer care continuum successfully.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Aurora Integrated Oncology Foundation	Gaining Access to Cancer Cures through Navigation	AK	Rural, remote, and frontier Alaskans face significant non-clinical barriers to timely cancer screening follow-up and specialty care. Travel distance, limited transportation, financial strain, and fragmented referral pathways often delay movement from abnormal screening findings to specialty consultation. Many rural residents postpone or forgo evaluation because distance, cost, and logistical complexity create substantial obstacles to care engagement. Cancer incidence in Alaska is 432.6 per 100,000, and cancer remains the leading cause of death for Alaska Native people, who experience significantly higher rates (588.4 per 100,000). Despite this burden, rural communities frequently experience extended delays between abnormal findings and confirmed specialty connection. While elements of patient coordination exist within the network, there is no centralized, structured navigation model dedicated to reducing barriers statewide. Without coordinated navigation support, patients may struggle to move efficiently from screening to consultation and treatment. With a mission of ‘Improving the quality of and access to cancer prevention, treatment and supportive care for all Alaskans’ this project addresses that gap by formalizing AIOF Patient Navigation as a statewide, resource-centered coordination model designed to strengthen referral continuity, improve care engagement, and reduce logistical barriers for rural Alaskans facing cancer.	AIOF Patient Navigation will implement a structured, statewide coordination model embedded within AIOF’s existing oncology network. The project centralizes navigation responsibilities currently dispersed across staff into a dedicated role focused on referral coordination, barrier assessment, and resource linkage. By centralizing navigation within an established oncology network, the project leverages existing clinical infrastructure through an innovative system-integration model rather than creating a parallel service line. Upon referral from screening partners or providers, the navigator will conduct timely outreach, facilitate connection to appropriate specialty providers, and support appointment coordination as needed. A core component of the approach is resource navigation, including coordination of travel logistics, lodging arrangements, and linkage to approved financial assistance mechanisms and community-based services. Direct cash payments or gift cards are not part of this model; instead, assistance will be coordinated through structured partnerships and established support systems. Standardized referral protocols will be developed with Alaska Health Fair, regional hospitals, and additional community partners to ensure consistent communication and follow-up processes statewide. The project also incorporates rural awareness and partner education efforts managed by C3 to increase understanding of navigation services and strengthen referral engagement.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Aurora Integrated Oncology Foundation	Greater Alaska Exercise Oncology & Lifespan Wellness Initiative	AK	Obesity rates in Alaska have more than doubled in the past 25 years. Approximately 35% of adults are classified as having obesity, with more than two-thirds of adults and one-third of children exceeding a healthy weight. Excess weight is not only linked to diabetes and cardiovascular disease—it is a well-established risk factor for more than 12 types of cancer and is associated with poorer cancer outcomes, increased treatment complications, higher recurrence risk, and reduced survival. Each year, approximately 3,400 Alaskans are diagnosed with cancer. Many would benefit from evidence-based, oncology-specific exercise and lifestyle support to improve treatment tolerance, maintain functional independence, and enhance long-term survivorship outcomes. For rural Alaskans, these risks are compounded by geography. Patients often travel hundreds of miles for diagnosis and treatment, then return home without structured rehabilitation support. Without supervised exercise oncology services, many experience preventable physical decline, worsening fatigue, depression, and diminished quality of life. Geographic isolation, workforce shortages, limited oncology-specialized rehabilitation services, inconsistent referral pathways, and gaps in culturally responsive resources create an urgent opportunity to redesign cancer prevention and rehabilitation delivery across Alaska.	This initiative will implement a coordinated, statewide transformation strategy to build long-term healthcare capacity in Alaska’s rural and frontier communities. At its core is workforce development. The project will expand the proven outcomes achieved at the AIOF center in Anchorage by scaling access to Maple Tree Cancer Alliance’s nationally recognized Exercise Oncology Instructor (EOI) and CancerFit certifications. Alaska’s approximately 130 registered Athletic Trainers represent a highly skilled but underutilized pipeline for specialized oncology training. Scholarships will also support rural fitness professionals, Community Health Aides, and physical education teachers. By training Alaskans to serve Alaskans, the initiative strengthens trust, builds local ownership, and creates durable in-state expertise that persists beyond the grant period. To overcome geographic barriers, the project will expand a hybrid model of supervised virtual exercise oncology delivery. Individualized, supervised sessions will increase statewide, and live tumor-specific group classes—for breast, colorectal, prostate, hematologic, and other cancers—will be launched. Referral pathways with hospital partners will be standardized so cancer rehabilitation becomes an expected component of survivorship care rather than an optional service. To ensure cultural relevance and equitable access, Maple Tree On Demand will be adapted for Alaska communities. Core materials will be translated into four principal tribal languages, and a dedicated Alaska-focused website and centralized education portal will provide culturally responsive survivorship resources and workforce training materials optimized for low-bandwidth environments. Community playground signage promoting healthy eating and physical activity will feature QR codes linking families to free, downloadable wellness resources, extending prevention messaging directly into neighborhoods. A school-based wellness initiative will reinforce prevention early by teaching age-appropriate cancer risk reduction principles and promoting lifelong physical activity. Physical education teachers will receive CancerFit training to ensure programming is safe, evidence-based, and sustainable. Finally, a coordinated statewide marketing and education campaign will normalize cancer rehabilitation as a standard of care, improving awareness, referral consistency, and engagement across rural Alaska.	\$1M-\$5M	Clinic	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Aurora Integrated Oncology Foundation	Screen. Connect. Care. An Alaska Cancer Awareness & Navigation Initiative	AK	The intent of this proposal is to provide any Alaskan easy access within their own communities while bridging cultural & language barriers to provide evidenced based screenings & vaccines. To understand the challenge, in 2024, Alaska ranked 44th in the nation for adherence to eligible colorectal screenings. Poor screening rates contribute to late-stage diagnosis and higher mortality. For Prostate-specific antigen (PSA) screening prevalence within the past year, Male ages 55-69 perfumed poorly with Anchorage, Nome, and the Aleutians all ranking at the bottom with under 26.3% adherence. As a result, Alaska mortality for prostate cancer ranks 47th in the nation. At root of the poor outcomes are Access, Acceptance, and Availability, with each creating its own significant barriers and independent solutions. We believe screening addresses the first half the problem. To address, we must build upon the existing success AHF has had to include wider community partners & more culturally specific events to gain acceptance. The second half we well addressed within our pilot through navigating those found to have a suspicious finding through both informed & coordinated clinical work up. If necessary, navigating access to patients at their chosen location for treatment. Addressing the high mortality rate across Alaska can only address the problem if it provides for screening, treatment, follow-up.	RHTP is a remarkable opportunity to fund the resources necessary to scale a successful model that contributes towards addresses poor health outcomes across Alaska. For over 45 years AHF has made an impact & with additional resources, can make the difference. By adding 2 purpose vehicles, 3 employees, culturally developed content & awareness, AHF can reach more Alaskans. Having best in market software available in larger lower-48 locations, we will support care coordination from village to hospitals for continuity & standard of care principles. Vaccines will be provided when appropriate to foster prevention as well as smoking cessation services. AIOF will recruit a dedicated Navigator to provide care coordination & facilitate appointment to patient preferred locations, providing measured follow through & expert guidance rather than making Alaskan responsible to manage unassisted access to care. Tiered Mobile Screening Infrastructure: To overcome Alaska’s geographic barriers, AHF will deploy a dual-model mobile delivery strategy: 1) Regional Hub Mobile Clinic (Modular Truck): A fully equipped mobile clinic capable of supporting high-volume screening events in regional hubs & larger rural communities 2) Rapid-Deployment Medical Van: A smaller, flexible mobile unit designed for road-system communities, blood draws, & targeted outreach in hard-to-reach areas 3) Flyable Mobile Screening Kits: Compact screening systems that can be transported by small aircraft or standard vehicles to off-road-system villages. Both vehicles will be visibly branded to increase awareness & normalize preventive screening across Alaska. Community-Embedded Outreach: AHF will model a proactive rural engagement by 1) Hiring 3 rural outreach coordinators (preferable tribal) 2) Partnering with tribal health organizations, local health centers, & local leaders 3) Aligning events with seasonal & community schedules Closed-Loop Navigation & Data Integration: Screening alone is insufficient. Suspicious findings will trigger rapid AIOF navigation through 1) A dedicated patient navigator responsible for appointment scheduling, referral management, & follow-up 2) Deployment of a care coordination platform (Equicare) integrated into mobile screening vehicles with ability to connect with provider EMR’s for seamless integrated care 3) Remote connectivity solutions (ie: Starlink) for off-grid communities 4) Closed-loop tracking with local health centers, tribal health partners, & specialist groups	\$1M-\$5M	Clinic	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Aurora Maternal Fetal Medicine	Expanding access to Maternal-Fetal Medicine subspecialists in Alaska for high-risk pregnancy care	AK	The objective of the project includes addition of ambulatory outpatient clinics around hub cities in Alaska equipped to perform specialty ultrasound services, MFM consultative services and high-risk pregnancy care via telemedicine for underserved communities and patients in Alaska. The mission will be to improve maternal and neonatal outcomes by providing continuity of care for patients with known fetal abnormalities or maternal conditions that require close monitoring that can be done close to home while not requiring substantial patient travel in the right clinical situations. Patient travel time to the proposed hub locations will be significantly less and the opportunity for expert care to be available in areas of maternity deserts will be life-changing for rural Alaskans. Grant funding would be used to lease state of the art ultrasound machines, payroll for employees of Aurora MFM, provide 1FTE physician to see patients remotely (provided by Obtelectcare), LilyLink remote diabetes management, lease of office space in proposed hub cities and telemedicine technology to perform remote consultation and management of high-risk pregnant patients.	Ambulatory clinic locations will be created in Fairbanks, Soldotna and Juneau. Existing clinics in Wasilla and Anchorage will expand with new ultrasound equipment and Teladoc stations for remote physician consultation. Aurora MFM will partner with Obtelectcare to provide physician telemedicine MFM services. Obtelectcare will supply one full time MFM physician to see patients remotely with their pool of physicians who are licensed to practice in Alaska. These subspecialty services provided will include diabetes management (remote LilyLink support staffed by MFM specialists), review and interpretation of specialty ultrasound, consultation and co-management of high risk pregnancy conditions by remote MFM physicians via Teladoc stations provided by Obtelectcare. Tricefy is an ultrasound image storage program (cloud based) that will be purchased and used to upload images from the ultrasound for remote physician review and interpretation. PNC IT will continue to be the internet technology company that will help to provide support of technology in Alaska sites. As research has shown, Maternity deserts tend to be associated with poor outcomes in pregnancy, including increased maternal mortality, increased risk for low birthweight and increased neonatal mortality. Providing care remotely via Teladoc connection, use of state of the art GE ultrasound equipment and expert involvement of skilled MFM teams via telehealth will likely lead to improved outcomes and management of high-risk conditions in pregnancy for Rural Alaskans that may not have been discovered until it is too late due to patient inability to seek care with MFM physicians early in pregnancy to manage complications. • Lease of 5 GE Voluson Expert 22 ultrasound machines x 60 months with Verisound Collab program and ongoing technical support from GE = \$924,704.00 • Teladoc telemedicine stations x 5 clinic sites = \$18K for the equipment, shipping and configuration (per device) and another \$9K per year in recurring annual fees = \$135,000 for the first year • Upgrade of computer equipment and IT support from PNC IT = \$30,000 • AMFM payroll (1 year) to support outreach ambulatory clinics = \$1,059,790.81 • One full time Obtelectcare MFM physician to provide telemedicine coverage of clinic sites for one year = \$1,000,000	\$1M-\$5M	Clinic	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Austin's Compassionate Enterprise	Southcentral Alaska Rural Medical Equipment & Access Hub	AK	Rural Alaskans discharged from Anchorage-based hospitals, including Alaska Native Medical Center and Southcentral Foundation facilities, frequently experience delays accessing medically necessary durable medical equipment (DME) and reliable transportation for follow-up care. The absence of centralized equipment redistribution infrastructure and coordinated mobility support creates gaps between hospital discharge and safe recovery in rural communities. Currently, Austin’s Compassionate Enterprise (ACE) operates a statewide medical equipment redistribution program from temporary storage containers without permanent infrastructure. This limits processing capacity, data tracking, hospital integration, and coordinated expansion. The opportunity is to strengthen Alaska’s rural health system by establishing a centralized Rural Medical Equipment & Mobility Access Hub that integrates equipment redistribution with transportation coordination. This project addresses structural barriers to discharge stabilization, continuity of care, and rural health sustainability.	Austin’s Compassionate Enterprise will establish a centralized Rural Medical Equipment & Mobility Access Hub integrating medical equipment redistribution (ACE Lending Closet) with coordinated transportation access (Guardian Patient Services). The approach includes: • Securing and developing centralized infrastructure to safely store, sanitize, repair, and inventory durable medical equipment • Formalizing discharge coordination pathways with hospital and tribal health partners to streamline referrals • Expanding rural redistribution logistics for wheelchairs, hospital beds, respiratory equipment, and assistive devices • Integrating transportation coordination to ensure patients can obtain equipment and attend follow-up appointments • Implementing inventory tracking and referral monitoring systems to improve efficiency, transparency, and accountability The hub-and-spoke model positions Anchorage and the Matanuska-Susitna Borough as the central coordination site, with rural communities connected through structured referral pathways. By aligning hospital discharge planning with community-based equipment and mobility access, the project strengthens care transitions, reduces avoidable delays, and enhances continuity of care for rural and Alaska Native patients. This approach advances rural health transformation by building infrastructure that improves access, coordination, and fiscal sustainability within Alaska’s health system.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Avel eCare	Avel eCare Crisis Care	SD	Despite impactful investments in crisis care, gaps in community-based behavioral health crisis response have been identified as an area of opportunity across Alaska (Milliman Report, 2024). As a result of this lack of access, state can experience an over-reliance on law enforcement, emergency medical services, and hospital emergency departments to manage behavioral health emergencies, particularly in rural and frontier communities. Alaska’s behavioral health crisis response system relies heavily on these community resources in responding to individuals experiencing acute mental health or substance-related crises, particularly in rural and frontier geographies where clinical crisis resources are limited or unavailable. In many communities, officers are frequently called to situations that fall outside traditional public safety roles because alternative crisis response options do not exist locally. Limited access to appropriate stabilization settings often results in default transport to emergency departments or involvement with the criminal justice system—outcomes that can be traumatic for individuals, inefficient for public safety agencies, and costly for the healthcare system.	Avel’s Virtual Crisis Care program addresses gaps in community-based behavioral health crisis response by providing law enforcement officers with real-time, virtual access to behavioral health clinicians who can assist with assessment, de-escalation, stabilization, and safety planning at the point of contact. This model supports officers in determining when hospitalization or involuntary holds are not clinically necessary, helping divert individuals from emergency departments and correctional settings toward more appropriate care pathways. By enhancing existing public safety responses with clinical expertise—rather than replacing them—Virtual Crisis Care aligns with Alaska’s stated goal of strengthening its behavioral health crisis continuum through telehealth-enabled solutions that reduce unnecessary emergency utilization, minimize trauma, and better meet individuals’ emotional and physical needs during a crisis. Over time, this approach supports both cost containment and system sustainability by reducing avoidable ED visits and preserving law enforcement resources for core public safety functions. Our care program utilizes HIPAA-compliant, video-enabled telehealth, and staff trained in the use of evidence-based practices. Additionally, funds would be used to deploy portable audio/visual equipment, along with the costs associated with training and management of equipment. Avel will collaborate with the State of Alaska and law enforcement agencies across the state, and work with local community providers to ensure appropriate referrals and promote coordination and safety. Virtual Crisis Care directly supports Alaska’s stated goals to strengthen the behavioral health crisis continuum, reduce reliance on law enforcement and emergency departments, improve safety and outcomes during crisis response, and expand access to appropriate behavioral health care in rural and frontier communities through telehealth-enabled solutions.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Avel eCare	Avel eCare Emergency Medicine and Emergency Medical Services	SD	In medical emergencies such as trauma, heart attack, and stroke, rapid access to definitive care is critical to survival and recovery. However, residents of rural and frontier communities-- particularly in Alaska-- face significant disparities in emergency response and outcomes. These populations are often located hours from Level I or II trauma centers or cardiac catheterization labs, and local facilities frequently lack on-site emergency physicians. Further, EMS agencies are commonly staffed by volunteers or limited scope providers, leaving them as the primary point of care during life-threatening events. While recent investments in telehealth, data systems, and communication tools have improved access, these resources alone do not reduce unnecessary emergency transports or improve outcomes. The core challenge is not a lack of information, but a lack of delegated clinical authority and real-time medical direction that allows EMS personnel to safely treat patients in place or pursue other care pathways when appropriate. Without physician ownership of field decisions, EMS providers default to transport-based risk mitigation, increasing strain on patients, health systems, and transport resources. This dynamic contributes to higher mortality rates in rural trauma cases, as well as provider burnout and ongoing recruitment challenges. Avel's Emergency and EMS solutions provide the opportunity to close this gap by enabling timely, supported clinical decision-making in the field.	Avel eCare proposes a scalable, technology-enabled emergency care model designed to improve outcomes, reduce unnecessary transports, and support frontline clinicians in rural and frontier communities. Building on more than 30 years of experience delivering virtual care in underserved settings, this project will deploy ready-to-launch emergency programs: Avel eCare Emergency for rural emergency departments and Avel eCare Emergency Medical Services (EMS) for field-based providers. Through high-definition audio/video technology activated at the push of a button, local clinicians and EMS personnel gain immediate access to a virtual team consisting of a board-certified emergency physician, an experienced emergency nurse, and a paramedic. This team provides real-time medical direction, diagnostic support, clinical decision-making, and assistance with transfer coordination. The approach ensures faster access to definitive emergency expertise during time-sensitive events while reinforcing, rather than replacing, local care teams. For EMS agencies, Avel eCare will equip ambulances with in-rig telemedicine capabilities, enabling peer-to-peer support in the field and during transport. This model not only improves clinical confidence and supports volunteer and limited-scope providers, but it also enhances patient safety in high-acuity situations. By providing physician-led guidance at the point of care, our model reduces reliance on transport-based risk mitigation and improves system efficiency. As a second phase, Avel will address the root cause of unnecessary transports in frontier settings: the lack of delegated clinical authority. We will extend established EMS protocols to allow personnel to participate in treat-in-place and alternate destination pathways through real-time physician delegation and oversight (without permanent scope-of-practice expansion). Physicians retain clinical authority and decision ownership, while technology supports immediate consultation, documentation, and escalation. Together, these approaches extend established EMS medical principles through modern telehealth infrastructure, improving access to timely emergency care for high- and moderate-acuity patients; strengthening rural workforce support; and advancing safer, more appropriate care pathways for rural and frontier populations.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Avel eCare	Avel eCare Senior Care Services	SD	Alaska is experiencing a significant demographic shift that is placing increasing strain on its long-term care system. The number of Alaskans aged 65 and older continues to grow, while the working age population is shrinking, exacerbating long standing workforce shortages across health care and long-term care settings. This imbalance limits the availability of trained staff needed to support older adults with increasingly complex medical, cognitive, and behavioral health needs. At the same time, Alaska’s long term care capacity is constrained by a small number of licensed nursing home beds and a highly fragmented network of assisted living homes, many of which are small and geographically isolated. As a result, hospitals are frequently used as a default setting for individuals who no longer require acute medical care but cannot be safely discharged due to the lack of appropriate continuing care options. Collectively, these pressures (an aging population, a declining workforce, and limited long term care capacity) create challenges in timely clinical assessment, care coordination, and treatment in place. The resulting delays in discharge, avoidable hospital utilization, and strain on both hospital and long-term care staff underscore the urgent need for scalable solutions that extend clinical capacity, support the workforce, and strengthen Alaska’s long term care continuum.	Avel eCare Senior Care addresses these challenges by connecting long term care and assisted living facilities to geriatric trained clinicians through 24/7, two-way audio and visual telehealth. Avel’s virtual care model provides just in time access to physicians, nurse practitioners, nurses, and psychiatric nurse practitioners who support urgent evaluations, chronic condition management, medication and laboratory review, behavioral health services, RN assessments, and admission and documentation support. By extending local clinical capacity regardless of geography, the model strengthens Alaska’s long term care system, improves quality and safety, reduces unnecessary hospitalizations, stabilizes the workforce, and improves hospital bed availability. This approach is designed for Alaska’s highly dispersed long term care landscape, including rural, frontier, hub based, and off-road system communities. Participating sites will include licensed nursing homes, assisted living and memory care communities, and small residential care homes serving residents with increasing medical and behavioral complexity. Avel’s model integrates into existing workflows, supporting on site staff as capacity extenders rather than replacing local providers. Through real time consultation and collaboration, Avel clinicians assist with urgent assessments, chronic disease management, medication and laboratory review, behavioral health evaluation, and admission and documentation support, enabling facilities of all sizes to access specialized expertise at any time. The project will primarily serve adults aged 65 and older, as well as younger residents with aging related complexity, multiple chronic conditions, dementia, behavioral symptoms, or advanced illness. Designed to support treatment in place when clinically appropriate, Avel eCare Senior Care helps facilities manage acute issues on site while improving resident comfort and continuity of care. Beyond resident outcomes, the model directly supports Alaska’s long term care workforce. Avel clinicians provide decision support and clinical partnership to on-site medical directors, nurses, administrators, and providers. By reducing after hours call burden and providing immediate access to geriatric expertise, the model improves clinical confidence and supports recruitment and retention across long term care settings.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Avel eCare	Avel eCare Specialty Clinic	SD	Due to low patient volume and workforce shortages, most specialists do not serve rural communities, requiring patients to travel long distances (often across challenging geography and weather conditions) to access specialty care in more populated areas. As a result, patients experience significant delays in diagnosis and treatment or forgo care altogether, leading to exacerbation of chronic and complex conditions that could have been managed with timely specialty intervention. These access barriers also place additional strain on rural primary care teams, who are asked to manage conditions beyond their scope without specialist support. In many cases, rural facilities lose patients not only for specialty services and associated diagnostics, but also for ongoing primary care, diverting care and revenue out of the local community and further weakening the sustainability of local health systems.	Avel’s Specialty Clinic enables patients to receive scheduled specialty services and treatment at their local clinic, reducing scheduling delays and costs associated with patient and family travel while strengthening coordination between local primary care providers and specialists. Leveraging Rural Health Transformation funding, Avel will partner with participating Alaska clinics to implement specialty telehealth services aligned with local community needs and existing workflows, Our Specialty Clinic model includes scheduled telehealth visits using secure, two-way audio and visual technology within the originating clinic. First, clinics schedule appointments through Avel’s centralized scheduling platform, enabling access to specialty providers while maintaining local control over patient flow and follow-up care. Then, Avel eCare’s board-certified physicians and advanced practice providers conduct specialty consultations, document in the EMR, and coordinate care recommendations directly with on-site teams. Avel’s Specialty Clinic solution offers a wide range of services and is customizable to each community’s priorities. To date, behavioral health has been the most in-demand specialty, and Avel has responded by providing access to adult and child/adolescent psychiatrists, behavioral-health-certified advanced practice providers, and master’s-prepared social workers for assessment, medication management, and ongoing therapeutic support. Additional specialties may include rheumatology, endocrinology, dermatology, cardiology, gastroenterology, pulmonology, oncology, neurology, and nephrology, allowing clinics to address high-need conditions without requiring patients to leave their communities.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Avvento Consulting Inc.	Alaska Rural Health Transformation: Program Management and Oversight	CA	Rural healthcare systems in Alaska operate across vast geographic distances and rely on a combination of small clinics, tribal health organizations, regional hospitals, telehealth platforms, and state systems to deliver care. Many transformation initiatives therefore require coordination across multiple organizations, technology platforms, and vendors. Without strong program governance and independent oversight, complex health technology initiatives can become fragmented, difficult to manage, and challenging to sustain. The Rural Health Transformation Program presents an opportunity to strengthen the planning, coordination, and implementation of technology and operational initiatives that support rural healthcare delivery. This includes the need for independent program management, vendor oversight, and technical validation to ensure that projects meet performance, security, and interoperability expectations. Many large technology initiatives rely heavily on vendors to manage implementation, test system performance, and validate security controls. Establishing an independent oversight capability allows the state and participating organizations to conduct objective project monitoring, security and privacy reviews, and independent quality testing when internal resources are limited. This approach strengthens accountability, reduces risk, and helps ensure that technology investments deliver reliable and sustainable benefits for rural communities.	Our proposed approach establishes an independent program management and governance capability to support rural health transformation initiatives across Alaska. Rural health systems operate across small clinics, tribal health organizations, regional hospitals, and telehealth networks, which creates significant challenges for coordinated implementation of technology, data interoperability, and operational initiatives. Without structured oversight, projects can become fragmented, difficult to manage, or unsustainable. Our approach strengthens planning, coordination, and independent oversight to ensure initiatives are implemented effectively, securely, and sustainably, maximizing benefits for rural communities. The project begins with establishing governance frameworks, reporting structures, and decision-making processes that align initiatives with statewide priorities. We would facilitate coordination among state agencies, providers, tribal health organizations, and vendors to ensure consistent standards, timely delivery, and clear accountability. Key services include independent monitoring of vendor deliverables, software quality testing, privacy and security reviews aligned with HIPAA, CJIS, NIST, and FedRAMP, and validation of technical and operational performance when internal resources are limited. This independent oversight ensures vendors cannot self-certify their work, reduces risk, and strengthens accountability across initiatives. Additional support includes program and project planning, risk tracking, stakeholder engagement, continuity of operations planning, disaster recovery planning, and development or review of policies, procedures, and standards. By providing independent oversight and structured program management, our approach improves interoperability, care coordination, and the reliability of health systems. It also reduces reliance on vendors, mitigates technical debt, and supports sustainable, high-quality healthcare delivery and access for Alaska’s rural, remote, and frontier communities. Through clear oversight, measurable performance tracking, and alignment with statewide goals, this project ensures technology investments deliver long-term impact and build capacity for ongoing transformation.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

AWARE, Inc	Behavioral Health Support for Vulnerable Youth	AK	Behavioral health supports for youth are in short supply in Juneau, and nearly non-existent for remote communities in northern SE Alaska. While several agencies provide these services (Bartlett Outpatient Services, SEARHC, JAMHI Family), they are unable to maintain a qualified staff to meet demand, and their waitlists are long- some over 8 months. As emergency shelter providers, AWARE and ZGYC see families in acute crisis, often experiencing violence, homelessness, food insecurity, and extreme poverty. As a result of acute and generational trauma, many families and young people experience substance use disorders, and/or mental illness. All of the youth we see likely have substantial ACEs scores, and many have or will develop PTSD as a result of their repeated early traumas. Shelter can be a reprieve from the dangers of the street or violent homes, however, staying in a congregate shelter, even when the youth or family really want assistance, is often very challenging. The staff at both shelters is experienced and caring, however, the magnitude of challenges facing these children and young people rightfully call for clinical supports. When children or youth use violence against themselves or others, we have very few options, outside of the emergency room, to access care that can help keep them safely sheltered. And leaving shelter, either because they are a danger to others or they cannot cope with the environment, increases their risk of harm dramatically.	AWARE and ZGYC propose funding and sharing a clinical provider who can provide behavioral health support in a acute and medium-term situations for children and youth utilizing our shelter services. We believe that one clinical position could serve the needs of both shelters, and also be available for assistance with families who are housed but are utilizing AWARE's victim services or ZGYC support services. We envision a Behavioral Health Consultant (BHC) model, with the clinician located in our shelters, that can provide brief, solution-focused, sessions aimed at functional improvement, often utilizing cognitive-behavioral therapy (CBT), relaxation techniques, and psychoeducation. We are looking for a BHC who has experience with individual, group, and family interventions. We believe this program could grow to include a range of options based on the unique child/youth need. It is essential that safe family members are included in the youth's care, and can learn to be that person's support as they transition out of crisis care. We also believe that a small but extremely vulnerable population of youth would benefit from accessing behavioral/substance abuse assessments to access longer term care. If these assessments are available within their shelter/care environment, the chance that the youth will cooperate and finish the assessment increases greatly. Access can mean the difference between receiving needed treatment as a teen vs living with a lifelong substance use disorder. Also, our BHC would assist with staff development, helping to increase successful interactions between youth and non-clinical staff. Staff, particularly at AWARE, often struggle with 18-21 year olds, as they present often with adult challenges, but have yet not developed adult coping capacities. AWARE would also require additional funding to hire part-time childcare providers, as staffing ratios often cannot accommodate childcare on top of necessary advocate duties, such as answering our 24 hour careline and monitoring the shelter. Finally, both programs would benefit from assistance from a nutrition specialist, as the families and youth who enter our programs often experience food insecurity, and have developed unhealthy habits around food consumption. Youth in ZGYC programming demonstrate often demonstrate confusing beliefs about food and nutrition, that may not fit the definition of a clinical eating disorder, but are clearly negatively impacting their health.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

AWARE, Inc	Ensuring Access for Low Income Alaskans in SE Alaska	AK	There are two "elements" to this problem- the significant need for low-income Alaskans, particularly those served by social service agencies in Juneau, to obtain functioning computers/laptops to attend remote appointments for medical and behavioral health appointments. AWARE serves many remote clients who have been impacted by domestic and sexual violence, are seeking assistance, and are asked to access telemedicine options in Juneau. Many of these folks lack the financial resources to buy and maintain a home computer. Some are able to access telemedicine from their phones, but even for those individuals/families may have difficulty operating the software or even seeing the provider due to the limited screen and functionality. Laptops would enable better remote access, as well as other collateral benefits, including the ability to fill out on-line applications for services, medical releases, job search and resumes materials, etc. The need is the first element of this problem; the second element is the waste that is generated by laptop turn-over at agencies served by Hansen Gress. Their clients replace hardware as needed and also according to funding/service schedules. This means that older, but functional, laptops are often surrendered for wiping and end up not being used. Hansen Gress would like to see these resources being used by low-income Alaskans who really need technology to access care, rather than surrendered for parts or disposal.	Our project envisions Hansen Gress providing these recycled laptops to AWARE for distribution to AWARE's existing clients, as well as other low-income Alaskans who need assistance. AWARE sees such a benefit to this program for our participants that they are happy to serve as the distribution hub, and expand that distribution beyond survivors,. because access to healthcare and services is an essential element of violence prevention. This project would use funding to ensure Hansen Gress could wipe and restore functionality to laptops surrendered by their clients as well as any hardware-related expenses to ensure security compliance standards are met. They would provide those machines to AWARE, who would use the remaining funding to distribute the laptops to survivors and low income Alaskans who apply to the program.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Skagway (Municipality); Yakutat (City and Borough)	Deferred or Not Advanced

A-Z Speech Therapy, Inc	Alaska Rural Therapy Project: A-Z Mentorship Collective	AK	Rural Alaska students and families experience uneven access to speech-language services. Many districts fill vacancies by contracting with large, out-of-state staffing companies whose itinerant providers fly up for short assignments. This approach: Increases travel time and cost, Sends a significant share of public funds Outside, Contributes to provider burnout when “Alaska adventure” travel is layered on top of clinical work, and Leaves little lasting connection to community priorities or local mission. Because funding for in-person services varies widely, some districts can afford regular on-site SLP weeks while others must rely heavily on teletherapy. This creates inequities in service intensity, opportunities for coaching, and IEP/IFSP compliance across regions. The opportunity is to use Rural Health Transformation support to build an Alaska-based itinerant and mentorship collective that: Hires clinicians who live in Anchorage and travel out to rural communities, Keeps funding and expertise in Alaska, and creates a structured pathway for therapists to serve rural students, experience rural communities, and enhance service delivery given a hybrid approach to speech therapy services. By building relationships with the communities, the ART Project aims to mentor therapists over multiple years rather than as brief visitors.	A-Z Speech Therapy will launch the Alaska Rural Therapy (ART) Project as an Anchorage-based itinerant SLP and mentorship program dedicated to rural communities as a resource pool for first school districts, and eventually ILPs and/or Native Corporations. Key elements of the approach include: Anchorage-based itinerant team: Recruit 2 SLPs who live in Anchorage and commit to 2-3 years of blended work that includes regular hub-and-spoke rural travel with remaining time focused on Anchorage-based services and project activities. Services in Anchorage may be delivered as part of a hybrid model with contracted partners when specified in agreements, or as private speech therapy services through A-Z Speech. Provide approximately 6-12 service weeks per school year across one to two partner districts and/or associated ILPs/Native corporations (depending on expressed need of district or entity). Service model During rural weeks: conduct evaluations, direct intervention, IEP/IFSP participation, screenings, staff and caregiver coaching, and planning so strategies continue after the team leaves. Between trips: offer teletherapy and consultation where contracts support it; otherwise, clinicians participate in mentorship, complete follow up documentation and report writing, while maintaining skills and employment through Anchorage-based intensives during weeks not providing rural services. Mentorship and workforce development Implement a staged mentorship program (Foundations, Growing Clinician, Senior Clinician, Mentor) with IECMH-informed reflective supervision and Alaska-specific training. Recruit therapists into a defined “Alaskan abroad” experience, with an option to progress into mentor roles by year four, acknowledging and planning around expected workforce mobility. Partnership and design Conduct at least one owner-led, Rural Health Transformation-funded site visit to partner communities in Year 1 to co-design schedules, workflows, and communication practices. Formalize contracts and MOUs where districts pay for billable services and lodging, while grant funds support recruitment, mentorship, planning, and infrastructure. Infrastructure and data	\$50,000-\$250,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area	Deferred or Not Advanced

Build telehealth capacity as needed, documentation templates, and simple data systems to track students served, sessions delivered, and outcomes, supporting continuous improvement and reporting.

Bamboo Health, Inc.	Transforming Rural Care Through Real-Time Connectivity and Coordination	KY	Alaska’s vast geography, dispersed population, and current behavioral health infrastructure create unique challenges for rural and village communities. Even though providers collaborate well, they often operate in isolation, with limited visibility into available treatment capacity across regions. As a result, individuals in crisis may face long wait times, unnecessary emergency department boarding, out-of-state placements, or gaps in follow-up care. Workforce shortages and constrained financial resources further strain the system. Transforming rural care through real-time connectivity and coordination is essential to overcoming these barriers. Bamboo Health’s approach connects hospitals, crisis teams, behavioral health providers, and other stakeholders through shared, real-time data infrastructure. This visibility enables faster placement into appropriate levels of care, reduces duplication and delays, and strengthens care transitions at pivotal moments such as crisis events or hospital discharge. By unifying fragmented data streams and embedding coordination into daily workflows, Alaska can better preserve scarce rural capacity, support providers with limited staff, and intervene earlier to prevent costly escalation. Real-time connectivity ensures that geography no longer determines access to timely, appropriate care—creating a more equitable, efficient, and sustainable system for Alaska’s rural and village communities.	Bamboo approach to transforming rural care in Alaska centers on building shared, real-time infrastructure that connects providers, improves visibility, and embeds coordination into workflows. Bamboo creates a unified ecosystem that enables providers to act quickly and confidently at pivotal moments in care. At the foundation of this approach is the Bamboo Intelligence Hub® (BIH®), a statewide platform that integrates data across hospitals, behavioral health providers, crisis, and other key partners. BIH® delivers longitudinal, real-time insight into an individual’s interactions across the care continuum, ensuring that providers in rural communities no longer operate in isolation. As an initial step, Bamboo proposes implementation of Open Beds®, our real-time behavioral health availability with embedded closed-loop referrals. Open Beds® gives providers immediate visibility into treatment capacity across regions, replacing time-consuming phone calls and manual processes with streamlined digital referrals. This accelerates placement into appropriate levels of care, reduces boarding and delays, and helps retain patients locally whenever clinically appropriate. Beyond improving placement, Bamboo’s approach strengthens care transitions. BIH® surfaces pivotal care moments, such as crisis encounters, hospital admissions, or discharges, and flags individuals at elevated risk of repeat utilization. This real-time intelligence allows providers to intervene earlier, coordinate follow-up, and reduce preventable escalation to higher-acuity, higher-cost settings. In future phases, BIH® can expand to integrate additional data sources, including PDMP access, Justice-Involved data, ADT feeds, and Bamboo Bridge®, an AI-enabled care navigation model with human-in-the-loop support. By unifying these data streams within a single secure hub, Alaska can move from reactive care to proactive, coordinated intervention. Importantly, Bamboo’s approach is provider-centered and locally informed. We engage stakeholders through listening sessions, workflow alignment, and role-based training to ensure the platform supports, not burdens, rural teams with limited capacity. Through real-time connectivity, closed-loop accountability, and cross-sector collaboration, Bamboo’s approach addresses geographic barriers, workforce constraints, and fragmented systems, creating a more coordinated, efficient, and sustainable model of care for Alaska’s rural and village communities.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Bartlett Regional Hospital	Bartlett EHR Conversion - Technological Infrastructure Update	AK	Bartlett Regional Hospital currently uses five different software platforms for Electronic Health Records (EHRs). Our main hospital, skilled nursing facility, Home Health and Hospice, pediatric clinic and other clinics each use separate EHR systems which are not connected. Some of these are older and outdated, and several came to us with clinics or facilities we have absorbed while expanding our community services. These software platforms are not designed to integrate, and advanced AI healthcare applications cannot gather information from our wide array of patient health information platforms. For our clinical staff, accessing patient information in so many ways, from so many sources, is challenging and can create gaps that impact care. In addition, older technology limits our access to opportunities to improve healthcare outcomes by not accessing the most modern technological advances in healthcare data and insight.	This project involves the purchase of and conversion to a single EHR platform (EPIC) that will integrate all the data systems of our hospital and specialty clinics and facilities. Consolidating patient information and providing smooth and contiguous access across our departments and clinics will prevent gaps that can negatively impact patient care. With this cutting-edge software, we would be able to access new and emerging AI healthcare applications that would provide a world of insight and pertinent information for each individual healthcare interaction. A patient at Bartlett would benefit from the same world-class assistive technology as would a patient in a higher density community. Bartlett Regional Hospital will purchase cutting-edge EHR software and conversion services to integrate information from existing hospital software and provide AI and other assistive technology for improved clinical usage and enhanced patient experience and outcomes. Bartlett leadership has approved this project and will manage implementation. Institutional staff, including Information Systems department and executive steering committee are experienced at managing systems upgrade and conversion projects.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

Bartlett Regional Hospital	Bartlett New Cardiology Clinic	AK	Juneau's healthcare system lacks local cardiology services; this represents a longstanding gap in access to care for our region. Patients requiring cardiology or ongoing management of cardiac issues must travel by airplane out of the region to either Anchorage or Seattle. This can result in delayed diagnosis of cardiac disease, increased medevac flights for consultation of cardiology, and poor cardiology management, as travel can place financial and emotional stressors on the patient as well as their family. Sometimes, it means that patients simply don't get the care they need, because the barrier to access is just too high. Cardiovascular disease remains a leading cause of morbidity and mortality in Alaska. As Juneau is geographically isolated and has an aging in place population, Juneau's lack of cardiology services creates significant access barriers and inequities in care. Currently Juneau has approximately 5,500 seniors over 65; projections for 2030 rise to 6,200 seniors over 65. That is a 13.7 % increase in the next 4 years. This request seeks to close the gap in access to cardiac services that will be felt far into the future. Having local cardiology services will help Alaskan seniors age in place and remain in their home state, getting the care they need throughout their lives.	Bartlett has been talking with a cardiology practice in Anchorage that has expressed interest in working with our hospital to provide services in Juneau. Bartlett also has an available space that is already set up to provide clinical services. The cost of starting up a new cardiology clinic in Juneau is prohibitive, as it will take up to a year to establish a patient roster sufficient to self-sustain. For this reason, private cardiology groups are hesitant to commit to coverage in Juneau without a guarantee of income. RHTP funding would support the startup cost of contracting with the cardiology group to bring services to Juneau during the first year of establishing the clinical practice. The bridge funding would ensure that the specialists were paid while Bartlett stands up and advertises the new services, building a sufficient patient load for sustainability.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

Bartlett Regional Hospital	Bartlett Secure Communication Expansion	AK	Bartlett Regional Hospital currently relies on TigerConnect for secure HIPAA compliant, clinical communication, care coordination, and operational messaging. However, our clinical workflows, physician scheduling processes, and patient engagement functions remain fragmented across multiple unrelated platforms. This results in delayed communication, inefficiencies in provider scheduling, difficulty coordinating care teams, and limited patient-to-clinician communication pathways. The opportunity is to expand and stabilize the hospital’s communication infrastructure by renewing TigerConnect under a multi year unified platform model, adding modules that improve patient engagement and experience and ease staff burden. This will allow Bartlett to strengthen role based communication, integrate scheduling directly into care team messaging, and introduce standardized patient engagement tools that operate inside a single, HIPAA compliant system. Consolidating these functions improves reliability, reduces paging and manual outreach burdens, and enhances the speed and safety of clinical decision-making.	This project renews Bartlett’s TigerConnect contract for a 3-year term and strategically expands its capabilities to strengthen secure communication and care coordination. Offering a secure avenue for communicating with patients will equally benefit our workforce and our patients by enhancing their security and increasing access and promoting the flow of communication. The approach includes: 1. Unified Communication Platform Continue providing 700 Clinical Collaboration + Archiving licenses to ensure all care team members—including nursing, physicians, ancillary departments, and support services—operate in a single, secure messaging environment. 2. Integrated Physician Scheduling (250 users) Implement the TigerConnect scheduling module to centralize call schedules, automate fair-shift assignments, and sync role-based communication assignments. This removes reliance on manual spreadsheets and third-party scheduling tools, reducing errors and delays when identifying the correct on-call provider. 3. Patient Engagement Module (50 licenses) Adopt Patient Engagement Pro to allow secure patient texting, virtual visits, and care follow-up without requiring patients to download an app. This creates a consistent pathway for nurses and clinicians to communicate with patients during pre-admission, post-discharge, and ongoing care. 4. Multi-year cost stabilization A 3-year agreement provides predictable annual expenses, mitigates price volatility, and reduces staff turnover associated with repeated re-contracting. 5. Implementation & Training TigerConnect will conduct implementation work included in the agreement, ensuring configuration of scheduling rules, role-based assignments, and integration with existing systems where applicable. Staff education will be delivered through BRH’s Clinical Informatics and IS departments. This approach strengthens clinical operations, enhances patient experience, and builds a sustainable communication infrastructure.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

Bartlett Regional Hospital	Bartlett Clinical Mobility & Point of Care Infrastructure Upgrade	AK	Bartlett Regional Hospital is an aging but still very useful facility that benefits from the use of modern mobile technology solutions instead of purpose-built spaces with hardwired tech devices. The workstations on wheels (WOWs), for example, work well for bringing patient charts and records to the bedside -- as long as they are charged and ready to use. Unfortunately, our fleet of WOWs is aging, and specifically, they rely on aging, short-use batteries that often don't hold a charge long enough to complete patient care services. In addition, the different WOWs work differently. Some have locking storage for prescription distribution and various accessories, but others do not. Lack of standardization and decreasing reliability makes it increasingly difficult to rely on these WOWs for bedside patient care. Bartlett Regional Hospital's clinical mobility equipment is aging, inconsistent, and increasingly unreliable across Med/Surg and other patient-care areas. This leads to workflow delays, reduced documentation efficiency, inconsistent infection-control practices, and increased maintenance burden on IT.	Workstations on Wheels (WOW) are an excellent solution to the problems of aging facilities and infrastructure and allow hospitals to provide excellent, modern care at the patient's bedside in buildings that were built under a paper chart model. Rather than attempting to fund large-scale construction or remodel projects, utilizing updated, ergonomic and efficient WOWs allows hospitals to provide excellent care with a sustainable investment. This project seeks to replace aging WOWs with standardized, AC-powered Mosaic LCD carts (with and without drawers) and associated accessories such as slotted shelves, scanner mounts, and wipes holders. These devices ensure improved ergonomics, availability, and workflow reliability for frontline staff. Bartlett will acquire 15 Mosaic AC carts with drawers and 15 Mosaic AC carts without drawers, each with standardized accessories to support clinical operations. The project will proceed as a coordinated clinical-infrastructure upgrade. IT will procure and deploy 30 standardized Mosaic WOWs (15 with drawers, 15 without) along with their accessories. These include slotted shelves, rear T-slot mounts, adjustable wipes holders, and other workflow equipment designed for point-of-care reliability. Deployment would occur in stages: 1. Procurement & Inventory Validation – Finalize order quantities and receive hardware. 2. Configuration & Imaging – Install BRH standard clinical workstation images and security tools. 3. Accessory Mounting & Testing – Attach scanner holders, wipes holders, and mounts; confirm power and mobility readiness. 4. Clinical Rollout – Introduce units into Med/Surg and associated units, removing failed/aging carts. 5. Training & Change Management – Provide short, targeted orientation for nurse super-users. 6. Retirement of Old Units – Decommission outdated carts to reduce support demands.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Bartlett Regional Hospital	Bartlett Computer Replacement Project	AK	Bartlett Regional Hospital has 800 employees serving a regional population of 70,000 Alaskans -- and every service we provide involves the use of a computer and monitor. Currently, staff are using outdated devices that are slow, harder to support, and don't always work well with newer systems like Windows 11, Wi-Fi 6E, or modern clinical applications. As we adopt newer technological solutions and software, updated computers and monitors are essential to the success of these innovations. As it is, our IT department is stretched very thin meeting the ongoing requests for tech support to solve problems caused by incompatible or outdated equipment. Existing equipment at the hospital is hard pressed to meet the daily needs of our clinical tasks, and plans for additional regional telehealth services will stretch this even thinner.	Bartlett proposes to upgrade all older computers and monitors with compatible equipment (approximately 200 laptops, 300 desktop computers, and 1,000 27 inch monitors, some with docking hubs). These devices will make workstations faster, more reliable, and easier for staff to use. Moreover, it will be easier to train clinical and IT staff in their use and repair, as devices will be consistent across the hospital. The upgrade will also support expanding telehealth, Hospice, day-to-day clinical tasks, and remote work. The project plan is as follows: 1. Buy identified equipment (quote already obtained): - o 200 laptops (Dell Pro 14 Plus) - o 300 desktop computers (Dell Pro Micro Plus) - o 1,000 27" 4K monitors (USB C and Thunderbolt models) 2. Prepare the devices: We will load each device with our standard Windows 11 setup, security tools, hospital software, and automatic update settings. The quote includes Windows Autopilot, which makes setup faster. 3. Deploy in phases: - o Start with clinical areas (ED, inpatient units, clinics). - o Move to registration and support staff. - o Finish with administrative departments. 4. Train users and support the rollout: We will provide simple instructions for the new single cable monitor setup and have staff available during go lives to help with questions. 5. Use the included support: Laptops and desktops include ProSupport / onsite service, and the monitors have advanced replacement service. This helps keep downtime low.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Bartlett Regional Hospital	Bartlett Data Center Conversion	AK	Bartlett Regional Hospital’s datacenter controls storage of and real-time access to patient and hospital data. More than just historical records, this data includes labs, x-rays, family histories, prescriptions -- all the information we need to access while treating patients in our hospital, nursing facility, and clinics. Unfortunately, the system is now end-of-life, and the support of its various elements has become prohibitively expensive due to skyrocketing annual contracts for each of the separate elements which no longer work well together. We now spend each year more than 25% of the original cost just to have access to the support. In addition, as the companies have all been sold to other companies, the number of people who still work on this convergent system has dwindled to just a handful, putting us in a very vulnerable position. We need to move to a cloud-based storage system that is not tied to specific vendors, giving us the flexibility to choose vendors based on costs and to access newer technology and innovation. The current datacenter infrastructure also lacks capacity and redundancy for rapid and comprehensive disaster recovery. Mean Time to Recovery (MTTR) remains well below industry-recommended Recovery Time Objectives (RTO), leaving the hospital vulnerable to service interruptions that could jeopardize patient care. We need to establish a secondary offsite data storage center to hold data concurrently for immediate access in the event of disruption.	We will replace our current data center with a more flexible system that is not tied to multiple, non-integrated vendors with expensive support contracts and limited available expertise. We will store data on the cloud, and also use an offsite data storage facility to maintain a redundant storage system that will prevent gaps in access during any disruptive event. 1. Deploy a vendor and hypervisor agnostic hybrid cloud-integrated data-center platform on Bartlett campus. 2. Deploy a one-to-one off-site disaster-recovery (DR) site, creating a real-time replication datacenter, with automatic failover to ensure continuity of care and meet the state’s emphasis on resilient health IT systems. We have identified an available data center within a City and Borough of Juneau (CBJ) facility, and we would offer our hospital data center as a redundant system for CBJ data as well. 3. Modernized infrastructure positions Bartlett to leverage zero-cost, open source, self-hosted, Large Language Models and other advanced AI data analytics tools. 4. Additional and more efficient infrastructure provides the capacity to pilot emerging technologies and develop shared service partnerships with other organizations. 5. Sustainability comes from elimination of skyrocketing vendor support costs and contracts. Extensibility of non-converged architecture and the pay-as-you-go cloud resources connections create a financially sustainable solution that can scale up or down with demand.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Bartlett Regional Hospital	Bartlett Molecular Diagnostics	AK	Bartlett's laboratory currently has an aging molecular testing system that has reached end-of-life. We currently have eight testing slots, which is insufficient to meet our testing volumes. We need to double our testing slots and increase the number of unique tests that we offer in house, in order to provide accurate diagnosis and enable appropriate interventions. As we bring in more tests, lack of slots can delay test resulting and affect care decisions and outcomes.	Bartlett needs to replace end-of-life laboratory testing equipment with newer molecular testing technology and expand the slots for testing to meet the overwhelming need. Having recently added a skilled nursing facility and primary care and pediatric clinics to our institutional umbrella, the laboratory needs to support increased in-house testing requests and provide timely results to all our departments. Replacing aging equipment with advanced molecular testing technology with expanded capacity will improve access to timely healthcare and appropriate intervention for all Bartlett patients. Modern molecular testing is more sensitive than other testing solutions and offers rapid results for many testing inquiries that determine diagnosis and treatment. Rapid molecular testing also identifies bacterial, viral and parasitic pathogens, providing accurate detection of disease and aiding in infection control by early diagnosis.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Bartlett Regional Hospital	Bartlett Staff Trauma Support System	AK	Bartlett currently lacks a structured, evidence-informed system to support staff exposed to traumatic events, critical incidents, and cumulative occupational stress. Hospital employees frequently and regularly encounter emotionally intense situations, yet responses are handled inconsistently, often relying on informal peer support or ad hoc debriefings in the absence of structured supports. This gap increases the risk of burnout, compassion fatigue, absenteeism, and long-term psychological effects. With more than 800 employees and an average of 70 open positions, worker satisfaction and retention is a critical goal that affects our ability to provide excellent care to our patients. Protecting and supporting our staff is also a humane responsibility of the organization, as our coworkers are also our community members and patients.	Bartlett will establish a coordinated Critical Incident Stress Management (CISM) trauma support program that provides timely, standardized interventions, strengthens organizational resilience, and fosters a culture where psychological safety of staff is prioritized. By implementing a proactive and comprehensive approach, the organization can reduce negative impacts of trauma exposure and improve staff wellbeing, retention, and overall functioning -- positively affecting patient care. We will create an internal response team, trained in the CISM principals and overseen by a clinician, providing appropriate supports to employees experiencing the effects of trauma exposure. The project will implement a multi-tiered Critical Incident Stress Management (CISM) program tailored to the organization’s operational environment. The approach includes: • Program Design and Policy Development: Establish protocols for activation, confidentiality, referral pathways, and integration with existing wellness and HR systems. • Team Formation and Training: Recruit a multidisciplinary CISM team composed of trained peers, supervisors, and mental health professionals. Team members will complete recognized CISM training modules (e.g., Group Crisis Intervention, Assisting Individuals in Crisis). • Core Intervention Services: Provide structured interventions such as defusing’s, debriefings, one-on-one crisis support, peer support, and follow up check-ins after critical incidents. • Preventive and Educational Components: Offer resilience building workshops, psychoeducation on stress reactions, and training for supervisors on recognizing early signs of distress. • Partnerships and Referral Networks: Collaborate with local mental health providers for higher level clinical care when needed. • Evaluation and Continuous Improvement: Track utilization, participant feedback, and organizational indicators (e.g., sick leave, turnover) to refine the program. This approach ensures a comprehensive, scalable, and culturally aligned trauma support system grounded in best practices.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Basecamp Medical, LLC	Preventive and specialty-level metabolic care across geographically isolated communities.	AK	Rural Alaska faces persistent structural barriers to timely specialty and preventive healthcare access. Extended waiting times for endocrinology, metabolic medicine, and primary care services contribute to delayed diagnosis, unmanaged cardiometabolic risk, and avoidable disease progression. System-level gaps include: • Limited rural access to metabolic and hormone-focused specialty evaluation • Inadequate early screening for insulin resistance and cardiometabolic dysfunction • Fragmented care following hospital discharge • Workforce shortages limiting service expansion • Reduced telehealth reimbursement models impacting rural care delivery • Geographic barriers that increase travel burden and delay intervention These structural barriers disproportionately affect workers in Alaska’s essential and resource-based industries. These sectors represent the backbone of Alaska’s economy and frequently operate in geographically isolated or rotational work environments where preventive healthcare access is limited. Delays in early metabolic and cardiometabolic intervention contribute to workforce absenteeism, reduced productivity, medical evacuation costs, and avoidable high-acuity utilization. Strengthening preventive access in these populations directly supports both individual health outcomes and statewide economic stability.	Basecamp Medical proposes the development of a statewide, telehealth-enabled rural metabolic optimization network designed to strengthen Alaska’s healthcare infrastructure through early detection, coordinated management, and system integration. Key components include: • Expansion of telehealth-based metabolic and endocrine screening services • Standardized rural screening protocols for metabolic syndrome and related dysfunction • Integration of remote monitoring technologies (continuous glucose monitoring, blood pressure monitoring, cardiovascular risk markers) • Deployment of mobile diagnostic and point-of-care testing capabilities • Interim specialty-level management for patients awaiting referral appointments • Workforce expansion to include additional acute/primary care providers and interdisciplinary care team members (health coaches, nutritionists, pharmacists, exercise physiologists) • Structured care coordination to reduce fragmentation and improve continuity This model shifts care upstream by addressing modifiable risk factors before progression to advanced chronic disease.	\$250K-\$1M	Private practitioner	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Be Well Counseling LLC	Expanding Access to Perinatal Mental Health Education and Support for Alaska Families	AK	Perinatal mental health conditions, including postpartum depression and anxiety, can significantly affect the wellbeing of mothers, infants, and families. In Alaska, access to mental health providers with specialized training in perinatal mental health remains limited, particularly for individuals covered by Medicaid and those living in rural or remote communities. As a result, many pregnant and postpartum mothers struggle to find providers with expertise in prevention, early intervention, and treatment of perinatal mental health conditions. Pregnancy and postpartum care providers in Alaska often include basic screening and education related to maternal mental health. However, these conversations are typically brief and may not provide mothers or families with practical tools, strategies, or guidance for recognizing and responding to mental health challenges during pregnancy and the postpartum period. Partners and family members may also have limited understanding of warning signs or ways to support maternal mental health. These gaps represent an opportunity to strengthen preventive behavioral health support for mothers and families across Alaska. Expanding access to education, early awareness, and specialized support can help healthcare providers better support maternal mental health while improving outcomes for mothers, infants, and families statewide.	A central component of the project will be the development of a Perinatal Mental Health Resource Hub, a free digital platform providing structured educational content focused exclusively on maternal mental health. The Hub will guide individuals through a mental health curriculum similar in structure to childbirth education programs, supporting mothers through different stages of pregnancy and the postpartum period. Content will focus on mental health awareness, coping strategies, emotional regulation, and practical tools that support wellbeing during pregnancy and early parenthood. While national maternal mental health resources exist, they are often designed for urban healthcare systems and do not address the geographic, cultural, and healthcare access realities of Alaska. This project will develop Alaska-specific perinatal mental health resources designed to integrate into prenatal care and support mothers, families, and providers in Alaska. The Resource Hub will include short educational videos, reflection exercises, mental health toolkits, validated screening tools as well as guided self-check resources, and practical strategies designed to help mothers recognize emotional changes and develop supportive coping skills. Educational resources for partners and family members will help them recognize warning signs and better support maternal mental health. Content will be developed in collaboration with community partners to ensure materials reflect culturally relevant perspectives and the lived experiences of families across Alaska. Healthcare providers, including obstetric care providers, midwives, behavioral health clinicians, and community health professionals, will be able to refer patients to the Resource Hub during pregnancy as part of routine care. This allows maternal mental health education to enhance remote maternal health care in Alaska. The project will also support workforce development by recruiting and training mental health therapists interested in providing perinatal mental health services in Alaska. Recruitment efforts will focus on therapists interested in providing virtual services to Alaska residents or relocating to serve Alaska communities. Together, these activities will expand access to perinatal mental health education, strengthen provider referral pathways, and increase Alaska’s capacity to support maternal mental health.	Under \$50,000	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Be Well Counseling LLC	Strengthening Neurodivergent Care Access and Workforce Capacity in Alaska	AK	Adults with ADHD and autism face significant challenges navigating employment, education, relationships, and independent living due to executive functioning difficulties, sensory regulation needs, and other impacts of neurodivergence. Access to specialized care that helps individuals develop strategies to manage these challenges is limited across Alaska. While some services exist for children and adolescents, far fewer resources are available for adults. Occupational therapy and behavioral health professionals can play a key role in helping neurodivergent adults develop strategies that support independence and wellbeing. However, Alaska currently has very few providers experienced in supporting adults with ADHD and autism. As a result, many adults rely on general healthcare or behavioral health providers who may have limited training in neurodivergent-informed care. Healthcare providers, behavioral health clinicians, case managers, and community support staff report lacking tools and training to effectively communicate with and support neurodivergent adults. Many students leave the state to pursue higher education and do not return to practice. This project presents an opportunity to strengthen Alaska’s workforce by recruiting clinicians and trainees interested in supporting neurodivergent populations and encouraging them to build careers serving Alaska communities while increasing statewide capacity to support adults with ADHD and autism.	To address the limited availability of neurodivergent-informed care and support for adults in Alaska, Be Well Counseling proposes to develop a statewide initiative focused on three pillars: provider education, public access to practical resources, and workforce development. The project will be led by a full-time Occupational Therapist with expertise in ADHD and autism who will serve as Program Director. This role will coordinate project implementation, develop training curriculum, support outreach and partnership development, establish a practicum placement program, and guide the creation of educational resources. A neurodivergent-specialized mental health clinician will also support the project by contributing clinical expertise, assisting with curriculum development, and co-facilitating trainings. A core component of the project will be the development and delivery of a statewide neurodivergent training program designed to strengthen provider capacity across Alaska. Quarterly virtual trainings will be offered to healthcare providers, behavioral health clinicians, case managers, and community support staff. Additional workshops may be delivered in collaboration with partner organizations to support staff working directly with neurodivergent adults. The project will also develop the Be Well Neurodivergent Resource Hub, a free digital platform providing practical tools and educational resources for neurodivergent adults and their families. The Hub will include short educational videos, downloadable guides, and practical strategies related to executive functioning, sensory regulation, communication skills, and daily living supports. These resources will be accessible online to individuals and families throughout Alaska. Providers will be able to utilize this resource hub when providing care. To support long-term workforce development, the project will establish a neurodivergent training pipeline by recruiting occupational therapy and mental health trainees interested in working with neurodivergent populations in Alaska. Practicum placements and mentorship opportunities will provide trainees with specialized experience supporting Alaska residents. Together, these activities will strengthen the capacity of providers across Alaska while also improving access to practical neurodivergent support resources for individuals and families statewide.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Bee Well Chiropractic	Alaska Rural Health Access & Long-Term System Sustainability Initiative	AK	Rural Alaska communities lack consistent access to preventative musculoskeletal and nervous system care. Families in Talkeetna, Glacier View, and Kodiak already travel extended distances for chiropractic services. This travel burden delays care, increases out-of-pocket costs, and limits early intervention opportunities. Chiropractic care remains concentrated in urban hubs, despite its role in chronic pain management, maternal health support, pediatric development, and nervous system regulation. There is a transformative opportunity to build a Native American veteran-led rural expansion model that integrates prevention, workforce development, technology, and regional partnerships into a long-term statewide strategy.	Year 1: Infrastructure & Pilot Expansion • Portable equipment acquisition • Telehealth platform integration • Establish Talkeetna and Glacier View outreach rotations • Partnership outreach to Kodiak providers Years 2–3: Rural Deployment & Workforce Development • Regular outreach clinics in Talkeetna, Glacier View, Kodiak • Begin collaboration with Tribal Health Organizations Year 4: Regional Integration • Expand into additional hub communities • Establish recurring service contracts or shared-care models • Recruit additional providers with rural focus Year 5: Sustainability & System Integration • Embed services into regional care networks • Reduce reliance on travel to Palmer • Develop long-term workforce pipeline The approach supports RHTP goals of innovation, prevention, workforce strengthening, and sustainable statewide health transformation.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Denali Borough; Kodiak Island Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Behave Health Corp.	Software Access For Effective Treatment (SAFE-T)	CA	A persistent barrier to behavioral health care in rural Alaska beyond limited capacity is limited visibility and coordination across fragmented provider networks. This makes it difficult for those in need to find and connect to appropriate services. This proposal advances a Core Platform Strategy through SAFE-T (Software Access For Effective Treatment), a statewide network directory with provider information and, where enabled, real-time bed availability. SAFE-T will serve as (1) a provider-facing coordination and referral tool to support timely placement and warm handoffs, and (2) a patient-facing directory that helps people identify, schedule, and engage with care across the spectrum. SAFE-T supports Alaska RHTP’s Spark Technology & Innovation priority to “develop community-based system navigation applications” and aligns with CMS Rural Health Transformation goals to promote innovative technology that improves care efficiency, strengthens data security, and expands access to digital health tools for rural providers and patients. The platform will apply privacy-by-design safeguards for workflows involving ePHI, including HIPAA Security Rule-aligned controls (45 CFR §164.312) and, where applicable, protections consistent with 42 CFR Part 2. Beyond navigation, SAFE-T strengthens cross-cutting RHTP priorities by improving access pathways, reducing administrative burden, and providing reporting that identifies service gaps and supports sustainable system planning.	Behave Health has served over 2,000 opioid use disorder treatment centers, recovery residences, and recovery community facilities for the past 11 years. We currently provide directory software for 19 states through chartered state-level National Alliance for Recovery Residences (NARR) affiliate organizations. Building on this experience, our Alaska deployment will follow a phased, stakeholder-led approach that prioritizes verified data, rapid onboarding, and continuous improvement. SAFE-T strengthens and integrates with Alaska’s broader transformation agenda. It can reinforce Alaska’s Behavioral Health 1115 Waiver service delivery (7 AAC 139) by making waiver-covered services and access pathways more visible and actionable. It aligns with statewide crisis system transformation work documented by the Alaska Department of Health, helping operationalize “no wrong door” routing. 1. Stakeholder discovery and scope definition. We will convene state and regional stakeholders to define directory scope, priority service categories, required data fields, and Alaska-specific taxonomy. The platform can accommodate listings across the full spectrum, including treatment centers, recovery residences, peer support, recovery community organizations, FQHCs, CCBHCs, and other community resources as requested. 2. Data seeding and verification. We will identify authoritative data sources (for example, state licensing datasets) to seed initial listings, then validate and refine records with stakeholders. Participating facilities can enable a bed availability widget to display real-time capacity, while clearly distinguishing real-time fields from informational listings. 3. Provider onboarding, training, and adoption. We will conduct remote structured training and awareness campaign for organizations across Alaska, with streamlined onboarding and support. Providers will be able to enhance profiles with photos and standardized tags such as populations served, modalities, levels of care, accessibility, and culturally specific supports. 4. Dissemination and integration. SAFE-T will be easily embeddable on state, regional, and partner websites to maximize public and referral-partner access. 5. Monitoring, reporting, and quality improvement. We will monitor utilization, data quality, and deliver regular reports on participation, coverage by region and service type, and directory actions. Ongoing retraining and outreach will expand adoption and strengthen statewide impact over time.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Behavior Matters, LLC	Behavior Matters: Building Rural Capacity through ABA Clinical Rotations and Community Training	AK	Rural and frontier Alaska faces a systemic "geographic gap" in behavioral health. While urban hubs are able to offer Applied Behavior Analysis (ABA) services, families in remote regions must navigate a clinical desert. For children with autism or complex developmental challenges, the absence of local Board Certified Behavior Analysts (BCBAs) leads to delayed interventions, extreme caregiver burnout, and a reliance on costly, disruptive travel to urban hubs. Behavior Matters recognizes a transformative opportunity to shift the paradigm from a "fly-in/fly-out" service model to a capacity-building residency model. By mobilizing clinical expertise directly into the community, we address immediate behavioral needs while seeding a permanent, local support ecosystem that can sustain itself long-term.	Our initiative, "The Ripple Effect," utilizes a hybrid "On-Site Residency + Telehealth-Out" framework to ensure clinical excellence is sustainable, not just episodic. The approach is built on three pillars: - Direct Clinical Mobilization: A BCBA will travel to designated rural communities on regular, scheduled intervals to conduct initial assessments, design individualized behavior plans, and provide intensive face-to-face coaching. - The "Train-the-Trainer" Framework: Every interaction is a "knowledge transfer." By training the families in ABA principles, we empower the existing client team to manage behaviors and promote skill acquisition long after the BCBA departs. - Continuous Digital Mentorship: Between physical visits, we deploy high-frequency, HIPAA-compliant telehealth. This ensures real-time data review, emergency behavioral support, and emotional "wellness checks" for families, maintaining clinical momentum regardless of weather or geography.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kuskokwim Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Behavior Matters, LLC	Behavior Matters: Empowering Alaskans to Localize Behavior Excellence	AK	Rural and frontier Alaskan communities face a critical shortage of intensive behavioral health services. Currently, families rely on infrequent telehealth or high-cost travel for care, leading to inconsistent intervention for children with complex needs. There is a significant opportunity to convert this unmet need into a workforce development engine. By providing high-quality ABA training to local providers, families, schools, and child care facilities, we can resolve the crisis of care while establishing a professional career ladder within the community.	Our approach utilizes a hybrid mentorship model. We will deploy BCBA's to rural sites at regular intervals to provide hands-on, clinical training to parents and community partners. This "in-the-trenches" coaching focuses on functional communication, emotional regulation, and reducing maladaptive behaviors. Between site visits, we maintain continuity via weekly telehealth supervision. This ensures that the science of ABA is not just taught in a classroom, but applied directly within the unique cultural and environmental context of each Alaskan community.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kuskokwim Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

BelleTorus Corporation ("Belle AI")	AlaskaSkin.ai - Statewide Skin Cancer Screening and Skin Health Assessment Powered by AI	AK	Dermatology is among the most access-limited specialties in rural Alaska. Patients routinely wait months and travel hundreds of miles (often by small plane) to see a specialist. These barriers drive delayed diagnosis of skin cancers and common skin conditions that, left untreated, significantly reduce quality of life. Alaska Native and American Indian communities bear a disproportionate share of this burden. AI/AN individuals have the second-highest melanoma incidence in the United States, with melanoma incidence among AI/AN females rising 186% from 1999 to 2017. Fewer than 21% of AI/AN individuals with skin disease have ever seen a dermatologist. Conditions like impetigo, scabies, eczema, and diabetic skin ulcers - highly prevalent in AN communities - also go undertreated due to access barriers. AlaskaSkin.ai presents an opportunity to reach every Alaskan household with a smartphone photo and create a statewide skin health safety net. By combining accessible smartphone-based image submission, AI-assisted triage, central human-in-the-loop review, and targeted BelleLens™ deployment for high-risk cases, this project turns smartphones already in people's hands into the front door of dermatologic care.	The project launches AlaskaSkin.ai - a free, HIPAA-compliant web platform accessible from any smartphone browser - enabling statewide skin triage without requiring app downloads, provider visits, or travel. Stage 1 – Smartphone photo upload and AI triage: Any Alaskan visits AlaskaSkin.ai, photographs a skin concern with their phone camera, and submits it through a guided intake form. Belle's AI analyzes the image across 2,000+ dermatologic conditions and generates an AI-assisted assessment with risk stratification. Cases are reviewed by a human-in-the-loop provider who confirms the triage and issues a structured finding. Stage 2 – BelleLens Deployment for Moles and Pigmented Lesions: When the triage identifies a mole or pigmented lesion warranting dermoscopic evaluation, Belle ships a BelleLens™ dermatoscope to the patient's home or a designated nearby clinic. The patient or a community health aide captures high-quality dermoscopic images using the BelleLens™ paired with Belle's mobile app. These images are reviewed centrally by the dermatologist for skin cancer risk assessment, with clear referral pathways for high-risk findings. This staged funnel maximizes reach while concentrating the highest-cost intervention—BelleLens™ deployment—where clinical need is greatest. The AlaskaSkin.ai platform is designed for low-bandwidth environments and minimal digital literacy, with culturally adapted content for Alaska Native communities. Importantly, AlaskaSkin.ai will have the ability to analyze images of dark-skin population, a unique and fully validated capability of the Belle AI technology. All data is stored in a HIPAA-compliant, encrypted environment. Belle has demonstrated this approach across 70+ countries and 1,000+ sites, including a \$3.5M ARPA-H deployment in the Bronx, Harlem, Queens community health centers, and also in a Defense Health Agency skin cancer screening program for all skin tones in rural Georgia. Belle AI deck for Alaska: https://docs.google.com/presentation/d/1yXj7o3Sxxo00oiqveF1U0eqsWpxDASI2JRpE3mrHEQQ/edit?usp=sharing BelleLens dermatoscope video: https://www.youtube.com/watch?v=9Szr6T47v-s	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Bering Home	Bering Home is a planned residential nursing care home in Unalaska.	AK	Presently, there is no way for ailing residents in the Aleutian region to age in place or pass away at home. Teams of licensed professional caregivers will be on-site 24 hour a day providing adult daycare, assistance with daily living activities, memory care, palliative and hospice care, and respite services in a secure, regulated setting. The program will utilize telemedicine technology between residents' primary care providers and personalized holistic healthcare teams at Bering Home. We will be located in the hub community of Unalaska which has a stable base population of approximately 5500, large enough to support a healthy labor pool. This project will encourage job growth and career stability in the caregiving field as it evolves into internships for on-the-job training and certification.	Bering Home is designed to meet the longstanding and critical need for localized elder care in the Aleutian region. Unlike other care options that require relocation to Anchorage or beyond, Bering Home provides a local solution that will provide professional service while honoring cultural values and strengthening family connections. The company goals are to offer stability by keeping elders, families, and their care-teams together in the community. This will be achieved by: - utilizing new telemedicine technology to connect with residents' primary care providers - developing community-based caregiving teams to enhance health and cultural continuity - developing career opportunities with stable employment - providing housing for staff and residents' traveling family members - creating a financially viable model for rural elder care to model for other communities Bering Home will provide essential services for ten residents on the first floor. The second floor will be reserved for level 2 assisted living residents. The top two upper floor apartments provide caregiver housing to support staff retention and service consistency as well as offering potential housing for family members traveling with their loved ones from nearby communities. This on-site employee housing will promote consistent staffing and sustainability. Our mission is to maximize the quality of life for those who choose to remain in the Aleutian region. Teamwork, confidentiality, accountability, compassion, dignity, and cultural respect are embedded in the home's operational manual. These core values ensure that resident's needs are respected and promptly attended to. Employees act with compassion in even the most difficult situations with the understanding that loss of physical and social control combined with Dementia and Alzheimer's is often the reason for some unacceptable behaviors. It's imperative to maintain dignity when presented with difficult situations. Employees work within teams to mitigate the stress. With careful monitoring and regular communication with healthcare providers via the telehealth program, symptoms of a variety of conditions can be slowed with preemptive care. Diabetes, Alzheimer's and Dementia, even cancer can be treated to minimize symptoms. Teamwork, confidentiality, accountability, compassion, dignity, and cultural respect describes who we are as a business, as a caregiver, as a resident, and as a home.	Under \$50,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Deferred or Not Advanced

Bering Strait School District	Connecting Kids to Behavioral Health Support in the Bering Strait	AK	The Bering Strait region has especially high rates of completed student/young adult suicides and attempted suicides. The percentage of students who self-report they use tobacco, alcohol and marijuana has increased steadily in the past 4 years - the biggest increase being around marijuana. We have higher rates of pregnant or parenting teens and teens being treated for STIs than the national and state averages. This list could continue on - we know this data. The needs are screaming. Despite these significant indicators of mental health struggles, we do not do a good job of connecting our young adult population to mental health supports until their need hits a nearly crisis level. And, even then, there seem to be barriers to making a good connection with village based counselors or regional clinicians. Quite often, students do not want to leave the village to get help but they also have issues with the local village based counselor so they feel stuck. We need to be able to bring the regional resources to the villages. We also need to intervene earlier with stronger prevention, before young people feel hopeless or overwhelmed by other negative feelings. We need to teach them about mental health and practice skills that will allow them to navigate sad or stressful situations successfully so they have agency	The three partners in this grant request are in the beginning stages of planning this work. Our goals are 6-fold: 1) Coordinate together so behavioral health supports are easily and seamlessly available to children and young adults in local villages. Using the school counselor at each site as a conduit between regional agencies and schools and the village based counselor as primary contact with the broader community. Developing MOU's and procedures as needed. 2) Determine where there are gaps and overlaps in our services and make necessary adjustments, if possible. 3) Create a protocol for a coordinated crisis response that works in all parts of our region and considers whole communities, not separating school and village. 4) Create coordinated prevention/education campaigns that are responsive to needs as determined by data collected by partner agencies. Initially, regional specialists could guest present in schools and eventually, school staff could take over those presentations so that regional specialists could continue to develop new trainings. 5) Support recruitment and retention of qualified staff so therapists, clinicians, health specialists and school counselors do not have to itinerate. 6) Create professional development that explores cultural ways of understanding wellness and behavioral health. Envisioning staff at Liitfik guiding this for school counselors and new therapists or clinicians.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Best Beginnings	Screen Smart Alaska: Reducing Screen Exposure to Improve Sleep, Health, and Childhood Development	AK	Alaska children are experiencing growing negative impacts to their physical and mental health due to excessive screen time and reliance on digital media. The American Academy of Pediatrics recommends that children ages birth to five be limited to no more than one hour of screen time per day, including television, videos, movies, and video games. However, Alaska data shows many young children exceed this recommendation. In 2017, more than three-quarters of Alaska mothers of three-year-olds reported their child had at least one hour of screen time per day. Recent statewide assessments reinforce these concerns. The 2024 Early Childhood Alaska Needs Assessment identifies improving child wellbeing as a priority, including decreasing screen time and increasing physical activity. Parents surveyed in both the 2020 Alaska Department of Health and Social Services Needs Assessment and the 2024 Early Childhood Public Opinion Survey reported that children are getting less physical activity and spending more time on screens. Excessive screen time is linked to increased risks of obesity, poor sleep, and cognitive, language, and social-emotional delays. 1 in 3 Alaska children are considered overweight or obese, and the 2025 Alaska Physical Activity, Nutrition and Obesity Facts Report shows declining physical fitness trends. While many recommendations focus on older children, healthy screen habits begin in early childhood and are strongly influenced by parent education and family routines.	Best Beginnings will lead a statewide initiative combining research, community engagement, workforce training, and a public awareness campaign to reduce excessive screen exposure in early childhood. The project will focus on prevention and early intervention by equipping caregivers, educators, and health providers with practical tools that support healthy sleep, physical activity, and reduced sedentary behavior. By embedding guidance on healthy media use within existing early childhood systems and rural health delivery networks, the initiative will strengthen provider and family capacity to address early risk factors associated with childhood obesity and chronic disease. The first phase will research screen use among children from birth through elementary school to better understand where and why screens are used, caregiver attitudes toward digital media, barriers to reducing screen time, and culturally meaningful alternatives to screen use. Through statewide surveys, interviews with educators and health providers, and community listening sessions, the project will analyze patterns across Alaska’s geography, seasons, and diverse communities. The second phase will translate findings into practical toolkits for professionals serving young children. Toolkits will summarize research, explain health implications of excessive screen exposure, and provide guidance on discussing screen use with families. Materials will include strategies that reduce screen time while encouraging play, sleep, and family interaction. Toolkits will also include assessment tools to help programs identify ways their services may unintentionally increase screen exposure. Resources will draw from national models while reflecting Alaska’s unique conditions and barriers identified through research. The project will also launch a statewide public awareness campaign focused on realistic behavioral changes families can adopt. Schools may participate through screen free challenges supported by small mini grants and family rewards. Community gatherings will support adoption and local adaptation. To strengthen rural health systems, the project will integrate healthy media counseling into pediatric care, community health aide programs, home visiting services, and education. Training and toolkits will help providers incorporate guidance during well child visits, developmental screenings, and caregiver education, expanding access to preventive health education and coordination between systems.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Bethel Family Clinic	Bethel Family Clinic Rural Access and Mobile Care Transformation Initiative	AK	Residents of rural communities in the Yukon-Kuskokwim Delta face significant barriers to accessing primary care and preventive health services due to geographic isolation, transportation limitations, workforce shortages, and limited local clinical infrastructure. Many patients must travel to Bethel for routine care or delay treatment until conditions worsen, leading to preventable complications, increased emergency utilization, and higher health care costs. Bethel Family Clinic seeks to address these challenges by expanding access to care through a coordinated rural service delivery model that includes a structured Village Travel Program and mobile care capacity. The program would deploy multidisciplinary clinical teams to rural communities on a scheduled basis to provide primary care, chronic disease management, preventive screenings, and behavioral health services. In addition, the initiative will strengthen the infrastructure needed to support reliable rural care delivery, including electronic health record modernization, improved IT systems, and facility resiliency investments such as backup power systems. Together, these efforts will improve access to timely care, support earlier diagnosis and management of chronic conditions, and strengthen the sustainability of health care services for rural and remote communities across the region.	Bethel Family Clinic proposes to expand access to care for rural communities in the Yukon-Kuskokwim Delta through a coordinated rural care delivery model centered on mobile service delivery, technology-enabled care coordination, and strengthened clinical infrastructure. This project is currently in the Concept Formation stage. Bethel Family Clinic has identified the need to expand access to care for rural communities through a Village Travel Program and supporting infrastructure improvements. The proposed approach includes mobile service delivery, telehealth-enabled care coordination, and technology upgrades to support rural care delivery. While the overall concept and approach are defined, key elements such as detailed scope, operational model, staffing plans, partner roles, and implementation timelines are still being developed. Funding at this stage would support refining the project design, coordinating with partners, and preparing a detailed implementation plan. A key component of the approach is the development of a Village Travel Program, in which multidisciplinary care teams travel to rural communities on a scheduled basis to deliver primary care, preventive services, chronic disease management, and behavioral health support. This model will bring care directly to communities that currently face significant barriers to accessing routine services due to distance and transportation limitations. The program will also incorporate telehealth and digital care coordination tools to ensure continuity of care between village visits and to connect patients with additional services when needed. Investments in electronic health record modernization and upgraded IT infrastructure will strengthen data sharing, improve care coordination, and support more efficient clinical operations. In addition, the project will include facility and operational resiliency improvements, such as backup power systems and upgraded technology infrastructure, to ensure reliable care delivery in a remote and environmentally challenging region. Together, these strategies will allow Bethel Family Clinic to expand access to care, strengthen preventive and chronic disease services, and build a more sustainable and resilient rural health care delivery system that better serves communities across the Yukon-Kuskokwim Delta.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area	Deferred or Not Advanced

Betty Eliason Child Care Center	Healthy Foundations through Quality Early Childhood Care	AK	Currently Sitka's demographic age is shifting with a reduction in the ages of 30-50 years. This is due highly in part to a lack of access to affordable child care. Families often find themselves unable to move to Sitka, and families with young children residing here are struggling to remain in Sitka. Businesses are affected as well both economically and with the situation they find their employees facing with the child care crisis. Sitka licensed child care centers currently do not cover the full child care needs of our community. Additionally, families would like to see options in what early learning environments are available for their children, such as a variety of philosophies applied within different programs. Our enrolled families could benefit from an opportunity for parent education and community resource networking which we'd like to share with others not enrolled in our program as well. The foundation for a healthy life starts with the family and our staff would benefit from collaborative training and education and community networking with the parents and guardians of our enrolled children. I have a Montessori certification and would like to apply more Montessori concepts within our program, offering our community another philosophical approach to their childcare options. SEARCH employees need childcare and employee recruitment efforts can be stifled by lack of childcare for potential providers and staff to move to Sitka, or remain in Sitka.	Betty Eliason Child Care Center (BECCC) has a license capacity of 99 children per day, yet we currently only provide care for 32 children per day operating at about 1/3 our license capacity. This is due highly in part to our workforce recruitment, training, and retention. Another factor is that the quality of materials available to children is outdated, and our building is aging and has maintenance needs to be upkeep. My approach to the above community problems is an opportunity to further develop the quality of care our staff can provide through additional staff training, offering adequate prep and sanitization time to their workday, offering fair compensation, and researching potential Health Benefits to offer our staff. I would seek appropriate Montessori training for our staff, giving them the opportunity to expand their skills and certifications and ultimately build their self-esteem and interest in remaining employed in our childcare facility. When adequately staffed, we can expand our infant program, increasing infant care for Sitka and increase our enrollment throughout the facility. BECCC would invest in high quality Montessori learning manipulatives, furniture, and equipment for our infant, toddler, preschool and school-age classrooms. If SEARHC were interested in working on a partnership, we could discuss priority enrollment within our facility to support long-term health care staff for Sitka. We would look at the building's needs and determine if a new roof is necessary now, or later. Additionally, we would improve our north side yard to a state where children could utilize that space safely. I would continue to design our current classrooms in our facility in a way that would allow for an adult education location on site, and we would begin to reach out to local organizations that may want to collaborate with us in providing parent & family education workshops and/or develop a family/caregiver networking system. Building stronger support systems for our staff, parents and caregivers, will improve their ability to nurture solid, healthy foundations for their children; Quality staff will support program development to increase capacity and better meet the child care needs of Sitka; more childcare access means better recruitment for Sitka employers including health care professionals.	\$50,000-\$250,000	Single Community	Sitka (City and Borough)	Deferred or Not Advanced

Big Brothers Big Sisters of Alaska	Strengthening Alaska’s Preventive Behavioral Health Infrastructure: Regional Mentoring Expansion	AK	Healthy Alaskans 2030 identifies improving youth mental health, reducing suicide, and strengthening protective factors as statewide priorities. For healthy development, children need stable, supportive relationships both within and outside their families. Yet approximately half of Alaska’s children and youth have experienced at least one Adverse Childhood Experience (ACE). ACEs, including family instability, substance misuse, abuse, neglect, and economic hardship, are strongly associated with long-term depression, suicide risk, substance use disorders, and poor physical health outcomes. Youth experiencing ACEs are also more likely to report social isolation and lack of consistent adult support, both significant risk factors for worsening mental health. In rural Alaska, access to licensed behavioral health providers is limited and workforce recruitment remains challenging. Expanding access to evidence-based mentoring represents a scalable, community-based opportunity to strengthen protective factors and improve mental health before youth require intensive behavioral health intervention. By increasing the number of youth who have consistent, supportive adult relationships across multiple regions, BBBSAK strengthens preventive behavioral health capacity and advances Alaska’s broader health system transformation goals.	BBBSAK serves children, youth, and young adults ages 6–25 who have experienced ACEs. Youth (“Littles”) are matched with trained, screened, and professionally supported adult volunteers (“Bigs”) in structured one-to-one mentoring relationships focused on strengthening social-emotional skills, resilience, and connectedness. Matches meet multiple times per month and are supported by professional Match Support Specialists (MSS) who monitor child safety, relationship quality, and youth well-being. MSS staff provide ongoing supervision through structured check-ins with youth, volunteers, and parents/guardians. This professional oversight allows for early identification of emerging behavioral health concerns and timely referral to academic, social service, or mental health resources when needed. Monthly group activities for Big/Little matches support relationship building, volunteer retention, and equitable access to positive community experiences. Across Alaska, BBBSAK consistently maintains a waitlist of 100–150 youth, reflecting significant unmet demand for supportive adult relationships among children and young people who have experienced ACEs. Prolonged wait times delay access to critical protective factors that reduce risk for depression, substance use, and social isolation. Two causes for youth wait times include inadequate staffing levels to move youth and volunteers quickly through enrollment and screening processes; and a reduction in volunteerism that makes it challenge to recruit and enroll volunteer Bigs. Through this project, BBBSAK will increase enrollment and match support staffing to reduce wait times, expand volunteer recruitment, improve match support services quality, and ultimately increase the number of youth participants. With full funding, BBBSAK will create 65 new mentoring matches and support 260 existing matches during the funding period, increasing total youth served from approximately 260 annually to approximately 325. This approach increases access to preventive behavioral health services for youth with ACEs and enhances mentoring quality by ensuring matches have access to professional supervision and evidence-based standards.	\$50,000- \$250,000	Multi- Community or Participating in Regional Hub-and- Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Matanuska-Susitna Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Big Brothers Big Sisters of Alaska	Strengthening Rural Preventive Behavioral Health Infrastructure Through AI-Enabled Workflow Redesign	AK	Big Brothers Big Sisters of Alaska (BBBSAK) delivers preventive behavioral health supports to youth experiencing Adverse Childhood Experiences (ACEs). One-to-one mentoring is an evidence-based, CDC-recognized intervention that builds protective factors for youth experiencing adversity. BBBSAK has expanded statewide mentoring in recent years. However, administrative inefficiencies within enrollment, screening, matching, and match support workflows create delays for the people we serve. Inadequate internal systems lead to longer waits for youth before being matched with a mentor; and delays in scheduling match support meetings. These inefficiencies disproportionately affect rural and frontier communities supported through BBBSAK’s centralized infrastructure, where regionally embedded staff rely on Anchorage-based systems to process enrollment, complete background checks, schedule match support, and monitor youth safety. We have achieved incremental gains through internal quality improvement efforts and an increase in volunteer recruitment; however, these improvements were labor-intensive, dependent on staff overextension, and are not sustainable without structural systems redesign. Without modernization, administrative bottlenecks will continue to limit timely access to preventive behavioral health services and increase workforce burnout risk.	BBBSAK proposes a 12-month Preventive Behavioral Health Infrastructure Modernization initiative through implementation of the McBride Method, a nationally recognized BBBS-specific operational redesign model integrating workflow automation and AI-assisted quality oversight within Big Brothers Big Sisters’ Matchforce case management system. Implementation will be led by a former BBBS practitioner who exclusively supports BBBS agencies nationwide, ensuring alignment with National Standards and reducing implementation risk. The project will deploy: • Automated youth and volunteer enrollment workflows • Automated reference and background check reminders • Automated match support scheduling • AI-assisted summaries of match support documentation • AI-enabled early warning flags to identify potential behavioral health or safety concerns • Centralized workflow redesign to eliminate bottlenecks These enhancements will reduce manual administrative burden, accelerate match formation, and strengthen real-time monitoring of youth well-being indicators. Automation is projected to reduce staff processing time by 30–40%, allowing staff, particularly those supporting rural regions, to shift time from paperwork to direct preventive behavioral health support. Because BBBSAK operates a centralized statewide infrastructure supporting regionally embedded staff in rural communities, modernization of core systems directly improves rural access. Reducing delays in match formation ensures faster delivery of protective adult relationships, strengthening Alaska’s preventive behavioral health capacity in alignment with Initiative #6: Spark Technology and Innovation.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Matanuska-Susitna Borough; Sitka (City and Borough); Southeast Fairbanks Census Area	Deferred or Not Advanced

Big Delta Rescue Inc	EMS Led Sustainable Rural Health Care (Copper River, Upper Tanana Valley, Deltana)	AK	Our area of the Alaskan Interior has been struggling to define an EMS solution that can provide a modern level of emergency response with an affordable, sustainable financial plan. Big Delta Rescue is a new community nonprofit located in Delta Junction. On February 17, 2026, Big Delta Rescue’s bid proposal won the City of Delta Junction’s two-year contract to provide ALS ambulance service to the city and the greater Deltana area (REAA 15). Big Delta Rescue’s goal is to establish a long-term community health asset, capable of growing and adapting to our community’s needs. This must involve developing specialized EMS response abilities to ensure the most effective use of personnel and resources.	BDR’s approach to the sustainable transformation of rural health care in the REAA15 region will focus on developing a workforce of cross-trained, multi-disciplinary EMS personnel available to provide Mobile Crisis response, Critical Care, community paramedicine/MIH, on-site telehealth (medical, BH, MAT), mobile MAT, local SUD treatment options, local 24 hour trauma center, transport and/or referral of patients to alternative destinations, and increasing the capacity for appropriate ground transport to the ER in order to reduce the inefficient and wasteful over-reliance on long-distance transports. BDR proposes to facilitate the expansion of a growing network of existing partnerships, identify and recruit new partners, and join other projects as supporting partners in order to implement transformative and sustainable approaches to rural healthcare in Alaska’s super-rural Copper River, Delta Junction, Tok, and surrounding service areas. BDR’s project will facilitate mutually beneficial and sustainable partnerships between willing Emergency Services organizations in the Copper River, Delta Junction, Tok and surrounding service areas. Projects that work for one of these regional services will have a high probability of transformative success and sustainability in other neighboring regions due to their many similarities. Partnerships and expanded collaboration will yield many unique, transformative and sustainable pathways for similarly challenged low-volume rural AK ambulance services to increase efficiency, expand services offered, expand access to care, share the administrative and financial burdens of under-utilized and seldom utilized resources, share technical assistance, reduce waste, increase resilience, and increase the sustainability of EMS and its expanded role in the healthcare system throughout the combined service areas of CREMS, Tok Area EMS, and Big Delta Rescue (Delta Junction) to include the many independent EMS first responder groups including Dry Creek EMS, Dot Lake EMS, Slana EMS, Rural Deltana Volunteer Fire Department, Gakona Volunteer Fire, Chitina EMS, Strelna Volunteer Fire Department and McCarthy Area EMS.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Southeast Fairbanks Census Area	Advance to Implementation Application

Big Delta Rescue Inc	Big Delta Rescue ALS Emergency Response Vehicle	AK	1) Leasing a new, fully equipped ambulance is costly. 2) At the end of a year of leasing, Big Delta Rescue still doesn't own the ambulance. Equipment ownership and eventual repair/replacement must be a major component of a sustainability plan. The lease arrangement, while convenient, requires a capital drain so that funds are no longer available to be invested back into building BDR's security and sustainability. 3) Many 911 calls are for situations that do not require state of the art ALS capabilities in the response team and its equipment. Many do not require transportation and therefore do not result in a billable service. Our community does not have the resources for the initial investment in separate vehicles and equipment suited to different levels of response. Currently, we must use our leased ALS vehicle (and personnel required to provide ALS service) to respond to all community needs. Additionally, Big Delta Rescue would like to be an onsite ambulance presence at many community events without the financial burden of paying for the full team of ALS EMTs and paramedics.	1) An RHTP-granted ambulance featuring the latest advances in workforce safety, patient care, and patient safety will ensure that a modern, reliable ALS response vehicle is permanently available to serve our community. 2) At the end of one year of NOT having to lease an ambulance, an RHTP grant will have freed up \$60,000 in budgeted funds to invest back into an equipment replacement fund, improving Big Delta Rescue's long-term sustainability. 3) An RHTP-granted ambulance would be ready to provide ALS service, 24/7. Existing older ambulances could be dedicated to serve the community in specialty situations that do not require the hundred-mile emergency transport to Fairbanks, such as SUD support and intervention programs and being an on-site presence at community and school events.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Southeast Fairbanks Census Area	Deferred or Not Advanced

bingli	AI-Supported Clinical Intake and Decision Support for Community Health Aides	MA	Many rural Alaska communities rely on village clinics staffed by CHA/Ps as their primary point of care. These frontline providers operate in remote settings where access to physicians and specialists is limited, and consultations with supervising clinicians often occur remotely. While the CHA/P Manual (CHAM) provides structured clinical protocols, documenting patient encounters, navigating guidelines, and preparing consultation notes can be time-consuming and inconsistent. This creates administrative burden for CHA/Ps and can delay consultations with regional care teams. There is an opportunity to improve the efficiency and consistency of clinical intake, documentation, and remote consultation by equipping CHA/Ps and supervising clinicians with modern, AI-supported tools that structure patient information and support protocol-based decision making.	The project will enhance clinical assessment, documentation, and consultation workflows in village clinics by deploying Bingli’s AI-enabled clinical intake and decision-support platform to CHA/Ps and their supervising clinicians. The platform will complement the existing CHAM and the hub-and-spoke care model that connects village clinics with regional care teams. Patient information can be captured through two complementary workflows. In some cases, patients may complete a digital symptom intake assessment prior to visiting the clinic or contacting a CHA/P, allowing key information to be collected before the encounter begins. When intake occurs during the clinical encounter, Bingli’s ambient listening capability can capture and structure relevant information from the conversation between the patient and CHA/P. Both methods generate a structured clinical intake that organizes symptoms, relevant history, and key clinical observations. The platform will incorporate relevant CHAM protocols, helping ensure that the information collected aligns with the protocol-driven workflows already used by CHA/Ps to assess patients and determine appropriate next steps. By mapping patient symptoms and findings to appropriate protocol pathways, the system helps CHA/Ps quickly identify recommended assessments, treatments, or consultation requirements. As information is captured, the system generates structured clinical summaries and documentation, reducing administrative burden on CHA/Ps and improving the clarity of patient records. These summaries are also available in real time to supervising physicians and regional care teams, giving them remote visibility into cases being managed in village clinics and enabling faster, more efficient consultations when needed. Implementation will begin with a preliminary deployment in a small number of village clinics, working in partnership with Tribal Health Organizations (THOs) and regional health systems. Participating CHA/Ps and supervising clinicians will receive onboarding, training, and workflow support. Lessons learned during the pilot phase will inform broader expansion across additional communities. By combining AI-enabled intake, CHAM-informed decision support, and improved consultation workflows, the project strengthens Alaska’s frontline rural workforce while improving care coordination across the state’s distributed health system.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

bingli	Alaska AI-Enabled Nurse Triage & Telehealth Access Network	MA	Many residents of Alaska’s rural, remote, and frontier communities face significant barriers to accessing timely healthcare. Geographic isolation, severe weather, limited transportation, and persistent healthcare workforce shortages make it difficult for patients to obtain prompt clinical guidance when new symptoms arise. As a result, individuals often delay seeking care, rely on local emergency departments for non-emergent conditions, or require costly medical transport to distant facilities for issues that could be safely addressed through primary care or telehealth. While some healthcare organizations operate NALs or telehealth services, these systems often function separately. NALs can provide guidance but typically cannot directly connect patients to treatment, requiring patients to schedule a separate telehealth or clinic visit, causing delays, increasing the burden on healthcare resources, and leading to unnecessary escalation of care. Additionally, legacy nurse triage processes that rely on unstructured information and lack clinical decision support are time-consuming and inconsistent. This project offers an opportunity to improve rural healthcare access by integrating AI-enabled nurse triage and telehealth services into a single coordinated system. By enabling patients to move seamlessly from triage to clinical evaluation when needed, the project helps ensure patients receive the right care when they need it while making better use of limited healthcare resources.	The Alaska AI-Enabled Nurse Triage and Telehealth Access Network would be implemented as a rural-focused care access service designed and convened by the State of Alaska, with Bingli providing the enabling technology that supports clinical intake, triage, care navigation, and telehealth clinical decision support. Rather than creating a new statewide call center, the project would focus on designing and launching a coordinated nurse triage and telehealth service specifically for rural, remote, and frontier populations where access barriers are most significant. RHTP funding would support the design, implementation, and early operational scale of the program, including deployment of the enabling technology platform. Under this model, the State of Alaska Department of Health (DoH) would assemble the operational components of the service by partnering with organizations that already provide clinical capabilities. This may include aligning the program with Alaska’s Medicaid program, which covers a large share of rural residents and has strong incentives to reduce avoidable emergency utilization and medical transport costs. The state could also partner with a large Alaskan health system with existing telehealth services, enabling rapid deployment of clinical staffing and infrastructure. Bingli would provide the AI-enabled intake, triage, and clinical decision-support platform used by both the NAL and telehealth clinicians. The system structures patient-reported symptoms, presents clinical summaries to triage nurses, and supports evidence-based care routing. When clinical evaluation is required, patients can be seamlessly transferred to a telehealth provider who will receive structured clinical information from the triage encounter, differential diagnoses, and diagnostic and treatment recommendations. The service would initially focus on rural Medicaid populations and high-need frontier communities, ensuring that RHTP investments deliver the greatest impact where access challenges are most severe. Over time, additional payers and health systems could opt into the service through a subscription or participation model, allowing the network to expand while supporting long-term financial sustainability. This approach allows Alaska to rapidly launch a rural NAL and telehealth service that leverages existing clinical partners while building a sustainable model for long-term operation.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

bingli	Alaska Rural Interoperability Gateway	MA	Rural clinics and health facilities in Alaska often face barriers to participating in interoperable health information exchange due to limited technical infrastructure, small IT teams, and the high cost of building and maintaining HL7 or FHIR integrations. As a result, many providers rely on manual data-sharing methods such as fax or scanned documents, which slows care coordination and limits the ability of regional providers to access complete patient information. This creates an opportunity to strengthen care coordination across Alaska’s geographically dispersed health system by lowering the technical barriers to interoperability. Enabling rural clinics, Tribal health facilities, and critical access hospitals to more easily share structured clinical information with the statewide HIE can improve continuity of care, reduce duplication of services, and support more efficient referrals and telehealth consultations across the state’s rural care network.	This project is designed to expand rural participation in Alaska’s statewide HIE by deploying Bingli’s Prism AI platform as a shared rural interoperability gateway for clinics and health facilities. The project will focus on communities where limited technical infrastructure and workforce capacity currently restrict participation in interoperable health information systems and coordinated care initiatives. This approach supports Alaska’s goal of advancing tech-enabled health infrastructure that improves data sharing, care coordination, and access to care across rural and frontier communities. Ideal participants include rural clinics, Tribal health facilities, and critical access hospitals that maintain electronic clinical records but lack the technical resources to implement and maintain HL7 or FHIR interfaces required to connect with the statewide HIE. These organizations often rely on manual data sharing methods such as fax, scanned documents, or limited EHR exports, which creates barriers to care coordination across Alaska’s distributed health system. A phased implementation will begin with a small group of rural clinics and facilities. During this phase, Bingli will configure the Prism AI platform to ingest clinical documents and patient data from participating clinics, automatically structure and code the information, and securely transmit it to the statewide HIE and other authorized providers using standardized APIs. Prism AI can also be configured to serve as a user-facing access point, allowing rural providers to view relevant patient information available through the HIE even if their local systems lack direct integration capabilities. The system architecture is designed for efficient statewide expansion. Rather than establishing separate integrations between each clinic and the HIE, the project will implement a single secure two-way connection between Prism and the HIE. Multiple rural facilities can then be onboarded within the same Prism environment using organization-specific access controls. This shared gateway model significantly reduces technical complexity while enabling rapid onboarding of clinics. Participating facilities will receive onboarding, training, and centralized support to integrate Prism into existing workflows. As additional clinics are added, the shared infrastructure model will allow the network to scale efficiently while maintaining consistent interoperability and support services across Alaska’s rural health system.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Birchwood Behavioral Health	Bridge to Wholeness Transitional Living Program for Young Adults	AK	Alaska lacks structured transitional residential programs for young adults ages 18–25 aging out of youth residential treatment or foster care. Without transitional support, many experience homelessness, relapse, justice involvement, or psychiatric hospitalization. This gap creates significant costs for Medicaid, hospitals, shelters, and public safety systems. A structured transitional living model provides housing stability, clinical continuity, life-skills training, workforce development, and coordinated care management. The opportunity is to reduce system cycling while building long-term self-sufficiency for high-risk young adults.	Bridge to Wholeness Transitional Living Program will establish a licensed adult residential behavioral health program aligned with Alaska Adult Mental Health Residential Services Level 1 and 2 standards and Medicaid billing requirements. Core components include: • 12–16 bed supervised residential setting • Integrated behavioral health services • Individualized treatment planning • Life skills curriculum (budgeting, cooking, employment readiness) • Educational and workforce pathway development • Peer mentorship • Case management and discharge planning • Telehealth integration for rural continuity The program will align with: • Alaska Administrative Code Chapter 50 and 135 • Medicaid documentation and service authorization standards • CARF accreditation standards • Trauma-informed and faith-integrated care practices RHTP funding will support capital preparation, workforce development, infrastructure buildout, and technology integration necessary to launch and stabilize the program.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Anchorage (Municipality)	Deferred or Not Advanced

Birchwood Camp	Challenge Accepted: Empowering at-risk Youth through Teamwork, Leadership, and Supportive Community	AK	Young people are facing larger and more serious challenges than ever before with fewer spaces to develop skills to overcome challenges in a safe and healthy way. Community is fractured, individuals are hurting, and youth lack space for safe and structured growth. A low ropes challenge course offers a unique, holistic approach to preventative mental healthcare.. Through structured physical challenges and team-based activities, participants develop mental resilience, self-confidence, critical thinking, leadership skills, and positive teamwork experiences in an outdoor, nature-centered environment. For individuals and families facing adversity, the course can be healing — a place where personal growth happens through movement, trust, and shared experience. The collaborative nature of the activities nurtures emotional well-being, problem-solving, communication, and teamwork. As a preventative healthcare measure, this course encourages the five Leading Causes of Life: Agency, Coherence, Connection, Intergenerativity/Blessing, and Hope (Gunderson and Pray, 2007). As a community space, the low ropes course brings together youth, families, schools, behavioral healthcare providers, and partner organizations under a common goal: to challenge individuals in a healthy way, to support one another, and to grow together. For youth in particular, these experiences build the foundational confidence and preventative mental healthcare that carries into classrooms, homes, and communities.	Birchwood's approach to this opportunity is rooted in a commitment to providing a safe, impactful, and sustainably managed challenge course that serves as a preventative mental healthcare model for holistic health and development. Our approach to providing an improved experience on our challenge course is threefold: 1. Physical Improvements to the Challenge Course: The foundation of this project begins with assessing and improving the physical condition of the low ropes challenge course. We will conduct a thorough inspection of all course elements to identify areas in need of repair, replacement, or enhancement. Volunteers, community partners, qualified inspectors and vendors will work collaboratively to bring the course up to the highest safety and usability standards through both fixed and portable elements. These improvements ensure that every participant — regardless of age or ability — can engage with the course in a secure and welcoming environment. 2. Leadership and Facilitation Training: A well-maintained course is only as effective as the people who lead it. Birchwood Camp will conduct a comprehensive leadership and facilitation training for local volunteers, staff, behavioral healthcare providers, and community partners. Working alongside a qualified trainer, participants will develop the skills needed to guide groups through challenge course activities with intention, safety, and a trauma-informed lens. This training builds lasting local capacity, ensuring the course continues to serve the community long after the project is complete. 3. Safety Renewal for the Course In addition to physical improvements, Birchwood will pursue formal safety renewal for the course, ensuring all elements and procedures meet current industry standards. This process includes professional inspection, documentation, and certification that affirms the course's readiness for community use. Regular safety renewal reflects Birchwood's ongoing commitment to responsible stewardship of this community resource. Blood Bank of Alaska Inc.	Anchorage and Fairbanks Blood Transport Vehicles	AK	Alaska’s geography, weather conditions, and transportation constraints create unique challenges for maintaining a stable blood supply. Hospitals rely on rapid and carefully controlled transport of blood products between collection, testing, storage, and clinical facilities. Currently, blood transport in Anchorage and Fairbanks relies heavily on third-party courier services and ad hoc transportation solutions. These arrangements create several challenges: • Limited availability during nights, weekends, and emergencies • High and increasing courier costs • Reduced flexibility during urgent or weather-related transport disruptions • Lack of dedicated vehicles equipped for proper biological transport • In Fairbanks, no organizational vehicle exists to support airport or hospital transport These limitations create inefficiencies and potential delays in blood distribution that can impact patient care. The lack of dedicated vehicles particularly limits the Fairbanks operation’s ability to independently manage transport between the airport, hospitals, and other partners that serve the Interior region. At the same time, the growing need for timely transfusion services—particularly for trauma, oncology, and surgical care—creates an opportunity to strengthen the logistical backbone of Alaska’s blood system.	This project will purchase two dedicated transport vehicles to support blood distribution operations in Anchorage and Fairbanks. The vehicles will be used to: • Transport blood products between the airport and processing facilities • Deliver blood components to hospitals and healthcare partners • Retrieve blood donations and supplies when needed • Respond rapidly to urgent hospital requests • Reduce dependence on third-party courier services In Fairbanks, the new vehicle will provide the first dedicated transportation resource for the Blood Bank of Alaska’s Interior operations. It will enable direct transport between the airport and local hospitals and allow staff to manage urgent deliveries more efficiently. Vehicles will be equipped and operated according to established blood transport standards, ensuring proper temperature control and chain-of-custody procedures. This project strengthens a critical logistical component of Alaska’s blood supply system and enhances the organization’s ability to support hospitals that serve rural patients.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Blood Bank of Alaska Inc.	Equipment Upgrades, ACP 215 Cell Washer	AK	The Blood Bank of Alaska currently faces several challenges that this project will address. 1. Imminent Equipment Sunset Our existing legacy cell washer will reach its sunset date in June 2026. After this date, manufacturer support and parts availability will be limited, creating operational risk. 2. Limited Redundancy The blood bank currently relies on a single ACP 215 cell washer purchased more than ten years ago. Operating with only one unit increases vulnerability to equipment failure, maintenance downtime, or unexpected surges in demand. 3. Increasing Demand for Specialized Blood Products Advances in clinical care, including neonatal medicine, oncology treatments, and transplant support, have increased the need for specialized blood products such as washed red blood cells. 4. Statewide Responsibility Because many healthcare facilities in Alaska do not have the capacity to perform cell washing themselves, the Blood Bank of Alaska must maintain reliable centralized production for the entire state. While these challenges pose risks, they also present an opportunity to strengthen statewide blood processing infrastructure and ensure that specialized transfusion services remain available for years to come.	To address these challenges, the Blood Bank of Alaska will purchase and implement a new Haemonetics ACP 215 Cell Washer. This approach includes several key components: Equipment Acquisition Funding will be used to purchase a new ACP 215 cell washer, including installation and validation. Operational Integration Laboratory staff are already trained and experienced in operating ACP 215 systems, allowing the new unit to be integrated immediately into existing workflows. Quality and Compliance The new device will be validated according to regulatory and accreditation standards, ensuring continued compliance with transfusion medicine best practices. Statewide Distribution Washed units produced using this equipment will continue to be distributed through the Blood Bank of Alaska’s existing statewide logistics network, supporting hospitals and healthcare providers across Alaska. This strategy leverages existing expertise, infrastructure, and distribution systems, making it a highly efficient and sustainable investment.	\$50,000-\$250,000	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Blood Bank of Alaska Inc.	Equipment Upgrades, Blood Storage Units, Cold Chain	AK	The Blood Bank of Alaska seeks funding through the Rural Health Transformation Project to purchase three medical-grade blood storage refrigerators to be placed at three strategic locations: two in Anchorage and one in Wasilla. These units will store transfusable blood products and ensure that the organization can maintain safe, compliant, and accessible blood supplies across Southcentral Alaska.	Reliable storage of blood and blood components is essential to maintaining a functional transfusion network for hospitals and emergency medical services throughout the region. The requested refrigerators will provide dedicated, temperature-controlled storage for red blood cells, plasma, and other transfusable products in accordance with U.S. Food and Drug Administration (FDA) guidelines for blood product storage. Medical-grade refrigerators provide continuous temperature monitoring, alarm systems, and controlled environments necessary to maintain product integrity and patient safety.	Under \$50,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced
Blood Bank of Alaska Inc.	Equipment Upgrades, Platelet Storage	AK	The Blood Bank of Alaska is seeking funding through the Rural Health Transformation Project to purchase two PC4200 platelet incubators to replace aging equipment that is no longer supported by the manufacturer. These incubators are essential for maintaining the proper storage and monitoring conditions required for platelet products used in patient care. Replacing the current units will ensure the Blood Bank of Alaska can continue safely collecting, processing, and distributing platelet and plasma products to hospital partners across the state. These products are critical to trauma care, surgery, cancer treatment, and other lifesaving medical interventions. In addition, maintaining reliable platelet incubation capacity strengthens Alaska’s emergency preparedness infrastructure by ensuring a stable and responsive blood supply during disasters, mass casualty events, and other public health emergencies. Investment in this equipment will support the sustainability of Alaska’s only statewide blood provider and help ensure healthy, resilient communities throughout the state.	Reliable storage of plasma and platelets is essential to maintaining a. Functional transfusion network for hospitals and emergency services throughout the state. The requested incubators will provide dedicated, temperature-controlled storage for plasma and platelets in accordance with U.S. Food and Drug Administration (FDA) guidelines for blood product storage. These incubators provide continuous temperature monitoring, alarm systems, and controlled environments necessary to maintain product integrity and patient safety. Blood Bank of Alaska Inc.	South Anchorage and Fairbanks Facility Upgrades	AK	Alaska faces unique challenges in maintaining a resilient blood supply due to geographic isolation, severe weather conditions, and limited transportation infrastructure. Two BBA facilities critical to statewide blood collection currently face infrastructure limitations: South Anchorage Blood Center: The facility experiences high donor volume but has aging flooring, outdated furnishings, and lighting systems that no longer meet the expectations of modern donor care environments. An outdated physical environment can negatively impact donor comfort and repeat donation rates. Fairbanks Blood Center: The Fairbanks facility serves Interior Alaska and plays a key role in collecting blood products for hospitals throughout northern and rural Alaska. However: • Exterior signage is outdated and no longer fully functional due to lighting components that cannot be replaced. • Lack of visible roadway signage limits community awareness of the facility. • Parking lot lighting is inadequate, creating potential safety concerns for donors and staff during long winter darkness. These limitations reduce the visibility, accessibility, and safety of the donation center and may discourage donor participation. Addressing these infrastructure gaps presents an opportunity to improve donor engagement, strengthen the blood supply, and enhance health care access for rural communities dependent on these blood products.	The Blood Bank of Alaska will implement targeted capital improvements at both facilities to address safety, accessibility, and donor experience. South Anchorage Blood Center Improvements • Replace aging flooring in donor areas • Upgrade donor seating and furniture • Install energy-efficient lighting • Update branding elements and interior environment to create a welcoming, modern donation experience Fairbanks Blood Center Improvements • Replace the exterior building sign with energy-efficient illuminated signage • Install visible roadway signage directing donors to the facility • Install upgraded parking lot lighting to improve safety and accessibility Project activities will include: 1. Facility design and vendor selection 2. Procurement of materials and services 3. Construction and Installation All improvements will be implemented with minimal disruption to blood collection operations.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough	Deferred or Not Advanced

Blood Bank of Alaska Inc.	Statewide Collections, Apheresis Trima Kits	AK	The increasing cost of apheresis collection kits has created a growing financial strain on the Blood Bank of Alaska. As a nonprofit organization responsible for maintaining the state’s blood supply, the Blood Bank must absorb rising procurement costs while continuing to provide reliable access to blood products for hospitals and patients throughout Alaska. External funding is necessary to help offset these escalating costs and to support the purchase of apheresis kits in sufficient quantities to establish and maintain a 3–4 month emergency preparedness inventory at all times. Grant funding will allow the Blood Bank of Alaska to purchase kits in bulk, helping stabilize costs while ensuring a consistent supply of the materials required to collect plasma and platelets. Investing in this inventory will also support the Rural Health Transformation Program’s goal of creating healthier communities through improved access to essential health services. By strengthening the state’s blood collection capacity, this project helps ensure that hospitals—particularly those serving rural and remote communities—have timely access to life-saving blood products without relying on costly or delayed imports from outside Alaska.	The Blood Bank of Alaska proposes to strengthen the stability and affordability of the state’s blood supply by increasing the inventory of Trima apheresis collection kits used to collect plasma, platelets, and red blood cells. These kits are required for each apheresis procedure and are essential to maintaining the statewide availability of blood products used in trauma care, cancer treatment, emergency surgery, and chronic disease management. Since 2018, the cost of Trima kits has increased by approximately 73%, with additional annual price increases of 5–10% due to global supply chain pressures, tariffs, and shipping costs associated with transporting medical supplies to Alaska. These rising costs create significant financial strain and increase the risk of supply interruptions in a state that already faces geographic and logistical challenges. To address these challenges, the Blood Bank of Alaska will implement a strategic bulk purchasing and inventory stabilization approach. Grant funding will allow the organization to purchase a larger quantity of Trima apheresis kits at one time, enabling the Blood Bank to: • Reduce the per-unit cost of kits through bulk purchasing agreements and reduced frequency of smaller orders. • Offset annual cost increases by purchasing inventory before anticipated price adjustments. • Decrease shipping and handling expenses by consolidating orders and reducing the number of deliveries required throughout the year. • Build a 3–4 month supply reserve of apheresis kits to protect operations from supply chain disruptions. This approach will ensure the Blood Bank of Alaska can maintain continuous apheresis collection capacity, which is essential to producing the more than 6,000 blood component units distributed annually to hospitals across the state. By stabilizing the supply of collection kits, the Blood Bank will also expand healthcare access statewide, particularly for rural and remote communities. Alaska’s healthcare system relies heavily on locally collected blood products because importing blood from outside the state can be expensive, time-consuming, and unreliable due to weather and transportation limitations. Maintaining a stable supply of Trima kits will allow the Blood Bank of Alaska to continue collecting and distributing blood components locally, ensuring that hospitals throughout Alaska—including those serving rural communities—have reliable access to life-saving transfusion products when they are needed.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Blood Bank of Alaska Inc.	Statewide Collections, Whole Blood Bag Collections	AK	The increasing costs of whole blood bag sets has created a growing financial strain on BBA. As a nonprofit organization responsible for maintaining the state’s blood supply, BBA must absorb rising procurement costs while continuing to provide reliable access to blood products for hospitals and patients throughout Alaska. External funding is necessary to help offset these escalating costs and to support the purchase of whole blood bag sets in sufficient quantities to establish and maintain a 3-4 month emergency preparedness inventory at all times. Grant funding will allow BBA to purchase these bag sets in bulk, helping stabilize costs while ensuring a consistent supply of the materials required to collect whole blood. Investing in this inventory will also support RHTP’s goal of creating healthier communities through improved access to essential health services. My strengthening the state’s blood collection capacitor, this project helps ensure that hospitals - particularly those serving rural and remote communities, have timely access to life-saving blood products utility relying on costly or delayed imports from outside Alaska.	BBA proposes to strengthen the stability and affordability of the state’s blood supply by increasing the inventory of whole blood bag sets used to collect whole blood. These bags are essential for each donation at all of our centers, including mobiles, and are essential to maintaining the state wide availability of blood products used in trauma care, child birthing and emergency surgery. Since 2018, BBA has increased 5%, with additional price increases to continue. Supply chain pressures, tariffs, and shipping costs associated with transporting medical supplies to Alaska has impacted these increases, too. These rising costs create significant financial strain and increase the risk of supply interruptions in a state that already faces geographic and logistical challenges. To address these challenges, BBA will implement a strategic bulk purchasing and inventory stabilization approach. Grant funding will allow BBA to purchase a larger quantity of blood bags at one time, enabling BBA to: • Reduce the per-unit cost of bags through bulk purchasing agreements and reduced frequency of smaller orders. • Offset annual cost increases by purchasing inventory before anticipated price adjustments. • Decrease shipping and handling expenses by consolidating orders and reducing the number of deliveries required throughout the year. • Build a 3-4 month supply reserve of bag sets to protect operations from supply chain disruptions. This approach will ensure that BBA will maintain continuous whole blood bag collection capacity, which is essential to producing the more than 25,000 blood units distributed annually to hospitals across the state. By stabilizing the supply of these bag sets, BBA will also expand healthcare access statewide, particularly for rural and remote communities. Alaska’s healthcare system relies heavily on locally collected blood products because importing blood from outside the state can be expensive, time-consuming, and unreliable due to weather and transportation limitations. Maintaining a stable supply of blood bags will allow BBA to continue collecting and distributing blood components locally, ensuring that hospitals throughout Alaska – including those serving rural communities, have reliable access to lifesaving transfusable products when they are needed.	\$250K-\$1M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Blue Phoenix Dental LLC	Aleutian Oral Health Transformation	AK	Aleutian residents face barriers from the extreme cost and unpredictability of air travel in the region and the lack of local healthcare providers. The costs of travel and temporary housing can easily exceed \$3,000 for a single dental emergency. Expanding clinical operations and providing care, prevention, and education directly within small communities will substantially reduce costs to patients and other 3rd party payers, such as tribal organizations or Alaska State Medicaid, and reduce the rates of emergency extractions and preventable disease. Improving local training and clinical operations will empower residents to make a positive impact on their community.	Our approach is a "Hub and Spoke" model centered in Unalaska/Dutch Harbor. The Hub: We will renovate existing clinic space to include a high-tech training operatory and simulation station. In partnership with the ANTHC ADTEP program, we will provide clinical rotations for students who commit to serving the region. Moreover, we can assist in housing with existing resources and we will be able to expand that opportunity through the time-limited housing assistance offered through the RHTP program. Housing in frontier Alaska is one of the most difficult barriers to attracting providers to the region. Hygienists and Dentists have already expressed interest in working with Aleutian Family Dentistry and this program would allow them the opportunity to serve in these communities with the mentorship of experienced staff. The Spoke: We will purchase and deploy portable dental suites and AI-enhanced intraoral cameras for teledentistry. This team will travel to villages and schools to provide preventive care, screenings, and triage, overseen by the Dutch Harbor clinical lead. According to the American Dental Association, this type of outreach can reduce emergency care by over 50%.	\$250K-\$1M	Dental	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Deferred or Not Advanced

Blueberry Pediatrics	Statewide Pediatric Access Network for Alaska Medicaid Children	CA	Access to pediatric care remains a persistent challenge across Alaska. Many families live in communities off the road system, where accessing pediatric care can require expensive and disruptive medical travel. Workforce shortages, geographic barriers, weather-related travel disruptions, and limited pediatric specialty availability often require families to travel long distances or rely on emergency departments for conditions that could otherwise be managed earlier or at home. As a result, many pediatric ED visits occur because families cannot quickly reach a pediatrician to evaluate symptoms, determine whether care can be managed at home, or initiate treatment early. This contributes to unnecessary ED utilization, higher system costs, and additional strain on rural health facilities that often operate with limited workforce capacity. This project addresses that gap by establishing a statewide pediatric access layer that complements Alaska’s existing healthcare infrastructure and supports the work of local clinics, community health centers, tribal health organizations, and rural hospitals. This is done through the combined benefit of 24/7 on-demand access to board-certified pediatricians via video, call, or text, supported by the at-home medical kit for higher diagnostic capability. The result is earlier treatment of common pediatric conditions, reduced reliance on EDs, and improved access to pediatric expertise for children across Alaska regardless of location.	Blueberry Pediatrics proposes to establish a statewide pediatric access network that allows every Alaska Medicaid child with internet or cellular connectivity to reach a pediatrician when they are sick, regardless of location, bandwidth, or internet connection speed. Families who enroll in Blueberry receive access to board-certified pediatricians available 24/7 on demand. Blueberry provides episodic pediatric care when a child becomes sick or a caregiver has an urgent concern. Pediatricians evaluate symptoms, provide treatment guidance, prescribe medications when appropriate, and help families determine whether a condition can be safely managed at home or requires in-person care. Participating families receive a pediatric diagnostic kit that includes a wireless digital otoscope, pulse oximeter, and infrared thermometer. These tools allow physicians to evaluate common childhood illnesses remotely with significantly greater clinical confidence than traditional telehealth and enable pediatricians to diagnose and treat conditions that would otherwise require in-person visits. Diagnostic kits will also be deployed to community health centers and other local access points to ensure families can enroll and access pediatric care immediately, while also providing rural providers additional pediatric expertise when caring for children in their communities. Blueberry coordinates care with local providers whenever in-person evaluation or follow-up care is needed. After each encounter, a visit summary is shared with the child’s primary care provider when one is identified, helping maintain continuity of care and supporting the child’s existing medical home. The program can be deployed rapidly following project approval. Blueberry expects to be fully licensed to operate in Alaska by March 16, enabling statewide implementation. Blueberry will collaborate with the State of Alaska to evaluate program impact using Medicaid claims data, including analysis of emergency department utilization, urgent care use, and other avoidable pediatric cost drivers. Findings will help inform long-term strategies to expand pediatric access while strengthening Alaska’s rural health system.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Boys & Girls Clubs of the Kenai Peninsula	Growing Pathways to Health Careers	AK	Across the Kenai Peninsula, many youth—especially in rural communities—have limited access to programs that support lifelong health, career awareness, and workforce development. At the same time, our region faces growing health disparities and workforce shortages in healthcare, skilled trades, and other professions critical to sustaining rural health systems. This project will expand the Boys & Girls Clubs of the Kenai Peninsula’s (BGCKP) existing youth development programs to build a foundation of lifelong health while introducing youth to careers that strengthen community wellbeing. Through Growing Pathways to Health Careers, youth will participate in hands-on activities such as gardening, harvesting, and food preservation, building practical life skills while learning about nutrition, sustainability, and healthy living. Programming will promote physical activity, nutrition education, and well-being to strengthen mental health resilience and encourage prevention-focused healthy lifestyles. To expand career awareness, BGCKP will integrate Transfr’s virtual reality–based learning, allowing youth to explore careers in healthcare, skilled trades, and environmental fields that support rural health systems. Strong partnerships with schools, Tribal organizations, local colleges, and community partners will ensure programming reaches underserved youth while creating a continuum of learning that connects healthy living, career pathways, and community health across the Peninsula.	BGCKP will implement Growing Pathways to Health Careers through a phased approach that builds foundational knowledge about healthy living while gradually introducing youth to career pathways that support community health. Programming will begin with hands-on experiences that help youth understand the connection between food systems, nutrition, environmental stewardship, and overall wellbeing. Youth will participate in activities such as gardening, harvesting, and food preservation while learning about sustainable practices and healthy food choices. These experiences build practical life skills while helping youth understand how personal health choices impact families and communities across the Kenai Peninsula. As the program becomes established, BGCKP will expand learning opportunities by integrating Transfr’s virtual reality career exploration platform. Through immersive virtual experiences, youth will explore careers in healthcare, skilled trades, environmental stewardship, and other fields that support rural health systems. This phased approach allows youth to first develop an understanding of healthy living before discovering how those concepts translate into education and career pathways. The program will strengthen prevention-focused youth development by expanding opportunities that address the root causes of chronic disease and promote lifelong wellness. Youth will participate in physical activity opportunities, including fitness challenges from National Boys & Girls Club of America evidence-based programs, while receiving nutrition education and engaging in well-being learning that strengthens mental health resilience and positive decision-making. BGCKP will prioritize youth in communities where access to health education, career exploration, and wellness programming is limited. Program spaces will be adapted for dual-purpose use supporting recreation, wellness activities, and itinerant programming to expand access. Strong partnerships with the Kenai Peninsula Borough School District, Kenaitze Indian Tribe, Salamatof Native Association, local colleges, trade schools, and community organizations will help ensure programming reflects community priorities and strengthens sustainability. Together, these partnerships will connect healthy living, career awareness, and community wellbeing for youth across the Kenai Peninsula.	\$50,000-\$250,000	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Brave Heart Maternity Home	Brave Heart Maternity Home - Strengthening Alaska's Healthy Beginnings	AK	Alaska has no housing program for unhoused pregnant women with complex behavioral health challenges. Despite high rates of substance use during pregnancy, inadequate prenatal care, and Neonatal Abstinence Syndrome (NAS) and Fetal Alcohol Spectrum Disorder (FASD), there is no coordinated maternal system that keeps mothers and infants together while addressing medical needs and social determinants of health. Unhoused pregnant women often cycle through shelters and unsafe settings, disrupting prenatal care and increasing risk. Many are not identified until presenting in crisis settings such as the emergency room (ER), labor and delivery, or child welfare systems. Fragmented services limit early identification, coordinated discharge planning, and prevention-focused care. Systems are largely crisis-driven rather than integrated and preventive, and are not structured to address housing instability, maternal behavioral health, substance use recovery, and infant stabilization simultaneously while preserving family unity when safe. As a result, families cycle through emergency care, Neonatal Intensive Care Unit (NICU) admissions, and child welfare involvement, increasing public costs and worsening outcomes. Brave Heart Maternity Home was founded in September 2024 to create a coordinated maternal stabilization model that bridges housing, maternal health, and recovery supports, intervening early to improve outcomes, preserve families, and reduce reliance on high-cost systems.	Brave Heart will implement a three-phase approach to building maternal-child stabilization infrastructure in Alaska. Brave Heart's model was shaped through conversations and site visits with established maternity homes and infant care programs in the Lower 48, drawing from what works while adapting those approaches to fit Alaska's unique geography and systems. Phase I (July 2026) – Maternal Stabilization: Establish trauma-informed, long-term maternity housing providing prenatal, postpartum, and wraparound stabilization supports for pregnant and postpartum women experiencing substance use disorder, trauma, domestic violence, and housing instability. The program combines safe housing with coordinated prenatal care navigation, behavioral health support, recovery services, and parenting preparation in a family-centered environment that prioritizes keeping mothers and infants together when safe. Brave Heart will function as a coordination hub, strengthening care transitions between rural referral partners, tribal health organizations, medical providers, behavioral health systems, and child welfare agencies. Coordinated discharge planning, clear referral pathways, and travel coordination for rural participants will reduce geographic barriers and support consistent engagement in prenatal and behavioral health care. Phase II (2028) – Early Childhood Care: Expand to include a trauma-informed early childhood daycare that supports healthy child development while enabling maternal employment, education, and continued treatment engagement, strengthening long-term family stability and workforce participation. Phase III (2030) – Infant Recovery Care Center: Develop a family-centered, non-medical Infant Recovery Care Center serving substance-exposed infants and caregiver-infant dyads following hospital discharge, filling Alaska's non-medical stabilization gap during a critical transition period. Through this phased, scalable model, Brave Heart will build a comprehensive maternal-child stabilization continuum that shifts care from crisis response to prevention, improves birth outcomes, preserves families when safe, and reduces reliance on high-cost medical and child welfare systems.	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Matanuska-Susitna Borough	Advance to Implementation Application

Braveheart Volunteers	Bridge of Hearts - a coordinated community grief support program	AK	Alaska has some of the highest rates of traumatic loss in the United States, including accidental injury, alcohol-related illness, and roughly 80% of young Alaskans have unmet mental health needs. Alaska Native people experience suicide rates 91% higher than the general population. These realities mean that many Alaska communities experience frequent trauma, creating widespread unaddressed grief. A single traumatic death affects dozens of people. In small rural communities, repeated exposure to loss can result in “multiple loss exposure,” where individuals experience numerous deaths within their social networks. This increases the risk of prolonged grief, depression, and social isolation across all ages. This is especially relevant in Sitka, where geographic isolation, limited behavioral health resources, and workforce shortages make it difficult to access grief support services. Sitka is uniquely positioned to pilot a coordinated community grief support program due to its strong traditions of collective care, including Alaska Native cultural values that emphasize shared responsibility during times of loss. Because BHV is trusted in the community with strong partnerships and a reputation for compassionate, reliable care, it is positioned to lead a program that specializes in grief, and establishes clear pathways to support during times of loss. BHV aims to create a framework that can be adapted and shared with other rural Alaska communities facing similar challenges.	BHV will address this need through a structured process to develop a community grief support program for Sitka. The planning phase will focus on designing the framework, partnership strengthening, and development of a work plan for the Grief Support Coordinator role. BHV mission is to champion people who are experiencing loneliness, loss, and end of life. Over the last 25 years our non profit has built a robust volunteer network, with 60 volunteers who serve over 100 Sitkans annually. We are a solid, trusted volunteer organization with a reputation for reliability by serving our community members at a time when they are most vulnerable. BHV will grow a network of partners, including SEARHC, the Sitka School District, Sitka Counseling, Sitka Tribe of Alaska, Youth Advocates, and other community organizations to identify current gaps in grief support services and define clear referral pathways between health care providers and community-based support programs. Creating a strong local model will allow for adaptation into other rural Alaska communities. As part of this planning process, BHV will conduct a community needs assessment survey to connect with and gather input from our local residents, caregivers, volunteers, educators, and health care partners in order to better understand where our community needs are greatest when it comes to grief support services, and barriers to care. Assessment will intentionally include voices from our local elders to ensure the program reflects cultural traditions. Feedback from the survey will allow for the best possible design of volunteer training, youth grief programming, caregiver support resources, and community education efforts. As part of phase one, we will develop the work plan for the Grief Support Coordinator who will organize volunteer engagement, coordinate referrals, raise the profile of grief and its impact in the community, and serve as a bridge between community members and available services through SEARHC. Planning will include development of volunteer training materials, identification of a grief expert who can provide training to professionals and laymen, coordination with schools, grief education, support group meetings, and program guidelines to support compassionate presence and peer support. Finally, the planning phase will establish measurable program goals, evaluation metrics, and sustainability strategies to guide long-term implementation.	\$50,000-\$250,000	Single Community	Sitka (City and Borough)	Deferred or Not Advanced

Breast Cancer Detection Center of Alaska	Envision Hope	AK	Alaska continues to face significant disparities in access to timely breast cancer screening and follow-up care, particularly in rural and frontier communities. Geographic isolation, severe weather, limited specialty infrastructure, and high travel costs create structural barriers that delay screening and prolong time to resolution. When a suspicious finding is identified, women may wait weeks or travel long distances for additional imaging. For uninsured, underinsured, and rural patients, these delays increase anxiety, financial strain, and the risk of later-stage diagnosis. In many communities, access to advanced imaging depends on travel outside the region, placing additional pressure on families and local healthcare systems. Envision Hope represents a strategic infrastructure investment to modernize breast imaging technology and strengthen in-state capacity. By upgrading both mobile and clinic-based mammography equipment, this project improves image quality, reduces repeat imaging, and enhances early detection across Alaska. Modernized systems will increase reliability, improve efficiency, and support a sustainable, statewide breast imaging program capable of serving Alaska’s geographically dispersed population.	BCDC’s approach focuses on strengthening rural breast cancer screening access by modernizing both our mobile mammography program and clinic-based infrastructure. Our mobile unit travels across Alaska to deliver screening directly to communities where access to specialty services is limited. To sustain this rural access model, we will replace our aging mammography system on the mobile mammography truck and in the clinic. The upgraded system provides higher-resolution imaging, captures more breast tissue per exam, and improves radiologist confidence in interpretation. Improved image quality at the point of service will reduce repeat imaging critical in communities where return travel may require flights, long-distance road travel, or extended time away from work and family. Modernized equipment will also improve operational reliability, reducing cancellations and service interruptions that disproportionately impact rural outreach schedules. Upgrading the Fairbanks clinic strengthens statewide capacity by increasing appointment availability and providing timely follow-up imaging within Alaska. Together, these coordinated upgrades reinforce a sustainable, Alaska-based breast imaging system designed to serve geographically dispersed populations.	\$50,000-\$250,000	Specialist	Statewide	Aleutians West Census Area; Denali Borough; Fairbanks North Star Borough; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Skagway (Municipality); Southeast Fairbanks Census Area; Yakutat (City and Borough)	Deferred or Not Advanced

Bridges Community Resource Network, Inc.	100% Recovery Responsive Communities – Kenai Peninsula	AK	By establishing a self-sustainable RCO in the central peninsula, we can remove silos by offering support to individuals enrolled in any organized recovery program as well as those who are considering recovery and those approaching sobriety through alternative paths. Trained peers have participated in outreach and support services as agencies are able to hire or contract with trained peers. However, when individual organizations with peer support only exist within the entity, the population served is limited. Such programs prevent community wide efforts and are often impossible to financially sustain without ongoing grant funding. An independent RCO will create sustainability through collaboration with multiple entities for direct peer services through a wide referral network, bridging with the proposed Alaska Impact Alliance pilot program (the Medicaid Support Hub) to utilize the Medicaid concierge services that will support Medicaid enrollment and provide clinical, billing, claims, and compliance support, building alternative financial resources and acting as a hub for community training and events, and providing sustainable space to other organizations in the community for meetings, training, and events. The RCO would act as a hub and serve the community by providing services.	We will build out an RCO through partnership and guidance with Homer’s RCO and True North Recovery in Wasilla who has successfully built a robust peer support system in their community and through national resources such as Faces and Voices of Recovery. We have approached a local group, Universal Recovery Services to build their board of directors, train members as peer supports and peer trainers, and work to meet the requirements of a Recovery Community Organization. We will work with this group up to the point where they are able to obtain RCO designation, build policy and procedures, coordinate with clinical and administrative supports or build these into the project if necessary. Initial steps will be site visits with KBRC and True North, RCO Bootcamp training, building out the board of directors to include a cross section of community recovery members, identifying and contracting with an individual to create policies and procedures and strategic plan, contracting or hiring a community navigator to begin providing services as we establish the framework, identifying appropriate lease space, outreach, and coalition building with providers, organizations, and individuals in the area.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Bridgewell Analytics	Healing the Healers: Rural Alaska year 1 clinician wellness and retention program	AK	Alaska’s rural health access challenge is compounded by workforce instability, vacancies, and reliance on traveling clinicians, reducing appointment availability, continuity, and quality of care. Burnout is higher in health care than in nearly any other profession, driving turnover, higher costs, adverse patient outcomes, and harm to providers. Clinicians experience high levels of impact of work on personal relationships (IWPR), which affects patient outcomes, clinician compassion, and clinician wellbeing. These effects are amplified in rural communities, where clinicians face psychological distress and isolation. The opportunity is not only to address burnout, but to address a system gap in rural Alaska. Most solutions either measure burnout or offer generic wellness support. Rural health systems need a non-punitive, evidence-based way to identify distress, apply interventions, and measure whether those interventions improve retention, patient care, access, and fiscal sustainability. Evidence-based interventions such as couple-oriented retreats, popular opinion leader groups, and clinical consultation groups have reduced burnout and IWPR and improved professional fulfillment, but they have not been adequately implemented or evaluated in rural communities. Their downstream effects on patient outcomes, continuity of care, workforce retention, and ROI have not been well quantified. Without these measures, securing stakeholder buy-in and lasting system change is challenging.	We propose strengthening Alaska’s workforce through improvement in health care providers’ well-being. Our primary RHTP alignment is Strengthen Workforce, with direct benefits to Health Care Access, Healthy Communities, Pay for Value/Fiscal Sustainability, and Spark Technology & Innovation. Working with ANMC to identify pilot sites, and with UAA and Stanford as partners, we will use an annual, non-punitive measurement-to-action cycle: measure, intervene, and re-measure. Year 1 will focus on a practical pilot. First, we will establish baseline measurement and data governance. Key wellness measures developed by Stanford will be collected at pilot sites, including burnout, professional fulfillment, impact of work on personal relationships (IWPR), values alignment, and wellness-centered leadership behaviors. We will pair these with patient experience measures and workforce stability measures such as attrition; if direct turnover data are not available, we will use self-reported intent to leave as a proxy. We will provide accessible, de-identified aggregate dashboards so stakeholders can track trends in a way that supports improvement while protecting trust and anonymity. While baseline measurements are established, we will implement an evidence-based Year 1 intervention focused on IWPR: a retreat for providers and their partners led by UAA and supported by Stanford. This approach is grounded in recent findings showing reduced IWPR and burnout and increased professional fulfillment. Systematic measurement, reporting of results, and use of results to inspire local organization-level improvement efforts will be an overarching intervention strategy. As the project advances, we will expand to additional evidence-based interventions, continue re-measurement across sites, and train local facilitators so organizations can implement interventions within their existing systems. In later phases, we leverage technological innovation to explore opt-in passive measures, app-based recommendations, and efficiency-of-practice improvements, including AI-enabled tools, to reduce burden and further support rural workforce sustainability.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Bristol Bay Area Health Corporation	Bristol Bay CHA Recruitment: Adventure, Service and Compassion in the Alaska Frontier	AK	BBAHC is unable to fill the Community Health Aide roles needed for the 28 villages we serve in the Bristol Bay region. We currently have at least 7 vacant villages, a problem that has persisted over a number of years. Community Health Aides/Practitioners perform vital health care services in BBAHC village clinics and are key part of our regional health care delivery system. Without these roles filled, our health care delivery system cannot function optimally. The model works best to recruit, train and retain people from local villages.	Our approach is to develop a persuasive, engaging, informative campaign focused on successful Community Health Aides working with patients in the clinic, engaged in cultural activities in the villages and chronicle their journey. The campaign would be entitled, “Community Health Aide Recruitment: Adventure, Service, and Compassion in the Alaska Frontier.” It will also emphasize the training and continuing education provided to support each CHA in their essential role, and how they interface with patients and other providers as part of a health care team. Storytelling will emphasize the challenges, benefits, and unique advantages of working as a CHA in BBAHC village clinics. Campaign goals would include: • Promoting workforce development through “grow your own” pathways • Promoting the role of CHA as an entry point into the health care field • Raising awareness of the need for CHAs, their importance, and impact in people’s lives • Increasing interest in, and application for open CHA positions	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Advance to Implementation Application
Bristol Bay Area Health Corporation	Bristol Bay Chignik Lagoon Clinic Upgrade	AK	The facility lacks in basic structural integrity as its original use was modified into a clinic. Upgrades will address life safety, structural integrity as well as functionality of the facility. The building foundation skirting is not insulated making assessable to water and waste lien freeze up, as well as higher energy costs. The facility lacks in data capabilities for all components of lab, and pharmacy needs. The exterior siding is compromised from the elements and lacks in thermal protection from the elements. Case work inside the facility is dated and worn lacking in functionality. Furniture is dated and lacks functionality. Interior walls are in need of patching and new finish.	We would have a construction crew address the by the following. *exterior cladding, metal siding *modify building interior to include a lab *insulate crawlspace *new data runs *new flooring *paint *new office furniture *new casework	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Lake and Peninsula Borough	Advance to Implementation Application

Bristol Bay Area Health Corporation	Bristol Bay Expansion of Behavioral Health Aide Program	AK	Expansion of the BHA Program by the hire of additional BHA's would support the increased demand for immediate access to certified providers for mental health, substance use disorder, and prevention services, by tribes and village communities.	The approach is to ask for funding for two additional Behavioral Health Aides. They are located in the villages. Once we identify the applicant and the village, then we look for space to rent and will need associated furnishings and IT equipment. And to augment funding for additional village travel and supplies.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Advance to Implementation Application
Bristol Bay Area Health Corporation	Bristol Bay: Supporting Communication in Our Villages	AK	Purchase devices to assist with communication and hearing for our patients. Many residents of the Bristol Bay Area have un- or under-managed hearing loss, which makes it difficult to communicate with caregivers and family members in a clinical setting.	We will provide low cost, high quality, and durable ALDs to Bristol Bay Area clinics for clinicians to use when interacting with patients in one-on-one settings.	Under \$50,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Advance to Implementation Application
Bristol Bay Area Health Corporation	Community Health Representative Program	AK	The Bristol Bay region faces significant barriers to accessing timely, coordinated, and culturally grounded health care due to its extreme remoteness, limited local staffing, and high burden of chronic and behavioral health conditions. Most communities are only accessible by air or water, and many communities have minimal, to no local health education, navigation support, or prevention services. Patients often struggle to understand referrals, manage chronic disease, navigate complex travel healthcare protocols and processes, or stay connected to care after returning home. These gaps contribute to delayed treatment, fragmented care, and preventable health complications. This project addresses the opportunity to strengthen BBAHC's healthcare system by establishing a trained, community-based CHR workforce that can provide consistent outreach, navigation, and culturally relevant support in every community, which will improve on the ability to deliver accessible, high-quality, and sustainable care.	BBAHC's proposed approach addresses the region's limited access to local health education, navigation, and prevention services by establishing a phased Community Health Representative (CHR) Program that can operate effectively despite space and staffing constraints in many communities. Because not all communities currently have the capacity to house a full-time CHR, the program will begin by hiring six positions, one CHR Coordinator and five CHRs, who will be strategically placed in subregional hub communities. From these hubs, CHRs will travel to their assigned communities on a quarterly basis to deliver prevention activities, school-based education, home visits, and culturally grounded outreach. This phased model ensures that all communities begin receiving CHR services immediately while long-term community capacity is developed. The approach also includes comprehensive training for all CHRs, including certification, higher education pathways, and ongoing continuing education, ensuring a skilled, culturally competent workforce capable of providing consistent, high-quality support across the region. As communities expand space and staffing capacity over time, CHRs can transition from subregional rotation to permanent placement, strengthening the sustainability and reach of the program.	\$1M-\$5M		Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Advance to Implementation Application

Bristol Bay Area Health Corporation	Bristol Bay Home Health	AK	There are a number of elderly, or chronic ill, or patients of various kind that struggle getting into a clinic appointment and some are home bound and may need palliative care. We often find patients staying in our small hospital for long periods of time because we do not have a place to discharge them or their family is unable to support at home. Also, by being closer to the patient and families we will be better able to make informed decisions about their care.	BBAHC is interested in a planning grant that will help us create policies and procedures that would enable us to integrate the home services into a care model, care plans and appropriate staffing even with some use of telemedicine, Community Health Aides, nurses and providers. We may need to invest in devices for the patients' home environment that enable remote monitoring, such as blood pressure and video where the village infrastructure permits and allows care in the home even when faced with weather and travel delays. This can assist with mitigating provider shortages as well. And to Identify Home Health that works in our region's infrastructure capabilities that may include digital instruments that measure, record, and transmit health data directly to providers for chronic condition management and post-operative care. Key devices include blood pressure monitors, glucometers, pulse oximeters, digital scales, and wearables.	Under \$50,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Advance to Planning
Bristol Bay Area Health Corporation	Bristol Bay Substance Misuse Awareness Campaign: Bristol Bay Recovers	AK	Almost every Alaskan has been touched by substance use disorder through an experience they or a family member has had, or they know of someone who has been affected. Efforts to address the problem have taken many forms, however information may not be easily accessible when it is needed most. Community partners struggle to provide consistent, reliable information and may lack the funding for local outreach work. Additionally, stigma is a contributing factor to the delay in seeking treatment and ultimate success in recovery.	This project addresses substance misuse by providing access to a centralized, community-based system to navigate existing programs and resources based on individualized needs. It provides community organizations resources to support their work in local communities. It addresses stigma through sharing the lived experience of those in recovery in the Bristol Bay region. Components of the project include a marketing campaign and website development, to include video storytelling and social media promotions.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Deferred or Not Advanced
Bristol Bay Area Health Corporation	Bristol Bay Workforce Recruitment and Retention Program	AK	We have a lot of difficulty recruiting and retaining critical staff in our region. This is a pilot to assist in finding the staff we need to provide comprehensive services to our communities.	Provide recruitment and retention incentives for the following hard to fill positions: Registered Nurse, Mental Health Clinician, Case managers, Pharmacists, Community Health Aides, Resident Attendants, Counselor Technicians, Patient Access Representatives, Patient Travel Coordinators and Health Benefits Specialists.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Deferred or Not Advanced

Bristol Bay Foundation	Bristol Bay Rural Health Fellowship	AK	Rural communities in the Bristol Bay region continue to experience persistent health workforce shortages across nursing, behavioral health, dental, emergency services, and primary care. Recruitment from outside Alaska has proven costly and unsustainable, with high turnover and limited long-term retention in remote settings. At the same time, Alaska Native students from the Bristol Bay region are already pursuing health related degrees and certifications through Bristol Bay Foundation’s Higher Education Scholarship Program. Health professions consistently rank among the top fields of study for BBF scholars. However, students in clinical training pathways face significant financial and logistical barriers during high intensity years, including travel for rotations, licensing fees, reduced work hours, and rural placement costs. The opportunity is to strengthen a grow our own workforce model by providing targeted fellowship support to Alaska Native students already committed to serving their communities. By enhancing BBF’s existing scholarship infrastructure with a structured Rural Health Fellowship track, this project will accelerate credential completion, increase rural clinical engagement, and build a sustainable pipeline of certified providers rooted in Bristol Bay.	The Bristol Bay Rural Health Fellowship will operate as a specialized workforce enhancement track within BBF’s existing Higher Education Scholarship Program. Rather than creating a new standalone program, the Fellowship leverages proven scholarship infrastructure, academic monitoring systems, teletherapy supports, and emergency aid resources already serving Alaska Native students. In Year One, the Fellowship will prioritize students entering their junior and senior years in health-related degree programs. This stage represents a critical transition into high intensity clinical coursework and licensure preparation, where financial strain and attrition risk are highest. An estimated 15 to 20 Health Fellows will be supported across priority fields including nursing, medicine, physician assistant studies, behavioral health, dental and DHAT programs, community health work, CHA or BHA programs, pharmacy, medical laboratory sciences, public health, and EMS or paramedicine. Simultaneously, BBF will identify first year students demonstrating strong academic performance and commitment to health careers to form a prospective second cohort. These students will receive early engagement, mentorship exposure, and workforce orientation so that when they reach junior standing, they are prepared to transition into the Fellowship track. This staged cohort model strengthens pipeline continuity and creates a rolling workforce development structure. The Fellowship includes a supplemental stipend to offset clinical travel and licensing costs, structured quarterly case management, coordination with Tribal Health Organizations for rural immersion opportunities, and continued access to integrated student supports. This approach directly aligns with Strengthen Workforce priorities by developing a rural provider pipeline and increasing retention strategies.	\$1M-\$5M	Statewide	Anchorage (Municipality); Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Advance to Implementation Application

Bristol Bay Housing Authority	Naknek Senior Housing - Public Health Infrastructure	AK	To ensure the long-term sustainability of this critical housing and health resource, we will replace the aging and unstable water filtration system serving SW Elder Home. The current filtration system is outdated. Maintenance and replacement parts are no longer available, requiring improvised and unsustainable repairs, creating ongoing risk to the reliability of safe drinking water for residents. For older adults, disruptions to safe and reliable water can directly impact health, sanitation, and the safe operation of the facility itself. The proposed project will install a new water filtration system designed to provide consistent and safe drinking water to the facility. This infrastructure investment will reduce the risk of service interruptions, decrease ongoing maintenance costs, and ensure the facility can continue operating safely for the elders who depend on it. By strengthening this core building system, the project will protect an essential piece of community health infrastructure and support continued access to stable housing located adjacent to the region’s primary healthcare provider. In rural communities infrastructure failures can have outsized impacts, maintaining reliable housing infrastructure is critical to sustaining local health systems. This project will ensure that SW Elder Home can continue to provide safe, stable housing that enables elders to age in place while maintaining access to healthcare and community support.	To address the instability of the current water filtration system at Southwest Elder Home, the project will install a new water treatment and filtration system designed specifically to address the water quality conditions present in the region, which include elevated levels of iron. The recommended system, developed in consultation with Alaska Water Tech, will provide reliable treatment of sediment and naturally occurring minerals in the local water supply while improving the overall stability and performance of the building’s water infrastructure. The proposed system is designed to remove sediment particles measuring 5 microns and larger and to effectively treat elevated levels of iron (2.1 ppm), manganese (307 µg/L), and hydrogen sulfide (up to 10 mg/L), which contributes to sulfur odor. The system will include a high-flow 2-inch sediment filter housing containing a single extra-large pleated filter cartridge that will function as a sediment pre-filter to the backwashing treatment vessel. A key advantage of the recommended system is that it does not require salt or oxidizing chemicals to operate, reducing operational complexity and long-term maintenance requirements for the facility. The treatment media within the system is expected to have a service life of approximately eight to ten years. At the end of that period, only the internal treatment media and under-bedding gravel will need to be replaced, while the mineral tank and control valve can remain in service. This approach provides a durable, low-maintenance solution that is well suited to the operational realities of a remote community. By installing a reliable water treatment system with long service intervals and minimal chemical requirements, the project will reduce maintenance demands on facility staff while ensuring consistent access to safe, reliable water for residents of Southwest Elder Home.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough	Deferred or Not Advanced

Bristol Bay Native Association	Bristol Bay Prenatal Outreach & Perinatal Support Project	AK	Pregnant women in Bristol Bay with substance use disorders face substantial barriers to early and continuous care due to remoteness, stigma, and fear of punitive responses. Limited behavioral health capacity, travel constraints, and lack of a dedicated outreach model delay treatment and prenatal care engagement. These gaps increase preventable risks including complications in pregnancy, neonatal withdrawal, and family instability. The region currently lacks a coordinated, non-punitive approach focused on initiating early contact, building trust, and connecting mothers to care in ways that are culturally grounded and locally delivered. This project seeks to create a maternal-health–centered outreach and care coordination model that meets mothers where they are, reduces stigma, improves access to treatment and prenatal care, and strengthens family wellness.	The project will implement a maternal-health focused outreach and care coordination model staffed by two Community Health Workers (CHWs) and supported by a 0.5 FTE supervisor. Outreach will occur in villages and homes, using trauma-informed, non-punitive methods to build trust with pregnant mothers who have substance use disorders . CHWs will provide culturally grounded engagement supported by the Wellness A Circle of Life and Positive Indigenous Parenting programs, partnering closely with Bristol Bay Area Health Corporation (BBAHC). Care navigation will include warm handoffs to substance use disorder treatment, medication assisted treatment, prenatal providers, and supportive programs. Each participant will receive a Perinatal Wellness Plan addressing healthy lifestyle goals, safety considerations, cultural supports, prenatal scheduling, and postpartum needs. Telehealth access and transportation support will reduce barriers. Formal referral pathways will be strengthened among BBAHC, BBNA programs, behavioral health providers, and public health nursing. Shared data processes will track outreach, linkages, engagement, and retention. Postpartum support will continue through 12 months, emphasizing parenting strength, culture, and connection to early childhood services. This approach creates a cohesive, maternal-health–anchored model that improves coordination and access for rural families.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Kodiak Island Borough; Lake and Peninsula Borough	Advance to Implementation Application

Bristol Bay Native Association	Revitalizing Marrulut Eniit Assisted Living (Grandma’s House) for Aging in Place in Bristol Bay	AK	Elders play a vital role in Bristol Bay communities, carrying language, cultural traditions and knowledge about subsistence lifeways and local history. However, many Elders face difficult choices as their health needs increase. Assisted living, daily caregiving support and coordinated medical services are limited across the region, forcing some Elders to relocate far from family, language and the subsistence lifestyle that has shaped their lives. Families who wish to keep Elders at home often take on significant caregiving responsibilities while balancing work, childcare and subsistence activities. For nearly two decades the assisted living facility known locally as “Grandma’s House” in Dillingham helped address this challenge. Opened in 2003, the small residential facility provided a home-like setting where Elders from across the Bristol Bay region could receive support with daily activities such as meals, medication management and mobility. Its model allowed Elders to age in a familiar environment rather than relocating for care. For many Bristol Bay families, it was the region’s only local assisted living option and helped Elders remain near family and community. When Grandma’s House closed in 2019 due to financial and operational challenges, the region lost its only assisted living option. The closure created a major gap in the continuum of care and underscored the need for a more durable operating model, stronger workforce supports and sustainable financing.	This project proposes revitalizing Grandma’s House as a culturally grounded, community-based model of aging-in-place care for Elders in the Bristol Bay region. Grandma’s House was originally developed and operated through a collaborative regional effort involving multiple Bristol Bay partners. Although the facility ultimately closed due to staffing and funding challenges, it demonstrated the strong community need for local assisted living services and the potential for a sustainable model when supported by clear operational strategies and stable resources. BBNA proposes to lead the planning and revitalization of Grandma’s House and establish a streamlined management structure designed to ensure long-term sustainability. The model will incorporate strategies such as workforce housing incentives to attract and retain caregivers, development of local caregiver training pathways, integration with Medicaid waiver and long-term care reimbursement programs, and diversified funding partnerships among Tribal entities, regional nonprofits, and state and federal programs. Together, these strategies will support a stable care model that enables Elders to age in place while remaining connected to their families and cultural traditions. As a long-standing regional nonprofit serving the Tribes and communities of Bristol Bay, BBNA is positioned to coordinate the Tribal, health, housing and community partners needed to plan and sustain a culturally grounded Elder care model. The initiative will, if site control can be secured, utilize the existing assisted living facility and undertake necessary renovations to create a safe, home-like residential care environment for Elders. The revitalized model will combine assisted living services, community health support and culturally relevant programming. Residents will receive help with daily living activities such as meals, medication management, mobility and transportation to health services. Partnerships with Tribal organizations, regional health providers and local workforce training programs will help ensure culturally competent care and strengthen the regional caregiving workforce. Ultimately, revitalizing Grandma’s House will restore a vital support system for Bristol Bay families. By creating a sustainable, culturally grounded model of Elder care, the project will ensure that Elders can age in place—remaining in the communities they helped build while continuing to guide and inspire future generations.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Kodiak Island Borough; Lake and Peninsula Borough	Advance to Implementation Application

Bristol Bay Native Association	Bristol Bay Reentry Transitional Housing for Rural Health and Recovery	AK	The Bristol Bay region faces a critical shortage of safe and stable housing for individuals returning to the community after incarceration. In rural communities such as Dillingham, the lack of transitional housing creates significant barriers for individuals attempting to reintegrate. Many returning individuals struggle to secure immediate housing, limiting their ability to access healthcare services, participate in outpatient substance use treatment, maintain employment, and establish stability. Without safe housing, individuals face increased risk of relapse, untreated behavioral health needs, homelessness, and recidivism. This project seeks to address this gap by establishing a transitional living facility in Dillingham that supports individuals returning to the Bristol Bay region after incarceration. The facility will provide a safe, sober environment where participants can stabilize while connecting with healthcare providers, treatment programs, and supportive services. In addition to supporting reentry clients, the facility will provide short-term emergency housing for men experiencing domestic violence in partnership with the Tribal Men’s Program, as well as temporary stabilization housing for families or children traveling with an OCS worker. By addressing multiple housing gaps affecting health and safety, this project will strengthen healthcare access, improve recovery outcomes, and support stabilization for vulnerable individuals and families in rural communities.	The BBRP proposes a phased approach to develop a transitional living facility in Dillingham, Alaska to support individuals returning to the community after incarceration while addressing critical short-term housing needs that impact health and community stability. Phase 1 (Months 1–12): Planning and Partnership Development During this phase, the project team and financial management systems will be established to ensure proper grant oversight. Reporting and monitoring procedures will be developed to support accountability and program effectiveness. Stakeholder meetings will align project goals with community partners. A 2024 regional Community Needs Assessment identified housing as a major barrier to reentry success, healthcare access, and community wellness; updates will be conducted if needed. Memorandums of Understanding will strengthen partnerships with healthcare providers, law enforcement, tribal councils, and regional service organizations. Community engagement will build awareness and support while program models are finalized. Phase 2 (Months 13–24): Facility Development and Program Preparation During this phase, contracts will be finalized to renovate the selected facility to meet program and safety standards. The facility will support transitional housing for reentry clients while reserving space for emergency housing through the Tribal Men’s Program for men experiencing domestic violence and temporary stabilization housing for families or children traveling with an OCS worker. Stakeholders will be updated on project progress while baseline data is collected to measure outcomes. Staff training, service coordination, and regional outreach will continue. Phase 3 (Months 25–36): Program Implementation and Evaluation In the final phase, the facility will begin serving individuals returning to the Bristol Bay region who need short-term housing and stabilization. Participants will be connected to healthcare services, behavioral health treatment, case management, and community resources. Program monitoring and evaluation will track outcomes using qualitative and quantitative data. By addressing three regional gaps—reentry housing, emergency housing for men experiencing domestic violence, and short-term housing for OCS families—the project will strengthen regional health infrastructure and community stability. Sustainability planning will support long-term success through partnerships and diversified funding.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Kodiak Island Borough; Lake and Peninsula Borough	Deferred or Not Advanced

Bristol Bay Native Association	Bristol Bay Regional Emergency Response Readiness Assessment	AK	Like much of Alaska, the Bristol Bay region is remote and largely inaccessible via the State’s highway system. Apart from roads connecting Dillingham–Aleknagik, King Salmon–Naknek, and Iliamna–Newhalen, the remaining 25 communities have no interconnecting road access. Residents rely on boats, personal vehicles, snow machines, ATVs, and charter aircraft for local travel, emphasizing the critical need for reliable emergency response services. The region has a year-round population of approximately 7,000, which can increase by more than 13,000 seasonal fishermen. Community populations range from uninhabited areas to several thousand residents. There is no formal regional emergency response system; each community’s capacity depends on available local resources. Dillingham hosts the regional hospital and serves as the primary healthcare hub. Twenty-one communities operate village clinics staffed by Community Health Aides (CHAPs) who coordinate with medical teams at Kanakanak Hospital. Village Public Safety Officers (VPSOs) are present in eight communities, including Dillingham, and frequently act as first responders. In communities without VPSOs or CHAPs, residents provide initial care until medevac transport arrives. Those serving in these roles often manage complex medical emergencies with limited supplies, outdated equipment and insufficient training—factors that can adversely affect patient outcomes and contribute to a high-pressure environment with increased provider burnout.	Phase I of this initiative will build the foundation for a coordinated, sustainable and culturally responsive regional emergency response system across the Bristol Bay region. Recognizing the geographic isolation, workforce limitations and infrastructure gaps that characterize many of the region’s 31 communities, this phase will focus on assessment, engagement and strategic planning to guide long-term system transformation. The project will begin with a regional needs and readiness assessment evaluating each community’s current emergency response capacity, including workforce availability, certification levels, training frequency, equipment condition, communication systems, transport logistics, and coordination with village clinics and the regional hospital. The assessment will also document informal response practices in communities without structured services to ensure existing local strengths are recognized and incorporated. A mixed-methods approach will include site visits, structured interviews with Community Health Aides, Village Public Safety Officers, tribal leaders, municipal officials and residents, along with review of response data, medevac utilization and incident trends. Particular attention will be given to barriers related to distance, weather, seasonal population fluctuations, and volunteer recruitment and retention. Findings will be synthesized into a regional gaps analysis identifying priority needs in workforce development, infrastructure, equipment standardization, governance and interagency coordination. By the conclusion of Phase I, the project team will have the assessment results needed to begin developing a data-driven regional strategic plan in Phase II (future funding need) that outlines phased investments, standardized training pathways, equipment benchmarks, communication improvements and governance recommendations. The plan will include cost projections, funding pathways and implementation timelines to guide future phases. Emphasis will be placed on building local capacity, strengthening stabilization capabilities, improving coordination with partners and reducing preventable delays in care. By the conclusion of Phase I and II, the region will have a clear, community-informed roadmap to expand into Phase III - implementation of strategies to provide timely access to emergency care, elevated service quality, enhanced sustainability of health resources, and advancement of health equity across its rural and frontier communities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Kodiak Island Borough; Lake and Peninsula Borough	Deferred or Not Advanced

Bristol Bay Native Association	Bristol Bay Regional Workforce Development Gaps Analysis	AK	Bristol Bay communities face persistent shortages in direct care, care navigation, EMS support roles and other frontline health positions. Many communities are small and isolated, making it difficult to recruit and retain qualified staff. Limited local access to training programs, high costs for certification and continuing education, and seasonal employment patterns tied to fisheries and other industries contribute to workforce instability. As a result, communities often rely on a small number of individuals to fill multiple roles or depend on temporary or itinerant providers, which can create gaps in services and disrupt continuity of care. These workforce shortages directly affect access to care. Limited direct care staffing reduces access to Elder supports and in-home care, making it harder for Elders to age safely in their communities. Gaps in care navigation roles can delay referrals, reduce follow-up, and make it difficult for residents to access benefits, specialty care or chronic disease management services. EMS and emergency response shortages can also affect response times and community readiness during high demand, severe weather or travel disruptions. The region also lacks a comprehensive understanding of service availability and workforce distribution across communities. Without coordinated service and workforce mapping, it is difficult to identify priority gaps, prioritize investments or design training and recruitment strategies that reflect regional needs.	In order to meet the need for stable health care roles in remote communities and provide consistent access to care, BBNA will conduct a regional workforce and service gap analysis to guide development of the “Grow Our Own Workforce Hub” in Year 1. A RFP will be developed to select a partner to complete the assessment. BBNA will engage key partners—including Tribal governments, regional health providers, EMS programs, Elder services organizations, schools and training institutions—to participate through surveys, interviews and data sharing across the 31 Bristol Bay communities. The analysis will identify workforce shortages by role and location, document service gaps affecting access to care and highlight barriers to building and retaining a local workforce. Findings will identify priority occupations for the workforce hub and inform a data-driven workforce development plan outlining training pathways, partnerships and investments needed to build a sustainable regional workforce pipeline. In Year 2, BBNA will operationalize the workforce hub by developing or adapting curriculum for priority pathways identified in Year 1, aligning training with certification requirements. Regulatory considerations for operating the workforce hub will be identified. BBNA will secure trainers and training partners, establish training locations within hub communities, and procure equipment and instructional materials. Programs will utilize a mix of in-person, hybrid and online learning models. Recruitment will prioritize residents from Bristol Bay villages and hub communities, and trainee supports will be identified to reduce participation barriers. By the end of Year 2, the workforce hub will launch its first cohort of students. In Years 3–5, the workforce hub will expand training pathways and enroll additional cohorts based on regional workforce needs. As participants complete certification, the number of locally trained health care workers entering the workforce will increase. BBNA will work with regional employers and Tribal partners to support job placement and retention through mentorship and career advancement opportunities. These efforts will help stabilize the health care workforce in Bristol Bay’s remote communities, improve access to care, and expand local career opportunities while strengthening the long-term sustainability of the regional health system.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Kodiak Island Borough; Lake and Peninsula Borough	Deferred or Not Advanced

Bristol Bay Native Association	Preventing Chronic Illness Through Nutrition in Vulnerable Populations Throughout Bristol Bay	AK	Residents of the Bristol Bay region face significant barriers to accessing healthy foods, particularly fresh fruits and vegetables. None of the communities in the region are connected to the road system and are accessible only by plane, boat, or snow machine depending on the season. These transportation challenges, combined with high food costs and limited retail options, make fresh produce difficult to obtain consistently. As a result, many households rely on shelf-stable foods and have limited access to the nutritious foods needed to maintain a healthy diet. Limited access to fruits and vegetables contributes to increased risk of diet-related chronic diseases such as diabetes, cardiovascular disease, and obesity. These conditions are already prevalent in rural Alaska and place additional strain on rural health care systems that often operate with limited workforce and infrastructure. Food insecurity also remains a persistent challenge in the Bristol Bay region. Many households rely on food assistance programs to meet basic nutritional needs, yet available food resources often lack consistent access to fresh, healthy options. Improving reliable access to fruits and vegetables represents an opportunity to address a key root cause of poor health outcomes in rural communities.	To address barriers to accessing nutritious foods, Bristol Bay Native Association (BBNA) proposes to expand the Bristol Bay Regional Food Bank by providing regular produce boxes to food bank clients throughout the region. This project will increase access to fruits and vegetables for households in communities that are only accessible by plane, boat, or snow machine and where grocery options are limited and costly. BBNA will partner with Full Circle Farms, a produce distributor that already maintains a regular shipping route to Dillingham. Through this partnership, produce boxes will be delivered to Dillingham and then distributed to communities throughout the Bristol Bay region using the Food Bank’s existing logistics and air freight systems. BBNA will coordinate ordering, packing, and shipment of produce boxes through the Food Bank facility before distributing them to participating communities. Once shipments arrive in each community, produce boxes will be delivered to a central and accessible location such as a Village Council office, school, or other trusted community facility. Food Bank clients will be notified when shipments arrive and will pick up their produce boxes from these locations. This distribution model allows BBNA to reach multiple communities efficiently while working within the transportation realities of rural Alaska. During the first year of the project, BBNA anticipates distributing produce boxes approximately every two weeks to participating households. This schedule balances the goal of increasing access to fresh foods while ensuring the program remains logistically sustainable for rural transportation and distribution systems. By increasing access to fruits and vegetables through an established regional distribution network, the project will help improve diet quality and reduce chronic disease risk factors associated with limited access to healthy foods. Expanding nutritious food availability through the Food Bank strengthens community-based prevention efforts and supports healthier lifestyles for residents across rural Bristol Bay communities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Kodiak Island Borough; Lake and Peninsula Borough	Deferred or Not Advanced

Bristol Bay Region Career and Technical Education	Classroom to Careers: Building Alaska’s Rural Health Workforce	AK	Workforce development is a multifaceted challenge in rural Alaska. Because of its vast size and isolated communities, rural Alaska faces unique challenges related to the delivery of formalized workforce training programs. Low population density creates significant barriers to sustaining local training programs, as developing workforce pathways within each community is cost-prohibitive and difficult to maintain over time. K–12 school districts represent a critical entry point into the healthcare workforce pipeline, yet most rural districts lack the infrastructure, curriculum, and trained instructors necessary to provide high-quality, career-aligned health education programs. Without early exposure to healthcare careers and accessible training pathways, many rural students are unable to pursue healthcare professions or must leave their communities to do so, reducing the likelihood they will return to work locally. This project addresses the opportunity to strengthen the rural healthcare workforce by building structured education-to-career pathways within rural schools and communities. By equipping schools with aligned curriculum, workforce partnerships, and instructor support, the program will help prepare local students for healthcare careers while creating a sustainable pipeline of homegrown healthcare professionals for rural Alaska.	Bristol Bay Region Career and Technical Education (BBRCTE) was formed as a collaborative partnership with four rural school districts in the Bristol Bay Region. The consortium was created to meet the unique needs of rural Alaskan students who have limited access to high-quality, industry-supported career training. BBRCTE believes that students should be empowered to take their place in the regional economy as leaders in their community. BBRCTE is a critical component of a regional workforce strategy that connects K–12 education, industry partners, and workforce training organizations to create sustainable healthcare career pathways for rural students. Through this project, partners will align their expertise to expand healthcare workforce exposure, training, and mentorship opportunities for students across the Bristol Bay region. BBRCTE will serve as the central convening and program delivery partner, coordinating the regional health career pathway and hosting two week-long career intensives that bring together students from 21 remote communities. BBRCTE will manage program logistics, student recruitment, and alignment with school districts to ensure participation from rural students who would otherwise have limited access to healthcare training. BBRCTE Career Guides will connect students with healthcare professionals, and introduce career pathways in fields such as nursing, behavioral health, community health, and allied health professions. Partners will provide industry expertise and curriculum aligned with healthcare workforce needs. Using hands-on instruction during the intensives. Their role ensures that programming reflects real workforce demands and exposes students to attainable career pathways within Alaska’s healthcare system. Local school districts will serve as the foundational pipeline for the program by identifying and preparing students for participation, integrating career awareness into the school year, and supporting students as they transition from exploration to postsecondary training opportunities. Together, this collaborative model addresses geographic barriers by pooling regional resources and expertise to deliver high-quality healthcare workforce training. By strengthening partnerships between education and healthcare sectors, the project creates a scalable pathway that prepares rural students for healthcare careers while building a locally rooted workforce for rural Alaska.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Deferred or Not Advanced

Brittany Gene Design Solutions, LLC	Rural Alaska Digital Care Navigation Hub	AK	Rural Alaskans, particularly Alaska Native populations in frontier regions such as the North Slope, face significant geographic and administrative barriers to healthcare. Residents often navigate a fragmented system where medical care, behavioral health services, and essential social supports—such as employment resources and cultural programs—are disconnected and difficult to access. A major bottleneck occurs in outdated administrative processes. Rural patients frequently wait five to seven weeks simply for paper intake forms to be processed before they can schedule an appointment. These delays can worsen behavioral health crises, prolong untreated conditions, and increase stress for families and caregivers. At the same time, healthcare providers often lack visibility into whether patients successfully access services after referrals are made, limiting their ability to coordinate care and monitor outcomes. Manual paperwork also places a heavy burden on the already limited rural healthcare workforce, taking time away from patient care and contributing to provider burnout. These systemic challenges highlight the need for modern, accessible tools that streamline navigation, improve coordination between services, and reduce administrative barriers for both residents and providers.	Our approach centers on community-led co-design and Indigenous human-centered design to ensure the platform reflects the realities of rural Alaska. Large healthcare systems often fail in frontier regions due to limited internet bandwidth, geographic isolation, and varying levels of technical literacy. To address this, we are developing a lightweight, customizable, low-bandwidth digital platform designed to function reliably in remote communities. This solution is being co-designed with tribal governments, cultural leaders, and strategic partners including the Arctic Slope Community Foundation, Recover Alaska, and the University of Alaska Anchorage. These collaborations help break down organizational information silos and consolidate fragmented resources into a unified, user-friendly digital entry point. By bringing clinical services, behavioral health support, and Social Determinants of Health (SDOH) resources into one system, the platform improves coordination while reducing duplicated efforts across organizations. The hub will feature a responsive AI-powered chatbot and intuitive digital intake forms designed for usability across a wide range of users. Residents will be able to navigate clinical, behavioral, and social resources through a single interface, reducing administrative barriers that currently delay care. By tracking engagement, common questions, and service needs, the platform can be continuously refined to improve responsiveness and service delivery. The platform architecture prioritizes both HIPAA compliance and Indigenous Data Sovereignty. A tiered, role-based access model ensures that public resources are widely accessible while Protected Health Information (PHI) remains strictly secured. The system also supports secure closed-loop referrals, allowing providers to coordinate care while sharing only the minimal data necessary. This protects privacy while building trust within Alaska Native communities. Development is guided by a multidisciplinary advisory team including an Iñupiaq cultural advisor and clinical psychologist, alongside experienced technology specialists. By integrating local resources, reducing duplicated efforts, and streamlining care navigation, this ecosystem helps lower operational costs across Alaska’s healthcare system while supporting the transition toward sustainable value-based care models.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Juneau (City and Borough); North Slope Borough	Deferred or Not Advanced

Brother Francis Shelter Kodiak Inc	Improving the Health of Kodiak's Homeless	AK	Brother Francis wants to better serve the homeless population by providing additional case management, addressing transportation barriers, and offering more services focused on client success, including employment, housing, and access to additional social services. We also need financial assistance with bathroom and kitchen upgrades. The bathroom upgrade will extend the life of our shelter and its ability to continue offering critical services to the community, and the kitchen upgrade will allow for clients who require accommodations to be part of the daily service team, which is shelter clients serving others. This concept helps build a sense of community here at the shelter. It improves shelter morale and individual mental health. When this population takes ownership of their well-being, they become healthier individuals and place less strain on our health systems.	We will begin by adding a case worker position to facilitate a more client-focused day service where clients can come to navigate housing applications, employment opportunities, and applications for additional services. This case worker will also schedule classes focused on budgeting, employment interviews, healthy cooking, and any subject that will lead to client success. During these day hours, we would schedule Public Health and the Kodiak Community Health Center's mobile unit to be on-site and available for blood pressure, diabetes, and COPD screening. We will also have a credentialed caseworker, Mrs. Mary Guilas-Hawver, LMSW, MAC, CDCS ADM, on call and available to clients needing evaluations, assessments, or additional in-depth case management. This access to client assessments can either eliminate the need for additional health care or streamline the process to necessary services. Providing transportation to this equation will reduce the number of emergency ambulance calls and also enable clients to attend wellness and prevention appointments. Transportation will be provided by our shelter vehicle or by passes for the local bus system. Having the plumbing issues corrected can be done intermittently. Should the shower areas be completely closed due to maintenance, we are located close to the harbor and their public bathing facilities, we will provide shower passes and transportation to and from on those days. Completing the dumbwaiter will have long-lasting benefits for the shelter. Once completed, it will allow many of our older clients to be involved in shelter services. These individuals want to be needed and appreciated; they will mentally flourish having this added responsibility. The combination of these services will reduce the demand on Kodiak's emergency healthcare systems, improve access to necessary care, encourage workforce development, and have long-lasting, positive effects on the homeless community of Kodiak. These will all be steps towards stabilizing homeless individuals, helping them obtain permanent housing, and creating a safer, healthier community.	\$50,000-\$250,000	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Build Alaska's Future Education Fund	Alaska Rural Health Workforce Pathways and Community Access Initiative	AK	The Problem: Alaska’s rural health system faces a critical, persistent shortage of healthcare professionals. Remote communities rely heavily on transient, nonresident providers, leading to inconsistent care, high turnover, and a lack of cultural alignment. Compounding this crisis is the systemic disconnect between rural residents, particularly Alaska Native youth, and the training pathways required to enter the health sector. They lack the exposure, accessible entry points, and localized data needed to confidently pursue health-related careers. The Opportunity: BAFEF has an established model that can be adapted for the health care workforce. We possess an established two-way workforce engagement model that currently connects rural Alaskans to the infrastructure sector. The RHTP presents a timely opportunity to adapt this proven framework explicitly for the health care workforce. Instead of building a new program from scratch, we will leverage our existing logistical infrastructure, community trust, and local government partnerships. We will pivot our 8-community rural outreach workshops and Fairbanks-based, week-long hands-on training cohorts to focus on nursing, EMS, behavioral health, and Community Health Aide Programs (CHAP). By allowing rural residents to "try out" healthcare fields before committing to long-term programs, and utilizing our GIS mapping to highlight workforce gaps, we will build a resilient, homegrown health workforce from within.	BAFEF will execute this project by adapting our proven Alaska Native Rural Workforce Development Collaboration to specifically build Alaska’s rural health workforce. Because our logistical infrastructure and local government partnerships are already established, our approach can be rapidly deployed through four phases: Phase 1: Targeted Rural Community Outreach: We will host intensive, multi-day workshops in eight geographically isolated and economically distressed communities. BAFEF teams will convene municipal leaders, tribal representatives, and educators to identify localized workforce needs. We will use these sessions to introduce rural residents, especially Alaska Native youth, to high-demand health career pathways, including nursing, Emergency Medical Services, behavioral health, and Community Health Aide Programs. Phase 2: Hands-On Urban Training Cohorts: To bridge the gap between initial interest and long-term commitment, we will transport prospective rural apprentices to urban training hubs (Fairbanks) for week-long health sector workshops. We will host three cohorts of approximately 12 participants each. Partnering with healthcare educators and facilities, we will provide a unique opportunity for participants to try out a healthcare field before committing to a rigorous certification program. This approach significantly reduces attrition, while allowing healthcare employers to build relationships with prospective trainees to improve long-term retention. Phase 3: Data Transparency & GIS Mapping: To sustain this effort and Spark Technology, BAFEF will expand our interactive GIS mapping platform. This tool will track RHTP investments, identify regional health workforce gaps, and help communities visualize where resources and opportunities intersect. Utilizing our innovative quasi Electronic Health Management System, we will share data across regions, collaborate on training priorities driven by community engagement, provide staffing needs system-wide and ultimately support any potential crisis interventions. This empowers local governments and tribal consortiums to make data-informed decisions regarding their local health infrastructure. Phase 4: Following the cohorts, we will host a virtual statewide convening for stakeholders to share insights and solidify collaborative workforce strategies. The project will culminate in a strategic report detailing best practices and actionable recommendations for sustaining a rural health workforce ecosystem.	\$50,000-\$250,000	Statewide	Bethel Census Area; Kusilvak Census Area; Nome Census Area; Northwest Arctic Borough; Prince of Wales-Hyder Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Cadence	Scaled Statewide RPM and Remote Care Delivered Through HIE Integration	NY	Alaska's rural and frontier populations carry a disproportionate burden of chronic disease — particularly Hypertension, Type 2 Diabetes, and Congestive Heart Failure — yet face persistent barriers to the consistent monitoring these conditions require. Geographic isolation, provider shortages, and the cost of travel make routine follow-up care inaccessible for many Alaskans, allowing manageable conditions to progress into costly hospitalizations and emergency events. At the same time, outpatient clinics that want to offer Remote Patient Monitoring face a separate barrier: the complexity and cost of integrating RPM platforms into their existing workflows. Most rural clinics lack the IT resources to build and maintain these connections, leaving RPM adoption fragmented and out of reach for the communities that need it most. Cadence sees an opportunity to solve both problems simultaneously. By deploying a turnkey RPM program for CHF, T2D, and Hypertension patients — and routing all vitals data and care summaries through Alaska's existing HealthEconnect HIE — Cadence can extend continuous, clinician-supervised monitoring to patients statewide while giving providers access to RPM data through infrastructure they already use. No custom integrations required. The result: meaningful chronic disease monitoring coverage for Alaskans who need it most, and a scalable model that grows as more clinics participate in the state HIE.	Cadence proposes to operate a statewide Remote Patient Monitoring program for Alaskan patients managing Hypertension, Type 2 Diabetes, and Congestive Heart Failure. The program is built on three core components: Referral and Enrollment: Participating outpatient clinics, including rural health clinics, FQHCs, and Critical Access Hospitals — identify eligible patients and refer them to Cadence. Cadence handles all onboarding, device fulfillment, and patient activation, placing no operational burden on the referring clinic. 24/7 Clinical Monitoring: Enrolled patients transmit daily vitals from home using Cadence-provided RPM kits. Cadence's clinical team monitors all incoming data continuously, proactively contacting patients when readings indicate risk. This replaces the need for frequent in-person visits and allows early intervention before conditions escalate to emergency events. HIE-Based Data Sharing: Cadence transmits structured vitals data and monthly patient summaries from its EMR into HealthEconnect, Alaska's statewide Health Information Exchange. Participating clinic providers can access their patients' RPM data directly through HealthEconnect, the system they already use, without requiring any direct integration with Cadence. This architecture is the key innovation: it makes the program accessible to any HIE-participating clinic in the state immediately, without IT build costs or vendor procurement on their end. Cadence currently serves ~300 Alaskan patients per month through partnerships with Community Health System and Providence Health, providing an active operational foundation from which to scale.	\$50,000-\$250,000	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

CalmKey Telehealth Connection LLC	Rural Arctic Health Psychology Postdoctoral Fellowship	AK	Alaskans face a critical shortage of licensed psychologists who specialize in care for people in rural and frontier communities. Even fewer experts are supervising new clinicians towards licensure and career opportunities in Alaska. As a result, individuals seeking help often encounter long waitlists. Long waitlists reflect a broader statewide gap in workforce development support and access to timely, specialized behavioral health care, particularly for trauma-informed, telehealth-based services that can reach remote communities. By the time care is accessed, conditions are often more complex and difficult to treat. These delays also contribute to burnout among the small number of providers currently serving rural Alaskans. I wish to address the workforce development gap by establishing a fellowship position in the Arctic setting designed to mentor an early-career psychologist through supervised postdoctoral training and licensure while expanding telehealth-based behavioral health services. The fellowship will increase access to culturally responsive, trauma-informed care for individuals across Alaska and support sustainable workforce development. The “grow-our-own” workforce development model expands immediate service capacity in a sustainable supervisory space for a new psychologist to gain Arctic practice skills. This initiative aims to reduce wait times, improve access to behavioral health care, and strengthen integrated workforce development by prioritizing local hire.	The proposed solution is the Rural Arctic Health Psychology Postdoctoral Fellowship development, a structured workforce initiative and service expansion project based at CalmKey Telehealth Connection in Fairbanks, Alaska under the supervision of National Register of Health Service Psychologists provider Dr. Rebekah Burket. The fellowship addresses two interconnected barriers to behavioral health access in Alaska: a shortage of licensed psychologists and a critical lack of supervisors available to train early-career clinicians toward licensure. The program will establish a competency-based postdoctoral training position for an early-career psychologist, providing a 2,000-hour supervised training experience over 12–24 months. The fellow will deliver substance use disorder treatment, psychotherapy, psychological assessment, and telehealth-based behavioral health services while receiving intensive mentorship in rural and frontier behavioral health practice. Training will emphasize evidence-based, trauma-informed cognitive behavioral principles, telepsychology, suicide risk assessment in low-resource environments, and culturally responsive care that integrates Indigenous healing practices and community collaboration. This fellowship uses a hub-and-spoke rural service model, with Fairbanks serving as the clinical hub and telehealth technology extending specialty care to underserved communities throughout Interior Alaska and other remote regions. Through this model, the fellow will provide direct, supervised services via in-person and secure telehealth platforms, expanding access to substance use treatment, psychotherapy, diagnostic assessment, and emerging service lines such as digitally-delivered neuropsychological testing. The fellow will participate in community capacity-building activities and develop a capstone project focused on sustainable rural behavioral health programming. This component strengthens partnerships with community organizations, health systems, and Alaska Native–serving institutions while supporting prevention, education, and systems collaboration. The fellowship is intentionally designed as a workforce capacity building effort for Alaskans by Alaskans. By training psychologists within the Arctic practice environment where they are needed, the program increases the likelihood that fellows will remain to practice and supervise future clinicians. Over time, the model can scale to support additional fellows and expanded supervisory capacity.	\$50,000- \$250,000	Private practition er	Statewide	Fairbanks North Star Borough; Yukon- Koyukuk Census Area	Deferred or Not Advanced

Camai CHC	Bristol Bay Regional Specialty Care Hub Transformation Project	AK	Residents of Bristol Bay and surrounding rural communities face significant barriers to accessing specialty healthcare. Patients requiring cardiology, ENT, and vision services often must travel to Anchorage or other urban centers. Travel is expensive, weather-dependent, and disruptive to patients and families, leading to delayed care, missed appointments, and worsening chronic conditions. Cama’i Community Health Center is expanding its facilities to meet growing healthcare needs in the region. The construction of a new standalone clinic creates an opportunity to repurpose the existing clinic building to address a critical gap in rural healthcare access: the lack of locally available specialty services. The current facility was originally designed to support emergency services and traditional clinic functions. As services transition to the new facility, the building can be redesigned to support a regional specialty care model that brings visiting providers and telehealth-enabled consultations directly to rural patients. Through architectural redesign and planning, this project will create a regional specialty care hub capable of supporting visiting specialists, telehealth services, and coordinated care delivery, improving access to specialty care for rural residents across the Bristol Bay region.	Cama’i Community Health Center proposes transforming its existing clinic into a regional specialty care hub that expands access to specialty services for rural residents of Bristol Bay and surrounding communities. With the construction of a new standalone clinic facility to house core primary care and other services, the current building can be strategically redesigned to support a new model of specialty care delivery. The project will begin with architectural design and facility planning to repurpose the existing clinic space for specialty services and telehealth-enabled care. Design work will focus on converting former emergency department and clinic areas into specialty exam rooms, telehealth consultation spaces, and flexible treatment areas to support visiting specialists. The redesigned facility will accommodate visiting providers in specialties such as cardiology, ear, nose, and throat (ENT), and chiropractic care, while also housing tele-optometry services that allow patients to receive vision assessments locally with remote specialist consultation. In addition to clinical space, the project will design a flexible community meeting and training area on the lower level of the building with an attached kitchen. This space will support regional healthcare collaboration, workforce training, community health education, and coordination among local partners. Cama’i has already completed a competitive RFP process and selected an architectural design team, allowing the project to begin immediately upon award. This design phase will produce detailed plans and cost estimates needed to support a future renovation phase that will implement the specialty care model. By repurposing existing infrastructure and integrating visiting specialists with telehealth technology, this project will expand access to specialty care, reduce costly patient travel, and strengthen care coordination across the rural healthcare system serving Bristol Bay.	\$50,000-\$250,000	Federally qualified health center	Single Community	Bristol Bay Borough	Advance to Implementation Application

Camai CHC	Connected Care: Remote Monitoring for Chronic Disease and Post-Hospital Recovery in Rural Alaska	AK	Rural residents in the Bristol Bay region face significant barriers to ongoing health monitoring and follow-up care due to geographic isolation, limited transportation options, and long distances between communities and higher levels of care. In Alaska, over 60% of communities are not connected to the road system, requiring travel by air or boat for hospital services, and weather conditions can delay care for days. Chronic conditions such as cardiovascular disease, diabetes, and hypertension are leading causes of hospitalization, and nearly 40% of Alaska adults live with at least one chronic condition. Elders and patients with multiple comorbidities are particularly vulnerable when consistent monitoring and follow-up care are limited. Preventable hospitalizations and emergency transports are among the most costly aspects of rural health care delivery in Alaska. This project will improve continuity of care through remote patient monitoring using wearable health devices and portable cardiovascular tools. By enabling providers to monitor patients remotely, Cama'i Community Health Center can detect early signs of health deterioration and intervene sooner, improving outcomes while reducing avoidable high-cost care.	Cama'i Community Health Center will implement a Remote Patient Monitoring program designed to support elders, patients with multiple chronic conditions, and individuals requiring close follow-up after hospital discharge or medication changes. The program will deploy approximately 200 wearable health monitoring devices and portable cardiovascular monitoring tools to high-risk patients in the Bristol Bay region. Patients enrolled in the program will receive devices that track key biometric indicators, including heart rate, activity levels, sleep patterns, and other cardiovascular signals. Portable finger-sensor diagnostic tools will allow patients to easily collect additional cardiovascular readings when needed. This data will be securely transmitted to the clinical care team, allowing providers to monitor trends and identify potential health concerns earlier than would otherwise be possible through periodic in-person visits alone. Cama'i will establish clear clinical protocols to identify eligible patients, including those recently discharged from the hospital, individuals with multiple chronic conditions, and elders who would benefit from additional monitoring as they age in place. Care teams will review incoming patient data and respond to alerts or concerning trends through telehealth visits, medication adjustments, or in-clinic follow-up, as needed. To ensure successful implementation and ongoing monitoring, the project will fund a part-time remote nurse or clinical staff member dedicated to managing the remote monitoring program. This individual will oversee device distribution, patient onboarding and education, daily monitoring of incoming data, and coordination with providers when follow-up is required. This role will also support patient engagement and caregiver communication to ensure the technology is used effectively. Over time, the program will generate valuable data that can support quality improvement initiatives, improve chronic disease management strategies, and help reduce preventable complications and hospital readmissions. By combining wearable technology with clinical oversight, this project will expand care beyond the clinic and create a more sustainable model for monitoring high-risk patients in rural Southwest Alaska.	\$250K-\$1M	Federally qualified health center	Single Community	Bristol Bay Borough	Advance to Implementation Application

Camai CHC	ACCESS Project: Alaska Collaborative for Clinic-Based Emergent Stabilization Services	AK	Rural community health centers in Alaska often serve as the first and only point of care for patients experiencing urgent and emergent medical conditions. In remote communities such as the Bristol Bay Borough, patients frequently must be stabilized locally while awaiting medevac transport to higher levels of care. Weather delays, distance, and transportation limitations can extend the time patients remain in local clinics, requiring providers to deliver emergent stabilization and monitoring for hours or even days. Despite providing these high-acuity services, community health centers are reimbursed under primary care billing structures because they are not licensed hospitals or emergency departments. This creates a structural financing gap between the services delivered and the services that can be billed. Cama'i Community Health Center operates as an independent rural safety-net provider and is not part of a larger hospital system or provider network. As the primary source of healthcare in the Bristol Bay Borough, the clinic must absorb the financial impact of emergent care services that cannot be appropriately reimbursed. This project will stabilize emergent care capacity at Cama'i while supporting participation in the ACCESS Project, a collaborative effort to document emergent care delivery in frontier clinics and inform development of sustainable reimbursement solutions for rural Alaska.	The ACCESS Project (Alaska Collaborative for Clinic-Based Emergent Stabilization Services) is a collaborative effort among rural clinics to better understand and address the structural challenges associated with delivering emergent care in frontier communities. This request focuses on stabilizing emergent care capacity at Cama'i Community Health Center while supporting the data collection and analysis needed to inform a broader policy solution being developed through collaboration with partner clinics in Skagway and Unalaska. Funding will support two primary activities. First, the project will provide short-term stabilization support, allowing Cama'i Community Health Center to continue delivering emergent stabilization services despite the financial gap created by current reimbursement structures. As an independent rural safety-net provider, Cama'i lacks the financial backing of a larger hospital system or provider network, making short-term stabilization critical to maintaining these services while longer-term solutions are developed. Second, the project will support the engagement of a consultant with expertise in rural health policy and reimbursement systems. The consultant will work with Cama'i and partner clinics to collect and analyze data related to emergent care delivered in rural clinic settings. This work will include documenting patient acuity levels, stabilization duration, staffing requirements, and the gap between services delivered and current reimbursement mechanisms. Cama'i will coordinate closely with partner clinics in Skagway and Unalaska that are advancing the broader ACCESS initiative. Data collected through this project will contribute to the broader effort to better define the scope of emergent stabilization services provided in frontier clinics and to support the development of a sustainable reimbursement framework appropriate for rural Alaska communities. Through this approach, the project will ensure that emergent care capacity at Cama'i remains stable while contributing critical data and operational insights needed to inform long-term system improvements for rural clinics providing emergent stabilization services.	\$250K-\$1M	Federally qualified health center	Single Community	Bristol Bay Borough	Deferred or Not Advanced

Camai CHC	BRACE: Bristol Bay Rural Administrative Capacity & Enhancement Initiative	AK	Cama’i Community Health Center has experienced significant growth in services in response to increasing healthcare needs in the Bristol Bay region, including expanded behavioral health programs, substance use treatment services, and school-based healthcare. While these programs improve access to care for rural and frontier communities, they also increase regulatory requirements, reporting obligations, and operational complexity. Currently, key administrative functions related to compliance oversight, quality improvement, and grant management are concentrated within a very small senior leadership team. As the organization expands programs and manages multiple federal and state funding sources, this structure creates risk related to regulatory compliance, quality monitoring, financial accountability, and long-term sustainability. The BRACE Initiative (Bristol Bay Rural Administrative Capacity & Enhancement) addresses this challenge by strengthening the administrative infrastructure required to support expanded rural healthcare delivery. By establishing dedicated roles focused on compliance, quality improvement, and grant management, BRACE will ensure that the systems supporting healthcare services are as strong and sustainable as the services themselves. Strengthening these systems will help stabilize healthcare delivery in Bristol Bay and position the organization to responsibly manage growth while continuing to serve rural and frontier communities.	Cama’i Community Health Center will address this challenge through the BRACE Initiative (Bristol Bay Rural Administrative Capacity & Enhancement), a comprehensive effort to strengthen the administrative infrastructure necessary to support sustainable healthcare delivery in the Bristol Bay region. BRACE will establish two key positions: a Compliance and Quality Officer and a Grants Administrator. The Compliance and Quality Officer will develop and oversee a formal compliance and quality improvement program aligned with federal, state, and FQHC requirements. This role will lead the implementation of compliance policies, coordinate internal monitoring and risk management activities, oversee clinical quality performance metrics, and provide training to clinical and administrative staff on documentation standards and regulatory requirements. The position will also support data analysis and reporting systems that allow the organization to monitor outcomes and continuously improve care delivery. The Grants Administrator will strengthen the organization’s ability to manage and sustain multiple funding sources that support rural healthcare services. Working closely with the Chief Financial Officer and program leadership, this role will oversee the grant lifecycle, including monitoring reporting deadlines, tracking deliverables and outcomes, ensuring compliance with federal funding requirements, and maintaining organized documentation for audits and monitoring reviews. In addition to these positions, BRACE will implement a governance and administrative training initiative to strengthen Board and leadership oversight. This component will provide training focused on fiduciary responsibility, compliance oversight, and accountability for federally funded programs. Strengthening governance will ensure that leadership and the Board are equipped to guide the organization through continued growth and increased regulatory complexity. Together, these investments will establish the operational systems required to support expanded healthcare services in Bristol Bay. By strengthening compliance, quality monitoring, grant management, and governance, the BRACE Initiative will build the administrative foundation necessary for sustainable rural healthcare delivery and long-term system improvement.	\$250K-\$1M	Federally qualified health center	Single Community	Bristol Bay Borough	Deferred or Not Advanced

Camai CHC	Bristol Bay Rural Health Cybersecurity and Digital Infrastructure Initiative	AK	Cama’i Community Health Center is a federally qualified health center serving residents of the Bristol Bay Borough and surrounding rural communities in Southwest Alaska. As the only non-Indian Health Service provider in the region, the clinic plays a critical role in maintaining access to primary care, behavioral health services, and emergency stabilization for local residents and the large seasonal workforce that supports the Bristol Bay fishery. Like many rural health providers, Cama’i relies on limited information technology infrastructure while facing increasing cybersecurity threats targeting health care systems nationwide. Rural clinics often lack the internal expertise and resources needed to fully assess vulnerabilities and implement modern cybersecurity protections. A cyberattack or system disruption could significantly impact patient care, compromise sensitive health information, and interrupt access to essential health services in a remote region where alternative care options are limited. This project addresses the need for a comprehensive cybersecurity and digital infrastructure assessment to identify vulnerabilities, strengthen system resilience, and ensure reliable, secure technology systems that support the delivery of health care in rural Bristol Bay.	Cama’i Community Health Center will implement a phased approach to strengthen cybersecurity and modernize the digital infrastructure that supports rural health care delivery. The project will begin with a comprehensive cybersecurity and information technology assessment conducted by qualified experts with experience supporting rural health care organizations. This assessment will evaluate the clinic’s current network architecture, electronic health record systems, data storage and backup processes, endpoint devices, access controls, and overall cybersecurity posture to identify vulnerabilities and areas for improvement. Based on the assessment findings, Cama’i will develop and implement a prioritized cybersecurity and infrastructure improvement plan. Planned improvements may include strengthening network security architecture, implementing advanced threat protection and monitoring tools, enhancing data backup and disaster recovery systems, improving identity and access management, and upgrading hardware or software needed to protect clinical systems and patient data. The project will also include staff training and policy development to strengthen organizational cybersecurity practices and ensure that employees understand how to recognize and prevent common threats such as phishing and ransomware attacks. Building internal awareness and capacity is critical for maintaining long-term system resilience. Together, these activities will strengthen the reliability and security of the technology systems that support patient care, protect sensitive health information, and ensure that Cama’i can continue delivering essential services to residents of Bristol Bay and surrounding rural communities. The project will also establish the secure digital infrastructure needed to support future technology-enabled care delivery models such as expanded telehealth services and remote patient monitoring.	\$250K-\$1M	Federally qualified health center	Single Community	Bristol Bay Borough	Deferred or Not Advanced

Camai CHC	Bristol Bay School HealthLink: A Wearable Health Monitoring Network for Rural Students and Staff	AK	Rural schools in Southwest Alaska face unique challenges in responding quickly to health and safety emergencies due to geographic isolation, limited on-site medical staff, and long EMS response times. In the Bristol Bay Borough School District, approximately 100 students and 50 staff spend most of their day in a setting where rapid coordination among school personnel, health providers, and emergency responders is critical. Currently, emergency communication relies on phones or radios, which can delay response during medical incidents such as asthma attacks, allergic reactions, injuries, or behavioral health crises. This project addresses the opportunity to improve emergency response and coordination by introducing wearable health and safety devices for students and staff that enable immediate alerts and communication with designated responders. By connecting the school with local health providers and emergency services, the project strengthens safety and health response capacity in a rural Alaska school setting.	The Bristol Bay School HealthLink project will implement a wearable health and safety alert system for approximately 150 students and staff in the Bristol Bay Borough School District. Each participant will receive a wearable device capable of initiating an immediate emergency alert and transmitting location information within the school environment. When activated, the device will notify designated school personnel and trigger established response protocols involving school leadership, emergency medical services, and Cama'i Community Health Center. Project implementation will occur in three phases. First, the project team will work with school leadership, local EMS, and clinic staff to finalize device selection, develop response protocols, and establish communication pathways between the school and health partners. Second, the wearable devices and supporting infrastructure will be deployed, and staff will receive training on use, emergency procedures, and response coordination. Third, the system will be integrated into routine school safety and health protocols. This approach strengthens rural health response capacity by enabling faster identification of emergencies, improving coordination between school staff and local health providers, and ensuring that students and staff can quickly request assistance during medical or safety incidents. The project will also collect implementation data to assess response times, system use, and opportunities for expansion to other rural school settings.	\$50,000-\$250,000	Federally qualified health center	Single Community	Bristol Bay Borough	Deferred or Not Advanced

Camai CHC	Riverside Safe Haven: A Bristol Bay Survivor Shelter and Healing Project	AK	Cama’i Community Health Center, in partnership with SAFE and Riverside Chapel, seeks to address a critical gap in services for survivors of domestic and sexual violence in the Bristol Bay region of Southwest Alaska. Bristol Bay is an extremely remote region where communities are not connected by road systems, and residents often travel hundreds of miles by small aircraft to access specialized services. These geographic barriers limit access to coordinated medical care, behavioral health support, and safe shelter for survivors of violence. Cama’i recently received funding to launch Sexual Assault Response Team (SART) exam services in the Bristol Bay Borough, allowing survivors to receive forensic exams locally rather than traveling to Anchorage or other urban centers. While this expansion improves access to medical care, the region has extremely limited shelter capacity for survivors who require immediate safety and trauma-informed support after an assault. This project will renovate the Riverside Chapel building to create additional shelter space and support services for survivors. Expanding shelter capacity will strengthen the region’s coordinated response to violence and ensure survivors accessing SART services can also access safe housing, advocacy, and culturally supportive healing resources within their community.	Cama’i Community Health Center, in partnership with SAFE and Riverside Chapel, will address the region’s lack of shelter capacity by renovating the Riverside Chapel facility to serve as a safe, trauma-informed shelter and support space for survivors of domestic and sexual violence. This project expands the coordinated response to violence in the Bristol Bay region and directly supports the newly funded Sexual Assault Response Team (SART) exam services being launched at Cama’i. The project will renovate the Riverside Chapel building to ensure the facility is safe and functional for year-round shelter use in rural Alaska. Planned improvements include replacing the existing furnace, installing a supplemental Toyo heating unit in the upstairs area, installing new flooring or carpet throughout the building, interior painting, and other necessary upgrades to ensure the building can safely support shelter operations. Following renovation, the facility will provide two additional sleeping spaces for survivors and their children, a private office for advocacy and case management, and a meeting room for support groups and healing activities. SAFE advocates will utilize the space to provide crisis response, safety planning, and ongoing support for survivors accessing SART exams and other victim services. This approach strengthens the continuum of care by ensuring survivors who receive forensic medical exams locally also have immediate access to safe housing and advocacy support. The meeting space will support trauma-informed group services and culturally grounded healing activities. Supplies will be purchased for traditional activities such as beading and kuspuk-making, which help promote cultural connection, resilience, and trauma recovery among Alaska Native and rural residents. To support implementation, the project will fund a part-time project manager/handyman during the first year to coordinate renovation activities and address maintenance needs associated with the older building. After renovation, SAFE will lease the facility to operate shelter services, and rental revenue will support building operations, including utilities, insurance, and maintenance, thereby ensuring the shelter's long-term sustainability.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Deferred or Not Advanced

Camai CHC	Strengthening Rural Diagnostic, Vision, and Infusion Care Access in Bristol Bay	AK	Residents of the Bristol Bay Borough and surrounding rural communities face significant barriers to accessing diagnostic and specialty healthcare due to geographic isolation, limited transportation, and the high cost of travel to regional hubs such as Dillingham or Anchorage. Many services—including diagnostic imaging, laboratory testing, vision care, and infusion-based treatments—often require patients to leave their home community. This can delay diagnosis, interrupt treatment, and create financial and logistical burdens for rural families. Cama’i Community Health Center operates a CLIA-certified moderate-complexity laboratory and provides primary care locally, but aging and limited equipment restrict the range of diagnostics and treatments available in the community. As a result, patients are frequently referred outside the region for services that could otherwise be provided locally. This project addresses the opportunity to strengthen rural healthcare access by modernizing diagnostic equipment and expanding the clinic’s ability to provide imaging, laboratory testing, vision care, emergency cardiac response, and infusion therapy locally. Expanding these services will improve timely diagnosis, support chronic disease management, and allow some patients requiring infusion treatments to remain in their home community. These investments will reduce the need for costly medical travel and improve access to timely, high-quality care for rural residents in Bristol Bay.	Cama’i Community Health Center will address barriers to rural healthcare access by expanding diagnostic and treatment capacity within the community through targeted investment in updated clinical equipment. This project will modernize critical diagnostic infrastructure and enable the clinic to provide a broader range of local services, reducing the need for patients to travel outside the region for routine testing and treatment. The clinic operates a CLIA-certified moderate-complexity laboratory and will expand its in-house diagnostic capabilities by purchasing updated laboratory analyzers, including equipment for complete blood count (CBC) testing, comprehensive metabolic panels (CMP), and rapid chemistry analysis using a Piccolo analyzer. These tools will allow providers to conduct timely diagnostic testing onsite and improve clinical decision-making for chronic disease management, acute illness, and medication monitoring. The project will also include the purchase of a modern digital X-ray unit to improve diagnostic imaging capacity for injuries, respiratory illness, and other common medical conditions seen in a rural primary care setting. To expand access to vision care services, the clinic will establish a new optometry diagnostic suite to enable providers to conduct comprehensive eye exams and screen for conditions such as glaucoma, diabetic retinopathy, and other vision-related health concerns. Emergency response capacity will be strengthened by purchasing a new defibrillator, ensuring the clinic can respond effectively to cardiac emergencies in this remote setting. Finally, the project will introduce infusion pump capability, allowing patients who require IV therapies—including chemotherapy, antibiotics, and other medically necessary infusions—to receive treatment locally under medical supervision. Together, these equipment investments will expand the scope of services available at Cama’i Community Health Center, improve the timeliness of diagnosis and treatment, and strengthen the sustainability of healthcare services for rural residents in the Bristol Bay region.	\$50,000-\$250,000	Federally qualified health center	Single Community	Bristol Bay Borough	Deferred or Not Advanced

Camp Fire Alaska	Summer Youth Wellness Programs for Western Alaska	AK	Rural Alaskan communities face a persistent summer gap in supervised, culturally relevant services for children and teens. Limited afterschool and extracurricular resources and geographic isolation leave youth with fewer opportunities for social learning, structured activity, nutrition education, and behavioral health supports. COVID-19 exacerbated these gaps: interruptions in annual programming make re-engagement difficult and increase disparities in mental and physical health outcomes between rural and urban youth. This project addresses that disparity by restoring and expanding Camp Fire’s proven Rural Alaska Program.	We will deliver four to eight-week, summer Camp Fire sessions in target communities, combining child care/supportive services with a hands-on wellness curriculum grounded in culturally relevant methods and intergenerational connection. Core Components: • Behavioral & mental health supports: daily social learning, trauma-informed practices, partnerships with Elders and local community members, and culturally based resilience-building activities. • Nutrition education: culturally adapted lessons, traditional foods integration, and daily healthy meals/snacks in partnership with local food suppliers. • Child care and structured activities: weekly programming including physical activity, behavioral and social wellness, and community engagement. • Intergenerational engagement: Elders and adult community members integrated into programming for cultural transmission and protective-factor building. • Facility optimization: collaborate with partners to adapt multipurpose community spaces (schools, halls) for flexible, dual-use to enable itinerant programming. • Sustainability strategy: combine start-up funding for initial costs with a longer-term braided funding model including family contributions when feasible, local/regional partner support, and diverse revenue streams, to move sites toward financial viability.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area	Deferred or Not Advanced

Cancer Connection	Southeast Alaska Cancer Care Support Network	AK	Cancer patients in SE Alaska face unique challenges due to geography, travel requirements, and the limited availability of services in small and remote communities. Local nonprofit organizations provide important assistance with travel, lodging, financial support, peer connection, and/or survivorship programs, yet many patients are unaware of the full range of resources available locally or across the region, yielding missed opportunities for support. Often health care providers do not refer patients to cancer support organizations, mostly due to lack of knowledge of their existence or the range of services offered. In 2025, Cancer Connection provided travel assistance funds for 58 residents from 15 different SE Alaska communities outside of Juneau. Forty of those individuals reside in localities without any type of organized support services other than, if aware, Cancer Connection’s hybrid support group, retreats, or the Let’s Talk peer mentor program. The cancer support nonprofits throughout SE Alaska currently operate independently of one another, with little information of what is being provided in other communities. Through creation of the Network participants will collaborate to gain deep knowledge of each organization's programs and services, develop strategies to increase patient and provider knowledge and use of programs and services, and establish a formal framework that increases awareness, referrals, and use of cancer support services region-wide.	Each of the identified cancer support organizations have local insights and connections that serve to realize important impact in their respective communities. By participating in the Network, significant opportunities exist to replicate or scale successful programs region-wide, and to create new work that will lead to improved and expanded prevention and support services locally and regionally. Funding from the RHTP will support a Project Director, a role essential for coordinating the Network and facilitating collaboration among volunteer-led partner organizations. The Project Director will conduct site visits, facilitate convenings, coordinate shared initiatives and support implementation of the Network’s collective work. The Project Director will contact each partner to schedule a community site visit. During this initial trip the Project Director will learn about the local nonprofit and their goals, explain the project, solicit input regarding convening design, and collaborate to identify a representative of the local organization. Once all site visits have been completed, the Project Director will plan, organize, and facilitate the first in-person Network meeting. This will include coordinating logistics, creating agendas, and preparing background research. At the convening the partners will collectively identify the Network purpose. They will set goals for what they hope to achieve, such as shared resources or joint planning, and identify collaborative actions. There will be a focus on building long-term relationships, mapping the system, identifying mutually beneficial opportunities, and combining efforts to amplify impact. The possibility of sharing resources to increase efficiency will be explored. The group will identify what data needs to be collected to measure outcomes and inform the work of the Network. A simple governance structure, with rotating leadership, will be established. Following the convening, the Project Director will: - publish and distribute a summary report - facilitate the implementation of collaborative actions identified by project partners - schedule routine check-ins with each partner - create digital tools to support communication, collaboration and data collection - host bimonthly on-line partner meetings - author and distribute a Network Newsletter - facilitate the Network Memorandum of Agreement to include each partner’s commitment	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough)	Advance to Implementation Application

Care Solace Inc.	Active Navigation, Care Coordination, and Resource Integration for Rural Alaska	CA	In the 2026 Alaska healthcare landscape, the primary barrier to wellness in rural and frontier communities is not merely a lack of clinicians, but a systemic "Last Mile" disconnection. RHTP is expanding clinical capacity and telehealth, but the burden of navigating this complex, fragmented ecosystem remains a significant point of failure for residents and providers alike. The Problem: The "Ghost Network" and Administrative Burnout Currently, 80% of Alaskan residents rely on static outdated insurance directories. This results in "ghost networks" where listed providers are unreachable or lack the specific low-bandwidth telehealth capabilities required for remote villages. For a Rural Health Aide or school counselor, coordinating a referral can take upwards of 10 to 20 hours of phone calls and follow-ups. Without a "Warm Handoff®," many referrals are abandoned, leading to crisis escalation and costly, avoidable medevacs (averaging \$50,000+ per flight). The Opportunity: Active Navigation as Infrastructure Care Solace identifies a critical opportunity to implement Active Navigation as a core component of Alaska’s "Spark Technology" (Initiative #6). By shifting from a passive "list-based" referral model to a high-accountability, human-driven coordination system, we can ensure that every RHTP-funded resource is utilized. We bridge the gap between village "spokes" and regional "hubs," ensuring that a screening in a remote village leads to a verified, attended appointment.	The proposed approach for the Alaska Rural Health Transformation Program (RHTP) is a "Frontier-First" navigation model that bridges the gap between identification and treatment. By aligning with Initiative #2 (Health Care Access) and Initiative #6 (Spark Technology), we move beyond passive directories to provide a high-accountability, human-driven coordination system. Active Navigation: The "Human-in-the-Loop" Core Unlike static resource lists that often contain "ghost" entries or providers 400 miles away, our approach utilizes Active Navigation. When anyone - a village health aide, school counselor, first responder - identifies a need, they trigger a Warm Handoff® to Care Solace. The 24/7/365 Care Companion: A dedicated team performs the exhaustive work of matching clinical needs to providers, verifying insurance (Medicaid/ARHOME/Tribal Health), and confirming current availability. Multilingual Support: We provide support in over 200 languages and dialects, ensuring cultural and linguistic barriers do not impede access in Alaska Native communities. Technical Integration: The "Digital Bridge" Our approach treats navigation as critical infrastructure, integrating directly with Alaska's health data ecosystem. HIE Connectivity: We can integrate with healthEconnect Alaska (Contexture). When an appointment is secured, the referral data can be pushed to the HIE closing the data loop. Low-Bandwidth Architecture: Our platform is optimized for the "Alaska Reality," using browser-based, light-data architecture that ensures village-level clinicians can access the system via limited satellite or GCI connections without lag. Workforce Optimization In rural Alaska, clinicians are often bogged down by administrative scope creep. Our approach acts as a Force Multiplier: Administrative Offloading: By centralizing the search-and-schedule function, we save rural staff 10–15 hours per case. Clinical Focus: This allows Village Health Aides and BHAs to focus on direct patient care and crisis intervention rather than being on hold with insurance companies. Data-Driven Sustainability To ensure the RHTP’s five-year sustainability (Initiative #4), we provide a Transparency Dashboard: Gap Analysis: We track real-time "Care Deserts" to justify targeted workforce investments. Value-Based Outcomes: We track "Speed to Care" and "Appointment Attendance," providing the DOH with evidence to move from volume-based grants to value-based care outcomes.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Cartwheel Health Services P.C.	Youth Mental Health: School-Based, Self-Sustaining Telehealth	MA	The Problem: Alaska’s students face some of the most serious mental health challenges in the country. We rank near the top nationally for youth suicide, and 43% of Alaska students were chronically absent — nearly double the national average — with unmet mental health as a leading driver. Geography makes this crisis uniquely hard to address. Long distances, extreme weather, and a limited local clinician workforce create barriers families simply cannot overcome. Even with dedicated local providers, families in many areas wait 6–12 months for basic care. Families naturally turn to schools for help. Schools are trusted institutions in their communities and see students every day. But schools can’t keep up with the volume of need, and they weren’t designed to deliver clinical care in the first place: They often lack licensed clinicians, crisis infrastructure, and the billing capabilities needed for financial sustainability. The result is a downward spiral of student crises, family frustration, and staff burnout. The Opportunity: With the right tools, schools are uniquely effective in helping families access quality mental health care. By integrating evidence-based telehealth into the local provider ecosystem, schools can reduce wait times by up to 90%, augment their local workforce, reduce staff overwhelm, and improve follow-through in care — thanks to their trusted relationships with families. This leads to better access, earlier intervention, and less burnout.	Anchorage School District (ASD) proposes to partner with Cartwheel Care to launch a school-based behavioral telehealth initiative serving students across Alaska. Cartwheel is the nation’s largest K–12 school-based mental health telehealth provider, serving 350+ school districts across 15 states including 25 tribal nations and Indigenous communities. The SouthEast Alaska Regional Health Consortium (SEARHC) is in active discussion to serve as a Tribal Health anchor for Southeast Alaska. The initiative delivers three components: 1. Direct telehealth mental health services, reducing waitlists for care by 90%. Students access therapy, psychiatry, and family counseling via telehealth — from school or home, including evenings and weekends. Clinical protocols will be co-designed with SEARHC to reflect Alaska Native cultural values and community norms. 2. Care Coordination Platform for Schools. School staff refer students to services, collaborate on cases, and track progress over time — replacing the current patchwork of email, phone, and spreadsheets. Built with the Massachusetts Dept. of Public Health and Arizona Dept. of Education, the platform improves quality of care, reduces staff burden, and gives districts the data they need to demonstrate ROI. 3. School-Based Medicaid Billing infrastructure, enabling 100% sustainability after RHTP ends. Most districts deliver services that qualify for Medicaid reimbursement but don’t bill due to complexity. This platform automates that billing. Our goal: 100% of ongoing program costs covered by Medicaid revenue by end of the grant period. Year 1 launches at two anchor sites. ASD — enrolling roughly one-third of Alaska’s K–12 students — functions as a statewide care hub, regularly serving students from rural and remote communities for care unavailable closer to home. SEARHC will facilitate introductions to districts across its 27-community network — including Juneau, Sitka, Pelican, Klawock, and Tenakee Springs — and will provide cultural guidance and a bidirectional referral pathway with Raven’s Way Campus. Students needing higher-intensity care transition seamlessly to SEARHC; SEARHC waitlist patients are referred to Cartwheel. Year 2+ scales statewide, building on Year 1 learnings and the sustainable funding model established in Year 1.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough)	Advance to Implementation Application

CATCH Global Foundation	From Prevention to Leadership: Scaling CATCH My Breath in Rural Alaskan Schools	TX	Youth vaping remains a significant public health concern among Alaskan adolescents. According to the 2023 Alaska Youth Risk Behavior Survey, 17.3% of students reported using a vape product in the past 30 days and 37.8% reported ever using one, indicating widespread nicotine exposure. While 61% of students who used tobacco products reported trying to quit, many lack access to effective prevention education and support. Nicotine exposure during adolescence carries serious health risks. Even limited use can lead to dependence, withdrawal symptoms, and long-term changes in brain development that affect attention, learning, and primes youth for susceptibility to future addiction to more dangerous substances. Vape aerosol also contains ultrafine particles, carcinogens, and toxic chemicals linked to respiratory, cardiovascular, and oral health problems. Without accessible prevention education, youth remain vulnerable to social influences, misinformation, and targeted marketing that normalize vaping. CATCH My Breath, developed in partnership with UTHHealth, is an evidence-based, school-based youth vaping prevention program grounded in Social Cognitive Theory. Research demonstrated that the program reduces vaping initiation and current use while increasing knowledge and positive perceptions of a vape-free lifestyle. This project addresses the urgent need to ensure students receive accurate information, skills, and peer support to make healthy decisions and avoid nicotine addiction.	This project will expand access to evidence-based youth vaping prevention in rural Alaskan schools by combining local leadership, virtual curriculum access, and virtual training to ensure high-quality and sustainable implementation of CATCH My Breath (CMB). Year 1: Establish Infrastructure and Build Momentum CATCH will hire and train a full-time Alaska-based CATCH Coordinator (CC) to lead statewide outreach, recruitment, implementation, and partner engagement. Working closely with organizations like SERRC, the CC will prioritize outreach to rural and geographically isolated districts. Participating schools will receive access to CATCH’s evidence-based CMB vaping prevention curricula through a robust digital platform featuring evidence-based lessons, middle school video lessons, Parent Toolkit, embedded asynchronous training, and available usage reports by teacher, school, and district to support accountability and measurable progress. Educators will also participate in virtual CATCH My Breath training, ensuring that they are prepared to implement the full scope of the CATCH My Breath program, including the 4-lesson (per grade group) core curriculum, curriculum supplements, environmental supports, and parent education materials. To strengthen program quality and foster collaboration across remote communities, the CATCH Coordinator will facilitate regular virtual Communities of Practice (CoPs) for participating educators and school leaders. These sessions will provide a structured forum for sharing implementation experiences, troubleshooting challenges, and identifying strategies for engaging students in vaping prevention, and foster an ongoing network of peer support. Years 2–5: Scale and Sustain The CC will continue district recruitment and educator support while hosting quarterly CoPs to replicate best practices and sustain peer learning. Technical assistance, usage reporting, and access to virtual training will continue. The Students Teach Students (STS) model will empower youth leaders to reinforce prevention messages among their peers. STS strengthens program relevance, increases student engagement, and helps normalize vape-free lifestyles within school communities. By combining evidence-based curriculum, virtual access, local coordination, and student leadership, this approach will expand vaping prevention programming in rural Alaska, improve the quality of youth health education, and build sustainable local capacity to address youth vaping.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

CATCH Global Foundation	Fueling Futures: School-based Physical Activity & Nutrition Curricula, Training & Sustainable Impact	TX	Alaska’s children face significant health risks driven by poor nutrition and inadequate physical activity. Per the State of Childhood Obesity, 16.3% of Alaska youth ages 6–17 have obesity, placing them at increased risk for lifelong health challenges like heart disease, type 2 diabetes, asthma, joint problems, and certain cancers. Only 18% of Alaska students meet national physical activity guidelines, less than 8% consume the recommended daily servings of fruits and vegetables, and more than half drink at least one sugar-sweetened beverage per day. These behaviors threaten long-term health and undermine academic success. Research shows healthy students are better prepared to learn, demonstrate improved cognitive performance, attend school more regularly, and achieve higher grades and test scores. Yet many Alaska schools lack the coordinated systems and trained staff needed to effectively promote student wellness. The 2022 CDC School Health Profiles Survey highlights a critical capacity gap: only 25% of classroom teachers and 28% of PE specialists received professional development (PD) related to physical activity in the prior two years, despite more than 53% expressing a desire for such training. Similarly, nearly 60% of lead health teachers wanted more PD in nutrition and dietary behavior. This project provides schools access to high-quality curriculum and PD to address the growing health and academic consequences of poor nutrition & physical inactivity among Alaska’s youth.	CATCH will implement a phased, capacity-building approach to expand access to high-quality physical education (PE) and nutrition programming while strengthening long-term sustainability across rural Alaska. Year 1: Establish Infrastructure and Build Momentum - CATCH will hire and train a full-time Alaska-based CATCH Coordinator (CC) to lead statewide outreach, recruitment, implementation, and partner engagement. Working closely with organizations such as SERRC, the CC will prioritize outreach to rural and geographically isolated districts. Participating schools will receive access to CATCH’s evidence-based PE and nutrition curricula through a robust digital platform featuring turnkey lesson plans, pacing guides, family materials, embedded asynchronous training, and usage reports by teacher, school, and district to support accountability and measurable progress. To ensure quality implementation, the CC will deliver in-person PE trainings, traveling between communities to model lessons, build educator confidence, and support fidelity. Live nutrition trainings will be offered virtually, reducing geographic barriers and enabling broad participation. In-person and virtual technical assistance will be provided throughout the year. Schools will also be introduced to the CATCH Coordination Kit (CCK). Grounded in the CDC’s Whole School, Whole Community, Whole Child model, the CCK provides a structured framework for forming interdisciplinary wellness teams, aligning stakeholders, and embedding health-promoting practices into school culture. Quarterly virtual Communities of Practice will foster peer learning, shared problem-solving, and continuous improvement across participating districts. Years 2–5: Scale and Sustain - CATCH will expand recruitment while deepening support for existing sites. A Train-the-Trainer model, initially focused on PE, will develop regional leaders capable of independently training additional educators, reducing long-term reliance on external support and embedding expertise locally. The CC will continue virtual and in-person support, monitor curriculum utilization through platform reporting, and facilitate Communities of Practice. Adoption of the CCK will be encouraged as schools build readiness and capacity. By prioritizing accessible curriculum, high-quality training, and gradual systems integration, this approach addresses immediate educator capacity gaps while laying the groundwork for sustainable, coordinated school wellness statewide.	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

CATCH Global Foundation	Healthy Minds, Ready Learners: School- Based Mental Wellness for Every Rural Alaskan Student	TX	Alaska’s youth are experiencing alarming levels of mental distress. According to the 2023 Alaska Youth Risk Behavior Survey, 34.5% of students reported feeling so anxious, nervous, tense, or scared for two weeks or more that it interfered with their ability to function. Even more concerning, 22.6% of students reported seriously considering suicide and 19% reported attempting suicide at least once during the year preceding the study. Young people across Alaska face significant barriers to accessing mental health services such as limited availability of mental health providers, fragmented systems of care, and logistical challenges such as transportation. Students may also experience internal and social barriers, including stigma, limited mental health knowledge, and fear of judgment, that prevent them from seeking help. These challenges highlight the need for a proactive approach that improves social support for preventive mental wellness and reaches all students before concerns escalate. This Tier 1, schoolwide approach is essential in communities where clinical services may be scarce or difficult to access. By integrating mental wellness education and prevention strategies into everyday school environments, schools can increase mental health literacy, normalize help-seeking, and foster safe and supportive climates for all students. Accessible, school-based prevention efforts, provide students with the knowledge, skills, and support needed to manage stress and seek help early.	This project will expand access to Tier 1 mental wellness education for Alaska’s students by partnering with school districts and community organizations to implement evidence-informed mental wellness programming and educator training designed for school-wide prevention. Year 1: First we will focus on building awareness and recruiting schools statewide. CATCH will hire and train a full-time Alaska-based CATCH Coordinator (CC) to lead outreach, recruitment, implementation support, and partner engagement. Working with organizations such as SERRC and other local education partners, the CC will prioritize rural, remote, and geographically isolated districts. Recruitment will also leverage relationships with schools already using CATCH programs. The second major activity will provide professional development to build educators’ capacity to support student mental wellness. Training will increase awareness of youth mental health factors, strengthen educators’ ability to recognize and respond to student needs, and provide strategies for fostering supportive classroom environments. Educators will receive orientation to the K-8 CATCH Health Ed Journeys curriculum, with emphasis on the Mental Health unit (3-4 lessons per grade level). Training will also introduce trauma-informed practices and strategies for integrating mental wellness promotion throughout the school day. Additional implementation training can focus on included substance misuse and vaping prevention lessons. Schools may also use the CATCH Coordination Kit to reinforce mental wellness through coordinated, schoolwide activities that promote positive school climate and normalize help-seeking. To ensure equitable access for rural schools, training will be offered through flexible live, interactive virtual sessions. The CATCH virtual curriculum platform allows educators across Alaska to access structured lessons, implementation guidance, and classroom-ready materials aligned with evidence-informed health education standards. Evaluation activities may be incorporated to assess program implementation and outcomes. Years 2-5: The CC will continue virtual and evaluation support, monitor curriculum utilization through platform reporting, and facilitate Communities of Practice. Adoption of the CATCH Coordination Kit will be encouraged as schools build readiness and capacity. Together, these strategies will equip Alaska’s schools with practical tools to proactively promote student mental wellness.	\$50,000- \$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Catholic Social Services Brother Francis Shelter Clare House	Closing the Gap: Rural Health Care Transitions for Medically Fragile Alaskans	AK	Alaska is facing an urgent and growing gap in care for Medicaid beneficiaries who are medically stable but lack a safe place to recover following hospitalization. Hospitals across the state routinely face challenges discharging individuals experiencing homelessness, which leads to avoidable or prolonged inpatient stays, repeated emergency department utilization, increased Medicaid expenditures, and poor recovery and adverse health outcomes. Consequently, medically fragile Alaskans are often discharged into unsafe environments, or they remain in high-cost hospital beds solely because they lack stable housing. This challenge is acute in Anchorage, where individuals experiencing homelessness relocate to access healthcare services and where hospitals serve as referral centers for patients from across Alaska’s rural and frontier communities. Geographic isolation, extreme weather, and limited discharge options create additional challenges. Currently, the state lacks a Medicaid-reimbursable service designed to provide short-term recovery support in community settings, despite evidence that such services are cost-effective and clinically appropriate. There is now an opportunity to establish a community-based recuperative care benefit through a Section 1115 Waiver demonstration. By building a fiscally responsible solution tailored to rural and frontier conditions, Alaska can support Tribal health systems and improve health and housing outcomes for Alaska’s vulnerable residents.	This project strengthens the Alaska health system by creating a fiscally sustainable level of step-down care for vulnerable Alaskans experiencing homelessness, who are too medically fragile to discharge to homelessness, but not sick enough to prolong their inpatient hospital stay. Adding respite or recuperative services to the Medicaid 1115 waiver demonstration provides for Alaskans who lack safe housing for recovery, specifically by creating dependable funding to provide medical respite services at our Complex Care Shelter. In rural and frontier areas, a single patient needing long-term recovery can consume a significant portion of available bed capacity, but medical respite provides a safe alternative discharge option that frees up acute care beds for emergencies and high-acuity patients. The Medical Respite program was successfully piloted in a 10-bed space at Brother Francis Shelter that provided guests with 24-hour access to semi-private rooms, meals, and intensive case management, ensuring a safe environment for recuperation for patients discharged from medical facilities in Anchorage. By offering a monitored, warm environment that supports healing and stabilization, Medical Respite supports rural residents who must travel long distances to regional hubs for acute treatment and cannot return home immediately due to medical restrictions or weather-related travel delays. Beyond immediate clinical quality, the project significantly improves system sustainability by transitioning this established Brother Francis Shelter program from a donation-dependent model to a Medicaid fee-for-service structure. This shift allows for stable staffing, better recruitment, and the establishment of consistent clinical protocols, moving the service away from unpredictable fundraising and donation cycles and into a permanent part of the healthcare delivery system. By providing a lower-cost alternative to inpatient stays and reducing avoidable emergency department returns—saving the community an estimated \$2 million in its first year alone—the project enhances the overall fiscal resilience of the state’s emergency and rural health systems. Finally, the infrastructure at Brother Francis Shelter serves as a scalable and flexible model that can be adapted across different regional hubs through Tribal organizations or other dedicated facilities.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Advance to Implementation Application

Catholic Social Services Brother Francis Shelter Clare House	The Brother Francis Shelter Integrated Recovery Hub	AK	The primary problem is the critical shortage of accessible substance use disorder (SUD) treatment for Alaskans, particularly those who are experiencing homelessness or at risk of experiencing homelessness. Alaska has recently seen a 47% increase in drug overdose deaths, and many of these individuals are rural residents who have been referred to urban centers for specialty care only to fall through the gaps of a fragmented system while experiencing homelessness. Traditional treatment models often fail this population because they frequently lack the transitional support needed to bridge the gap between high-intensity clinical interventions and long-term community stability. By establishing an ASAM Level 3.1 program at Brother Francis Shelter, we create a vital step-down recovery environment that provides the 24-hour structure necessary for individuals to maintain sobriety while focusing on social-skills development. This model allows guests to gain the essential employment, income, and personal stability required for a successful transition into independent living, effectively closing the loop in the recovery continuum. By establishing a dedicated SUD unit within this trusted community setting, we can address the root causes of disease and chronic instability for guests who would otherwise remain disconnected from broader healthcare services.	The startup costs for the new substance use disorder program have been primarily established through a congressional appropriation secured by Senator Murkowski. These initial funds provided the essential foundation for launching the SUD treatment center within the Brother Francis Shelter campus, demonstrating strong federal support for our mission to serve Alaskans with complex needs. This grant application seeks supplemental funding to bolster and complete the program’s physical and operational infrastructure. Specifically, these resources will be directed toward critical technology and safety enhancements, including a modernized security camera system and perimeter fencing designed to meet residential program standards. Additionally, the funding will support necessary location renovations, the procurement of specialized treatment materials, and the furnishings required to transform the space into a dignified, fully equipped environment for therapy-based recovery. We will leverage existing technology and telehealth infrastructure to coordinate care with tribal health organizations and rural providers, ensuring that when a guest is ready to return to their home village, there is a seamless transition of care and data sharing through the statewide health information exchange. This model prioritizes treating in place within the shelter environment to stabilize guests before they reach a point of medical crisis, thereby right-sizing the delivery system and shifting care to a more appropriate, cost-effective setting. By integrating these services into an established emergency shelter, we create a culturally appropriate, trauma-informed environment that supports both clinical recovery and social stabilization for individuals with the most complex needs.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Catholic Social Services Brother Francis Shelter Clare House	The CSS Healthy Communities Initiative: Bridging the Gap Between Farm and Pharmacy	AK	The primary challenge addressed by this project is the severe food insecurity and limited access to fresh produce across Alaska, where 95% of food is imported and grocery supplies often last only a few days. These systemic issues are exacerbated for vulnerable populations, including shelter residents and CSS clients in areas like Delta Junction and Wasilla, who lack consistent access to nutritious food. Low-income communities in Alaska currently face a high burden of chronic disease, with 75% of adults living with or at risk for conditions such as diabetes and hypertension, which are directly exacerbated by poor dietary options and high costs. Simultaneously, there is a significant gap in accessible workforce pathways for individuals with major employment barriers, such as language differences and a lack of professional networks. This project presents a strategic opportunity to expand the existing CSS client farm model to more clients to better serve these high-need populations. By scaling the "Give Local, Grow Local" framework, Catholic Social Services can connect health, food security, and economic mobility into a single, integrated pathway. Positioning agricultural production as preventative health infrastructure allows us to strengthen local food systems while providing low-income residents with a tangible route toward health stabilization and financial self-sufficiency.	The proposed approach centers on the strategic expansion of the existing CSS client agricultural framework into a comprehensive, tiered "Food as Medicine" pathway. By broadening eligibility, CSS will create a formal referral system for shelter residents and participants in the Supportive Services for Veteran Families (SSVF) program. This integration allows case managers to incorporate farm participation directly into individualized service plans, positioning agricultural engagement as a core component of health and stability. The program utilizes a structured, three-stage progression model designed to meet participants at their current level of readiness. The entry-level stage, Fresh International Gardens (FIG), provides a low-barrier environment for individuals to gain foundational skills and experience the immediate benefits of therapeutic, outdoor work. Participants then move to the advancement stage at Grow North Farm (GNF), which focuses on high-volume commercial production and rigorous skill development. The final entrepreneurship track provides specialized training in market logistics, pricing, and cooperative business models, empowering individuals to manage their own small-scale farming operations and participate in local marketplaces. A critical operational component is the "Give Local, Grow Local" (GLGL) campaign, which will be scaled to increase the volume of fresh, culturally appropriate produce distributed through the St. Francis House Food Pantry and CSS-operated shelters. This ensures that the fruits of the program’s labor directly address the food insecurity of the broader community while providing farmers with a reliable, dignified source of income. Rather than pursuing large-scale physical expansion, the initiative focuses on systems integration and demonstration, with capital investments limited to essential greenhouse improvements and agricultural equipment. Success will be measured through clear benchmarks, including food distribution volume, the number of employment-ready classes completed, and successful transitions into the broader workforce.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Catholic Social Services Brother Francis Shelter Clare House	The Food-as-Medicine Infrastructure Initiative	AK	St. Francis House faces an urgent crisis of displacement that threatens the health of Alaska’s most vulnerable populations. For 40 years, this program—the largest food pantry in the state—has operated as a cornerstone of the public health safety net. However, we are now being forced to relocate from our long-term site without a secured, permanent destination. This sudden displacement creates a critical gap in the "Healthy Communities" framework outlined in Alaska’s RHTP. Currently, 14,000 unique individuals annually—including elders, Alaskans with disabilities, and families from rural areas—rely on St. Francis House for nutrition. Without a stable location, these individuals face acute food insecurity, which is a primary driver of hospital readmissions and the exacerbation of chronic conditions like hypertension and diabetes. By renovating our existing building to house the pantry, we can move beyond a standalone service to a "Whole-Person Health Hub." This relocation allows for the seamless integration of nutritional support with our existing behavioral health and care coordination services. We have the chance to transform an emergency response into a permanent health infrastructure that addresses the Social Determinants of Health (SDOH) at their root, ensuring no Alaskan is forced into the acute care system due to a lack of basic nutrition or conditions resulting in a lack of basic, appropriate nutrition.	Our approach centers on the strategic renovation of our existing facility to create a purpose-built, permanent home for St. Francis House. By transitioning from a tenant model to an owner-occupied model, we are securing the physical infrastructure required to sustain the state’s largest and most critical nutritional safety net. The infrastructure and capacity enhancement phase of the project will transform a segment of our current facility into a modern, high-volume distribution hub. This process includes installing commercial-grade walk-in freezers and refrigerators to increase our capacity for fresh produce, lean proteins, and dairy, which serve as the cornerstones of medically necessary nutrition. We will also optimize the floor plan to implement a choice pantry model that allows clients to select foods aligning with their specific dietary restrictions. Furthermore, the facility will undergo accessibility upgrades to exceed ADA standards, ensuring we can safely accommodate the high volume of elders and individuals with complex physical disabilities who utilize the pantry. The core of our approach is the development of a Whole-Person Health Hub that integrates clinical and social services. Because the pantry will now be located within the same building as our care coordination and behavioral health teams, we will implement a dual-entry service model. Every pantry visitor will be invited to undergo a behavioral-health screening, and when a client is identified as having unmet mental health or housing needs, we will provide a referral to the appropriate internal or external resource. This referral system removes the gap where vulnerable Alaskans often fall through the cracks between disparate service providers. We also will commit to providing educational materials in all pantry boxes that deliver health education, increase health literacy, and promote sustained behavior change to prevent and manage chronic disease by featuring the National Diabetes Prevention Program and Alaska’s Fresh Start program to support improvements in weight management, blood pressure control, and tobacco cessation. This is a one-phase capital improvement project, and we have already identified the necessary building modifications. Because our organization already provides the staffing and operational oversight for St. Francis House, these funds are strictly dedicated to the bricks-and-mortar requirements of the relocation.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Catholic Social Services Brother Francis Shelter Clare House	Transforming Rural Care Delivery through Optimized Revenue Systems	AK	Catholic Social Services (CSS) is a new Medicaid-billing behavioral health provider dedicated to reinforcing the healthcare safety net for vulnerable Alaskans in Anchorage and surrounding rural regions. While CSS has rapidly expanded programs to meet the rising needs of individuals experiencing or at risk of homelessness, the agency faces significant challenges in building the administrative and operational infrastructure required for long-term sustainability. As a new billing provider, CSS has identified critical "pain points" within its Medicaid revenue cycle, including documentation gaps, inconsistent workflows across programs, and limited integration between clinical and billing systems. These inefficiencies lead to delayed reimbursements, increased staff burden, and financial instability, which hinder the agency's ability to maintain high-quality care while expanding services. This project seeks to engage an experienced consultant to conduct a comprehensive assessment of the revenue cycle and implement standardized systems of efficiency. Beyond internal stabilization, there is a transformative opportunity to develop a framework where CSS serves as a billing support hub for smaller rural agencies. By establishing shared processes and scalable infrastructure, CSS can alleviate the administrative burden on rural providers, allowing them to focus on direct service delivery and improving behavioral health access for Alaskans statewide.	Phase 1: Comprehensive Assessment and Data Gathering CSS will engage an experienced Medicaid revenue cycle consultant to conduct a full review of existing processes. This assessment includes mapping all billing workflows, reviewing documentation practices and coding accuracy, interviewing staff, and evaluating the current Electronic Health Record (EHR) functionality to determine if optimization or a new system is required. The consultant will analyze denied claims and interview staff to identify specific pain points and revenue leakage. Phase 2: Development of a Revenue Cycle Improvement Plan Working with leadership and clinical directors, the consultant will develop a prioritized action plan. Key deliverables include standardized documentation policies, updated billing procedures aligned with Medicaid requirements, and comprehensive training plans for clinical and billing staff. This phase also establishes quality assurance (QA) audit processes and EHR configuration recommendations to ensure long-term system health. Phase 3: Implementation of System Changes CSS will execute the high-impact recommendations with technical assistance and coaching from the consultant. This includes introducing standardized intake procedures, improving communication loops between clinical and billing teams, and creating performance dashboards to monitor revenue metrics and reduce claim denials. Standardized QA checkpoints will be established to maintain ongoing compliance. Phase 4: Design of a Billing Support Hub Model In collaboration with the consultant, CSS will design a scalable shared-services model to allow smaller behavioral health providers to utilize CSS's upgraded billing infrastructure. This phase involves designing workflow pathways for partners, establishing data-sharing requirements, and drafting formal partnership agreements or MOUs. The model will be piloted with one or two partner agencies to ensure scalability for rural providers. Phase 5: Evaluation and Sustainability CSS will track improvements in billing accuracy, reimbursement timelines, and staff efficiency using pre- and post-intervention metrics. Feedback from staff and pilot partners will be used to refine the shared billing model, securing long-term sustainability through revenue gains and potential partnership fees.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

CCS Early Learning	Mental Health Supports for Early Childhood	AK	Within the Mat-Su Borough, the problem to be addressed is that there are extremely limited behavioral health therapy and mental health support services for child 0-5. There is also very limited evidenced-based training for 0-5 behavioral health paraprofessionals and support staff to meet the unique needs of early childhood.	CCS’s approach is designed to significantly expand early childhood mental health services for children ages 0–5 and their families, increasing both access and quality of care. Our strategy is two-pronged: training and service delivery. First, CCS will become a certified hub providing high-quality early childhood mental health training to providers statewide. Community paraprofessionals will receive comprehensive instruction in both early childhood development and mental health before providing classroom-based support services. By equipping behavioral health associates with these specialized skills, CCS will strengthen the workforce across the Mat-Su Borough, ensuring that children in early learning programs receive timely, developmentally appropriate support. Second, CCS will establish and grow an early childhood mental health clinic. Leveraging our existing trained providers and leadership expertise in behavioral health operations, the clinic will provide outpatient services directly within our four campuses. This expansion includes hiring licensed clinicians and support staff, including case managers and fully trained early childhood behavioral health associates, to meet the growing needs of children with behavioral and emotional challenges. Through these efforts, CCS will increase both the volume and quality of early childhood mental health services. Children will have earlier access to specialized care, families will receive coordinated support, and community providers will benefit from advanced training opportunities. Ultimately, this project will not only expand services within CCS but also enhance the capacity of other local organizations to deliver high-quality early childhood mental health supports, creating a sustainable network of care for all Alaskan communities.	\$250K-\$1M	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

CCS Early Learning	Access to Early Childhood Preventative Health and Workforce Capacity Model	AK	Head Start programs are responsible for ensuring children receive preventive health screenings, care, and follow-up. In the Mat-Su, with geographic dispersion, limited transportation, and scarce provider availability it is challenging for families to access timely preventive care. Families often face delays in completing screenings and follow-up services. CCS plays a critical role in connecting children to care, but staff often manage complex health documentation without dedicated health professionals, and without the ability to access health care funding. This limits consistent support for preventive services. Strengthening preventive health access during early childhood is recognized as a key strategy for improving long-term health outcomes and reducing avoidable costs associated with delayed diagnoses, unmanaged chronic conditions, and preventable emergency care. This project presents an opportunity to advance the RHTP priorities by expanding access to preventive and primary care, enhancing workforce capacity, and implementing innovative service delivery approaches that improve care coordination. Embedding preventive health services directly within CCS centers addresses these barriers, allowing children and families to access care in known settings. This approach strengthens care coordination, improves timely access to preventive services, and builds sustainable community-based health capacity, advancing long-term health outcomes for children and families.	CCS Early Learning proposes an Early Childhood Health & Wellness Capacity-Building Model to strengthen access to preventive care, improve compliance with health requirements, and support staff and families. Central to this model is hiring a Nurse Practitioner or Registered Nurse to serve as a rotating health consultant across CCS centers. This consultant will focus on three interconnected areas: direct health services, health compliance and oversight, and workforce and family capacity building. In the direct service role, the consultant will assist programs with required Head Start health screenings, coordinate follow-up care with local medical homes and pediatric providers, and support families in completing EPSDT-recommended preventive screenings and diagnostics. This ensures that Medicaid-eligible children receive timely, comprehensive preventive care. The consultant will also provide program-level oversight, maintaining accurate health records, strengthening tracking systems, and aligning documentation with Head Start Program Performance Standards and EPSDT expectations. They will review and update health policies to reflect current regulations and evidence-based practices, and coordinate individual child health care plans, especially for children with chronic conditions such as asthma, allergies, or seizure disorders. Workforce development is a critical component. Early childhood staff will receive training in medication administration, communicable disease prevention, chronic condition management, and general health monitoring, promoting consistent, evidence-based practices across all centers. Families will also benefit from health education workshops, informational sessions, and resources on preventive care, nutrition, common childhood illnesses, and navigating pediatric services. The model uses a flexible, itinerant structure, allowing the health consultant to rotate across sites and provide hybrid telehealth support for families and staff. This approach reduces geographic barriers, aligns with RHTP priorities for mobile health teams and technology-enabled care, and ensures sustainable improvements in access, quality, and coordination of preventive health services for rural children and families.	\$50,000-\$250,000	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

CCS Early Learning	Quality Childcare for Health Care Providers	AK	The problem that we are prepared to address is the lack of availability of childcare for the healthcare workforce.	CCS Early Learning is uniquely positioned to address the shortage of childcare available to the healthcare workforce through strategic expansion, established partnerships, and phased facility development. With more than 55 years of experience delivering federally funded Head Start, Early Head Start, and other early childhood education programs in the Mat-Su region, CCS has a proven track record of providing high-quality, compliant, and sustainable childcare services. Our proposed approach includes a phased implementation strategy. In partnership with the Mat-Su Health Foundation and Mat-Su Regional Medical Center, CCS will begin increasing our organizational capacity which will allow us to offer a limited number of childcare slots for healthcare employees. These initial services would serve children ages 0–5 (with an emphasis on infants and toddlers) in a temporary location. This phase allows us to begin ramping up our capacity and to take initial efforts that begin addressing urgent workforce needs while longer-term infrastructure is finalized. Concurrently, CCS is collaborating with community partners to develop a new, purpose-built childcare facility on land located near the Mat-Su Regional Hospital campus. The proximity to healthcare employers will improve accessibility, reduce daily logistical barriers for providers, and strengthen workforce retention. We do not anticipate requesting funds for construction however, we might determine that funds for renovation or furniture, fixtures, and equipment is needed if that is determined to be allowable. Upon completion of the permanent center, CCS will obtain State of Alaska licensure and transition services into the new facility to ensure long-term sustainability and regulatory compliance. This phased model creates immediate impact while establishing a durable childcare solution designed to stabilize and support the healthcare workforce serving rural communities.	\$250K-\$1M	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced
Center for Community	Center for Community Fire Sprinkler Repairs – Sitka, AK	AK	The sprinkler in the building needs to be repaired so it works properly and is up to the NFPA 13 code	We would have someone who is appropriately certified for the job do all repairs needed to bring the sprinkler system up to code	\$50,000-\$250,000	Single Community	Sitka (City and Borough)	Deferred or Not Advanced

Center for Community	Electronic Health Record (EHR) System for Center for Community’s Early Learning Program	AK	Our Early Learning Program currently relies on paper-based documentation for progress notes. This manual system presents operational challenges that impact efficiency, accuracy, compliance, and overall program effectiveness. Handwritten progress notes are often difficult to read, increasing the risk of data entry errors and exclusion of mandatory documentation. For example, contact notes frequently have incomplete required elements such as: ICD codes, service dates, service times, billable units, signature of therapist, and location of service. These omissions create compliance risks with Medicaid Alaska and other billed insurances, require additional administrative time to correct, and may delay billing. The absence of an electronic health record system translates to duplicate data entry for record keeping and billing. There is a clear opportunity to modernize our documentation system by implementing an electronic record-keeping solution. Implementing a digital platform would: streamline documentation processes, improve data accuracy, save time, cut the cost of carbon copies, and reduce billing delays, which would all support higher-quality service delivery for children and families.	The Early Learning Program will research a secure electronic health record software that is specifically designed to support early intervention service delivery and billing. The ideal platform will have the ability to bill all health insurances, including but not limited to: Medicaid, Tricare and private insurance companies in Alaska. The Early Learning Program will connect with other Infant Learning Program coordinators across the state to gather information and reviews of the systems they are using. ELP will research across the nation what early intervention programs are utilizing for electronic health record keeping and billing. We will choose the best platform that will meet our program needs. Next, we will work with the chosen company to modify the software exactly tailored to the requirements of Alaska's early intervention laws. Finally, we will implement the electronic health record system and billing system. Training will be necessary amongst staff. During the last phase of implementation, we will receive ongoing technical assistance from the EHR company to trouble shoot any issues that arise.	\$50,000-\$250,000	Single Community	Sitka (City and Borough)	Deferred or Not Advanced

Center for Community	Expanding Eligibility For Southeast Alaska's Early Intervention Programs	AK	Many young children with developmental delays or involvement with Office of Children's Services enter school without receiving timely, high-quality early intervention. As a result, they are more likely to be referred for special education services, particularly for speech-language and social delays, even when earlier support could have prevented special education services. The current state system of a child needing a 50% delay in one or more developmental domains leaves many children behind. Current systems lack consistent developmental progress monitoring, child-centered outcome tracking, and longitudinal data for those children who miss the eligibility percentage (50%) but still qualify as at-risk or have a delay of 25-49%. At the same time, early intervention programs face sustainability challenges due to limited insurance billing capacity and inconsistent reimbursement. This proposal creates an opportunity to strengthen developmental monitoring, improve family outcomes, and build a sustainable funding model that reduces long-term educational costs. By implementing a structured data collection system, tracking children into early elementary school, and expanding private insurance billing, the project addresses both service quality and financial sustainability. This initiative fills a critical gap by generating actionable data on developmental progress, family engagement, and special education avoidance.	This project will implement a data collection and outcomes measurement system paired with a sustainability and billing expansion strategy. First, each child will receive a baseline standardized or criterion referenced developmental assessment at enrollment. Early intervention providers will then conduct quarterly progress monitoring using criterion-referenced checklists, language samples, parent-reported functional outcomes, and observational data from home and community visits. These data will generate individualized growth curves that show each child’s rate of skill acquisition and identify children who may no longer require services. Second, the project will build a longitudinal dataset to track whether children require special education services upon kindergarten entry. Data will include the type and intensity of services, comparisons between children with developmental delays and those with no delays, but has involvement with Office of Children's Services. Finally, this project will strengthen financial sustainability by expanding insurance billing. The insurance reimbursement from children with a 25-49% delay, will be able to support most of the program's future stability.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Juneau (City and Borough); Ketchikan Gateway Borough; Sitka (City and Borough)	Deferred or Not Advanced

Center for Safe Alaskans	Alaska Rural Transportation Safety Surveillance System	AK	There is a lamentable data gap in assessing transportation safety in rural Alaska. We have good data indicating the frequency of injuries resulting from snowmachines, boats, and ATVs from the AK trauma registry. We do not have data to understand "exposure" to off-road transportation in rural Alaska. There is no data on the actual amount of time or distance these machines are used. It is therefore difficult for community leaders to determine whether their local injury rates reflect a high-risk environment or simply a high-usage one, as modes of transportation and usage rates vary by region and season. This is an opportunity to leverage our group’s years of experience in survey design, methodology, and analysis to gain insight into the missing data and generate statistically valid estimates of injury rates stratified by geography, demographics, season, etc. We propose integrating incentivized web-based surveys into existing administrative touchpoints, like when residents register boats, snowmachines, and ATVs with the State. Further insight can be achieved by applying a similar approach to applicants for hunting and fishing licenses, endeavors that often require high use of these transportation modes, and are critically important to rural Alaskans’ subsistence. This project can alleviate a substantial data blind spot by implementing sophisticated, statistically valid survey sampling to better understand, compare, and monitor rural injury and identify prevention interventions.	Our approach utilizes "logical common sense" and established digital survey tools to capture the "denominator" data required for frequency estimation and true risk assessment. 1. Incentivized Web Surveys: We will design a low-bandwidth, mobile-friendly, incentivized survey platform that captures usage metrics (e.g., average hours per week or seasonal mileage) and recent injury experiences. 2. Strategic Integration: Rather than creating a standalone survey, for which identifying target populations to recruit from and successfully recruiting participants (e.g. text message recruitment with PFD database telephone information) is inefficient, we propose partnering with state agencies to achieve improved survey recruitment (and focused on likely users of off-road transportation) via encouraging with incentives and convenient web link survey participation at the point of action, specifically during the Fish & Game licensing process or ATV/boat/snowmachine registration. Persons “touching” the State system at both of these departments are almost certainly the majority of users of these alternative modes of transportation (and if not themselves specifically, they can report family use) 3. Data Linkage: We will apply appropriate statistical modeling and weighting to link this new usage data with existing State injury registry data. This allows us to calculate, for the first time, injury rates per hour of operation across different regions/groups. 4. Targeted Oversampling: To ensure the results are representative of "truly rural" life, we will specifically oversample rural and Alaska Native populations in our survey recruitment efforts (perhaps through the use of survey “quotas”). By integrating this surveillance into existing state portals, we can minimize rudimentary mandatory reporting burden while using sampling techniques/methods to maximize the quality of the data	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Center for Safe Alaskans	Data Insights to Action: Building Rural Prevention Communication and Action Capacity in Alaska	AK	Alaska's prevention landscape is fragmented. Coalitions addressing suicide, substance misuse, violence, and family wellbeing often operate in silos — unaware of complementary efforts nearby or statewide — despite sharing common upstream drivers. Limited infrastructure exists to connect these coalitions, align messaging, or translate the state's rich surveillance data into tools communities can actually use. The result is inefficiency and missed opportunity. Prevention data sits in dashboards while frontline coalitions craft messaging without analytical support. Communities with the greatest prevention needs often have the least capacity to communicate effectively about them. Coalition leaders — frequently volunteers or multi-role staff — face significant barriers in turning data into practical action, and data professionals are stretched too thin to provide consistent community-level support. This project creates the connective tissue Alaska's prevention ecosystem is missing: linking data analysts with communicators, coalitions with each other, and surveillance systems with locally resonant community action.	The Center for Safe Alaskans will build practical, sustainable infrastructure connecting prevention data to community action through three mutually reinforcing strategies. Strategy 1: Data Translation and Asset Development Beginning in Summer 2026, graduate students will be mentored in data translation — reviewing, refining, and expanding a toolkit designed to convert Alaska OARS and other surveillance data into ready-to-use messaging assets. Coalition partners statewide will help shape these assets to reflect local priorities, cultural contexts, and community voices rather than generic statewide messaging. The Center's Health Communications Neuromarketing Lab will support message testing to ensure outreach resonates with intended audiences. Strategy 2: Coalition Alignment and Capacity Building The project will convene prevention coalitions, data professionals, and communication practitioners to strengthen collaboration across Alaska's prevention ecosystem. Prevention coalitions rarely have both data and communications skill sets in-house. By bringing these groups together, the project breaks down silos that keep good data from becoming good messaging — and creates innovation spaces where partners can respond collectively as the communication environment evolves. Strategy 3: Locally Relevant Communication Working alongside community partners, the Insights to Action Team will develop communication approaches that resonate within rural Alaska communities. Strategies include community-authored media, culturally grounded storytelling, adaptable messaging toolkits, and locally shaped outreach materials. Flexible contractual partnerships will expand reach by engaging local experts, media producers, and implementation partners as needed. Across all three strategies, the project will track outreach efficacy over time, creating a continuous feedback loop that improves both messaging quality and coalition reach — and ensures measurable, evidence-informed impact in rural Alaska communities.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Center for Safe Alaskans	Rural Injury Prevention Safety Initiative	AK	Injuries remain a significant and preventable cause of death and disability in Alaska. Rural communities face particular challenges due to limited access to prevention programs and workforce shortages, making it difficult to sustain safety initiatives locally. Over the past 25 years, Safe Alaskans has developed and implemented evidence-based transportation safety initiatives across Alaska, including child passenger safety programs, youth engagement initiatives, pedestrian safety education, and driver safety tools. While these initiatives have demonstrated success, many rural communities lack the capacity, training, and resources needed to implement them consistently. At the same time, Alaska currently lacks a structured model for delivering injury prevention programs through rural hub communities that builds lasting local capacity. Programs often operate as short-term projects rather than sustainable systems. This project addresses that gap by developing a replicable rural implementation model for safety initiatives. Through partnerships with hub communities, Safe Alaskans will adapt existing programs to local contexts, train community-based professionals to implement them, and provide the equipment and technical support necessary to sustain them. By creating a scalable framework for delivering prevention initiatives in rural settings, this project will strengthen community capacity to prevent injuries, improve health outcomes, and support safer environments across Alaska.	Safe Alaskans will establish a Rural Injury Prevention Initiative to expand access to evidence-based injury prevention programs while building long-term community capacity. The project will use a hub-community partnership model, working with regional communities to serve surrounding areas. Safe Alaskans will collaborate with local partners,such as public health nurses, school districts, tribal health organizations, and community safety advocates, to adapt and implement programs that address local transportation safety needs. Core project activities will include: Training and Workforce Development •Train and mentor community members to become Certified Child Passenger Safety Technicians and develop child passenger safety programs. • Provide training in pedestrian and bicycle safety education through traffic garden programs. • Train local staff to use virtual driving assessment technology to support safe driving skill development among youth. • Train local staff to implement fall prevention initiatives, specifically fall prevention kits (i.e. kits of materials to reduce falls in and around the home), to support fall prevention among older Alaskans. Program Implementation • Support local car seat inspection and distribution programs. • Implement youth pedestrian and bicycle safety programs. • Provide safe-driving education opportunities using virtual simulation technology. • Support youth-led community safety projects that promote protective factors and leadership. • Increase access to fall prevention education and resources among older Alaskans. Community Adaptation and Learning Programs will be adapted collaboratively with local partners to ensure alignment with community needs and cultural values. Safe Alaskans will work with communities to refine program models that can be implemented sustainably in rural contexts. Development of a Rural Implementation Model Throughout the project, Safe Alaskans will document lessons learned and develop practical tools—including training materials, implementation guides, and evaluation tools—to support future expansion of transportation safety initiatives across Alaska. This approach combines prevention programming, workforce development, and healthy community capacity building, aligning with RHTP priorities to strengthen rural health systems and improve population health outcomes.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Center for Safe Alaskans	Virtual Home Visiting: Developing a Cell-Based Model for Rural and Remote Alaska Communities	AK	Alaska's rural mothers and infants lack support that mountains of evidence indicates results in better child outcomes. Home visiting programs consistently demonstrate improved birth outcomes, reduced child abuse and neglect, better developmental trajectories, and stronger family functioning. Yet rural communities with perhaps the greatest need have the least access. No existing home visiting model sustainably in rural Alaska, given the logistic barriers of these villages. Our work builds on the “SmartMom” concept developed by Dr. Adam Zolotor at the University of North Carolina, who explored “cell-based” virtual home visiting. That early work stalled because necessary technology was not yet mature. Satellite internet through Starlink and expanding cellular coverage have been a game-changer, reaching communities that were previously disconnected. Dr. Zolotor has encouraged us to advance his foundational work within Alaska's rural context. The model concept has 3 core components. First, rural mothers gain access to professional clinical support, peer connection, and developmental screening. Second, the model extends nurse capacity dramatically, allowing a single nurse to support families across many communities, less limited by geography. Third, the approach builds in sustainability by design via lower per-family costs and a staffing model that does not require recruiting providers to relocate to remote villages.	Our approach is to develop a complete, pilot-ready, virtual home visiting program package. . The model centers on nurse-facilitated support delivered through smartphones to mothers across multiple rural villages simultaneously. Core service components include facilitated group video sessions where mothers from different communities connect with peers and a facilitating nurse, scheduled one-on-one video consultations for individualized clinical assessment, structured educational content in culturally appropriate formats, validated developmental and psychosocial screening with immediate nurse review, and warm referrals to behavioral health, substance use treatment, nutrition programs, and other services. As an incentive, each enrolled mother receives a smartphone with activated service at no cost - as long as they maintain regular program participation Development has four phases. First, we will build a mobile technology platform optimized for Alaska's connectivity realities with offline functionality for intermittent service and low-bandwidth design. This aligns with the Spark Technology and Innovation initiative by deploying consumer-facing digital health tools in frontier settings. Second, we will adapt comprehensive curriculum content in partnership with ANTHC, THOs, tribal health workers, and traditional birth workers, spanning prenatal preparation through 36-month child development. This directly advances Healthy Beginnings by expanding evidence-based home visiting to rural families. Third, we will develop clinical protocols including screening tools, referral coordination systems, and nurse training curricula. This supports Health Care Access by creating support for behavioral health, specialty care, and community services regardless of location. Fourth, we will design operational systems including enrollment workflows, data management, quality assurance, and sustainability models demonstrating long-term cost-effectiveness. We will engage diverse rural Alaska communities representing different cultural groups, geographic regions, and existing health infrastructure in the process to ensure the model respects local preferences, incorporates village health aide expertise, and builds on, rather than displaces, existing community support systems. This aligns with the Healthy Communities initiative by centering community voice in program design.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Central Area Rural Transit System, Inc. (CARTS)	Collaborative Rural Transit Development Plan for Sustainable Mobility in Seward and Homer	AK	Across the Kenai Peninsula, communities such as Homer and Seward are growing and changing, yet neither community has undertaken a comprehensive process to evaluate long term public transportation needs or identify feasible service models that reflect current population patterns, travel needs, and community priorities. Without a coordinated planning effort, communities lack the data, partnerships, and strategic direction necessary to pursue sustainable transportation solutions. This project addresses the opportunity to conduct a structured, community driven planning process that brings together local governments, service providers, health organizations, and community stakeholders to better understand mobility needs and evaluate potential transit strategies. The project will assess current transportation conditions, identify service gaps, analyze demand for transit, and explore practical options that could improve connectivity within each community and between surrounding rural areas and essential services. By developing a comprehensive transportation plan, communities will gain a clear framework for future decision making, funding opportunities, and implementation strategies. The planning effort will position Homer, Seward, and surrounding areas to pursue transportation solutions that support community mobility, strengthen access to services, and respond to the evolving needs of residents across the region.	This project will support the development of a comprehensive transportation plan for Homer, Seward, and surrounding communities on the Kenai Peninsula. Planning funds will be used to hire a qualified transportation consultant with experience in rural and community based transit planning to guide a structured and collaborative planning process. The planning process will begin with an assessment of existing transportation conditions within each community. This will include reviewing current transportation services, identifying gaps in mobility, and analyzing how residents currently travel to reach health care, employment, education, and other essential destinations. Particular attention will be given to understanding how transportation barriers affect residents living outside city centers. Community engagement will be a central component of the project. Residents, health care providers, social service organizations, employers, tribal partners, and local governments will be invited to participate through public meetings, surveys, and targeted stakeholder discussions. These activities will help ensure that the planning process reflects the experiences and priorities of the people who rely most heavily on transportation to access essential services. Using data gathered through research and community engagement, the consultant will evaluate potential service models and operational approaches that could improve mobility in Homer and Seward. This may include analysis of flexible transit options, partnerships with existing transportation providers, and other scalable solutions appropriate for rural communities. The planning process will also examine potential governance structures, operating costs, and funding strategies needed to support long term sustainability. The final outcome of this project will be a comprehensive transportation plan that outlines recommended strategies, phased implementation options, and potential funding pathways for developing public transit in Homer and Seward. This plan will provide local partners with a clear roadmap to guide future investments and support the development of transportation solutions that improve mobility, strengthen access to services, and respond to the evolving needs of the region.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Planning

Central Council Tlingit and Haida Indian Tribes of Alaska	Rooted in Wellness: Building a Sustainable Model for Tribal Behavioral Health	AK	Alaska Natives, which include many of our staff and the individuals that Tlingit & Haida serves, experience disproportional rates of mental illness, substance use disorder, incarceration, and victimization. This, coupled with a nation-wide disparity of services and providers, especially indigenous providers, speaks volumes to the problems the Tribe’s Community and Behavioral Services division attempts to address. One of the most important statistics is that among American Indian and Alaska Native people needing treatment in 2021, only 5.3% received any treatment and just 3.7% received specialty care - the largest gap of all racial/ethnic groups. Furthermore, in 2022, AI/AN people were 91% more likely to die by suicide than the U.S. population overall. Tlingit & Haida strives to improve mental health and wellbeing for our tribal citizens, to increase access to care, to reduce violence, reduce incarceration, and reduce untreated substance use disorders and mental illness. We strive to increase the number of providers available to our tribal citizens, especially Alaska Native providers.	Tlingit & Haida’s Community & Behavioral Services (CBS) division hopes to leverage these funds toward the following three goals: 1. Expand and increase access to the of spectrum of behavioral health services available to tribal citizens in Southeast Alaska communities; 2. Improve staff development and retention; 3. Ensure program fiscal sustainability. CBS consists of our CARF accredited Healing Center providing behavioral health services, our NARR Accredited Reentry & Recovery program consisting of three non-congregate homes offering reentry support services for people coming out of substance use treatment and incarceration, and the Community Advocacy Program serving tribal citizens that are victims of crime, co-located with the Healing Center. Services within our division include Individual, family and group therapy; same-day crisis response; assessments and referrals; case management; prevention and education; reentry support; victim advocacy and emergency support; postvention crisis collaboration; community healing events; psychological testing; 24/7 365 Crisis Hotline; CultureHeals.com online platform. Our mission is to empower community healing and break intergenerational cycles through the holistic embodiment of our tribal values. Our vision is to provide comprehensive, integrated behavioral health services spanning the continuum of care from prevention to postvention, easily and readily available to our tribal citizens throughout Alaska. Tribal values are the core of our work. Culture is not just something we learn about – it is the daily life of our staff, integrated into everything we do, and represented in all our day-to-day functioning. We prioritize individual and community needs, truly attempting to reduce barriers to care and healing. We value strong collaboration with other programs and community partners and ensure we are accessible and trustworthy in all our work. The foundation has been laid, and these funds would bridge us from ‘start-up programs’ that have to chase grants every year, to a fully sustained division that is billing for a spectrum of behavioral health services. We hope to explore value-based care and reduce administrative burdens from the start. These funds would ensure vital access for our tribal citizens and help expand our current offerings. Additionally, they would help strengthen our workforce, would ensure adequate training and licensure, prevent staff burn-out, and build future leaders.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

Central Council Tlingit and Haida Indian Tribes of Alaska	Indigenous Foods: A Traditional Solution to the Modern Health System	AK	Since 1935, Tlingit & Haida has watched the colonization of our food systems. Diets shifted from traditional to commodities-based, bringing health issues. The obesity rate among Alaska Native youth is 33.8%, approximately 50% higher than the rest of the U.S. (NIH, 2023), increasing risk for adult obesity, liver disease, cardiovascular disease, and diabetes. Alaska Natives are 2.5 times more likely than Caucasians to die from type 2 diabetes, 1.2 times more likely to die of heart diseases, and more than 4 times more likely to die from diseases of the liver. Reliance on food systems of the continental U.S. means importing groceries with high prices and short shelf life. More than 25% of Alaska Natives are living in poverty, a rate over double the general population (NIH). Certain tribal groups are approaching 40%. Alaska ranks 49 in average weekly grocery cost by state (BLS, 2025), with households seeing an 8.8% average annual cost increase year over year. Southeast Alaska spans more than 35,000 sq. mi. Urban communities such as Anchorage or Juneau have different food needs than the rural villages, and due to indigenous history, geographical location, and accessibility, no two rural communities share the same food needs. With encapsulating regional food data being such a difficult task, Tlingit & Haida’s Traditional Food Security program will conduct a traditional food needs assessment and transform the region’s health systems through food.	Tlingit & Haida serves 38,000 Tribal Citizens across 19 communities – including Anchorage, Juneau, and 17 rural Southeast Alaska villages and towns. Since time immemorial, our people have served as stewards of the lands and seas of the Inside Passage, ensuring balance throughout the region as we carefully harvested indigenous foods and upheld our traditional way of life. The Tlingit and Haida people’s history is spoken, not written. Culture was passed along in-person and learning opportunities involved storytelling and hands-on demonstrations. While utilizing technology typically improves data collection, technology use lags in rural areas not only due to limited connectivity, but an inherent need to adhere to traditional communication methods. For this reason, efforts to collect regional data have been ineffective. Data collection attempts by the Traditional Food Security program - including mailings lists and social media - have provided limited responses and, ultimately, unreliable data. As part of the three-year project, Traditional Food Security staff would host indigenous foods community events in 19 Alaska locations – Anchorage and 18 Southeast Alaska communities. These community events would feature hands-on demonstrations focused on the traditional methods of harvesting, processing, preserving, and preparing foods of the region. They will feature storytelling, language, and arts, as well as in-person data collection. Our program will partner with local clinics to provide education and health screenings as part of the event. Community events would typically last 1-2 days, demonstrations will feature foods with availability based on the traditional foods calendar and be open to Tribal Citizens of all ages. The Traditional Food Security program hosts community events for 1,000 participants annually. Whether hosting classes focused on the traditional harvest of fish, deer, seal, or other historical food source, these events are continually well attended and are the ideal space to not only connect people with foods and pass on traditional knowledge, but to combine with data collection. Data that will help us mold a strategic food plan for the region while addressing the unique needs of all our Tribal Citizens. For us, food is medicine. A health system built on this idea will not only address food security but decrease reliance on Tribal health systems.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Wrangell (City and Borough)	Deferred or Not Advanced

Central Council Tlingit and Haida Indian Tribes of Alaska	Transforming Rural Youth Health Through Indigenous Physical Activity and Community Leadership	AK	Rural Alaska Native youth face disproportionate challenges related to physical inactivity, mental health risk, and social isolation—factors that significantly influence long-term health outcomes. Alaska’s geography includes vast remote communities accessible only by air or water. These challenges contribute to serious health disparities. Alaska has one of the highest youth suicide rates nationally, and Alaska Native youth experience disproportionately higher suicide rates and behavioral health challenges than other populations. Research identifies physical activity, cultural identity, and mentorship, as protective factors that strengthen youth resilience and reduce suicide risk. However, many rural communities have limited opportunities for organized physical activity programs outside of school settings. The Central Council of Tlingit and Haida Indian Tribes of Alaska proposes to expand its Youth Wellness Native Youth Olympics (NYO) work, a culturally grounded approach that combines traditional athletic games with mentorship, leadership development, and mental health awareness. By expanding NYO-centered programming in rural communities, this initiative will increase youth engagement in healthy activities, strengthen community support networks, and advance culturally rooted approaches to youth wellness. The project aligns with Rural Health Transformation Program goals to improve physical activity, strengthen mental health resilience, and build healthier rural communities.	This project will implement a community-driven, four-component model that equips rural Alaska communities to establish and sustain culturally grounded youth wellness programming centered on Native Youth Olympics. 1. Local Capacity Building and Training The project will train local community members to serve as NYO coaches and youth mentors. Training will include: • NYO coaching certification and program facilitation • Youth Mental Health First Aid and suicide prevention training • “Together We Are Stronger” leadership development modules • First Aid and CPR certification to ensure safe activity environments These trainings equip trusted local adults to guide youth in culturally relevant ways while strengthening community capacity to support youth mental health and resilience. 2. Equipment and Program Resources Many rural communities lack basic recreational equipment and program materials due to limited budgets. The project will provide: • NYO equipment and physical activity supplies • materials for community events and youth programming • resources for camps, training sessions, and community gatherings Providing direct resources allows communities to begin programming immediately without financial barriers. 3. Community Site Visits and Sustainability Planning Program staff will conduct site visits to participating communities to deliver equipment, support program launch, and conduct collaborative planning with local leaders. These visits will help identify community strengths, program needs, and potential barriers while developing sustainability plans tailored to each community. 4. Regional Engagement and Youth Leadership Development Funding will support travel for youth to participate in regional and statewide NYO events and gatherings. These events foster cross-community mentorship, strengthen cultural identity, and reduce the sense of isolation experienced by many rural youth. Annual summer camps will provide immersive physical and cultural programming, followed by seasonal refresher trainings that maintain program momentum during the school year. The program anticipates serving three to four rural communities each year, prioritizing areas demonstrating both need and readiness for partnership.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Central Peninsula General Hospital	Rural Health Facility Modernization to Meet Patient Demand	AK	Central Peninsula Hospital (CPH) serves as the primary hospital for the Kenai Peninsula. As the population grows, particularly among older adults with complex medical needs, demand for inpatient care, diagnostic services, and rehabilitation increases. However, several core hospital facilities are aging or constrained, limiting the hospital’s ability to expand services and support patient volume growth. The clinical laboratory currently lacks sufficient space to install modern diagnostic analyzers and expand microbiology and hematology services, restricting CPH’s capacity to provide timely local testing. Similarly, other infrastructure, such as laundry services and clinical support spaces, was not designed for the expected 50–60% growth in inpatient and long-term care census. Without expansion and modernization, these infrastructure limitations slow diagnostic turnaround times, create operational bottlenecks, and constrain service capacity. In addition, several facilities identified through the hospital’s facility condition assessment require timely upgrades to maintain safe and reliable operations. Addressing these issues presents an opportunity to modernize critical infrastructure while preparing CPH to support future growth in patient volume and service complexity. This project will modernize and expand key hospital facilities, including the clinical laboratory, laundry services, and rehabilitation clinic, while creating additional clinical space to support growing demand.	CPH will implement a coordinated facility modernization and capacity expansion strategy focused on strengthening core infrastructure that supports inpatient care, diagnostics, and hospital operations. This project focuses on minor renovations and capacity adjustments within existing facilities that allow critical hospital systems to function efficiently and safely. Clinical Laboratory Renovation: CPH will make limited modifications to the existing laboratory footprint to accommodate updated diagnostic analyzers and additional workstations for chemistry, microbiology, and hematology. These improvements primarily involve reconfiguring existing space so new equipment can be installed. This modest renovation will allow the laboratory to maintain modern testing capability and support faster diagnostic turnaround times. Laundry Facility Modernization: The hospital will complete a minor renovation of the existing laundry department to improve workflow and increase processing capacity within the current facility. These upgrades will help the hospital keep pace with increased linen and material processing needs as patient census grows, ensuring reliable operational support for inpatient and long-term care services. Rehabilitation Clinic Priority Improvements: The project will address minor but important facility repairs identified through the hospital’s facility condition assessment. These include roof, exterior enclosure, and site improvements needed to maintain safe and reliable building operations at the rehabilitation clinic in Kenai. Addressing these issues proactively prevents larger facility failures that could disrupt patient services. Support Services Building Alterations: CPH will perform minor alterations to an existing off-site commercial space to create additional operational capacity and relieve pressure on crowded hospital departments. This renovation focuses on adaptive reuse of an existing building rather than new construction, allowing the hospital to efficiently expand functional space. These incremental infrastructure improvements allow CPH to maintain reliable hospital operations, accommodate modest growth in patient demand, and preserve essential services for rural communities without requiring large-scale capital expansion.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Central Peninsula General Hospital	Rural Healthcare Access Expansion Through Technology-Enabled Care	AK	Central Peninsula Hospital (CPH) serves as the regional health care hub for a large and geographically dispersed population across the Kenai Peninsula. Like many rural health systems, CPH faces growing challenges related to provider workforce shortages, increasing patient complexity, documentation burden, and limited access to specialty services. Clinicians spend significant time on administrative tasks, reducing time available for direct patient care and contributing to burnout. At the same time, gaps in clinical documentation and data management limit CPH’s ability to capture appropriate reimbursement, demonstrate quality outcomes, and participate effectively in emerging value-based payment models. Rural access barriers further compound these challenges, as patients often travel long distances for specialty services that could be offered via telehealth. This project addresses these challenges through a bundled investment in digital health infrastructure, including clinical documentation improvement, telehealth expansion, and cybersecurity. This expansion will reduce administrative burden on providers, improve care coordination, enhance regulatory compliance, and strengthen the hospital’s ability to deliver high-quality care locally.	To address these barriers, CPH will implement a coordinated digital health modernization strategy that integrates clinical documentation technology, telehealth expansion, data management infrastructure, cybersecurity protections, and compliance systems. The approach is designed to reduce provider administrative burden, improve documentation accuracy, strengthen data security, and expand access to specialty care for rural patients. Implementation will occur over 12 months to allow for testing, training, and gradual scaling across departments. Project components include: • Clinical Documentation Improvements: CPH will deploy ambient AI documentation technology and a structured clinical documentation improvement (CDI) program. These tools reduce administrative burden on clinicians, improve documentation quality, and strengthen reimbursement accuracy. • Rural Telehealth Expansion: CPH will expand access to telehealth services for pediatric specialty care and support for rural patients. • Data Infrastructure and Cybersecurity: CPH will deploy an upgraded data management and cybersecurity system to strengthen data governance and protect patient data. These upgrades provide the backbone required to support telehealth, AI tools, and secure patient data. • Compliance and Operational Infrastructure: CPH will deploy a Compliance Management System, a centralized platform for environment-of-care and life safety monitoring, and an environmental services software designed to digitize paper-based processes. The systems improve regulatory compliance, infection control monitoring, and operational efficiency. This initiative directly supports several Rural Health Transformation Program priorities: • Spark Technology & Innovation: Implements modern health IT infrastructure • Health Care Access: Expands rural access to specialty services through pediatric telehealth consultations • Pay for Value Fiscal Sustainability: Improves documentation accuracy and data readiness to support quality reporting, utilization management, and participation in emerging value-based and alternative payment models. • Strengthen Workforce: Reduces administrative burden through workflow redesign and technology-enabled documentation	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Central Peninsula General Hospital	Rural Specialty Care Access and Advanced Diagnostics Expansion	AK	As demand for specialty care grows, particularly among the region’s aging population, access to advanced diagnostics, surgical services, and coordinated specialty care remains limited. Rural residents must travel to Anchorage for procedures, specialty consultations, or advanced imaging when local capacity is constrained or unavailable. These transfers create financial hardship, delay treatment, and disrupt continuity of care. At the same time, several critical pieces of equipment at Central Peninsula Hospital (CPH) are outdated, creating reliability risk and limiting the ability to expand specialty services locally. Without modern surgical technology, imaging systems, and sterile processing capacity, CPH cannot safely grow procedural volume or support new specialty providers in the region. In addition to infrastructure limitations, patients with incidental findings or complex conditions often experience delays navigating specialty referrals and diagnostic follow-up. Strengthening patient navigation and utilization management capacity presents an opportunity to ensure that rural patients move efficiently through health care pathways. The project addresses these challenges through a coordinated investment in advanced surgical technology, diagnostic equipment modernization, patient navigation tools, and utilization management systems. Improvements will expand access, improve diagnostic capacity, and strengthen coordination, allowing more patients to receive care close to home.	CPH will implement a coordinated specialty care expansion strategy that combines advanced clinical technology, improved diagnostic capacity, and enhanced care coordination systems. The project focuses on expanding local procedural capability, modernizing diagnostic equipment, and strengthening systems that guide patients through specialty care pathways, allowing more rural patients to receive specialty care locally while improving clinical quality and operational efficiency. Advanced Surgical Capacity: CPH will deploy a robotic surgical system to expand minimally invasive surgical options. Robotic-assisted surgery allows more complex procedures to be performed locally with shorter recovery times, improved precision, and reduced complications. Diagnostic and Procedural Technology Modernization: The project will modernize critical diagnostic and procedural equipment needed to support expanded specialty services. A new mobile C-Arm fluoroscopy system will replace aging imaging equipment, improving image quality, reducing radiation exposure, and increasing reliability during surgical and interventional procedures. Additional diagnostic equipment will strengthen the CPH’s ability to evaluate and manage complex patient conditions locally. Sterile Processing and Surgical Support Infrastructure: To support increased surgical volume and maintain infection prevention standards, the project includes upgrades to sterile processing systems. Modern equipment will improve turnaround times, maintain compliance with current clinical standards, and allow surgical teams to perform procedures safely and efficiently. Patient Navigation and Utilization Management: CPH will implement a patient navigation platform that combines AI-supported imaging review with RN navigators to identify incidental findings and ensure patients receive timely follow-up and specialty referral. A strengthened utilization management and review program will improve care coordination and ensure patients receive the appropriate level of care while reducing delays, unnecessary transfers, and avoidable hospital utilization. Facility Support: Facility improvements, including upgrading resident beds at Heritage Place skilled nursing facility, minor renovation of the Serenity House Treatment Center to expand care, and establishment of a dedicated Mobile Crisis program space, will improve patient safety and operational readiness across care settings that serve rural residents.	Over \$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Central Peninsula General Hospital	Rural Patient Safety & Clinical Infrastructure Modernization Initiative	AK	Central Peninsula Hospital (CPH) serves as the regional referral hub for residents [RBM3.1] across the central Kenai Peninsula. When core hospital infrastructure becomes unstable or outdated, rural patients must travel long distances to Anchorage for care, contributing to higher costs, delayed treatment, and growing perceptions that essential services are unavailable locally. Core clinical infrastructure is aging and capacity constrained, including laboratory systems, IV medication delivery platforms, patient safety monitoring tools, and diagnostic equipment. In a geographically isolated region, infrastructure instability does not simply create operational inconvenience; it constrains access transformation. Equipment failures or outdated systems delay diagnostics, reduce medication safety, restrict surgical throughput, and increase avoidable transfers to urban hospitals. At the same time, the Borough has one of the fastest-growing populations of residents 65 and older, increasing demand for diagnostics, medication management, and inpatient monitoring. Without reliable foundational systems, CPH cannot safely expand specialty services, support population health needs, or reduce costly care outmigration. Modernizing core clinical infrastructure is therefore a prerequisite for broader rural health transformation, enabling CPH to maintain reliable hospital services, improve patient safety, and strengthen access to care closer to home.	CPH will implement a bundled modernization strategy focused on stabilizing essential clinical infrastructure required to sustain and improve rural hospital services. The approach prioritizes replacement of outdated equipment, installation of modern patient safety systems, and targeted upgrades to diagnostic and medication management technologies. By bundling these investments into a coordinated initiative, CPH will efficiently modernize core systems that support care directly enable faster diagnostic turnaround, safe expansion of inpatient and specialty case volume, reduced transfer dependency, and support for increasing geriatric and complex patient demand. Major investments include: • Clinical and diagnostic equipment, including portable X-rays and ultrasounds, vein viewers, transport monitors, newborn hearing screening, medical imaging system, scope guide and drying cabinet, and endoscope reproprocessors. • Medication management and patient safety systems, including IV pump replacements, medication-grade refrigerators, malignant hypothermia cart, infant security system, in-code identity verification, and security cameras. • Inpatient and outpatient care equipment, including affinity birthing beds, exam tables, podiatry exam chairs, and upright cycles for physical therapy. • Facility operations and clinic improvements, including automatic door and sliding door upgrades, flooring replacement, autoscrubber, and food storage systems. This initiative directly supports several Rural Health Transformation Program priorities: • Health Care Access: Strengthens diagnostic, surgical, and inpatient infrastructure needed to maintain essential services locally. • Healthy Beginnings: Supports maternal and newborn safety. • Healthy Communities: Improves patient safety and quality of care through modern medication delivery systems, diagnostic tools, monitoring equipment, and infection-prevention infrastructure. • Strengthen Workforce: Provides clinicians with reliable equipment and safer care environments, improving staff efficiency, recruitment, and retention. • Spark Technology & Innovation: Advances modern health system capabilities through upgraded diagnostic imaging, medication management systems, and patient safety technologies that support evolving care models and regional coordination.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Central Peninsula General Hospital	Rural Workforce Stabilization and Service Line Expansion Initiative	AK	Alaska’s rural health workforce volatility has increased reliance on locum providers and created inconsistent access to specialty services. This variability drives patient transfers, raises system costs, and disrupts continuity of care, particularly as the region’s 65 and older population grows and requires more complex chronic disease management. At the same time, behavioral health crisis demand exceeds current shift coverage, and the absence of a structured palliative care pathway limits the ability to manage complex or serious illness locally. This project addresses these interconnected gaps through a bundled set of time-limited start-up investments that strengthen workforce stability and expand access to care. The initiative includes targeted specialty recruitment and retention support, expansion of Mobile Crisis shift coverage, development of a leadership and workforce development program, launch of an inpatient palliative care consult service with future outpatient expansion, and deployment of a secure workforce wellness platform to improve staff resilience and retention. Together, these investments will stabilize specialty access, improve behavioral health crisis response, and build leadership and workforce capacity necessary to sustain rural health services.	CPH will implement a coordinated strategy with two primary components to address the root causes of rural access gaps and build sustainable systems that allow care to remain close to home: 1) Expanding Health Services Capacity: CPH will expand access to critical clinical services through targeted specialty recruitment, behavioral health crisis response expansion, and the development of a palliative care program. Recruitment and retention support will be used to stabilize specialty practices in cardiology, ENT, urology, dermatology, and internal medicine/hospitalist care. CPH will also establish an inpatient palliative care consult service. The program will provide symptom management, goals-of-care conversations, and care coordination while building protocols and clinical expertise needed to support future outpatient expansion. CPH will also expand the Mobile Crisis Team shift coverage. Additional resources will allow the program to provide more consistent daily coverage and surge response during peak demand periods. Improved coordination with EMS, emergency departments, and outpatient providers will enable more patients experiencing behavioral health crises to be stabilized in the community rather than requiring emergency department care or out-of-area transfer. 2) Workforce Development and Resilience: The second component focuses on strengthening the rural health workforce through leadership development, training infrastructure, and workforce wellness initiatives. Renovation of a staff development space will provide dedicated capacity for workforce training, continuing education, and interdisciplinary collaboration. A multi-year leadership development program will build management and clinical leadership capacity across the organization. Leadership training will focus on workforce retention strategies, operational reliability, and team-based care models that improve service stability in rural settings. To further support workforce resilience, CPH will pilot a digital wellness platform to promote employee health, engagement, and burnout prevention. This platform provides structured wellness programming and behavioral health resources that help sustain staffing levels and improve workforce stability.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Central Rescue Team	Central Rescue Team Emergency Response Center	AK	Rural emergency response time is critical for the injured and sometimes survival depends on it. Our Central Response Team improves the chances of patient's survival and recovery, but we have no facility in which to attend to people's injuries or even a way to transport the injured in a safe and timely manner. We want to provide a safe place where we can administer first aid and assist with transportation when needed. Our community sits at 130 Mile on the Steese Hwy, we have potential patients who are the Alaskan families who are our residents, Steese Hwy road travelers, gold miners and moose and caribou hunters the type of injuries and illnesses we may encounter as an ETT are too many to list here but we intend to increase the patient's odds by providing a place and a way to get needed medical attention. We plan to elevate our community with much needed services while providing emergency care in a safe environment. There are currently no emergency services in our rural area and we will do our best to provide the care that we all hope will be there when we need it.	We intend to utilize the abandoned school buildings and land in Central which are now owned by the State of Alaska as an Emergency Trauma Technician Response Team center and to have a vehicle available for emergency transport when needed, there's even an old bus barn where we can store the ETT vehicle to ensure that its ready when needed. We will use the grant funding to bring these buildings up to code, furnish the center appropriately, re-establish utilities, install communications and to purchase a vehicle that will accommodate having a patient laying down on a backboard securely. We will contact the State of Alaska to facilitate the use of the buildings and the land which are currently sitting empty since the school closed in approximately 2007. By creating an Emergency Response Center we will add a much-needed service to the rural area around Central Alaska.	\$50,000-\$250,000	Other	Single Community	Yukon-Koyukuk Census Area	Deferred or Not Advanced

CFHM	Value-Based Care Readiness Service	MD	Federal value-based payment programs are creating financial exposure for Alaska providers who lack the technical support to navigate them. Two challenges are converging: CMS's mandatory Ambulatory Specialty Model (ASM) launches in 2027, imposing episode-based financial accountability on approximately 50 Alaska providers with no prior experience in bundled payments. Simultaneously, over 20% of Alaska's MIPS-eligible clinicians are already being penalized under a program that's been in place since 2017. These providers, many without dedicated quality reporting staff or data infrastructure, need education, assessment, and hands-on support to build the internal capability to succeed in value-based care on their own.	We propose a two-track technical assistance program delivered in partnership with a healthcare consulting firm with direct experience supporting providers in CMS value-based care programs including MIPS, EQIP, and ACO Programs. Track A — ASM Readiness (~50 providers currently on CMS’s ASM Participant List): A tiered engagement that moves providers from education through implementation. This includes a CME-approved education series on the ASM model, a practice-level readiness assessment identifying clinical and operational gaps, an optimization dashboard for ongoing performance visibility, and hands-on advisory support to help practices build the internal workflows and capabilities needed before the program launches. Track B — MIPS Optimization (~1,300 MIPS-Eligible clinicians): A parallel program focused on quality metric reporting and fiscal sustainability. This includes statewide education on MIPS scoring and common pitfalls delivered virtually at low cost, a preparedness assessment reviewing current scores and workflow gaps, an optimization dashboard tracking performance against benchmarks, and advisory support to help practices build sustainable reporting and quality improvement processes. Both tracks are designed to transfer knowledge and build lasting capability within the practices we serve — not to create dependency on outside consultants. All services are delivered virtually, making them accessible statewide.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

CGI Technologie s and Solutions	Child Welfare Quality Improvement and New Foster Parent, Provider and Tribal Portal	WA	Alaska’s current Child Welfare Information System was designed for a different era of service delivery and does not adequately support today’s needs for timely decision-making, cross-system coordination, workforce efficiency, or equitable service delivery—particularly in rural, Tribal, and frontier communities. Limitations include: • No self-service or portal for engaging Foster / Provider and Tribal communities • Fragmented data across child welfare, behavioral health, courts, and Medicaid • Manual, duplicative casework that increases staff burden and turnover • Limited real-time visibility into safety, permanency, and well-being outcomes • Barriers to culturally responsive and community-based service coordination These gaps directly impact children and families by delaying services, increasing placement instability, and limiting accountability. To modernize Alaska’s Child Welfare Information System into a secure, interoperable, user-centered platform that improves child safety, permanency, and well-being outcomes while strengthening the child welfare workforce and enabling cross-agency collaboration.	Phase 1: Months 1 to 12 - CGI in partnership with State of Alaska FCS OCS develop and deploy portals to Parents, Providers, base as front end to existing system Phase 2: Months 12 to 24 - the second phase of the project will focus on modernization of Intake and Investigation of OCS case load Phase 3: Months 18 to 24 - the third phase of the project will focus on introducing AI Case Mining Phase 4: Future - further incremental modernization of the child welfare case management platform (future year funding is likely required)	Over \$5M	Statewide	Anchorage (Municipality); Juneau (City and Borough)	Deferred or Not Advanced

CHADIS, Inc.	Technology for evidence-based health care to empower patients and providers to improve outcomes	MD	Rural health care has more issues with access, quality and cost than more populated areas. People living in rural areas often lack access to primary and tertiary care due to distances and clinician availability as well as preventive measures. Families have barriers of child care to make visits. Quality of healthcare is also an issue in rural areas. Even when able to travel for care, not having their issues triaged in advance may either delay appropriate care or cause visits at great effort and expense when it is not needed- both quality issues. Coordination of care over time may be impeded by changing staff and a lack of shared records, resulting in gaps in care or, at times, duplication, with associated costs. Quality of rural care may be lower when there are fewer physicians and specialists and more care by less well-trained providers. Costs for taking time off for care may be higher for lengthy travel, and this is more of a burden for low-income families who may also have jobs with limited time off. Costs may be higher when there are fewer site options for care. All of these issues can be ameliorated when previsit data is collected for triage, evidence-based care by telehealth is facilitated by previsit online data collection, choices of clinicians are possible by telehealth, and quality is assisted by easily accessed linked decision support and proven Care Pathways, as well as mental health navigation linking primary care with mental health care, as CHADIS provides.	CHADIS will help Alaskans by: Collecting data pre-visit: Questionnaires (>1000) are custom set up initially, with auto-assignment by visit type and age including for health, mental health (>200), and social drivers of health for all ages, suitable for pediatric, family, internal and OBGYN medicine and mental health. Patients are reminded by text/email to complete the questionnaires in English (or other languages) before visits, at home, or waiting room via QR code via phone or tablet; perfect for telehealth. Teachers etc. are invited by staff or parents to fill questionnaires; with results only for clinicians. CHADIS works with or without an EHR integration (9 so far). Streamlining visits, improving quality, and reducing burnout: Clinicians see results instantly, scored, graphed and linked to patient-specific decision supports, including evidence-based Care Pathways for chronic conditions, to inform care and obviate redundant questions. Patient input automates notes for every visit type, streamlining and assuring comprehensive care, earning higher billing codes, and reducing burnout. CHADIS data informs AI Scribes (CHADIS or others) for comprehensive notes. Post-visit: Patient-specific local/national resources and prevention education based on questionnaire results are offered in portals or printed. A MemoryBook created for young children, links their milestones to activities to promote parent-child interaction and relational health. Wellness is promoted by assessment of and resources for Abilities and Interests, Goals and Strengths, and Best and Hardest parts of parenting for discussion. Clinicians or algorithms can schedule follow-up monitoring and outcome questionnaires. Care coordination and improved access via CHADIS closed loop referral system: CHADIS' prefilled referral form faxed or securely emailed can share information for remote or in person care by specialists to help triage and coordinate care and return feedback to PCP. A code allows inviting other clinicians to see data without requiring an EHR and replaces/reduces a care coordinator. CHADIS Background: CHADIS, developed with \$27.4M NIH funding, is used in 48 states by >5000 PCPs, and screens 375,000 patients/month. Care Pathways are validated for asthma, autism, depression, suicide risk, substance use, and social drivers of health. Care Pathways won AAP Technology Innovation of the Year. CHADIS research validated many tools including a superior early autism and development screen.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Challenge Alaska	Challenge Alaska Keil Center Tenant Improvements	AK	Investing in the renovation of Challenge Alaska’s Keil Center in Girdwood would address significant barriers that prevent many Alaskans with disabilities from accessing outdoor recreation and adaptive sports. Individuals with disabilities often face high equipment costs, as adaptive skis, sit-skis, outriggers, handcycles, and other specialized gear can cost thousands of dollars and require proper storage, maintenance, and fitting. Financial barriers also limit participation, as travel to recreation sites, lift tickets, instruction, and specialized support can quickly become unaffordable for many families. In addition, safe participation in adaptive recreation requires trained instructors, volunteers, and therapists with specialized knowledge to match participants with appropriate equipment, teach adaptive techniques, and manage safety needs. Without facilities designed to provide adaptive equipment, train staff and volunteers, and provide accessible spaces for participants to prepare and learn, many individuals are excluded from these life-changing experiences. Improving the Keil Center would expand Challenge Alaska’s capacity to remove these barriers and strengthen the training hub that makes adaptive recreation possible for people with disabilities from across Alaska.	Originally built in 1993, the Challenge Alaska Keil Center for Adaptive Sports and Therapeutic Recreation is no longer adequate to promote the physical and mental health needs of Alaskans living with disability. Using RHTP funding, Challenge Alaska leadership will transform this state-wide hub into a world-class venue for year-round access to adaptive sports, therapeutic recreation, and education. The overall facility improvements have both an expansion of the facility planned, as well as tenant improvement throughout the existing structure. For the sake of compliance with the allowable use of the funds, only the portion of the project considered tenant improvements are included in the scope of RHTP funding. No RHTP funds will be used for the new construction portion of the total facility project. The tenant improvement budget is \$3,552,327. The expansion will be an additional \$3,033,315. This request is for the \$3,552,327 tenant improvement budget. By investing in a renovation of the Keil Center, RHTP Funding is investing in the overall health of all Alaskans living with disability. Having safe and affordable access to recreation opportunities has been proven to increase health outcomes and reduce preventable illness and negative impacts to mental health. As the only facility of it's kind in the state, Challenge Alaska will work within rural communities to promote inclusion in Challenge Alaska activities and provide a safe place to stay while doing so. Alaskans will travel to the Keil Center to participate in Challenge Alaska programing. If they are traveling by air, Challenge Alaska will assist with transport to/from the Anchorage Airport for the participant(s) and their caregiver(s). Once on-site, the facility will have all the amenities needed to participate in programming and live comfortably during their visit. During their stay, the individuals will receive instruction on the activities they are there to participate in, and given the tools to continue that activity once they travel back home, or if that community cannot support the desired activity, they will work on a plan of care that ensures that progress is continued though repeat visits supplemented with suitable cross-training.	\$1M-\$5M	Home- and communit y-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Changing Tides Therapy Services, Inc	Southcentral Alaska Pediatric Development & Community Integration Institute	AK	Children in rural Alaska face significant barriers to accessing timely developmental and behavioral health evaluations. Families across the Kenai Peninsula and surrounding rural communities often travel long distances or wait many months to access autism diagnostic assessments, pediatric behavioral health evaluations, and specialized developmental services. These delays can prevent children from receiving early identification and intervention during critical developmental periods when treatment is most effective. At the same time, rural Alaska faces persistent shortages of pediatric developmental specialists and behavioral health providers. Recruitment and retention of clinicians in rural communities remains challenging, limiting local diagnostic capacity and access to multidisciplinary care. These challenges create an opportunity to develop new models of care that expand access to early childhood developmental diagnostics while strengthening the rural pediatric workforce. This project seeks to address these gaps by creating a regional pediatric neurodevelopmental hub that improves diagnostic access, builds workforce training pathways for early-career clinicians, and introduces innovative care environments that support children’s functional participation in their communities. Together, these efforts aim to improve early identification of developmental conditions, reduce travel burdens for rural families, and build sustainable pediatric care capacity for rural Alaska.	To address limited access to pediatric neurodevelopment diagnostics and rural workforce shortages, Changing Tides Therapy Services proposes establishing the Southcentral Alaska Pediatric Development & Community Integration Institute, a regional hub designed to expand access to multidisciplinary developmental care for rural children and families. The project will introduce a rotating specialist model that brings credentialed diagnosticians, including developmental psychologists, neuropsychologists, and developmental pediatric specialists, to a regional hub location to conduct scheduled diagnostic clinics. Local clinicians will complete structured developmental assessments, caregiver interviews, and standardized testing prior to these visits, allowing visiting specialists to conduct comprehensive evaluations and provide diagnostic determinations and care recommendations. This approach reduces the need for families to travel long distances for diagnostic services while expanding diagnostic capacity within the region. In addition to expanding diagnostic access, the institute will serve as a training hub for early-career pediatric clinicians through partnerships with universities and professional training programs. Student clinicians, interns, and fellows in speech-language pathology, occupational therapy, behavioral health, and related disciplines will complete supervised rural training placements focused on neurodevelopmental diagnostics, interdisciplinary care models, and early childhood intervention. By training clinicians in rural environments early in their careers, the program aims to strengthen long-term workforce retention in Alaska. The project will also develop a community integration learning environment, or “Life Skills Lab,” where children can practice real-world social, emotional, and daily living skills in simulated community settings. These natural-environment therapy models allow children with developmental differences to practice functional skills such as social interaction, emotional regulation, school readiness, and daily routines in contexts that mirror everyday life. Together, these components create a new rural pediatric care model that expands diagnostic access, builds regional workforce capacity, and prepares children with developmental differences for meaningful participation in school and community life, strengthening long-term pediatric developmental care capacity for rural Alaska.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Chapel of the Cross Church of the Nazarene	Develop Family Health by ensuring access for people with disabilities	AK	In rural Alaska, where long winters, limited recreational infrastructure, and geographic isolation already restrict opportunities for physical activity and social engagement, accessible indoor spaces are essential to community health. Families with young children, grandparents serving as caregivers, individuals with disabilities, and those recovering from illness or injury are currently unable to fully participate in programs and services offered in our lower-level facility. This barrier limits equitable access to: • Safe indoor physical activity for children • Family-centered wellness programming • Intergenerational community connection • Mental health–supportive gathering space during winter months Installing an elevator will remove a critical structural barrier and align with the goals of the Alaska Rural Health Transformation Program by improving accessibility, reducing isolation, and strengthening protective factors for families. The project will ensure that all community members—regardless of mobility status—can safely access health-promoting programs and supportive environments. By increasing accessibility, Chapel of the Cross will expand inclusive participation, promote physical and mental well-being, and enhance community resilience in our rural setting.	Our approach is to have an elevator installed that will give access from the entry-way of the building (parking lot level) to the downstairs area where Chapel of the Cross services are provided to seniors, families and youth. Along with the installation of the elevator there will need to be some remodel of the main entry to accomodate the location and usability of the elevator.	\$250K-\$1M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Cheesh'Na Tribal Council	Cheesh'na Healthy Community & Food Sovereignty Planning Initiative	AK	The community faces multiple interrelated health and resilience challenges due to its remote location, limited infrastructure, and vulnerability to natural disasters that can isolate the region. Food insecurity is a major concern, particularly if the Tok Cutoff Highway becomes impassable due to earthquake, wildfire, or flood. In addition, community members have expressed concern about the need for stronger support systems for young men, including mentorship, healthy relationship education, and positive pathways for leadership and cultural engagement. The Cheesh’na Tribal Council sees an opportunity to strengthen community resilience through planning focused on food sovereignty, youth mentorship, and improved health system coordination. By working with tribal health organizations and community partners, the Tribal Council aims to develop a long-term strategy that strengthens access to healthy foods, improves behavioral and chronic health outcomes, and supports healthier families and relationships.	This project will support a two-year planning and development initiative designed to gather community input and develop a comprehensive Healthy Community Plan. Activities will include community listening sessions, culturally appropriate engagement with elders and youth, coordination with regional tribal health organizations, and collaboration with local service providers. Planning efforts will focus on several key areas: • Food sovereignty and emergency food system resilience planning • Mentorship and healthy relationship programming for young men • Behavioral health and chronic disease prevention priorities • Community-driven strategies to improve quality of life and wellbeing • Strengthening partnerships among tribal government, health providers, and community organizations Mt Sanford Tribal Consortium, the local tribal health organization will partner with the Tribal Council to help guide community engagement, health system coordination, and long-term strategy development.	\$50,000-\$250,000	Single Community	Copper River Census Area	Deferred or Not Advanced

Cherokee Nation System Solutions	Developing a State-Tribal Interoperable Electronic Client Record Infrastructure for Alaska	OK	Rural and frontier communities in Alaska face persistent healthcare workforce shortages that limit access to care and strain rural health systems. Geographic isolation, limited transportation infrastructure, and small population centers make it difficult to recruit and retain physicians, nurses, behavioral health professionals, and other essential staff. Many rural facilities rely on temporary or itinerant clinicians to maintain services. While these arrangements address short-term staffing gaps, they increase costs, disrupt continuity of care, and make it difficult to sustain stable care teams. Workforce challenges are also shaped by broader community conditions. Limited housing, transportation barriers, childcare access, and social isolation can make it difficult for healthcare professionals to remain in rural communities after relocation. At the same time, Alaska has an opportunity to strengthen its rural health workforce by aligning workforce development, community support systems, and workforce planning across Tribal health organizations, healthcare providers, educational institutions, and state partners. This project addresses that opportunity by supporting a coordinated workforce ecosystem that strengthens workforce pipelines, improves workforce retention, and supports data-informed workforce planning.	Our proposed approach focuses on strengthening the systems that support the rural health workforce by implementing a coordinated workforce ecosystem that improves workforce planning, expands workforce pipelines, and supports long-term workforce retention in rural communities. The project is organized around four interconnected strategies. Workforce Intelligence and Data Integration The project will support the development of workforce intelligence tools that integrate workforce data across healthcare providers, training programs, and workforce agencies. These tools help identify workforce shortages, forecast future workforce needs, and guide workforce investments. Data-informed planning allows healthcare leaders to target workforce development strategies where they will have the greatest impact. Strengthening Rural Workforce Pipelines The project will expand pathways that connect rural residents to healthcare careers. This includes strengthening partnerships with educational institutions, supporting rural training opportunities, and expanding programs that introduce students to health professions. Evidence shows that individuals trained in rural communities are more likely to remain and practice in those communities. Workforce Stabilization and Retention Support Recruitment alone does not address workforce shortages if professionals leave soon after relocating. The project will support workforce stabilization strategies that address barriers such as housing availability, relocation logistics, transportation access, and family support. These efforts help healthcare professionals transition successfully into rural communities and remain there over time. Community and Tribal Partnership Engagement The project will be implemented in collaboration with Tribal health organizations, healthcare providers, educational institutions, and community partners. These partnerships help ensure that workforce strategies reflect the needs and priorities of the communities they serve and support culturally responsive care. Together, these strategies strengthen the entire lifecycle of the rural health workforce—from early career pathways through long-term community integration. By improving workforce planning, expanding training pipelines, and supporting workforce retention, the project helps ensure that rural and frontier communities have reliable access to healthcare services now and in the future.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Cherokee Nation System Solutions	Operationalizing the Social Determinants of Work	OK	Rural and remote communities in Alaska face persistent healthcare workforce shortages that limit access to care and strain local healthcare systems. Many communities rely on small teams of providers who must deliver a wide range of services across large geographic areas. Recruiting healthcare professionals to these locations is difficult, and retaining them is often even more challenging due to housing shortages, transportation barriers, professional isolation, and limited community support resources. These workforce challenges lead to increased reliance on temporary staffing, higher operating costs for healthcare providers, and disruptions in continuity of care for patients. At the same time, many rural residents face barriers to entering healthcare careers due to limited access to training programs and workforce development opportunities. This project addresses these challenges by strengthening workforce planning, expanding rural workforce pipelines, and supporting long-term workforce stability. By improving coordination among healthcare providers, training institutions, and community partners, the project will support sustainable workforce solutions that improve access to care and strengthen rural healthcare systems across Alaska.	This project will address rural healthcare workforce shortages by implementing a coordinated, data-driven approach that strengthens workforce planning, workforce development pipelines, and long-term workforce stability in rural and frontier communities. The project will begin by improving workforce planning through the development and use of workforce data systems that provide insight into workforce supply, demand, and regional workforce needs. These data tools will help healthcare organizations and policymakers identify workforce gaps, anticipate emerging shortages, and better align workforce development investments with community needs. The project will also support the expansion of rural healthcare workforce pipelines. Partnerships with educational institutions, healthcare providers, and workforce development organizations will help increase access to healthcare career pathways for rural residents. Activities may include early exposure to healthcare careers, rural training opportunities, and support for programs that prepare students for careers in fields such as nursing, behavioral health, and allied health professions. In addition to expanding workforce pipelines, the project will focus on improving workforce retention in rural communities. Many healthcare professionals leave rural positions due to challenges related to relocation, housing availability, and community integration. The project will support workforce stabilization strategies that address these barriers and help healthcare professionals build stable careers in rural communities. Regional collaboration will play a central role in the project. Healthcare providers, tribal health organizations, educational institutions, and community partners will work together to coordinate workforce initiatives and share resources that strengthen regional workforce capacity. By strengthening workforce planning, expanding training pathways, and supporting long-term workforce retention, this project will help improve access to care, strengthen healthcare delivery systems, and support sustainable rural healthcare workforce development across Alaska’s rural and frontier communities.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Chevak Traditional Council	Improving Access to Behavioral Health Care in Chevak’s Rural Community	AK	Rural Alaska communities face significant challenges in accessing timely and culturally appropriate mental health services. In communities such as Chevak, geographic isolation, limited behavioral health providers, transportation barriers, and long wait times for care create major gaps in mental health support. Residents often must travel to regional hubs to receive services, which can be costly, disruptive to families, and sometimes impossible during severe weather or seasonal travel limitations. At the same time, rural communities are experiencing increasing mental health needs, particularly among youth and young adults. Without consistent access to prevention, early intervention, and behavioral health support, individuals may face worsening mental health conditions, substance misuse, or crisis situations. This project seeks to expand mental health services through the Chevak Traditional Council’s Behavioral Health Program. The project will provide the Chevak community with virtual mental health resources while funding future support for local staffing and programming. By strengthening local capacity, the project will ensure that residents can access services within their own community, reducing barriers to care and improving overall community well-being. This opportunity will allow the community to build sustainable behavioral health support systems that are culturally responsive and better equipped to address the growing mental health needs of rural Alaska residents.	To address the gaps in access to mental health services in rural Alaska, this project will expand and strengthen behavioral health services through the Chevak Traditional Council’s Behavioral Health Program. The proposed approach focuses on increasing capacity, improving early intervention efforts, and providing culturally responsive support to community members. In addition to implementing virtual services for tribal members, the project will support future dedicated behavioral health staff positions responsible for prevention programming, outreach, and direct support services. These staff members will provide early intervention for individuals experiencing mental health challenges, assist community members in accessing appropriate care and referrals, and coordinate crisis response support when needed. For members needing support in the moment and virtually, through the Talkspace platform, individuals can access therapy via asynchronous messaging as well as scheduled live video sessions, allowing them to engage with care in a flexible format that accommodates varying schedules, connectivity limitations, and comfort levels. This model removes the need for long-distance travel and allows our community to receive support from the privacy of their own community. Participants will be matched with licensed therapists through the Talkspace platform, which pairs individuals with providers based on clinical needs, preferences, and therapist expertise. This process allows individuals to begin care quickly, often within 24 hours, while expanding access beyond our limited pool of local providers. Through a combination of locally delivered services, prevention programming, and coordinated partnerships, this approach will improve access to behavioral health services, support early intervention, and build a sustainable system of mental health care for rural residents.	\$50,000-\$250,000	Single Community	Kusilvak Census Area	Deferred or Not Advanced

Chickaloon Native Village	Chickaloon Village Personal Care Agency and Rural Care Coordination Initiative	AK	CVTC has identified a growing need for improved access to home-based care and coordinated healthcare navigation for community residents. Through this project, CVTC will begin developing the infrastructure needed to support a tribally led Personal Care Agency workforce and care coordination system serving Alaska Native Elders. During the first year, CVTC will focus on partnership and program development, workforce preparation, and the establishment of care coordination services. The project will support the hiring and training of a Care Coordinator, development of a Personal Care Assistant (PCA) training program aligned with Alaska Medicaid standards, and collaboration with Cook Inlet Tribal Council to explore a sustainable reimbursement model for home-based care and care coordination services. CVTC will also establish program policies, procedures, and compliance structures while recruiting potential trainees from the local community. CVTC has already identified community members who would benefit from these services and will begin with a small client base while building program capacity. This project will strengthen rural healthcare systems, expand access to culturally responsive care, and develop a local workforce capable of supporting Elders and individuals with disabilities to safely remain in their home communities.	1. Program Infrastructure Development - CVTC staff will develop the operational infrastructure necessary to support a tribally operated Personal Care Agency (PCA) program. Activities will include: • Researching Alaska Personal Care Agency program requirements and regulatory standards. • Developing culturally responsive training materials and curriculum aligned with Alaska Medicaid PCA standards. • Establishing compliance procedures and documentation systems. • Developing policies and procedures for service delivery, caregiver supervision, and quality assurance. 2. Care Coordination and PCA Capacity - CVTC will recruit and hire a full-time Care Coordinator to lead program development and service implementation. The Care Coordinator will oversee client care plans, coordinate medical appointments, assist with service referrals, and support individuals in navigating healthcare and social service systems. Existing CVTC staff will receive PCA training and as capacity grows, new recruits will be hired and trained. 3. Sustainability and Systems Alignment - CVTC will collaborate with Cook Inlet Tribal Council (CITC) to establish a framework for long-term program sustainability. Collaborative activities will include: • Designing a reimbursement model for PCA and care coordination services. • Exploring Medicaid/Medicare billing pathways for home-based services. • Contracting with CITC for shared use of segmented Electronic Health Record (EHR) systems. • Aligning care coordination practices with regional Tribal healthcare systems. • Developing shared best practices for service delivery and program administration. Goal 1: Improve continuity of care within the Chickaloon Native Village ANVSA service area. Objective: Train at least three staff members as certified Personal Care Assistants (PCAs) within 12 months. Goal 2: Enhance care coordination and improve client outcomes. Objective: Hire and onboard a full-time Care Coordinator within three months of receiving funding. Goal 3: Strengthen health information sharing and operational efficiency. Objective: Sign an MOA with CITC within the first 6 months. Goal 4: Evaluate program development and early implementation. Objective: Conduct a program development and implementation	\$1M-\$5M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

review by the end of Year 1 to guide future program expansion.

This phased approach allows CVTC to build the operational, workforce, and partnership infrastructure necessary to support a sustainable tribally led home-based care program.

Chickaloon Native Village	Ahtna Language Reading and Writing Curriculum Development Project	AK	The Ya Ne Dah Ah School has been actively engaged in Ahtna language preservation efforts and has successfully developed a Total Physical Response (TPR) curriculum focused on language comprehension and pronunciation. While this approach has strengthened students’ listening and speaking abilities, the next phase of preservation efforts must focus on developing structured reading and writing instruction to sustain this at-risk language. The Ya Ne Dah Ah School proposes to develop and pilot an Ahtna Language Reading and Writing Curriculum designed to strengthen cultural identity, literacy skills, and community wellness in the Chickaloon community. Language revitalization is widely recognized as an important cultural determinant of health for Alaska Native communities, supporting mental health, resilience, and intergenerational connection. Funding will support hiring a curriculum developer to design Ahtna reading and writing materials and a teaching assistant to support classroom implementation and pilot testing with students. The pilot program will allow educators to test lesson plans, reading passages, writing exercises, and instructional strategies that integrate language learning with traditional cultural knowledge. By developing and piloting structured literacy materials, this project will strengthen language preservation while increasing student engagement, reinforcing cultural identity, and supporting community well-being in the Chickaloon region and across Alaska.	This project will include three main phases: Curriculum Development - A qualified curriculum developer with experience in Ahtna language curriculum development and education will work with Ahtna language speakers, educators, and cultural knowledge holders to create basic age-appropriate reading and writing materials. Curriculum components will include vocabulary guides, reading passages, writing prompts, and teacher instructional guides that reflect Ahtna cultural values and traditional knowledge. Curriculum Pilot - During the first year, a teaching assistant will support classroom implementation of the pilot curriculum at the Ya Ne Dah Ah School as lessons are developed. Students will participate in structured reading and writing activities designed to strengthen both literacy skills and language familiarity. The teaching assistant will work alongside teachers to support students and help document lessons learned during the initial pilot phase. Evaluation and Refinement Teachers, students, and language experts will provide feedback on the curriculum materials and instructional methods. This feedback will be used to refine lesson plans and reading materials to improve effectiveness and usability for future instruction.	\$250K-\$1M	Home- and communit y-based services provider	Multi- Community or Participating in Regional Hub-and- Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Chickaloon Native Village	Chickaloon Village Traditional Council Community Food Security and Sustainability Project	AK	To improve access to healthy, locally grown foods, the Chickaloon Village Traditional Council (CVTC) proposes to repair and upgrade its existing community greenhouse and develop an additional greenhouse and chicken coop co-located with Ya Ne Dah Ah School. These improvements will expand local food production and increase access to fresh produce and eggs for Elders, students, and community members. To support implementation, CVTC will hire a Project Coordinator during the first year to oversee project infrastructure development and coordinate community volunteers for planting, harvesting, and food distribution activities. The Project Coordinator will support CVTC’s weekly Elders’ lunch congregate and home-delivered meals program, which has served community Elders since 2007, by providing locally grown foods to improve the nutritional quality of meals. The coordinator will also provide community education on food production, food storage, and healthy food preparation in collaboration with Health & Social Services staff. Working closely with Ya Ne Dah Ah School staff, the coordinator will support development of the school greenhouse and chicken coop, creating hands-on learning opportunities for students while contributing to the production of eggs and fresh foods for the community.	The project will be implemented through four integrated components. 1. Greenhouse Expansion/Chicken Coop Set-Up and Management - The first season will be focused on infrastructure maintenance of the existing greenhouse in Sutton, and set-up of a new prefab greenhouse and chicken coop at the Ya Ne Dah Ah School. A full-time Food Security Program Coordinator will oversee: • greenhouse modifications and setting up the new greenhouse and chicken coop at the Ya Ne Dah Ah School • planting schedules • crop rotation planning • soil health management • harvest planning • volunteer coordination Expanded greenhouse production will focus on nutrient-dense crops such as: • leafy greens • root vegetables • herbs • tomatoes Production will be structured to maximize harvest periods and extend the growing season. 2. Community Volunteer Program The coordinator will develop a structured community volunteer network including: • youth • Elders • families • community members. Volunteers will participate in: • planting • greenhouse maintenance • harvesting • chicken husbandry • produce distribution The volunteer program will support intergenerational knowledge sharing, strengthening cultural connections to food systems and land stewardship. 3. Food Distribution for Health Produce and eggs harvested through the program will support: • Elders’ Lunch Program • Fresh vegetables will be incorporated into meals to improve nutritional quality.	\$50,000-\$250,000	Home-and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

- School Meal Program

The program will provide fresh produce and eggs to Ya Ne Dah Ah School, supporting healthier meals for students and reinforcing food nutritional education.

Community Food Access

- Excess produce will also be distributed during community events and food distribution days.

4. Health Promotion and Chronic Disease Prevention

Access to fresh foods will be paired with education offered in collaboration with staff from CVTC's Health & Social Services

Department addressing:

- diabetes and chronic disease prevention
- heart health
- nutrition education
- healthy cooking practices

Activities may include:

- cooking/food preservation demonstrations
- nutrition workshops
- culturally relevant food education for youth.

These efforts will support long-term improvements in dietary behavior.

Chickaloon Native Village	Chickaloon Village Traditional Council Natural Disaster Emergency Preparedness Project	AK	Funding will support the purchase and distribution of emergency preparedness equipment to help households maintain essential services during power outages. Equipment may include generators, battery-powered medical devices, emergency heating supplies, and communication tools. These resources will prioritize vulnerable residents, including Elders, individuals with medical needs, and low-income households. Goals & Objectives • Goal 1: Improve power and heat security for individuals within CVTC's ANVSA jurisdiction. • Objective: Purchase and provide equipment to have on hand to provide temporary power to homes of vulnerable individuals on a loaner basis. • Goal 2: CVTC staff will inventory and maintain all equipment. • Objective: Readily available and well-serviced equipment will be housed at the Health & Social Services Department for distribution by CVTC emergency responders during power outages. • Goal 3: Create a preparedness group to create a sustained plan for emergency preparedness. • Objective: Integrate community knowledge and create roles and responsibilities for CVTC staff for emergency response in the event of a disaster.	CVTC’s ANVSA area includes individuals and families facing geographic isolation, limited infrastructure, and economic disadvantages. Many lack reliable transportation, access to nutritional meals, or consistent power in the event of dangerous weather conditions or natural disasters. The remoteness and sparse infrastructure create a challenge for local electrical providers to get power back on line after an event causing loss of power for many vulnerable individuals. In response to recent outages this winter, CVTC opened a shelter at the Ya Ne Dah Ah School; however, bringing vulnerable elders to the school for long periods of time was a great inconvenience to them. The ability to heat their homes on a temporary basis was a better solution; however, we only had a few units available and had to rotate them between several residences requiring significant work on behalf of our emergency responders. These challenges in securing elders in their homes safely can lead to preventable hospitalizations, safety insecurities, and increased stress for community and Tribal employees. Community Impact of Creating a Heating and Medical Equipment lending program. • Health and Safety: Ensures that medical facilities, clinics, homes of the disadvantages and emergency response systems can operate during outages. • Resilience: Supports the ability of the Health and Social Services Department to continue providing care to vulnerable community members. • Inclusion: Benefits Tribal citizens, Alaska Native, and Native American peoples in CVTC's ANVSA, including those without reliable backup power.	\$50,000- \$250,000	Home- and communit y-based services provider	Multi- Community or Participating in Regional Hub-and- Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Chickaloon Native Village	Chickaloon Village Traditional Council Technology Advancement and Innovation Project	AK	CVTC has developed a sophisticated telephone and enterprise network system that connects multiple facilities through a centralized Administration office. Aquos Board Interactive technology is currently used at the Ya Ne Dah Ah School, Administration Office, and Government building meeting space to support meetings, trainings, and collaborative learning. CVTC also maintains a strong Information Technology Department led by an Information Technology Officer with over 30 years of experience in network design and deployment who will manage this project. CVTC’s existing laptops, desktop computers, and tablets are outdated and no longer support the needs of modern service delivery. Aging equipment reduces staff efficiency, creates increased demand for IT support, and limits compatibility with current platforms. Additionally, the current phone system has not kept pace with staffing growth and it is outdated as well. The lack of modern interactive technology in the Tribal Court and Police Department also limits opportunities for training, collaborative learning, and virtual participation in education, health, and wellness programs for staff, youth, and community members. Updating these systems will strengthen CVTC’s ability to deliver efficient services, support safety through communication, and coordinate care across programs and departments.	CVTC proposes to replace outdated technology infrastructure by purchasing a new multi-line phone system to serve all brick-and-mortar facilities, along with new laptops, desktop computers, and tablets for staff across multiple service departments. These devices will support program administration, telehealth coordination, case management, community safety and service, and outreach activities. The project will also install two Aquos Board Interactive systems to support restorative justice court hearings, virtual meetings, staff training, and collaborative learning across departments and with partner agencies. CVTC staff will provide all orientation and training required for the new equipment within the first month of installation. Additionally, they will continue to provide ongoing technical expertise to ensure systems operate optimally. By modernizing its technology infrastructure, CVTC will improve internal and external communications, increase staff efficiency, and strengthen coordination of services across programs. These upgrades will also expand opportunities for partners and community members to participate in remote delivery of services, education, health and wellness programming for community members in rural areas.	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Chickaloon Native Village	Ya Ne Dah Ah School Legal Status and Technical Transformation Project	AK	The Ya Ne Dah Ah School, founded in 1992, is a multi-age learning center located north of Palmer serving students from preschool through high school. Many of our students struggle in traditional school environments due to social-emotional and health-related challenges that require individualized learning plans and flexible teaching approaches. Technology has become an essential tool in supporting these diverse learning needs. Preschool students use educational apps on iPads to build early math and literacy skills and ensure kindergarten readiness. Students in kindergarten through 12th grade utilize Chromebooks to access math and language arts curriculum through our educational partner, the Mat-Su Central School District. However, much of our current technology is aging and failing. Funding will support the purchase of new Chromebooks, iPads, staff computers, and equipment for existing smartboards, ensuring reliable access to digital learning tools. Additionally, establishing the Ya Ne Dah Ah School as a 501(c)(3) nonprofit will allow us to access private funding opportunities, strengthening long-term sustainability for educational, cultural, and wellness programming in our community.	Chickaloon Village Traditional Council (CVTC) will implement this project using existing internal capacity and established professional partnerships to ensure efficient project execution. CVTC’s Information Technology staff will procure, configure, and deploy all technology purchased through this project. Equipment will be purchased through existing government contracts with Dell and Apple to ensure competitive pricing and reliable procurement. All technology purchases will be completed within one month of receiving notice of funding. Following procurement, CVTC's Information Technology staff will configure and prepare all devices for classroom use. The new Chromebooks, iPads, and smartboard support computers will be fully deployed in time for the 2026–2027 school year beginning in August 2026, ensuring students and teachers have reliable technology for instruction. In parallel, Chickaloon Village Traditional Council will initiate the process of establishing the Ya Ne Dah Ah School as a 501(c)(3) nonprofit organization. Upon notice of award, CVTC's Executive Officer will contract with Sonosky, Chambers, Sachse, Miller & Monkman, LLP to provide legal expertise in preparing and filing the necessary documentation for nonprofit status. The Council’s Finance Officer will also engage an experienced tax professional to assist with establishing financial reporting systems and compliance requirements associated with nonprofit operations. Finally, internal policies and procedures will be developed by CVTC Administration and Accounting staff to ensure ongoing compliance with nonprofit governance, financial reporting, and annual filing requirements. These steps will position the Ya Ne Dah Ah School for long-term operational sustainability and expanded access to funding opportunities.	\$50,000- \$250,000	Home- and communit y-based services provider	Multi- Community or Participating in Regional Hub-and- Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Chickaloon Village	Chickaloon Village Mat-Su Recovery Access and Outpatient Center	AK	The Mat-Su continues to face major gaps in timely, coordinated, and culturally responsive behavioral health and substance use services. The CHNA explains that residents are experiencing increased mental health concerns, inability to afford the cost of care and/or insurance, and limited provider availability for primary, specialty, and behavioral health care. The CHNA also reflects a long-standing need for a stronger behavioral health continuum, better local access, and more coordinated systems that address addiction and recovery resources. CVTC proposes to address this need through the Chickaloon Village Mat-Su Recovery Access and Outpatient Center, a recovery services project, based in Palmer and serving the broader Mat-Su Borough. CVTC proposes that our Recovery Services Department be expanded to lead a culturally grounded recovery access, assessment, outpatient treatment, and care coordination model for adults and families impacted by substance use and co-occurring behavioral health needs. This project is both a service expansion and a systems-building opportunity. It will expand local access to intake, screening, assessment, counseling, peer support, recovery case management, and coordinated referral pathways while also building the staffing, infrastructure, partnerships, and billing readiness needed for long-term sustainability.	CVTC will establish the Chickaloon Village Mat-Su Recovery Access and Outpatient Center in Palmer to expand access to outpatient behavioral health and substance use recovery services for residents of the Mat-Su. CVTC proposes that our Recovery Services Department be expanded to lead a culturally grounded recovery access, assessment, outpatient treatment, and care coordination model serving Tribal and non-Tribal residents with a particular focus on rural residents, Alaska Native and American Indians, and individuals facing transportation, cost, and system-navigation barriers. The project has six core components. First, CVTC will secure and equip leased commercial space in Palmer to provide an accessible, appropriate, and welcoming outpatient service setting. Second, CVTC will recruit, hire, and support a multidisciplinary team capable of providing intake, screening, assessment, counseling, recovery case management, peer support, cultural recovery supports, billing, and administrative functions. Third, CVTC will establish the operational infrastructure necessary for long-term success, including Electronic Health Record (EHR) workflows, telehealth capability, billing, credentialing readiness, data collection, quality assurance, and referral tracking. Fourth, CVTC will provide direct services including intake, comprehensive assessment, individualized treatment and recovery planning, individual and group counseling, case management, peer support, family engagement, and coordinated referrals to higher levels of care when needed. Fifth, CVTC plans to partner with CITC on this project to strengthen service development, workforce support, care coordination, referral pathways, and reimbursement readiness, while also coordinating with other referral, workforce, and service partners as appropriate. Sixth, the program will incorporate culturally grounded recovery planning, family-centered support, and community connection that reflect Chickaloon’s values and respond to the needs of Alaska Natives and American Indians in our service area.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Chickaloon Village	Chickaloon Village Mat-Su Diversion, Reentry, and Wellness Navigation Program	AK	The Mat-Su continues to face major gaps in coordinated behavioral health, recovery, and stabilization services, especially for people whose needs intersect with the justice system. The CHNA emphasizes the need for coordinated systems that connect residents to behavioral health, addiction, recovery resources, basic needs, transportation, and work, and notes that the behavioral health continuum of care has remained a major concern for years. At the same time, Alaska’s Civil Diversion Agreement model has shifted from law-enforcement-led to prosecutor-led diversion to support more diversions to Tribal courts. The agreement materials also note that Tribal remedies may be used in lieu of state prosecution for certain eligible offenses and may include restorative justice hearings and circle sentencing. In addition, Chickaloon has recently been contacted by the Department of Corrections (DOC) regarding reentry support and by the Department of Law (DOL) regarding possible work diversion monitoring in the Anchorage and Mat-Su area. CVTC proposes to address these needs through the Chickaloon Village Mat-Su Diversion, Reentry, and Wellness Navigation Program by leading a culturally grounded model for adults involved in Tribal court, referred through state diversion pathways, participating in work diversion, or returning from state incarceration, creating a pathway from justice involvement into stabilization, accountability, healing to wellness supports, and recovery-oriented services.	CVTC will establish the Chickaloon Village Mat-Su Diversion, Reentry, and Wellness Navigation Program through the Judicial Services Department to expand access to coordinated behavioral health, recovery, wellness, and stabilization pathways for justice-involved adults in the Mat-Su. The project will serve Tribal and non-Tribal residents, focusing on rural residents, Alaska Native and American Indian populations, and individuals whose justice involvement is connected to behavioral health, substance use, unstable living conditions, transportation barriers, unemployment, or limited access to care. This includes adults involved in Tribal court, referred through state diversion pathways, participating in work diversion, and reentering the community from state incarceration. The project has six core components. First, CVTC will build a judicial-services-based intake, screening, and navigation process for adults referred through diversion, work diversion, and reentry pathways. Second, CVTC will develop staffing and workflows to support assessment, case coordination, compliance monitoring, reentry planning, employment support, and referral follow-up. Third, CVTC will create core program infrastructure, including case tracking, referral coordination, data collection, interagency communication, and documentation practices that support accountability and continuity of care. Fourth, CVTC will provide direct supports, including diversion intake, reentry planning, individualized wellness and accountability plans, court-based monitoring, community accountability pathways, and navigation. Fifth, CVTC will recruit and formalize coordination with DOL, DOC, the Chickaloon Village Mat-Su Recovery Access and Outpatient Center, and other partners to support referrals, transition planning, work diversion implementation, and continuity of care. Sixth, the program will incorporate culturally grounded remedies, restorative approaches, healing to wellness principles, family and community connection, and recovery-oriented pathways that reflect Chickaloon’s values and respond to Alaska Native and American Indian populations in the service area. This project is designed to create a reliable pathway that connects judicial services, recovery services, and community supports. It is also designed to strengthen long-term sustainability by creating a more consistent referral funnel into treatment, case management, peer support, outpatient care, and related services as those systems mature.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Chickaloon Village	Chickaloon Village Mat-Su Youth and Family Wellness Access Center	AK	The Mat-Su continues to face major gaps in coordinated behavioral health care for children, youth, and families. The CHNA emphasizes that coordinated systems are needed to address behavioral health and promote healthy foundations for children and families, and it identifies children and families, and the behavioral health continuum of care as ongoing priorities. Community input specifically notes that children affected by the opioid crisis are being left behind, that counseling can take 6–8 months, and that families need more coordinated, affordable, and culturally aware mental health care. The CHNA also shows that school-based behavioral health is already a viable and growing model in the Mat-Su. Sunshine Community Health Center’s Behavioral Health in Schools program is able to bill for some services and serves 15 schools and more than 400 students annually. That creates a clear opportunity to build a Chickaloon-centered youth and family behavioral health model with stronger long-term sustainability. CVTC proposes to address these needs through the Chickaloon Village Mat-Su Youth and Family Wellness Access Center. Our Family Services Department would lead a culturally grounded model that creates a structured pathway from family stress, youth behavioral health needs, victimization, child welfare involvement, or school/community referral into screening, stabilization, counseling, family support, and longer-term wellness services.	CVTC will establish the Chickaloon Village Mat-Su Youth and Family Wellness Access Center through the Family Services Department to expand access to coordinated behavioral health, family stabilization, and wellness pathways for children, youth, parents, caregivers, and families in The Mat-Su. The project will serve Tribal and non-Tribal residents, with a focus on rural residents, Alaska Native and American Indian populations, children and youth with behavioral health or substance use concerns, and families facing trauma, transportation barriers, poverty, child welfare involvement, victimization, or limited access to care. The project has six core components. First, CVTC will build a family-centered intake, screening, assessment, and navigation process for children, youth, and caregivers referred through Family Services, schools, community partners, victim services, Indian Child Welfare Act (ICWA), child welfare, Youth Program, Native Youth Olympics (NYO), Raising Youth Success (RYS), 477, and Culture Camp pathways. Second, CVTC will develop staffing and workflows to support child and family assessment, individual counseling, family therapy, group services, behavioral health case management, family support, and referral follow-up. Third, CVTC will create core program infrastructure, including documentation practices, billing and credentialing readiness, telehealth capability, case tracking, quality assurance, and data systems. Fourth, CVTC will provide direct services, including screening, intake, comprehensive assessment, individualized care plans, youth counseling, family counseling, caregiver support, case management, and coordinated referral to higher levels of care when needed. Fifth, CVTC will formalize coordination with schools, early childhood and family partners, Southcentral Foundation, referral providers, and internal coordination with Judicial Services and Recovery Services where cross-referral is appropriate. Sixth, the program will incorporate culturally grounded family support, identity, connection, family healing, and community-based wellness pathways that reflect Chickaloon’s values and respond to Alaska Native and American Indian children and families in the service area. This project is designed to create a reliable pathway that connects family services, behavioral health, community supports, and long-term wellness. It's also designed to strengthen sustainability by creating a billable and coordinated youth and family program.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Chignik Bay Tribal Council	Chignik Sub-Region Health Systems Planning and Youth Environmental Health Initiative	AK	The Chignik sub-region — five communities (Chignik Bay, Chignik Lagoon, Chignik Lake, Ivanof Bay, and Perryville) in the Lake and Peninsula Borough — faces a convergence of urgent, unaddressed health system threats. All five communities are off the road system, reachable only by small aircraft or boat. Health care depends entirely on a single sub-regional clinic, yet the foundations that enable that clinic to function are deteriorating. Provider recruitment is undermined by the absence of adequate housing — a barrier so fundamental it prevents the community from sustaining minimal staffing. The clinic is physically threatened by coastal erosion, with no engineering assessment or protection plan in place. There is no local healthcare workforce pipeline, leaving the sub-region perpetually dependent on outside providers who are difficult to recruit and harder to retain. The community's youth have no access to programs connecting environmental health to their wellbeing, despite living in a subsistence-dependent environment where Harmful Algal Blooms, shifting ecosystems, and contamination pose direct and growing health risks. Each gap is serious in isolation. Together, they describe a health system without the infrastructure to sustain itself. This project addresses all four through targeted planning and youth programming that will position the Chignik sub-region for transformative investment in future funding cycles.	This project has four distinct but complementary components, each addressing a foundational gap in the Chignik sub-region's health system. Youth Environmental Health Literacy Program. Operating out of the existing Tribal Building in Chignik Bay and open to youth from all five sub-regional communities, this program delivers structured health education connecting environmental conditions to individual and community health outcomes. Core topics include how Harmful Algal Blooms and paralytic shellfish poisoning threaten subsistence food safety, how climate-driven ecosystem changes create new health risks, and how environmental stressors affect physical and mental wellbeing. Provider Housing Plan. RHTP funding will support engagement of a qualified planning consultant to assess provider housing needs and options in Chignik Bay, evaluate existing housing stock, develop financial feasibility analysis, and produce an implementation-ready plan for submission in a future capital funding cycle. Clinic Erosion Protection Plan. The Harris Subregional Clinic — the only healthcare facility serving the sub-region — is threatened by active coastal erosion. RHTP funding will support an engineering assessment documenting the current threat, evaluating protective infrastructure options, developing cost estimates, and producing a pre-development plan to support future capital funding applications. Healthcare Workforce Training Plan. RHTP funding will support a planning process to design a locally grounded healthcare training pathway for sub-regional community members. The plan will assess community interest, identify viable certification pathways including Community Health Aide/Practitioner, Behavioral Health Aide/Practitioner, EMT, Emergency Trauma Technician, First Responder, and other allied health roles, develop a partnership framework with BBAHC and training institutions, and produce an implementation-ready workforce pipeline plan for future funding.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Lake and Peninsula Borough	Deferred or Not Advanced

Chilkat Indian Village	Klukwan Emergency Fire Response Initiative	AK	Village residents in Klukwan are often the first to respond when emergencies occur, stepping forward to protect their community. However, our community currently lacks the equipment, training, and organized response capacity necessary to safely respond to structural fires. Many structures in the Village contain large amounts of Class A combustible materials, allowing fires to spread rapidly before outside assistance can arrive. Response from outside the community may take 30 minutes to an hour and is not guaranteed. In a small rural community, a single structure fire can quickly escalate into a life-threatening emergency and result in the loss of multiple homes. Despite these risks, Klukwan possesses a strong foundation for building local response capacity. Community members have expressed interest in organizing a volunteer responder team, and the Village has already begun investing in fire safety equipment, including approximately \$90,000 in self-contained breathing apparatus (SCBA). This project represents an opportunity to support and equip the community members who already step forward during emergencies, allowing Klukwan to build a safe, organized, and sustainable structural fire response capability.	CIV proposes to establish a Village-based structural fire response capability designed for the scale and needs of the community of Klukwan. This effort builds upon the longstanding reality that Village residents are often the first to act when emergencies occur. CIV is coordinating a community-led initiative to organize and support these responders while ensuring they have the equipment, training, and safety infrastructure necessary to respond effectively to structural fires. Funding through the Rural Health Transformation Program would catalyze the development of this program by allowing CIV to equip and train a local responder team composed of community members who have expressed interest in protecting the Village. The project builds upon existing community investments in fire safety equipment, including approximately \$90,000 in self-contained breathing apparatus (SCBA), and local technical expertise available within the Village to support responder organization, equipment planning, and training coordination. This effort also represents an important step in developing a local emergency response workforce in Klukwan. By training community members in structural firefighting and emergency response protocols, the project builds practical skills and creates pathways for community members to develop emergency service capabilities that are critically needed in rural Alaska. Further, this creates pathways future emergency service roles within the Village. Project activities will focus on establishing the foundational elements of structural fire response capacity. This includes procuring structural firefighting apparatus and safety equipment guided by National Fire Protection Association (NFPA) 1901 standards, acquiring turnout gear for community responders, and providing foundational structural firefighting training. CIV will also work with responders to develop response protocols appropriate for a small rural community and to formally organize the Village responder team. While the immediate focus of this project is structural fire response, this effort represents the first phase of building broader emergency response capacity within Klukwan over time. By organizing and equipping the community members who already step forward during emergencies, the project will establish a safe, sustainable Village-based response capability that strengthens protection of life, housing, and community health.	\$1M-\$5M	Single Community	Haines Borough	Deferred or Not Advanced

Chilkoot Indian Association	Chilkoot Indian Association Workforce Childcare Stabilization Initiative	AK	Haines is a frontier Alaska community experiencing healthcare workforce strain compounded by limited childcare access. The community currently has only one licensed in-home infant provider, with a documented waitlist of nine infants. Healthcare employees in Haines report difficulty securing reliable childcare, creating barriers to recruitment, retention, and workforce stability. In small rural systems, the loss or delayed recruitment of even one provider can significantly affect appointment availability and continuity of care. As healthcare infrastructure expands locally, workforce support systems have not kept pace. The Chilkoot Indian Association (CIA), a federally recognized tribal government, owns a building with the potential to house licensed childcare services. While structural rehabilitation funding is being pursued separately, there is an immediate opportunity to develop a workforce-supportive childcare model designed to address childcare-related barriers to healthcare employment. By advancing planning, program design, and implementation readiness for a tribally operated childcare facility, this project seeks to strengthen rural workforce stability and support reliable healthcare access for residents of Haines.	CIA will implement a phased Rural Health Workforce Childcare Stabilization Initiative designed to address childcare-related barriers affecting healthcare workforce recruitment and retention in Haines. Structural rehabilitation of a tribally owned building, including foundation and roof repair, is contingent upon separate capital funding currently being pursued. RHTP funds will not be used for major construction activities. RHTP investment will support planning, program design, and workforce-aligned implementation readiness activities necessary to establish a licensed childcare program serving healthcare and essential service workers. Key activities include: • Conducting a childcare demand assessment focused on healthcare and essential service workers • Developing a culturally grounded early childhood curriculum that incorporates local cultural knowledge and values • Interior childcare space planning aligned with licensing requirements and child development best practices • Designing an ADA-accessible outdoor playground space; currently there are no ADA-accessible playgrounds in the Haines community • Developing childcare safety plans and operational policies • Completing licensing preparation and regulatory compliance planning • Establishing a contract for nutritious meal services to support daily childcare operations • Developing a childcare workforce recruitment and staffing model • Establishing evaluation metrics to measure workforce stabilization impacts Through these activities, CIA will establish a childcare program that integrates cultural identity, accessibility, and safety while supporting workforce stability. By sequencing planning and program design prior to facility readiness, the project ensures that once structural rehabilitation is completed, childcare services can be launched efficiently and sustainably. This initiative aligns with Alaska’s Strengthen Workforce and Health Care Access priorities by addressing childcare access as a key barrier to workforce participation in rural communities.	\$1M-\$5M	Single Community	Haines Borough	Advance to Implementation Application

Christian Health Associates	Expanding the Healthy Smiles Forever Model of On-site Oral Healthcare to Rural LTC Facilities	AK	Delivery of adequate oral care to residents in long-term care (LTC) facilities has been neglected in the United States, including Alaska. It is very difficult for most residents in these facilities to be transported to obtain dental treatment. Many private dental practices cannot accommodate patients with these physical and mental disabilities. Lack of oral hygiene or clean dentures can lead to a proliferation of oral bacteria. Along with other conditions seen in the LTC populations, this increases the risk for aspiration pneumonia and may add complications to many other systemic diseases. Based on projections from the Alaska Department of Labor and the U.S. Census Bureau, Alaska's 65+ population has increased from 70,889 in 2015 to 118,725 in 2025 and is projected to reach 134,849 by 2035. This project will provide oral care in the growing elder population on-site in LTCs. This project fits into the state's initiative: Expanding and maintaining access to essential health services in rural, remote and frontier communities. Specifically the project fits into the category: maximizes care close to home by expanding access to primary, behavioral and oral health care within integrated systems. This project also fits under the potential use of funds to deploy mobile dental clinics and expand access to remote and frontier health options.	Healthy Smiles Forever is a model that is successful in 5 sites in Anchorage and the Mat-Su Valley. It has been operating for 10 years. The oral health clinics provide on-site care. The benefits include: - Critical services to underserved seniors and disabled individuals provided close to home. - Reduced need to transport patients that have significant mobility issues. (Ex. need Hoyer lift) - Clinical providers with expertise in geriatric treatment. - Reduced cost to facilities. - Increased preventive care. - Improved systemic health with improved health care for residents. - Partnership with medical care providers for improved overall health. - Training for long-term care (LTC) staff on providing routine oral health care for residents. - Improved quality of life for residents in ways as simple as being able to enjoy eating their meals or being able to smile and talk with others when dental needs are met. - Expertise in recruiting and hiring providers to serve this population group. This project will help to develop on-site oral health clinics in LTC facilities outside of Anchorage, initially expansion to 5 rural sites, with the possibility of future expansion to all nursing homes in Alaska. The planning steps will include: - Develop a template for expansion, including recommendations for clinical space, equipment, supplies, staffing, recruitment, billing, LTC staff training. - Analyze the best structure for expansion (one organization with many sites, independent sites, etc.) - Develop recruitment strategies. - Study improved reimbursement process from Medicaid and other insurers. - Hire a project manager. - Meet with partners and interested parties to expand the existing multi-disciplinary work group. - Hire consultants for space evaluation, accomplishing project goals, etc. as needed. - Purchase improved technology for existing sites (scanner for 3-D dentures, cloud-based billing system, etc.)	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Matanuska-Susitna Borough	Advance to Planning

Christian Health Associates	Anchorage Project Access - Project REACH: Reducing Equity Gaps in Access to Care and Health Outcomes	AK	As of early 2026, more than one in 10 Alaskans (approximately 73,300 residents based on recent data) are without health insurance. Alaska has one of the highest uninsured rates in the nation. This high uninsured rate is compounded by the expiration of enhanced premium tax credits and potential new work requirements for Medicaid. Alaskans lack access to specialty care due to the high cost of health insurance and limited plan options in Alaska. Other barriers include the high cost of health care, extensive wait times, difficulty navigating complex systems of care, transportation barriers, language barriers, and a lack of outreach to rural populations regarding donated specialty care in Anchorage. Limited access to affordable health insurance results in a lack of access to life-saving and essential specialty medical, dental, and mental health care, often resulting in health conditions progressing to higher acuity levels, protracted courses of treatment, overutilization of hospital emergency departments or crisis centers, sustained ill health, and the inability to meet family obligations, maintain employment, and achieve financial solvency and optimal health. Alaskans suffer from high rates of cancer, obesity, heart disease and diabetes. If specialty health care is provided earlier in a person’s health journey, health issues may be resolved, hospitalizations can be avoided, and patients have their health and hope restored in order to achieve optimal health.	Project REACH will increase access to life-saving donated specialty medical, dental, and mental health services for uninsured or underinsured Alaskans and improve health outcomes for patients enrolled in APA’s efficient and effective system of care. Project REACH will expand access to APA’s network of over 850 committed volunteer specialty doctors, dentists, licensed therapists, and ancillary care providers, centrally located in Anchorage, by increasing outreach to health clinics in outlying communities. APA serves residents across the state in the hub communities of Anchorage and the Mat-Su Valley. No cost mental health services are offered virtually to all areas of Alaska. Project REACH allows APA to specifically connect with over 100 health care clinics across Alaska to increase referrals to APA’s donated specialty health care program. By increasing APA’s outreach to rural communities, and expanding the capacity to serve uninsured Alaskans, APA will maximize primary care providers’ ability to connect rural residents with donated specialty care. For over 20 years APA has provided Alaskans with critical health problems with life-saving donated specialty health care services. Project REACH will increase capacity by adding a full-time Patient Care Coordinator and a full-time Community Access and Engagement Specialist to APA’s current direct service team allowing the program to meet the rapidly increasing need for donated care services across Alaska. APA’s Project REACH strengthens Alaskans’ lifelong health and well-being, provides outcome-driven health care systems, and increases workforce development and innovation. Project REACH achieves these goals through the following initiatives of the RHTP program: Healthy Beginnings - serving Alaska’s pregnant and postpartum women, infants and children Health Care Access – increasing Alaskans’ access to primary, behavioral, oral, specialty, home and community-based health services across rural communities for patients ages newborn to seniors Healthy Communities – investing and enhancing access to preventive and primary care services that enable early chronic disease management and improve population health Strengthen Workforce – developing and retaining direct service health care professionals through employment and training Spark Technology and Innovation – enhancing telehealth, facilitating data sharing and system interoperability, and testing new delivery modalities using emerging technologies.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Christian Health Associates	Anchorage School Based Health Centers: Increasing healthcare access for students	AK	ASBHC increases healthcare access so students can succeed at school and in life. We operate five school-based clinics and three itinerant sites in Anchorage. This project addresses two gaps: limited access to care at Romig Middle School and limited capacity to identify and manage chronic disease risk. Romig is the largest middle school in Alaska and serves a diverse student population with significant healthcare needs. Because the building is overcrowded and space has been unavailable, ASBHC has only provided itinerant services, reaching fewer than 30 students per year. Although consistent services began at adjacent West High School in fall 2025, the space has not supported practical access for Romig students. As a result, many—particularly those who face barriers to community care—lack consistent access to comprehensive, school-based services. Student data show a need for earlier identification of chronic disease risk. While ASBHC collaborates with school nurses to provide urgent care, most visits are comprehensive wellness exams for students who otherwise lack primary care. In 2025, nearly 25% of students seen were identified as at risk for cardiovascular disease or diabetes based on BMI and/or blood pressure. The clinic lacks point-of-care testing to fully assess and manage these risks. Expanding access at Romig and strengthening screening at all sites will improve student health outcomes and long-term well-being.	Rural Health Transformation Program funding will support two coordinated strategies. First, beginning in the 2026–27 school year, ASBHC will expand consistent services to a shared Romig/West clinic location. School administration has identified appropriate space that will allow regular access for Romig students and improved collaboration with the Romig school nurse, while continuing services for West students. Funding will support staffing the site at least one day per week, increasing as demand warrants. No additional supplies are required for this expansion. Second, ASBHC will implement point-of-care testing to strengthen identification and management of obesity- and diabetes-related risk during comprehensive wellness exams. Funds will support purchase of newly released testing equipment and supplies, development of clinical protocols, staff training, and the first year of implementation. Parent consent forms have been reviewed by legal counsel and will be incorporated into Anchorage School District online registration for 2026–27. A vendor bid has been secured. On-site testing will allow providers to deliver immediate education, monitor trends, make informed referral decisions, and coordinate care with families and community specialists. Students identified as at risk will receive case management and follow-up to ensure continuity of care. Together, these strategies expand access, strengthen preventive services, and improve long-term health trajectories for students.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Christian Health Associates	Cornerstone Health Counseling Telehealth and Counselor Training	AK	Living in rural Alaska presents challenges to receiving needed behavioral health services, including geographic isolation, limited service availability, social stigma and high-stress work. Many in rural areas of Alaska live miles from the nearest health center. Others are unable to continue established therapy while working seasonally in rural areas. Existing clinics experience staff shortages, and behavioral health providers in Alaska feel stressed by heavy workloads.	Cornerstone Health Counseling employs 10 licensed therapists, including psychologists, licensed professional counselors, clinical social workers and licensed marriage and family therapists. Cornerstone also has therapists trained in substance misuse. Cornerstone provides training and supervision for master-level therapists working towards licensure. This supervision is a required step towards licensure. Most of these supervisees go on to provide behavioral health services throughout Alaska, while some continue at Cornerstone. Cornerstone serves clients from Anchorage and the Mat-Su Valley through in-person visits and also serves a limited number of clients in rural areas via telehealth visits. With a limited investment in equipment, personnel and engagement tools, Cornerstone will expand its telehealth services to serve more people in rural Alaska. Cornerstone will also continue to train and supervise therapists working towards licensure to mitigate the staffing shortages in behavioral health.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Chugach Regional Resources Commission	Alutiiq Pride Traditional Foods Wellness Hub: Healthy Food Complex Readiness & Compliance	AK	Rural and frontier communities in the Chugach region face persistent barriers to healthy eating and wellness, including high food costs, seasonal supply disruptions, and limited local infrastructure for safe storage, handling, and culturally grounded nutrition education. In 2021, CRRC acquired three 40-foot food infrastructure containers (freezer, game processing, and controlled-environment unit) to strengthen food security, but the funding covered purchase/delivery only—not design, permitting, site preparation, or utility connections—so the assets remain temporarily placed, not fully code-compliant, and underutilized. This project opportunity is to convert those existing assets into a sustainable, year-round wellness and healthy eating platform that advances prevention, self-determination, and community resilience.	CRRC will advance the Alutiiq Pride Traditional Foods Wellness Hub at our Alutiiq Pride Marine Institute (APMI) campus in Seward as a “Healthy Communities” wellness-center platform focused on healthy eating and lifestyle change. During the project period, CRRC will complete A/M/E (as needed), permitting and compliance planning, and construction-ready design for long-term, code-compliant operation of the three containers, including a clear pathway for permanent siting and utility connections. In parallel, CRRC will implement allowable minor upgrades and equipment needs that enable reliable nutrition education, cooking classes, Traditional Foods programming, and safe cold storage/handling.	\$50,000-\$250,000		Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough	Deferred or Not Advanced
Chugachmiut	Expanding Rural Access to Comprehensive Behavioral Health Services	AK	Alaska faces a shortage of accessible behavioral health and neurodevelopmental services, particularly in rural and remote communities. Families often experience long wait times for psychological evaluations, autism and fetal alcohol spectrum disorder (FASD) diagnostics, therapy, and specialized interventions. Limited provider availability, geographic isolation, and fragmented care systems make it difficult for individuals to receive timely and coordinated support. As a result, many families must travel out of state, creating financial burdens and delays in care. These gaps are especially evident among individuals entering intensive outpatient treatment programs, including Recovery Camp, where participants frequently present with complex co-occurring conditions such as trauma, substance use disorders, neurodevelopmental conditions, and cognitive impairments. Without comprehensive diagnostic assessment, these underlying conditions may go unidentified, resulting in incomplete treatment planning and increased risk of relapse or repeated levels of care. This project would establish a multidisciplinary program that provides assessments, autism and FASD diagnostics, therapy services, and case management for children, adolescents, and adults across Alaska. By expanding access through both telehealth and in-person visits, the program will reduce travel burdens, improve care coordination,	Our proposed approach addresses the critical shortage of behavioral health diagnostic and treatment services in Alaska through a comprehensive, multi-disciplinary program that integrates psychological, neurodevelopmental, and physical health services under one coordinated model. The program will provide timely assessments for autism, FASD, ADHD, learning differences, mood disorders, and other neurodevelopmental conditions, reducing the need for out-of-state travel and improving access for rural communities. A team-based model will guide care, bringing together a psychologist, psychiatrist, psych registered nurse, behavioral health clinician, speech and language pathologist, occupational therapist, physical therapist, and administrative and billing support staff. Providers will conduct comprehensive psychological, neurophysical, and developmental testing to identify cognitive, emotional, behavioral, and neurological needs, and collaborate to create unified, evidence-based, culturally responsive, client-centered treatment plans. The assessment team will be based on the Chugachmiut Regional Health Center in Seward, providing in-person and telehealth consultations, assessments, and clinical services. Family-centered support will be a key component, including counseling, parent education, and group services designed to strengthen the home and community functioning. Behavioral analysis will support autism services and case management, while speech, language, and physical therapy services will address developmental needs. RHTP funding in year one will support the recruitment and hire of up to nine clinical provider and support staff, HIPAA-compliant telehealth hardware and software, occupational and physical therapy equipment and sensory tools, clinical assessment tools, and office equipment.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough	Advance to Implementation Application

support earlier diagnosis and treatment, and significantly enhance outcomes.

Behavioral Health clinicians will receive specialized training in autism, FASD, PTSD, and trauma-informed care to deliver targeted counseling services. Future funding may be used to hire additional staff and expand service delivery as need dictates. Billing for reimbursable services starting year two will help sustain the program long-term.

The program will outreach to clinics and hospitals across Alaska to explain the service model, and will develop formal partnerships with tribal health organizations, schools, hospitals, community programs, and state agencies, establishing workflows for referrals, intake, consent, data tracking, and quality assurance.

Chugachmiut	Expanding Rural Access to Diagnostic Imaging Through Digital X-Ray Technology	AK	Rural Chugachmiut clinics serve geographically isolated communities where access to diagnostic imaging is limited or unavailable locally. Patients frequently must travel by small aircraft or boat to regional hospitals for basic imaging studies, creating delays in diagnosis and treatment and increasing healthcare costs. Limited access to timely imaging can delay identification of fractures, respiratory illness, infections, and other acute conditions, often resulting in unnecessary emergency referrals or medevac transport. These delays also place an additional burden on rural providers who must make clinical decisions with incomplete diagnostic information. This project addresses these challenges by equipping five rural clinics with portable digital X-ray systems that enable local imaging and secure transmission for interpretation. Expanding local diagnostic capabilities will reduce travel burdens, accelerate treatment decisions, and strengthen rural providers' ability to deliver safe, high-quality care close to home. The five clinics to receive the X-ray systems are the Chugachmiut Regional Health Center in Seward, the Arch Priest Nicholas Kompkoff Health Clinic in Chenega, the Anesia Anahonak Moonin Health Clinic in Port Graham, the Tatitlek Health Clinic, and the Nanwalek Health Clinic.	Chugachmiut Health Services proposes to acquire and deploy five digital X-ray systems across rural clinics serving geographically isolated Alaska communities. These portable digital radiography units are designed specifically for small or remote clinical environments and will enable on-site diagnostic imaging for patients who currently must travel long distances for basic imaging services. The systems will be integrated into existing clinic workflows and electronic health record infrastructure to allow imaging studies to be obtained locally and securely transmitted for radiology interpretation. This approach ensures that rural providers can rapidly access diagnostic information while maintaining continuity of care within the broader regional health system. Implementation will occur in several coordinated steps. First, equipment procurement and site readiness activities will ensure clinics have appropriate space, electrical capacity, and network connectivity for safe system operation. Next, installation and calibration will be completed in partnership with the equipment vendor. Clinical staff will receive structured imaging training through established education modules and hands-on instruction provided by Southcentral Foundation's Medical Imaging Training Coordinator. Training will include equipment operation, radiation safety, image quality standards, and clinical workflow integration. Cross-training of multiple staff members at each site will ensure ongoing operational continuity. Once deployed, the systems will support real-time or near-real-time image transmission to radiology interpretation services at Alaska Native Medical Center. This allows rural providers to receive timely diagnostic guidance and strengthens coordination between village clinics and regional specialty services. Quality assurance procedures will be incorporated into routine clinic operations to monitor image quality, utilization, and workflow efficiency. This implementation model maximizes the use of existing rural clinical infrastructure while expanding diagnostic capability in a safe, sustainable, and scalable manner. By bringing modern diagnostic imaging directly into rural clinics, the project strengthens frontline care delivery, reduces diagnostic delays, and improves rural providers' ability to manage urgent and chronic health conditions close to home.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough	Advance to Implementation Application

Chugachmiut	Expanding Rural Access to Point-of-Care Laboratory Diagnostics	AK	Timely access to laboratory testing remains a significant challenge for rural Chugachmiut clinics serving geographically isolated Alaska communities. Many sites rely on laboratory specimens being transported to regional facilities for analysis. Weather disruptions, transportation limitations, and infrequent courier schedules often delay results by several days. These delays can postpone diagnoses and treatment for conditions such as diabetes complications, dehydration, renal dysfunction, electrolyte abnormalities, and infection. In some cases, providers must make clinical decisions without laboratory confirmation or request unnecessary patient travel to regional facilities. This project addresses the opportunity to expand point-of-care diagnostic capacity by equipping rural clinics with Piccolo Xpress Laboratory Analyzers. These analyzers enable essential chemistry testing to be performed on site during the patient visit, allowing providers to make faster and more informed clinical decisions while reducing dependence on off-site laboratory services.	Chugachmiut Health Services proposes to purchase and deploy five Piccolo Xpress Laboratory Analyzers across multiple rural clinic sites. The Piccolo system provides rapid, CLIA-waived chemistry testing using small sample volumes, making it well-suited for remote settings with limited laboratory infrastructure. The five clinics to receive the analyzers are the Chugachmiut Regional Health Center in Seward, the Arch Priest Nicholas Kompkoff Health Clinic in Chenega, the Anesia Anahonak Moonin Health Clinic in Port Graham, the Tatitlek Health Clinic, and the Nanwalek Health Clinic. Implementation will include equipment deployment, staff training, quality control procedures, and integration into existing clinical workflows. Providers will be able to perform chemistry testing during patient visits, allowing results to be reviewed immediately and incorporated into clinical decision-making. Staff will receive standardized training in equipment operation, specimen handling, quality assurance procedures, and documentation practices. Cross-training of multiple staff members at each clinic will ensure operational continuity and reduce disruption from staff turnover. Quality control and compliance procedures will follow established CLIA-waived testing standards. Routine monitoring will ensure accurate test performance, proper documentation, and ongoing staff competency. This approach allows rural clinics to expand diagnostic capabilities while leveraging existing workforce and infrastructure, reducing care delays and strengthening providers' ability to manage both acute and chronic conditions locally.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough	Advance to Implementation Application

Chugachmiut	Nanwalek Rural Health Access and Workforce Stabilization: Clinic Renovation and Provider Housing	AK	Remote Alaska communities face persistent barriers to healthcare access due to geographic isolation, workforce shortages, and limited healthcare infrastructure. In Nanwalek, the Community Health Aide Program serves as the foundation of healthcare delivery; however, limited clinic infrastructure and lack of provider housing constrain the ability to expand services and maintain consistent visiting provider rotations. Without reliable housing, visiting physicians, dentists, and behavioral health clinicians must rely on temporary accommodations that limit the duration and frequency of clinical visits. This reduces continuity of care, delays access to services, and places increased pressure on CHA/P providers who serve as the community’s frontline healthcare workforce. The current clinic also lacks dedicated infrastructure required to support behavioral health counseling and dental services. Behavioral health services require private spaces to ensure confidentiality and effective treatment, while dental services require specialized equipment and appropriate clinical space. Renovating the Nanwalek Clinic provides an opportunity to strengthen healthcare infrastructure, expand integrated healthcare services, and stabilize the rural healthcare workforce. By improving facilities and providing housing for visiting providers, this project will increase local access to medical, dental, and behavioral health care while reducing reliance on costly medical travel outside the community.	Chugachmiut Health Services will renovate the Nanwalek Clinic to enhance healthcare delivery capacity and strengthen an integrated rural healthcare model that supports the CHA/P workforce. Project renovation components include: • Interior modifications of building interior space to create two on-site provider housing units to accommodate visiting physicians, advanced practice providers, dentists, behavioral health clinicians, and other specialists • Reconfiguration of clinic interior space to establish a dedicated behavioral health counseling room designed to ensure privacy and support confidential mental health and substance use treatment • Creation of a fully equipped dental treatment area capable of supporting preventive, diagnostic, and restorative dental services • Reconfiguration of existing clinical space to improve care coordination between CHA/P providers, primary care providers, dental clinicians, and behavioral health professionals • Infrastructure improvements required for safe clinical operations, including infection control standards and utilities necessary to support dental equipment The renovated facility will allow visiting providers to coordinate services with primary care visits, enabling patients to receive medical, dental, and behavioral health services during the same visit. This integrated care approach supports early intervention, improves continuity of care, and reduces unnecessary travel for services that can be delivered locally. Chugachmiut will coordinate closely with tribal leadership, community representatives, and rural construction partners to ensure the project reflects community priorities and can be implemented efficiently within the logistical constraints of a remote Alaska village.	\$1M-\$5M	Clinic	Single Community	Kenai Peninsula Borough	Advance to Implementation Application

Chugachmiut	Prince William Sound and Lower Kenai Tribal EMS Workforce & Sustainability Demonstration	AK	Rural communities in Chenega, Tatitlek, Port Graham, and Nanwalek face persistent barriers to timely emergency medical care due to geographic isolation, severe weather, limited transportation access, and declining volunteer responder capacity. The four communities collectively serve nearly 600 residents and rely on only 1–2 active Emergency Trauma Technician responders to maintain local emergency response coverage. Historically, emergency responses depended on small volunteer groups, but workforce turnover, inconsistent training, and increasing regulatory requirements have made this model fragile and difficult to sustain. Without stable, licensed EMS services, these communities face delayed response times, inconsistent coverage, air transport, and preventable escalation of emergencies before transport can occur. Limited leadership structure, standardized equipment, and billing capacity further constrain long-term system stability. This project demonstrates a scalable rural EMS transformation model that replaces instability with licensed operations, local leadership, and fiscal sustainability. Establishing EMS Leads in each community and embedding services within a coordinated regional system creates a regional framework that can support coordinated EMS system development across rural Alaska. The initiative supports statewide priorities to strengthen EMS capacity through workforce training, improved patient assessment and triage, and stronger emergency response coordination.	Chugachmiut Health Services will implement a phased, regionally coordinated approach to modernize EMS across Chenega, Tatitlek, Port Graham, and Nanwalek. The project establishes a hub-and-spoke model anchored by EMS Leads in each community, shared clinical oversight, and standardized operational systems while preserving local response capacity. Key components include: Community-Based EMS Leadership: Dedicated EMS Lead positions will be established in each village to manage training coordination, quality assurance, licensing compliance, and operational continuity. This leadership structure strengthens tribal governance and creates a framework that can serve as a model for other regions, avoiding the need for additional state-level administrative structures. • Standardized Equipment and EMS-Specific Connectivity: Deployment of modern EMS equipment and portable and vehicle-mounted communication devices used solely for licensed emergency response and telemedicine consultation. These tools support real-time clinical coordination and may also be utilized for remote skills refreshers and high-fidelity simulation-based training to sustain competency in isolated environments. Connectivity investments exclusively cover EMS-specific equipment, excluding community broadband or telecommunications infrastructure construction or expansion. • Structured Workforce Advancement: Expansion of Emergency Trauma Technician (ETT), CPR, and continuing education pathways to build responder capacity and establish advancement into EMT and Advanced EMT (AEMT) certification. Ongoing continuing medical education (CME), mentorship, and leadership development create a defined workforce pipeline into Community Health Aide and allied health programs. This “grow-our-own” workforce strategy strengthens long-term rural health capacity by creating pathways for local residents, including students in mentored school programs, to enter the healthcare workforce through EMS training. • Operational and Fiscal Integration: Formalization of Incident Command, documentation, quality assurance, and billing systems aligned with state regulatory requirements and reimbursement standards, ensuring financial sustainability and ease of replication. This approach emphasizes administrative simplicity, tribal governance, and modular system design. The framework intentionally allows phased regional expansion by leveraging existing licensing, reimbursement, and health system infrastructure.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough	Advance to Implementation Application

Chugachmiut	Strengthening Rural Alaska Dental Access Through In-Clinic Digital Dentistry	AK	Rural communities served by Chugachmiut Health Services face significant barriers to timely access to custom dental appliances such as crowns, night guards, and other patient-specific devices. Currently, most appliances must be fabricated by off-site dental laboratories located in Anchorage or other urban centers. This process requires physical impressions, shipping, and multiple patient visits, resulting in extended turnaround times and delays in care. For patients in remote communities such as Chenega, Tatitlek, and Nanwalek, access to dental care is further limited by weather-dependent transportation, high travel costs, and infrequent provider availability. These barriers can lead to missed follow-up appointments, delayed treatment completion, and worsening oral health conditions. Rural and Alaska Native populations experience these access challenges disproportionately. This project presents an opportunity to strengthen rural dental care capacity by implementing digital dental scanning and 3D printing technology directly within Chugachmiut clinics. Local fabrication of dental appliances will reduce reliance on distant laboratories, shorten treatment timelines, reduce patient travel, and support more timely, equitable access to essential dental services for rural patients.	Chugachmiut Health Services proposes implementing four digital dental scanning and 3D printing systems to establish in-house fabrication of dental appliances across its regional clinic network. Each site will be equipped with a TRIOS intraoral digital scanner and a SprintRay Pro2 GOTO 3D printing system, including ProWash S, NanoCure, and NightGuard Flex materials, creating a fully integrated digital dental workflow from scanning through final appliance production. Using this system, dental providers will capture high-resolution digital scans and design patient-specific appliances that can be fabricated on-site. This capability will allow clinics to produce crowns, night guards, and other dental appliances with same-day or rapid turnaround, significantly reducing delays associated with external dental laboratories and shipping from remote communities. Vendor-supported training will be provided to dental providers and assistants to ensure competency in digital scanning, design software, printing protocols, post-processing, infection control, and quality assurance procedures. Training will support the safe integration of the technology into routine dental operations and ensure adherence to clinical standards. Once installed and operational, the systems will be incorporated into everyday dental workflows to support restorative care, preventive services, and improved treatment planning. This approach will enhance local service capacity, reduce patient travel for dental care, and allow rural clinics to provide more timely and comprehensive treatment. The four clinics receiving the digital dental scanning and 3D printing systems are the Chugachmiut Regional Health Center in Seward, the Arch Priest Nicholas Kompkoff Health Clinic in Chenega, the Tatitlek Health Clinic, and the Nanwalek Health Clinic.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough	Advance to Implementation Application

Chugachmiut	Strengthening Rural Dental Care with Advanced 3D Imaging	AK	Access to advanced dental diagnostic imaging is limited in rural Chugachmiut communities, often requiring patients to travel long distances for specialty dental imaging or treatment planning. This creates delays in diagnosis, treatment initiation, and follow-up care for conditions such as impacted teeth, complex extractions, infections, temporomandibular joint disorders, and dental trauma. The absence of on-site cone beam computed tomography (CBCT) limits the scope of dental services that can be safely and effectively provided locally. This project addresses that gap by equipping the clinic with a Planmeca ProMax 3D Plus (20 × 10) system to expand diagnostic capability and reduce the need for off-site referrals.	Chugachmiut Health Services proposes to acquire and implement the Planmeca ProMax 3D Plus (20 × 10) CBCT system within the dental program at the Chugachmiut Regional Health Center in Seward. This system will support high-resolution 3D imaging for comprehensive dental diagnostics, treatment planning, and procedural safety. Implementation will include vendor-supported installation, calibration, and staff training consistent with Alaska regulatory and professional standards. Imaging workflows will be integrated into existing dental operations and referral processes, allowing providers to diagnose and manage more complex dental conditions locally while maintaining appropriate specialty consultation when needed.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough	Advance to Implementation Application
Chugachmiut	Alaska Tribal Medical Transportation and Escort Program for Rural Patient Access	AK	Rural Alaska residents often face transportation barriers when accessing healthcare services. In many communities, patients with mobility limitations, disabilities, or complex medical needs may have difficulty traveling to local clinic appointments due to limited accessible transportation options. In addition, many rural patients must travel long distances to access specialty care located in regional healthcare hubs. While travel assistance may be available, patients who require a medical escort often do not have someone available to accompany them. As a result, some patients delay or miss critical appointments, discontinue treatment, or experience complications due to incomplete follow-up care. Establishing a Tribal Medical and Clinical Escort Program will address these gaps by providing accessible transportation to local clinics and escort services for patients traveling outside their communities for specialty care. The program will address two transportation needs: accessible local transportation to ensure patients can attend clinic appointments and medical escort services to support patients traveling outside their communities for specialty and hospital-based care.	The Alaska Tribal Medical Transportation and Clinical Escort Program will establish a structured service to support rural patients facing transportation barriers to accessing healthcare. The program will operate through a referral-based coordination model that identifies patients who require transportation assistance or escort services to safely complete medical travel. Providers, care coordinators, and discharge planners will identify patients needing services based on mobility limitations, clinical complexity, functional limitations, or safety considerations. Patients will be triaged to the appropriate level of transportation or escort support depending on their needs. The program will include the purchase and operation of wheelchair-accessible transportation vehicles to support patients traveling to local clinic appointments within hub communities. These vehicles will allow patients with mobility limitations, disabilities, or complex medical needs to safely attend clinic visits, diagnostic appointments, and follow-up care when accessible transportation is unavailable. For patients traveling outside their communities for specialty care, the program will provide two levels of escort services. Non-Clinical Medical Escorts: Trained escorts will assist with travel logistics, appointment navigation, communication support, medication pickup, reinforcement of discharge instructions, and safe return travel. Clinical Medical Escorts: Clinically trained personnel, such as registered nurses, licensed practical nurses, emergency medical technicians, and other licensed	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough	Deferred or Not Advanced

staff, will provide higher-level support when medical monitoring is required, including assistance with oxygen and medical equipment, as well as coordination with receiving providers.

Escort services will be coordinated with rural clinics, Tribal health organizations, hospitals, and specialty providers to ensure continuity of care. Program performance will be monitored through indicators such as referral completion rates, reductions in missed appointments related to transportation barriers, and patient safety outcomes during travel.

Chugachmiut	Energy Upgrades to Improve Healthcare Access in Nanwalek and Port Graham Village Clinics	AK	Health care services in Port Graham and Nanwalek are challenged by unpredictable electric power fluctuations, which endanger sensitive electronic devices and computer equipment and temporarily limit the services that village health care workers can provide. The brownouts and outages often coincide with stormy weather, frequent to the area, when health care workers should be most at the ready to respond to residents. These outages are the result of Port Graham and Nanwalek’s dependence on tree-strung power lines at the remote end of the Railbelt power grid. When trees fall on the lines and branches brush against them, it often causes an electrical fault that will flicker lights, shut down equipment, create brownouts or cause total power outages, and disruptions in one village impacts power supply in the other. As we contemplate transformative measures that will maximize care close to home for life-long health -- whether it's expanding telehealth infrastructure, empowering providers' use of appropriate AI, or encouraging regional communication -- we cannot ignore that obstacle created by the lack of reliable, high-quality power. Addressing the power issues affecting these clinics will enable sustainable healthcare improvements for decades to come.	Port Graham and Nanwalek are only a small part of HEA’s geographically large, diverse power grid, and there simply isn’t the staff or financial resources available to address the issues underlying the energy reliability of the two village clinics. This project will move beyond temporary, quick fixes by hiring a dedicated Energy and Health Resilience Project Coordinator who will perform a system valuation, manage energy upgrade projects, research grants and lead a capital campaign, work with vendors to conduct feasibility and assessment studies, work with stakeholders and develop a strategic plan and timeline that Chugachmiut can act on after the RHTP Year 1 project period concludes. The Energy and Health Resilience Project Coordinator will be contracted for one year, with an option to extend into the future if services are deemed necessary.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Chugachmiut	Rural Health Workforce Stabilization and Provider Incentive Program	AK	Healthcare workforce shortages remain one of the most significant barriers to healthcare access in rural Alaska. Remote communities frequently experience prolonged vacancies in essential healthcare positions due to geographic isolation, limited housing availability, travel costs, and fewer employment opportunities for provider families. These workforce shortages contribute to: • Long wait times for appointments • Limited availability of primary and specialty care services • Increased reliance on temporary or itinerant providers • Reduced continuity of care and increased provider turnover Healthcare organizations serving rural populations often dedicate substantial resources to recruitment and onboarding, which strains already limited administrative capacity. Recruitment cycles for rural healthcare positions can exceed 12 months, and frequent turnover can disrupt patient-provider relationships and continuity of care. This project addresses the opportunity to develop a sustainable workforce stabilization model that supports long-term provider retention in rural communities. By combining structured recruitment incentives with practical relocation supports, the program aims to reduce recruitment barriers and establish a more stable healthcare workforce serving rural Alaskan residents.	This project will establish a structured rural provider incentive program designed to recruit and retain essential healthcare professionals serving rural and remote communities. The program will provide financial incentives for high-need providers who commit to serving in rural communities for a five-year period. Eligible provider types may include physicians, advanced practice providers, nurses, dentists, pharmacists, behavioral health professionals, community health aides, and other clinical and community health professionals whose services are essential to maintaining access to healthcare. Incentives will be structured to encourage long-term retention, with payments distributed across the five-year commitment period and a larger portion of incentives provided in later years of service. Participants who do not fulfill the service commitment will be subject to repayment provisions to ensure responsible stewardship of funds. To address relocation barriers, the program will also provide targeted transition supports, including housing placement coordination with local housing partners, temporary housing stipends, and childcare assistance during the early transition period. These supports help reduce common barriers to rural recruitment and improve provider stability during the critical first years of employment. Implementation will occur in three phases: Phase 1 – Program Development (Months 1–6) Development of program policies, incentive structure, recruitment strategy, and partnership agreements. Phase 2 – Recruitment and Placement (Months 6–24) Recruitment of providers, coordination of relocation supports, and placement in participating rural communities. Phase 3 – Retention and Evaluation (Years 2–5) Monitoring provider retention, evaluating workforce stability, and refining program strategies based on outcomes. Program performance will be monitored through ongoing data collection and evaluation.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough	Deferred or Not Advanced

Chugachmiut	Strengthening Rural Health Access Through Mobile Satellite-Enabled Response Units	AK	Rural healthcare delivery in Alaska frequently relies on mobile response units—including ambulances, community health response vehicles, and public health outreach vehicles—to provide care in geographically isolated communities. However, these vehicles often operate without reliable internet connectivity, limiting access to critical clinical and communication tools. When connectivity is unavailable, healthcare teams cannot access electronic health records, conduct telehealth consultations, transmit patient information, or coordinate effectively with hospitals and emergency services. These limitations delay clinical decision-making, reduce situational awareness during emergencies, and can affect patient safety. Connectivity gaps are especially problematic during medical emergencies, disaster response, severe weather events, and patient transport between communities and hospitals. Chugachmiut Health Services proposes deploying vehicle-mounted satellite internet systems to support mobile healthcare delivery and emergency response operations. These systems will provide reliable, high-speed connectivity for designated healthcare and response vehicles operating in rural communities. By enabling real-time communication, telehealth capability, and access to clinical systems in the field, this project will strengthen emergency response capacity, improve care coordination, and support more timely and effective healthcare delivery for rural Alaskans.	RHTP funding will support the procurement, installation, and deployment of vehicle-mounted satellite internet systems on designated healthcare and emergency response vehicles serving rural communities. The project will include the following implementation components: Equipment Procurement Satellite internet systems, mounting hardware, and vehicle power integration components will be purchased to support reliable connectivity in mobile environments. Vehicle Installation and Integration Satellite terminals will be installed on selected response vehicles used for emergency response, outreach services, and mobile healthcare delivery. Systems will be configured to ensure reliable connectivity while vehicles are stationary or operating in remote areas. Testing and Deployment Connectivity systems will be tested in operational conditions to confirm coverage, reliability, and performance in rural environments. Training and Workflow Integration Healthcare providers, EMS personnel, and CHA/P staff will receive training on the appropriate use of mobile connectivity systems during patient care, emergency response, and outreach activities. Once deployed, mobile connectivity will support real-time EHR access, telehealth consultations, emergency coordination with regional hospitals, and improved communication during patient transport or remote response activities.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Kenai Peninsula Borough	Deferred or Not Advanced

Chugiak Vol Fire and Rescue Co Inc	Establish a prehospital Blood Program(Plasma)	AK	By equipping our advanced life support units with pre-hospital plasma capability, we will: Improve Access: Deliver blood product resuscitation within minutes of EMS arrival rather than after a 30–45 minute transport. This is especially critical in a frontier setting where distance and weather create unavoidable delays. Improve Quality of Care: Align our rural EMS system with national best practices for trauma and hemorrhage management, improving patient outcomes and survivability. Improve Sustainability: Strengthen the local emergency response system by reducing preventable mortality and long-term disability, thereby decreasing downstream healthcare costs and improving overall community resilience. Chugiak’s rural character, limited hospital proximity, and challenging environmental conditions make pre-hospital plasma not a convenience, but a necessity. This program ensures that residents of ZIP Code 99567 receive equitable, high-quality emergency care comparable to urban communities, despite geographic barriers. Ultimately, this initiative enhances survivability for trauma patients, supports rural healthcare infrastructure, and advances health equity for Alaskans living in remote and frontier regions.	We propose implementation of a Pre-Hospital Plasma Program integrated into our ALS ambulance service. Our approach includes the following key components: 1. Deployment of Plasma on ALS Units Our frontline ALS ambulance will be equipped to carry thawed plasma for emergent administration in cases of traumatic hemorrhage, hemorrhagic shock, and other critical medical indications. This will allow plasma to be administered at the point of care often 30 to 45 minutes before hospital arrival during the most time-sensitive phase of resuscitation. 2. Commercially Available Blood Storage System We will purchase and install a commercially available, temperature-controlled blood cooler/storage unit designed specifically for pre-hospital transport. This system will maintain required storage temperatures, provide continuous temperature monitoring, and ensure compliance with regulatory and blood bank standards for blood product integrity and safety. 3. Partnership with Blood Bank of Alaska Plasma will be procured through an established partnership with the Blood Bank of Alaska. We will coordinate closely with their medical and laboratory teams to ensure appropriate handling, storage, tracking, and documentation protocols are in place. 4. Rotational Inventory Management Program To ensure sustainability and eliminate waste, we will establish a rotational exchange program with the Blood Bank of Alaska. Plasma units nearing expiration will be returned to the blood bank for in-hospital use and replaced with fresh units. This system ensures: Zero or minimal product waste Responsible stewardship of a scarce resource Long-term financial sustainability of the program 5. Training and Clinical Oversight All ALS providers will receive training in plasma administration, transfusion protocols, recognition of transfusion reactions, and documentation requirements. The program will operate under established medical direction and evidence-based clinical guidelines. This approach leverages existing ALS infrastructure, builds strong regional healthcare partnerships, ensures regulatory compliance, and creates a financially responsible and sustainable model for delivering advanced resuscitative care in a rural/frontier environment. By integrating plasma capability into our pre-hospital response system, we are effectively extending hospital-level resuscitative care into the field, dramatically improving outcomes for severely injured and critically ill patients in our community.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Circle Village Council	Circle Community Wellness Space Initiative	AK	Circle currently lacks a dedicated space for community wellness programming, fitness activities, and nutrition education. While the community has an existing multi-purpose building, portions of the interior remain unfinished and cannot yet support structured wellness programming. Rural communities like Circle experience disproportionately high rates of chronic disease, including diabetes, heart disease, and obesity. Limited access to recreational facilities, preventive health programming, and nutrition education contributes to these health disparities. Residents must often travel long distances to access health services or organized wellness activities. The unfinished space within the community’s multi-purpose building presents an opportunity to develop a permanent wellness facility that supports physical activity, healthy eating initiatives, and culturally relevant health education. Completing the interior build-out will allow the Tribe to establish a dedicated wellness center that serves youth, adults, and elders. By investing in community wellness infrastructure, Circle Native Community can strengthen preventive health programming, increase opportunities for healthy lifestyles, and improve long-term health outcomes in this rural community.	Circle Native Community proposes to complete the interior build-out of an existing multi-purpose community building to establish a Community Wellness Center and Health Education Space. Funding will support renovation and construction activities needed to finish the facility, including development of a wellness activity space, classroom area for nutrition and cooking education, and office space to support wellness programming. The facility will serve as a hub for a variety of community-driven programs including: -Physical fitness and recreational activities -Nutrition education and cooking classes focused on healthy diets -Traditional foods education and preparation workshops -Youth recreation and healthy lifestyle programs -Community wellness workshops and cultural activities The design will allow the space to serve multiple purposes, supporting both wellness programming and extracurricular community activities. The facility will also provide space for itinerant health educators, trainers, and visiting providers to deliver health promotion programming. Circle Native Community will collaborate with regional partners, local schools, and Tribal leadership to implement programs that reflect community priorities and cultural practices.	\$250K-\$1M	Single Community	Yukon-Koyukuk Census Area	Deferred or Not Advanced

City & Borough of Yakutat	Yakutat EMS and Fire Response System Rebuild and Technology Modernization	AK	Yakutat Public Safety provides Fire and Emergency Medical Services to the City and Borough of Yakutat and surrounding areas within one of Alaska’s most remote and geographically isolated regions. Emergency services are volunteer-run and serve residents, seasonal workers, visitors, and nearby communities where access to advanced medical care often requires air or marine transport. Due to weather, transportation barriers, and distance from referral facilities, local emergency response is frequently the first and most critical point of care available to community members. Yakutat is currently rebuilding its EMS system from the ground up due to aging infrastructure, outdated equipment, communication limitations, and long-standing challenges sustaining volunteer responder capacity. Much of the emergency response equipment currently in use is outdated or expired, limiting safe and effective response capability. Rather than restoring past systems, the community has an opportunity to rebuild EMS using modern infrastructure, updated technology, and coordinated clinical partnerships to create a sustainable emergency care system for the future.	The proposed project will rebuild and modernize EMS and Fire response capacity through replacement of outdated and expired emergency response equipment, modernization of dispatch and communication systems, and integration of EMS operations with Yakutat Community Health Center to improve patient care coordination and transitions. The project also includes development of standardized volunteer responder training and certification pathways, recruitment and retention strategies to sustain volunteer responder capacity, and joint training and coordination exercises between responders and clinic staff. These improvements will allow responders and clinical teams to work together more effectively while strengthening the long-term sustainability of emergency services. This effort is expected to benefit rural and remote residents by improving the reliability and coordination of emergency response, expanding access to timely emergency and urgent care services, improving patient stabilization prior to transport, reducing preventable emergency transfers when safe local treatment is possible, and strengthening community safety and resilience through sustainable emergency response capacity.	\$250K-\$1M	Single Community	Yakutat (City and Borough)	Advance to Implementation Application

City and Borough of Juneau	Instructor Development	AK	Alaska faces persistent EMS workforce shortages, particularly in rural and frontier communities where volunteer and combination departments struggle to recruit and retain certified providers. A major barrier is limited access to locally based EMS instructors and Instructor Coordinators authorized to deliver and oversee EMT and ETT programs. Southeast Alaska agencies often rely on outside instructors, creating delays, travel costs, and inconsistent course availability. Currently, instructor capacity does not meet regional demand for EMT-1, EMT-2/Alaska Advanced EMT and ETT training. Without growing in-state instructor infrastructure, communities risk reduced response capability, increased provider burnout, and gaps in advanced prehospital care. This project addresses a critical workforce development opportunity: building sustainable, regionally based EMS instructor capacity. By developing new EMT, Advanced, and ETT instructors, along with Instructor Coordinators, CCFR will create a scalable training framework that supports certification, recertification, and long-term workforce stability across Southeast Alaska.	CCFR will implement a structured EMS Instructor Development Program designed to increase regional training capacity and reduce reliance on outside educators. The project will: • Provide Methods of Instruction (MOI) training to qualified EMS providers • Deliver the Alaska-specific EMS Instructor course • Support credentialing of new EMT-1, EMT-2/Advanced, and ETT instructors • Develop multiple Instructor Coordinators to oversee course quality and compliance • Establish standardized curriculum delivery and mentorship processes Participants will include CCFR personnel and regional EMS partners in Southeast Alaska. Selection will prioritize experienced providers committed to long-term instructional roles. Two training phases are anticipated: Phase 1 – Instructor Development MOI and Alaska EMS Instructor courses will be delivered locally. Candidates will complete required teaching practicums under supervision. Phase 2 – Instructor Coordinator Development Qualified instructors will be supported in completing additional requirements to become Instructor Coordinators, allowing regional autonomy in course approval and oversight. Following instructor credentialing, CCFR will host EMT and ETT programs to validate instructional capacity and immediately expand workforce output. This project strengthens workforce infrastructure by embedding education capability within the region, decreasing travel barriers, reducing course cancellations, and increasing frequency of certification opportunities.	Under \$50,000	Home- and community-based services provider	Single Community	Juneau (City and Borough)	Advance to Implementation Application

City and Borough of Juneau	Community Health Data and Billing Infrastructure	AK	CCFR Community Health Division is currently only funded through CBJ funds and has no reimbursement / revenue structures despite having close to 5000 transports, contacts and responses. Historically, growth has been achieved by pursuing local CBJ one-time awards or state/national grants. Not having billing infrastructure within our non-emergency functions has slowed potential growth, despite ever increasing community need. Specifically, we have seen significant fluctuations in the stability of grants that support mental health and substance use treatment. Finally, as the largest community in SE Alaska Juneau is a gold mine of community health data that is often difficult to distribute and use at the state and national level. This difficulty has mostly come from staff being overextended within their role and research and data management being triaged much lower.	To address our structural gap I would like to hire a contractor with specialized knowledge of Imagetrend, Alaska billing requirements, and data report systems within Imagetrend. This contractor would build billing and data collection infrastructure to provide program sustainability, better quality improvement systems, and allow CCFR to gather and distribute data more effectively.	\$50,000-\$250,000	Home-and community-based services provider	Single Community	Juneau (City and Borough)	Advance to Planning
City and Borough of Juneau	Enhancing Youth Health and Wellbeing Through Activities	AK	Juneau is an expensive community. It is difficult to ensure that all youth have access to healthy activities such as summer camps, sports, or appropriate gear for engaging in fishing, hunting, or gathering. Our organization partners with the Juneau Community Foundation and has limited funding available to provide scholarships to youth to participate in these types of programs and more, but unfortunately, there are simply not enough funds available to meet the need. Youth receive a cap of \$300 annually, however this often times barely covers the cost of one camp. Our organization also provides funds to local youth serving organizations through an annual grant process. Again, there is more need than there are funds to go around. While we are able to provide some amount of funding to nearly all the organizations that apply, it is always less than they request, leaving them to decide what to cut. This proposal aims to address both of these issues.	Additional funds provided to the Youth Scholarship Program will ensure that youth living in low income families are able to attend more than one camp a summer or take part in a youth sport and still do summer camps. We know that the more youth engage in healthy activities, the more a habit is formed for these types of things, and habits develop young grow healthy adults. Currently, 5-18 who qualify for free or reduced lunch at school, qualify for 100% of the scholarship funds and that is still not enough to ensure they are able to take part in the same amount of healthy activities as youth who come from families that have resources available to them. Many families put their young children in summer camps all summer long for example. This helps with childcare for the summer and keeps their kids out of trouble. This should not be an option for only families who have the resources to do this. Increasing the funds we are able to give out for Youth Activity Grants to our partners providing critical programming for youth across the community, including activities such as boating, running, fine arts, dance, theater, swimming, and more, will allow these partners to provide top notch services to youth in Juneau and have the funding required to meet the needs of the community.	\$50,000-\$250,000		Single Community	Juneau (City and Borough)	Deferred or Not Advanced

City and Borough of Juneau	Planning to increase the resiliency of Juneau's emergency sheltering services	AK	Despite providing what seems to be a significant scope of services for this population, those services that are provided are provided by a disparate set of organizations that coordinate with variable effectiveness. Further, some of the services to those who struggle the most (due to substance use and/or behavioral/mental health struggles) are clearly insufficient and we struggle as a community to find the staffing capacity, staffing expertise, and - occasionally - the financial resources to improve the outcomes we see within that hardest-to-serve group.	At a conceptual level, we're looking to bring on a consultant with expertise in this arena who can give us a series of concrete and specific recommendations that are eligible for future RHTP years that will expand and improve our community-wide ability to serve this group. While CBJ is the primary funder of this work, other funders exist (most notably - the Juneau Community Foundation and HUD), and the number of social services organizations participating is significant - St. Vincent de Paul, the Juneau Housing First Collaborative/The Glory Hall, and the non-profits operating out of the Teal Street Center are those most notable.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced
City and Borough of Juneau	Walk Southeast Expansion: Promoting Community Health Through a Region-Wide Walking Challenge	AK	When the program launched, participants tracked their mileage using a paper tracker. In response to participant feedback, Walk Southeast integrated the My Virtual Mission (MVM) app in 2022, which allows participants to visually track their progress along the Alaska Marine Highway route from Juneau to Ketchikan. The app was well-received, increased participation and retention, and has become a cornerstone of the participant experience. However, the MVM app costs \$6.50 per participant, a small fee that adds up as participation has surged. It has always been a core value of Walk Southeast to remain free and accessible to all, eliminating any financial barrier to staying active. Over the years, app costs have been covered through a patchwork of community budgets and sponsorships, and while we have successfully secured a presenting sponsor in the past, sponsorship has proven year-to-year to be unpredictable, making it difficult to rely on as a stable funding source for the program's continued growth. Beyond the app, Walk Southeast has an opportunity to expand its reach by promoting the program across all of Southeast Alaska, not just the four lead communities. Targeted outreach would invite more rural and remote residents to participate, directly advancing the program's mission of making free, accessible wellness programming available to every Southeast Alaskan. This grant would ensure Walk Southeast remains free, fully supported, and growing for years to come.	This grant would ensure Walk Southeast remains free and accessible to every Southeast Alaskan who wants to participate and stay active all summer long. Funding would directly cover the \$6.50 per-participant cost of the My Virtual Mission (MVM) app, which allows participants to visually track their progress along the Alaska Marine Highway from Juneau to Ketchikan — a feature that has become central to the participant experience and a key driver of engagement and retention. During the grant period, Walk Southeast will also begin exploring the development of a custom, branded mobile app to replace the third-party MVM platform long-term. A Walk Southeast app would be built for both iOS and Android, be free for all participants, and be designed specifically around the program's unique Alaska Marine Highway route experience. This would eliminate the recurring per-participant licensing fee entirely, further strengthening the program's long-term financial sustainability. In addition, this grant would meaningfully expand Walk Southeast's promotional reach beyond its four lead communities (Juneau, Ketchikan, Sitka, and Petersburg) to all residents across Southeast Alaska. An expanded promotion budget would fund targeted outreach through social media, YouTube, local news outlets, radio spots, and audio ads on platforms like Spotify and podcasts. This multi-channel approach would ensure that rural and remote residents, who stand to benefit most from a free, low-barrier wellness program, are aware of and encouraged to join the challenge. Together, these investments would strengthen the program's foundation while broadening its impact. They will ensure Walk Southeast continues to grow as a region-wide wellness initiative for years to come while supporting the program's long-term financial sustainability.	Under \$50,000		Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough)	Deferred or Not Advanced

City of Aleknagik	Aleknagik Rural Health Access Strategic Plan	AK	Aleknagik is a remote community in the Dillingham Census Area where extreme geography, weather, and limited transportation options create persistent barriers to timely, reliable care. The City’s small population and seasonal workforce fluctuations make it difficult to sustain clinic operations, recruit and retain staff, and maintain essential infrastructure. Residents must often travel or defer care, and the local clinic’s capacity is constrained by workforce housing, technology, and transportation logistics. This project will develop a comprehensive strategic plan to strengthen long-term health care access for residents of Aleknagik by addressing infrastructure, workforce sustainability, clinician housing, and transportation barriers that affect care delivery in this remote community. Through collaboration with City leadership, regional health care providers, Tribal partners, and the Alaska Municipal League, the initiative will evaluate municipal health barriers and identify sustainable approaches to maintain and expand access to primary care, preventive services, and telehealth. The plan will synthesize local priorities with regional referral patterns and federal allowability to chart costed, phased actions that can be implemented over time. This effort aligns with Alaska’s Rural Health Transformation Program goals to improve rural access, support workforce sustainability, and advance community-based solutions that reduce disparities in remote Alaska communities.	The 12-month planning process will focus on three critical areas, supported by structured engagement and data-sharing with partners: (1) Sustainable Rural Workforce Strategy—co-design a recruitment and retention plan with BBAHC/regional partners that right-sizes coverage. Assess training and precepting pathways, define shift/coverage models, and evaluate potential workforce housing solutions (site options, utilities, concept designs, cost ranges, phasing). (2) Long-Term Operations & Infrastructure for the Municipal-Owned Clinic—complete an operational review of the municipal-owned clinic and develop a capital improvement plan. (3) Transportation & Connectivity to Higher Levels of Care—assess medical transport gaps and weather contingencies; coordinate with regional transportation providers (air, marine, ground) and EMS to strengthen dispatch/communication, shared protocols (e.g., treat-in-place/alternate destination), and reliable connectivity to Dillingham and Anchorage. Cross-cutting activities include establishing a community-led Steering Group, executing data-sharing MOUs, and producing deliverables: a costed, prioritized 5-year implementation roadmap; a funding and policy alignment matrix (RHTP initiatives and other federal/state sources); draft partner MOUs; and an evaluation and data plan. The Alaska Municipal League (AML) will support strategic planning, implementation readiness, and subsequent execution, in coordination with local and regional partners.	\$50,000-\$250,000	Single Community	Dillingham Census Area	Advance to Planning

City of Bethel	New EKG Monitors (3)	AK	The Bethel Fire Department currently relies on older EKG monitors that have become unreliable in field conditions and occasionally produce inaccurate or inconsistent readings. These limitations can make it more difficult for emergency medical responders to quickly and confidently assess patients experiencing chest pain, heart rhythm abnormalities, or other cardiac-related symptoms. In a remote community like Bethel, where patients may need to be transported long distances for advanced care, accurate and timely cardiac monitoring is essential for making appropriate treatment and transport decisions. The Bethel Fire Department responds to medical emergencies across the community, often in challenging weather and operational conditions. When EKG equipment produces false readings or cannot be relied upon in the field, it creates uncertainty for responders and may delay diagnosis, treatment, or coordination with hospital-based providers. This project addresses the opportunity to modernize Bethel’s emergency medical response capabilities by replacing aging EKG monitors with reliable, up-to-date equipment. Improved cardiac monitoring will allow first responders to obtain accurate diagnostic information in the field, share data with receiving medical facilities, and provide better-informed patient care during emergency response and transport.	The City of Bethel will address the limitations of outdated cardiac monitoring equipment by purchasing three modern, field-reliable EKG monitors for use by the Bethel Fire Department’s emergency medical service response teams. These monitors will replace aging units that occasionally produce inaccurate readings and are no longer dependable in demanding field conditions. The new EKG monitors will be deployed on frontline emergency response units so that paramedics and emergency medical technicians can perform accurate cardiac assessments at the scene of medical emergencies and during patient transport. The Fire Department is responding to five EMS calls per day. The equipment will allow responders to quickly identify heart attacks, abnormal heart rhythms, and other cardiac conditions and transmit diagnostic information to receiving medical facilities when necessary. This capability will improve clinical decision-making in the field and support better coordination with hospital providers. The project approach focuses on strengthening existing emergency medical services infrastructure rather than creating new programs. By equipping responders with modern diagnostic tools, the Bethel Fire Department will improve the reliability and quality of pre-hospital care provided to residents and visitors in the community. This investment will enhance the department’s ability to deliver timely, accurate cardiac monitoring during emergencies and ensure patients receive appropriate care and transport decisions based on dependable diagnostic information.	Under \$50,000	Single Community	Bethel Census Area	Advance to Implementation Application

City of Bethel	Bethel Community Sports Project	AK	The City of Bethel currently has limited indoor recreational equipment available to support organized sports, youth programs, and community fitness activities. Because Bethel is a remote community with long winters, extreme weather, and few indoor recreation spaces, residents often have limited opportunities for regular physical activity during much of the year. The lack of adequate sports equipment and organized programming contributes to reduced physical activity, particularly among youth, which can negatively affect physical health, mental health, and overall community well-being. The Bethel Community Sports Project equips the community gymnasium with modern sports equipment, storage systems, and presentation technology needed to support recreational and organized activities. The project will enable the City to expand youth sports leagues, open gym activities, and community recreation programs, like the annual summer camp it hosts. Bethel is a community constructed on sand pads on top of tundra. The tundra with its wet holes, spongy mounds, and irregular land formations is not conducive to sports and organized play. Running on the tundra is dangerous. Improving access to structured recreation and physical activity will help promote healthier lifestyles, strengthen youth engagement, and support community wellness. Increasing opportunities for regular exercise and positive social activities represents an important investment in preventive health and long-term wellness.	The City of Bethel will address limited opportunities for indoor physical activity by purchasing the sports, storage, and projection equipment identified in the Bethel Community Sports Project equipment list and making it available for regular use in the community gymnasium. Bethel experiences long winters, severe weather, and limited outdoor recreation opportunities for much of the year, which means that many residents, especially youth, have few consistent opportunities for exercise. This contributes to sedentary lifestyles and higher rates of adverse health conditions such as obesity, diabetes, and high blood pressure, which are common concerns in many rural Alaska communities. By equipping the gymnasium with basketball, volleyball, pickleball, and other recreational sports equipment, the City will be able to expand youth sports leagues, school and after-school programs, adult recreation leagues, and open gym opportunities. These programs will provide residents with safe and accessible ways to stay physically active throughout the winter months when outdoor exercise is limited and during summer months when the Kuskokwim River is cold and weather is often cold and wet during rain events. Regular participation in sports and recreational activities helps increase physical activity levels, improve cardiovascular fitness, manage body weight, and reduce risk factors associated with chronic diseases. Providing accessible opportunities for exercise can also help counter sedentary lifestyles and support healthier habits in a community where access to fresh foods and health care services can be limited. By increasing opportunities for regular exercise and active recreation, the project supports prevention of chronic disease and promotes healthier lifestyles, strengthening long-term community health in Bethel.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area	Deferred or Not Advanced

City of Bethel	Bethel Public Safety Cadet Program	AK	The City of Bethel faces ongoing challenges recruiting and retaining qualified police officers and firefighter/EMTs to serve the community. Like many rural western Alaskan towns, Bethel must often rely on recruiting personnel from outside the region, which can be difficult due to geographic isolation, high living costs, and the demanding nature of public safety work. As a result, vacancies and staff turnover are high, placing a great strain on the community's emergency response system. At the same time, many local high school students may be interested in public service careers but have limited exposure to what the professions of police officer, firefighter, or emergency medical technician involve or how to pursue those careers. Without opportunities to learn about these professions early, potential local candidates may not consider these career paths. The Bethel Public Safety Cadet Program addresses this opportunity by introducing Bethel High School students to careers in law enforcement, fire protection, and emergency medical services through classroom instruction, mentorship, and hands-on learning experiences. By exposing students to these professions and providing guidance on training and career pathways, the program will help build a local recruitment program of future public safety professionals who are ready, willing, and able to serve their community.	The City of Bethel will address the challenge of recruiting and retaining public safety personnel by establishing a Public Safety Cadet Program at Bethel High School. The program will be taught by experienced Bethel Police Department officers and Bethel Fire Department firefighter/EMTs and will introduce students to careers in law enforcement, fire protection, and emergency medical services. The course will combine classroom instruction with hands-on training modeled after successful cadet and explorer programs used by public safety agencies nationwide. Students will learn about the roles and responsibilities of first responders, including emergency medical responders, fire safety and rescue techniques, basic incident command, teamwork, leadership, and community policing principles. Instruction will also include demonstrations of equipment, participation in supervised practical exercises, and discussions about career pathways, required certifications, and training opportunities. In addition to technical skills, the program will emphasize professionalism, physical fitness, decision-making, and public service values that are essential for careers in emergency response. Students will also have opportunities to observe or participate in training exercises with local police and fire personnel to gain a realistic understanding of the profession. By providing early exposure, mentorship, and career guidance, the program will encourage interested students to pursue training as police officers or firefighter/EMTs after graduation. This approach helps build a locally based workforce that strengthens the long-term capacity of Bethel's public safety and emergency medical services.	Under \$50,000	Single Community	Bethel Census Area	Deferred or Not Advanced

City of Cordova	Cordova Rural EMS Advanced Patient Assessment, Telemetry & Hospital Integration Initiative	AK	Our rural and remote community faces unique challenges that can create delays in patient care and strain our limited EMS resources. A key issue is the delay in transferring critical patient information to the receiving care team, which can slow staffing mobilization, treatment preparation, and clinical decision-making. We often rely on radio or verbal reports, which may be incomplete or delayed. In our rural settings with limited hospital staffing and on-call personnel, these delays can extend time to treatment for urgent conditions such as cardiac events, trauma, or respiratory emergencies. Additionally, access to advanced prehospital monitoring and diagnostic equipment is limited, restricting of EMS crew's ability to perform timely patient assessment, triage, and treatment during transport. Without tools that capture and transmit vital signs and clinical data to hospitals in real time, opportunities for early intervention are missed. This project addresses these challenges by providing our EMS crew with modern monitoring equipment capable of real-time telemetry, improving early clinical data transfer, and enhancing coordination between pre-hospital and hospital teams. Expanding access to specialized equipment and accelerating information flow will reduce unnecessary delays, strengthen patient triage, and support more effective, timely care—improving outcomes and sustainability for rural and frontier communities.	In our rural and remote community, every second matters, yet we often face significant barriers to delivering timely, high-quality care. Limited staffing, tough to access locations, and gaps in communication between the EMS team and hospitals can delay critical interventions. When a patient experiences a cardiac event, trauma, or respiratory crisis, hospital staff may not have full visibility into the patient’s condition until arrival, requiring additional time to mobilize personnel and prepare specialized equipment. Meanwhile, in the field, we lack the tools needed to share advanced patient assessment, triage, and real-time decision-making in a timely and effortless fashion, leaving both patients and care teams at a disadvantage. This project seeks to transform prehospital care in Cordova by equipping Cordova's EMS provider with advanced monitoring devices that can capture vital signs and clinical data and transmit them directly to the hospital in real time. By sharing accurate patient information before arrival, hospital teams can activate appropriate staff, ready critical equipment, and implement directed treatment protocols immediately, reducing delays and improving patient outcomes. Patients receive faster, more precise care, and we can make more informed on-scene decisions, including triage and interventions. The initiative will be implemented over 12 months in three coordinated phases. Phase 1 establishes wireless connectivity across all EMS units, ensuring reliable and secure telemetry. Phase 2 integrates the monitoring devices into daily EMS operations and includes comprehensive training for staff and volunteers on device use, patient assessment, and data workflows. Phase 3 connects EMS data streams to the hospital system, enabling pre-arrival alerts, early triage, and real-time collaboration between prehospital and in-hospital teams. By combining technology, training, and workflow integration, this project directly addresses the delays caused by staffing gaps, limited information transfer, and restricted access to specialized equipment. It strengthens our rural EMS capabilities, improves care coordination, and ensures patients receive timely, high-quality emergency care, even in a geographically isolated setting. Ultimately, the project enhances the sustainability, efficiency, and quality of prehospital care, creating a safer, more connected healthcare system for our community.	\$50,000-\$250,000	Single Community	Chugach Census Area	Advance to Implementation Application

City of Cordova	City of Cordova- Replacement of the Bob Korn Memorial Swimming Pool and Bidarki Recreation Center	AK	Both facilities are aging and are experiencing significant structural and mechanical deterioration due to decades of use and exposure to the harsh coastal environment. The Bob Korn Memorial Swimming Pool is currently closed, following the discovery of significant structural issues that occurred after a prolonged water loss investigation. The closure has highlighted the community’s reliance on the facility and the urgent need for a long-term solution to restore aquatic services in Cordova. Replacing these facilities will allow the city to develop modern recreation and wellness infrastructure designed to support injury prevention, drowning prevention, physical activity, behavioral health, and emergency preparedness for residents of all ages. The City of Cordova is committed to ensuring that future recreation and aquatic facilities meet the long-term needs of the community and continue to serve as critical public health and safety resources for Cordova and the surrounding region.	The City of Cordova proposes to undertake a comprehensive planning and design process to guide the rehabilitation or reconstruction of the Bidarki Recreation Center and the Bob Korn Memorial Swimming Pool. This process will evaluate the current condition of the facilities, identify long-term community needs, and develop a feasible and sustainable path forward for restoring these critical recreation services. The project will begin with a master planning phase that includes facility assessments, engineering analysis, cost estimating, and community engagement. The planning process will explore options for renovation, reconstruction, and modernization, with an emphasis on safety, accessibility, energy efficiency, and long-term operational sustainability. Through this process, the City will work with design professionals, community stakeholders, and partner organizations to develop a phased implementation plan and construction-ready designs. This approach will position the City to pursue construction funding and implement improvements that restore reliable recreation and aquatic services for Cordova residents.	Over \$5M	Single Community	Chugach Census Area	Deferred or Not Advanced

City of Cordova	Cordova Public Safety Dispatch Modernization Initiative	AK	Cordova Public Safety Dispatch needs to implement E911/NG911-ready technology. We have the GIS mapping and addressing complete, but without the modernization of our dispatch center, we do not have the ability to identify callers and their location when a call comes in. Our obsolete radio console is no longer being updated, is not consistently reliable, and makes heavy radio traffic difficult to manage. In Alaska, seconds matter. Currently, “silent” 911 calls/open line/hang-ups have no actionable response path. Language barriers, the inability to speak, cold exposure, unconscious callers, and victims in fear cause a delayed response. Visitors who are unfamiliar with local addresses or landmarks may not know where they are. Without E911/NG911-ready technology, there is confusion, radio congestion, and reduced operational readiness. According to The After-Action Report from the 2026 Active Shooter Training conducted by The Alaska State Troopers, radio communication issues, caller identification, and location were identified as the largest correctable gaps in assistance. The Cordova Public Safety Dispatch Center is staffed 24 hours a day, 365 days a year, often by one dispatcher. Without an integrated, modern 911 call handling solution, a more powerful radio console, and ergonomic workstations, precious time is spent using separate applications, duplicating data entry, and managing increased radio traffic when trying to convey vital information to responders.	The Cordova Public Safety Modernization Initiative will use a comprehensive, integrated, and proactive approach for this opportunity to improve first response in the community, further aligning with our commitment to excellence. Since 1909, The Cordova Department of Public Safety and The Cordova Volunteer Fire Department have worked together to provide emergency responses and remain uniquely qualified to serve our community. Together, we have been good “stewards” of past grant funding awarded for communications equipment, fulfilling the requirements and goals set forth in the opportunity. Going back to 2008, there have been documented efforts to transition to the industry standard of dispatch technology. We have continued to refine the approach to implementation geared toward success. Today, we are working with reputable vendors for E911 Call Handling Solutions, Radio Consoles, and Workstations. We have obtained quotes for equipment and installation. The local phone carriers are informed of our intention to implement this initiative and are compliant and compatible with the systems to be put in place. The Phase II request letters are prepared. The City Council will be presented with a resolution to re-instate the allowable E911/NG911 surcharge to fund the project into the future. Integrating E911 call handling solutions with our Computer Aided Dispatch (CAD) system would bridge the gap between the current applications we use to provide pre-arrival instructions during Fire, EMS, or Police calls. The ability to access these protocols from one application would save valuable time. This approach will allow dispatch to obtain vital information from the caller and update responders in real-time, without having to toggle between applications or duplicate data entry. Integrating a modern radio console that provides better range, multiple secure channels, and allows single channel recording would create improved communication between dispatch and responders. Modernizing all aspects of dispatch concurrently is the most efficient and effective way to implement the changes we are proposing. We have addressed the need for GIS mapping and addressing and are ready to move forward with an E911 call handling solution, modern radio console, and improve workflow by incorporating ergonomic workstations, cable and dust management, lighting, sound-dampening, and climate control.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area; Chugach Census Area; Yakutat (City and Borough)	Deferred or Not Advanced

City of Delta Junction	Being Healthier Together- Outdoor Fitness Park Project	AK	The City of Delta Junction currently lacks sufficient outdoor recreational amenities that support physical activity for all ages. Children, families, and seniors have limited access to safe, free, and engaging fitness options, which contributes to sedentary lifestyles and fewer opportunities for healthy family interaction. This project presents an opportunity to expand the Community Park with inclusive play, fitness, and walking amenities that encourage daily physical activity, promote lifelong healthy habits, and provide an accessible gathering space for residents and visitors alike.	The City of Delta Junction will address this opportunity by expanding Community Park with facilities designed to promote active, healthy lifestyles for all ages. The project will include installation of a children’s play structure, an outdoor fitness multi-station with bodyweight equipment, a splash pad, and a one-mile walking path with educational storyboards. These improvements will create a safe, free, and accessible environment for daily physical activity, family engagement, and outdoor learning. By offering amenities that support both structured exercise and recreational play, the project will encourage consistent use of the park and foster long-term healthy habits within the community.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Southeast Fairbanks Census Area	Deferred or Not Advanced
City of Delta Junction	Delta Junction EMS Services	AK	The City of Delta Junction is working to create a sustainable emergency medical services (EMS) system that will serve future generations in a rural and remote setting. Currently, long-term stability of ambulance services is a challenge due to limited resources, staffing constraints, and the high cost of providing advanced care across a large service area. This project presents an opportunity to establish a utility-style model for ambulance services through collaboration with Rural Alaska Emergency Services (RAES), Delta Area Response Team (DART), Delta Medical Transport (DMT), and AVEL eCare. Together, these partners will support the development of an advanced life support (ALS) system for the REAA15 service area. This project allows the City to take the first critical steps toward building a coordinated, reliable, and financially sustainable EMS system for the community.	The City of Delta Junction will address this opportunity by implementing a utility-style ambulance service model supported through strategic partnerships and modern medical technology. The City will collaborate with Rural Alaska Emergency Services (RAES), Delta Area Response Team (DART), Delta Medical Transport (DMT), and AVEL eCare to create an integrated advanced life support (ALS) system for the REAA15 service area. This approach includes acquiring and equipping an ambulance capable of providing ALS-level care, integrating telehealth support for real-time medical oversight, and coordinating staffing, dispatch, and response protocols among partner organizations. By combining local responders with telemedicine-enabled ALS capabilities, the City will improve patient outcomes while controlling long-term operational costs. This collaborative, scalable model establishes the foundation for a financially sustainable and reliable EMS system that can meet current needs and adapt for future generations.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Southeast Fairbanks Census Area	Deferred or Not Advanced

City of Fairbanks	The Fairbanks MIH Transformation Plan	AK	The current pre hospital healthcare system no longer fulfills its original purpose. It was created to address emergency needs by stabilizing patients and transporting them to appropriate hospitals. Over time, especially after the pandemic, ambulances and emergency rooms have become the primary source of care for many individuals who do not understand how to access the broader healthcare system. Ambulances and emergency rooms were never intended to provide chronic healthcare services, yet outdated policies, complex healthcare systems, limited access to primary care, and a payer model that supports ambulances solely for ER transport have exacerbated these challenges. If unaddressed, these conditions could eventually cause the healthcare system to collapse. The City of Fairbanks’ project seeks to resolve these issues by fundamentally changing how individuals navigate the healthcare system. The Mobile Integrated Healthcare (MIH) program will facilitate access and support for individuals to appropriate medical care, saving time and reducing system costs. Community paramedics will provide support and advocacy, home healthcare, in-field treatment, and enable patients to connect with primary care providers either in person or through telehealth. This approach strengthens chronic care management, reduces unnecessary emergency use, and modernizes care delivery, not only in rural areas, but across the healthcare system.	The City of Fairbanks project under Alaska’s Rural Health Transformation Program will expand Mobile Integrated Healthcare (MIH) and develop a telehealth integrated access hub to improve care for vulnerable residents in Interior Alaska. Fairbanks is well positioned to pilot a scalable model that reduces geographic, resource, and cultural barriers to care. The MIH program is currently delivered through a single community paramedic pilot, which has already shown measurable success and validated the effectiveness of this approach. This project will expand that proven pilot into a fully staffed, scalable division of the Fire Department capable of meeting community-wide demand. The project will strengthen the existing MIH program by adding community paramedic positions to provide 24/7 preventive, in home services such as chronic disease monitoring, medication support, and non emergency visits that will lower avoidable ER use and ambulance transports. A fire station will be repurposed into a telehealth access hub offering virtual consultations for primary and behavioral health care for individuals who struggle to succeed in the traditional healthcare setting. The effort focuses on a new partnership for individuals leaving Fairbanks Correctional Center with limited medication supplies and no primary care. It will continue to serve other high need populations: patients discharged from Fairbanks Memorial Hospital without stable housing, seniors lacking support systems, and others who have difficulty securing or following up for timely care. A multidisciplinary MIH team—paramedics, case managers, and peers—will coordinate services, offer advocacy and transportation, and work closely with the Mobile Crisis Team and Emergency Service Patrol to ensure ongoing support. Funding through this project will provide access to a board certified physician for consultation, prescriptions and lab orders, expanded innovation, and reducing treatment delays. Collaboration with regional and tribal partners will improve communication and outcomes for individuals with complex medical and behavioral health needs. By emphasizing prevention, continuity, and integrated support rather than crisis driven response, the project aims to reduce preventable hospitalizations, improve patient stability, and ease pressure on emergency systems. Leveraging Fairbanks’ role as a hub creates a sustainable model that can be adapted across Alaska to strengthen rural healthcare delivery.	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Advance to Implementation Application

City of Gustavus	Community CPR: hands-only CPR training, dispatcher-assisted CPR, advanced CPR training & equipment	AK	Population growth and seasonal surge: Gustavus is an off-road rural community in SE Alaska, and gateway to Glacier Bay National Park. Between the 2010 and 2020 decennial census counts, its population increased by 48%, making it one of the fastest growing communities in Alaska. The population of 664 triples during the summer due to the influx of the seasonal workforce, tourists and seasonal residents. Limited number of emergency responders: Gustavus VFD responds to structural and wildland fires, EMS, search and rescue, watercraft and aircraft incidents, behavioral emergencies, and hazardous materials events. It has a mutual aid agreement with the NPS and additionally provides medevac transport of cruise ship passengers from the Park to the airport. GVFD is staffed by a part-time Fire Chief, EMS Coordinator, and volunteers. Emergency dispatch is provided by a small number of volunteers. Like many residents, GVFD volunteer responders support themselves and their families through seasonal income as well as personal subsistence food harvesting and gathering. Delayed response due to road conditions and other factors: Gustavus has limited paved State-maintained roads linking the Park, Dock, Airport, City facilities and School. The majority of residences are on unpaved roads which are frequently rutted and seriously potholed. Response on the longest primary gravel road can take 20 to 60 minutes, not including snow conditions. Medevac flights are subject to weather-related delays.	Each year over 350,000 people experience cardiac arrest outside of a hospital, of which four out of five occur at home with only 10% surviving due to lack of timely CPR. This project was inspired by King County, WA which has trained more than 70% of its region’s population in CPR through community and school-based training programs. It has one of the highest survival rates (44%) of witnessed, shockable, sudden cardiac arrest in the country. CPR is the first link in the chain of survival, and the goal of this project is to address challenges to emergency care presented by our unpaved road system, limited number of responders, and the need for training, equipment and supplies. The project is designed to achieve timely access to CPR and treatment in 3 phases: Phase I: Bringing adult hands-only CPR classes to the community with a focus on small-group residential environments. Phases 1 and 3 training will be available to all sectors and venues, including government and private sector worksites, churches, school, preschool, social groups, public events, and the seasonal workforce (charter boat captains and lodges). Phase 2: Implementing dispatcher-assisted pre-arrival CPR instructions for family members and on-scene bystanders. Statistically, bystander CPR occurs in a minority of incidents of out-of-hospital cardiac arrest, and the goal is for the dispatcher to provide hands-only CPR instructions to the caller until the ambulance arrives to provide defibrillation and other vital interventions. Phase 3: Providing responders with the equipment, supplies, and training they need to support a patient before transport to definitive medical care. Starting with the dispatcher, this includes training in hands-only adult CPR progressing with “stop the bleed” training, and Basic Life Support training and certification. For responders, CPR equipment is needed for training in assessment, monitoring, and cardiac interventions as well as advanced EMS and Instructor training and certification.	Under \$50,000	Other	Hoonah-Angoon Census Area	Deferred or Not Advanced

City of Homer	HVFD Ambulance Acquisition: Expanding Pre-Hospital Emergency Care Capacity	AK	This project is an opportunity to advance two RHTP initiatives, expanding appropriate care availability and investing in capital infrastructure, in direct response to a documented and growing community need. HVFD currently operates two NFPA-compliant ambulances. For a service area of this scale and complexity, that is not sufficient to ensure consistent access to quality emergency care. Call volume has increased 25% over the past three years alone, from 680 calls in 2023 to 747 in 2024 to 848 in 2025 — and the rate of increase is accelerating. Concurrent call events — which occur on average 10 times per month — leave the region without an available unit, creating dangerous gaps for residents with no other emergency medical options. Because each ambulance transports only one patient at a time, multiple casualty incidents immediately exhaust two-unit capacity, requiring mutual aid from neighboring jurisdictions typically 20 to 30 minutes away — an unacceptable delay where geography and distance already constrain response. This gap represents a failure of the only emergency medical infrastructure serving rural, remote, and frontier communities across our service area. A third compliant ambulance directly right-sizes HVFD's pre-hospital emergency capacity to match documented and growing demand — a reasonable, well-justified capital investment that strengthens the long-term sustainability of emergency medical services across the Southern Kenai Peninsula.	HVFD proposes to purchase a fully outfitted, NFPA-compliant ambulance to ensure three deployment-ready units are available — eliminating the coverage gaps that occur when both existing units are simultaneously committed to calls. While HVFD volunteers can staff an additional unit from the station when one is available, the absence of a third compliant ambulance means that option does not currently exist. In a region where weather, geography, and distance already limit emergency response options, a 20-to-30-minute gap in transport capacity during a multiple casualty event can be the difference between timely care and a preventable outcome. A third unit directly addresses this vulnerability — ensuring HVFD can initiate transport for multiple patients simultaneously, reducing dependence on distant mutual aid, and delivering consistent, high-quality emergency response to the rural and remote communities that depend on Homer as their medical lifeline. This capital investment right-sizes our pre-hospital care capacity to meet documented and growing demand, sustaining access and quality emergency medical care and transport infrastructure in our region.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced
City of Houston	Houston's Health & Recreation Initiative	AK	Problem / Opportunity: The city owns a barren, fire-prone parcel and an outdated, non-accessible playground, and lacks public sports fields and modern recreational amenities within city limits. This forces families to travel for youth sports and limits local opportunities for physical activity, social connection, and preventive health outreach. Revitalizing the site into a multi-use park, inclusive playground, community stage, ball field, and expanded campground converts a hazard into an accessible community hub that supports year-round exercise, childhood development, mental well-being, mobile clinic access, school programming, and outdoor tourism—addressing clear gaps in infrastructure that affect health, equity, and local economic resilience.	The project will convert a city-owned, fire-prone parcel into a multi-use recreation complex that increases physical activity, social connection, preventive health access, and outdoor tourism. The Feasibility and design work will produce buildable plans, cost estimates, and an operational model that enable rapid implementation and sustainable operations.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

City of Houston	Station 9-3; Combined Fire Station and Public Works Facility: Feasibility Report	AK	Station 9-3 presents an opportunity to shorten response times, expand firefighter capacity and community training, protect road-maintenance assets for reliable winter access, and provide a flexible venue for vaccinations, screenings, and health education. The combined facility also supports campground and tourism improvements, strengthens emergency staging and sheltering, and can reduce long-term economic and health costs—potentially lowering insurance exposure and preventing large-scale losses from future wildfires or disasters.	We will deliver a combined Fire Station and Public Works facility that shortens emergency response times, protects road-maintenance assets, and creates flexible space for preventive health outreach. The Feasibility Report funded by this request will produce the technical, financial, and community documentation needed to secure construction funding and implement the project.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced
City of Kenai - Fire Department	Kenai Fire Department Rural Mobile Healthcare and EMS Transformation Initiative	AK	Rural EMS agencies across Alaska are facing increasing pressure from workforce shortages, rising medical call volume, and limited access to advanced diagnostic tools in the prehospital setting. In the Kenai Peninsula Borough, EMS providers frequently respond to patients experiencing cardiac arrest, respiratory failure, trauma, and complications from chronic disease. These emergencies often occur far from hospitals, requiring extended transport times and rapid stabilization in the field. At the same time, rural healthcare systems are experiencing growing access challenges as hospitals and clinics face staffing shortages and increasing patient demand. As a result, EMS providers are increasingly serving as the first point of contact with the healthcare system for many residents. However, traditional EMS systems were designed primarily for transport rather than functioning as integrated healthcare providers within the broader care continuum. This project represents an opportunity to strengthen rural healthcare delivery by expanding EMS capabilities, improving workforce capacity, and integrating technology that allows earlier diagnosis, better stabilization, and stronger coordination with regional healthcare partners. By enhancing the role of EMS as a mobile healthcare resource, this initiative will improve access to care and patient outcomes for rural residents in the Kenai Peninsula.	The Kenai Fire Department proposes a multi-component initiative to strengthen rural emergency medical services, expand workforce capacity, and integrate EMS more effectively into the regional healthcare system. The first component focuses on improving patient care during emergency response and transport. Investments in advanced EMS equipment—including powered patient transport devices, portable ventilators, and portable ultrasound—will allow providers to better stabilize critically ill patients and identify life-threatening conditions earlier in the course of care. Upgraded cardiac monitoring systems with hospital connectivity will enable EMS clinicians to transmit patient data directly to receiving facilities, improving coordination and preparation for incoming patients. The second component focuses on workforce development. Rural EMS agencies across Alaska face persistent challenges recruiting and retaining paramedics. This project will establish a structured pathway for current employees to advance their education through paramedic training programs. Funding will support tuition, travel, housing, clinical internships, and staffing backfill during training. In addition, a proactive emotional wellness and resiliency program will support workforce retention, reduce burnout, and strengthen the long-term sustainability of EMS services. Maintaining a healthy and resilient workforce directly supports reliable access to emergency care for rural residents while creating sustainable career pathways for EMS professionals. The third component focuses on strengthening EMS education and training infrastructure through the development of a simulation-based medical training program. High-fidelity simulation allows providers to practice complex medical emergencies in a controlled environment, improving clinical decision-making, teamwork, and patient care performance while supporting ongoing training for regional EMS providers. The final component explores the future role of EMS as a mobile healthcare resource through partnerships that connect EMS providers with healthcare professionals using telemedicine and nurse consultation services. These models may support treatment-in-place	\$250K-\$1M	Single Community	Kenai Peninsula Borough	Advance to Implementation Application

options and improved care coordination when emergency transport is not required.

Together, these initiatives will strengthen access to care, support workforce sustainability, and improve healthcare delivery for residents of the Kenai Peninsula.

City of Ketchikan	Annual Public EMT Course	AK	Rural island communities like Ketchikan face persistent challenges in maintaining adequate EMS staffing, particularly during seasonal population surges, severe weather events, and large-scale incidents. Cruise ship season significantly increases call volume, while the local system relies heavily on a limited number of career staff and volunteers. Geographic isolation and the cost of traveling off-island for EMT training create barriers for community members who want to serve as volunteer responders. As a result, volunteer capacity, disaster surge staffing, and regional mutual aid strength can be insufficient during high-demand periods. Limited redundancy increases strain on existing providers, raises burnout risk, and threatens overall system resiliency. This project addresses the opportunity to strengthen rural EMS sustainability by funding one community EMT course annually. By providing consistent, locally accessible certification, the program expands the pool of trained responders, builds surge capacity, supports mutual aid partners, and improves island-wide emergency coverage in this frontier setting.	The City of Ketchikan Fire Department proposes to fund and host one state-approved community EMT course annually to strengthen volunteer capacity, regional response partnerships, and disaster surge staffing. Each year, the City will coordinate delivery of a full EMT certification course that meets Alaska and National Registry standards. The course will include classroom instruction, hands-on skills labs, scenario-based simulations, and required clinical and field experience in partnership with Ketchikan Gateway Borough EMS and regional response agencies. Funding will support instructor compensation, training equipment and replacement supplies, simulation materials, textbooks, background checks, administrative coordination, and certification exam preparation support. Where appropriate, the program will offset exam fees to reduce financial barriers for volunteers. Recruitment efforts will prioritize volunteer responders, rural fire departments, tribal partners, community members interested in disaster response roles, and individuals seeking to strengthen regional mutual aid capacity. Outreach will occur through local emergency response agencies and community networks to ensure broad regional participation. By offering the course locally each year, the project eliminates common rural barriers such as travel, lodging, and limited course availability. Consistent annual access ensures that new volunteers can enter the system regularly rather than waiting multiple years for training opportunities. Over the years, this approach will build a larger and more reliable pool of certified EMTs capable of supporting routine EMS operations, seasonal population surges, cruise ship-related call volume increases, and disaster response. The annual model creates predictable workforce growth, improves system redundancy, and strengthens island-wide and regional EMS resilience in this geographically isolated community.	\$50,000-\$250,000	Single Community	Ketchikan Gateway Borough	Advance to Implementation Application

City of Ketchikan	Ketchikan High School EMT Program	AK	Rural Alaska communities face persistent emergency medical services (EMS) workforce shortages driven by geographic isolation, limited local training pathways, and high recruitment and relocation costs. Ketchikan relies heavily on recruiting certified EMTs from outside the region, which can be costly and often results in lower long-term retention. Workforce instability impacts emergency response capacity, increases strain on existing providers, and threatens overall healthcare system resiliency. At the same time, rural youth have limited access to locally available healthcare career pathways. Without early training opportunities, many students leave the community for education and may not return, further weakening the local workforce pipeline. This project addresses both challenges by fully funding the Ketchikan High School EMT course for five years, creating a sustainable, community-based EMS workforce pipeline. By providing state-approved EMT certification within the high school, the program increases local certification rates, strengthens staffing stability, and builds long-term workforce sustainability from within the community.	The program will deliver a state-approved EMT certification course integrated into the high school curriculum. Students will receive classroom instruction, hands-on skills training, and supervised clinical and field experience in partnership with Ketchikan Gateway Borough EMS. Upon successful completion, students will be eligible to sit for the National Registry or Alaska EMT certification examination. Funding will support instructor compensation, training equipment and medical supplies, simulation materials, student textbooks, certification exam fees, and program coordination. Stable funding ensures the course can be offered consistently without interruption due to annual budget uncertainty. The program will also incorporate mentorship opportunities with local EMS providers, exposure to career pathways in healthcare, and coordination to support graduates transitioning into part-time, volunteer, or career EMS roles within the community. By embedding EMT training within the high school setting, the project removes rural access barriers such as travel, housing, and tuition costs that often prevent students from pursuing certification. Students can graduate high school with an industry-recognized credential and immediate eligibility for employment in a high-demand field. This approach will increase the number of locally trained EMTs, strengthen recruitment and retention, reduce reliance on out-of-area hiring, and improve overall EMS system stability in this geographically isolated community.	\$50,000-\$250,000	Single Community	Ketchikan Gateway Borough	Advance to Implementation Application

City of Ketchikan	Ketchikan Mobile Integrated Healthcare Stabilization & Nurse Practitioner Expansion	AK	The City of Ketchikan operates a Mobile Integrated Healthcare (MIH) program that has demonstrated success in reducing avoidable emergency department (ED) visits and improving care coordination for high-utilizing and medically complex patients. However, as a geographically isolated island community with limited primary care capacity and workforce shortages, Ketchikan continues to experience preventable EMS transports, emergency department congestion, and gaps in chronic disease follow-up. Patients with complex care needs—including elders, individuals with chronic disease, and high utilizers of 911 services—often lack timely access to primary care and in-home follow-up. This results in avoidable hospital utilization, higher system costs, and strain on EMS staffing. To stabilize and expand this proven MIH model over five years, the City seeks to embed a full-time Nurse Practitioner (NP) within the MIH team. This addition will expand clinical capability, increase diversion from emergency transport, and strengthen hospital and primary care coordination in a rural, frontier setting.	The City of Ketchikan proposes a five-year stabilization and expansion of its existing Mobile Integrated Healthcare (MIH) program through the addition of a full-time embedded Nurse Practitioner (NP). The MIH team will continue proactive identification of high EMS utilizers, patients with chronic disease, recently discharged hospital patients, and individuals at risk of avoidable ED utilization. With the addition of an NP, the program will expand from primarily assessment and referral services to higher-level clinical intervention delivered in-home. Key components include: • Embedding a full-time NP within the MIH team • Conducting in-home assessments and chronic disease management • Providing limited prescribing, medication reconciliation, and treatment adjustments within scope • Delivering post-discharge follow-up within 24–72 hours • Coordinating closely with PeaceHealth Ketchikan Medical Center and local primary care providers • Supporting telehealth consultation when specialty access is limited The NP will reduce the burden on local primary care providers by managing appropriate low-acuity conditions and chronic disease follow-up in the home setting. This model expands diversion capability from emergency transport and enhances continuity of care. Over five years, funding will stabilize staffing, formalize data tracking and outcomes measurement, and strengthen reimbursement pathways to support long-term sustainability. This approach aligns with RHTP goals by improving access, strengthening workforce capacity, enhancing care coordination, and advancing innovative rural care delivery models.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough	Advance to Implementation Application

City of Ketchikan	EMS Simulation & Training Equipment Modernization Initiative	AK	Ketchikan’s EMS system serves a remote island community where providers must manage complex medical, trauma, obstetric, pediatric, and behavioral health emergencies with limited access to specialty care and potential transport delays due to weather and geography. In this frontier setting, maintaining high clinical competency is critical to patient safety and outcomes. However, much of the current training equipment is aging and lacks the fidelity needed to replicate realistic, high-acuity scenarios. Limited simulation capacity reduces opportunities for hands-on practice, especially for rare but high-risk events such as advanced airway management, cardiac arrest, or mass casualty incidents. In rural systems where providers may encounter certain critical cases infrequently, inadequate training tools can increase clinical error risk and impact certification success rates. This project addresses the opportunity to modernize EMS training infrastructure by investing in high-fidelity mannequins, advanced airway trainers, trauma simulation tools, and ongoing equipment refresh funding. Strengthening simulation capacity will improve provider competency, enhance certification preparation, and support high school EMT programs, community courses, and in-service training. By improving training quality locally, the project strengthens workforce readiness and patient care outcomes in a geographically isolated community.	The City of Ketchikan Fire Department proposes to modernize and expand EMS training capacity through the acquisition of high-fidelity simulation equipment and establishment of an ongoing equipment refresh plan. The project will invest in advanced training tools, including high-fidelity adult and pediatric mannequins, advanced airway trainers, trauma simulation equipment, and scenario-based training technology. These tools will allow providers to replicate realistic emergency conditions such as cardiac arrest, respiratory failure, obstetric emergencies, pediatric trauma, behavioral health crises, and mass casualty incidents. New equipment will be integrated into: • High School EMT certification courses • Annual Community EMT courses • Ongoing in-service and continuing education training • Skills verification and competency assessments • Interagency disaster and mutual aid exercises Simulation-based training will emphasize hands-on practice, team communication, critical decision-making, and error prevention in a controlled learning environment. Instructors will receive training on equipment utilization to ensure consistent, high-quality delivery. Funding will support initial acquisition, instructor training, maintenance planning, and a structured multi-year replacement schedule. Establishing ongoing refresh capacity ensures that equipment remains current, functional, and aligned with evolving clinical standards. By embedding modern simulation into all levels of EMS education, the project strengthens clinical competency across career and volunteer providers. Improved training quality supports higher certification pass rates, enhanced confidence, and reduced clinical error risk. This approach builds durable training infrastructure that supports workforce development, improves patient care quality, and enhances long-term EMS system resilience in this geographically isolated community.	\$250K-\$1M	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

City of Ketchikan	Ketchikan Fire Boat & Maritime Emergency Response	AK	Ketchikan is a remote island community with a heavy reliance on maritime transportation for commerce, tourism, and daily life. The harbor supports commercial fishing vessels, freight traffic, floatplanes, and seasonal cruise ships. Approximately 1.7 million cruise ship passengers are projected this summer, exceeding Juneau due to passenger caps, along with thousands of additional air-travel visitors accessing fishing lodges and charter vessels. Marine environments present unique risks, including vessel fires, fuel spills, traumatic injuries, hypothermia, cardiac events, and potential mass casualty incidents. However, the department's dedicated fireboat went out of service in 2023, eliminating primary marine firefighting capacity. Current marine response capability is limited relative to the scale and complexity of maritime activity. A significant vessel fire or large scale emergency could quickly overwhelm land-based resources and delay critical medical intervention. This project addresses the urgent need to restore and enhance maritime emergency response capacity through acquisition of a dedicated fire boat capable of firefighting, rescue, and EMS support. Expanding marine response capacity improves access to care in areas unreachable by road, strengthens surge readiness during peak tourism season, and enhances long-term healthcare system resilience in this geographically isolated coastal community.	The City of Ketchikan proposes to enhance maritime emergency response capacity through acquisition and full operational integration of a dedicated fire boat equipped for firefighting, rescue, and EMS support. The vessel will be outfitted with marine-grade firefighting pumps and suppression systems, rescue equipment, advanced life support (ALS) medical equipment, interoperable communications, and capacity to support mass casualty incidents. Design specifications will align with harbor risk assessments, cruise ship traffic demands, and regional mutual aid needs. Implementation will include: • Finalizing vessel specifications based on operational risk analysis • Procurement or retrofit of a fire boat meeting marine safety and firefighting standards • Installation of medical and rescue equipment • Training of fire and EMS personnel in marine firefighting, rescue operations, and onboard medical care • Integration into emergency response protocols and cruise ship contingency planning • Coordination with harbor authorities, local clinics, and PeaceHealth Ketchikan Medical Center The fire boat will operate as a frontline response asset for vessel fires, dockside emergencies, search and rescue operations, shoreline incidents, and marine-based medical emergencies. It will also serve as surge capacity during cruise ship season, large-scale public events, and disaster scenarios. Operational protocols will ensure seamless transition from on-water stabilization to land-based EMS transport and definitive care. Joint training exercises with local and regional partners will strengthen interagency coordination and mutual aid readiness. By combining modern marine firefighting capability with onboard EMS treatment capacity, the project ensures timely access to emergency care in areas not reachable by road. This approach strengthens patient outcomes, improves system redundancy, and enhances long-term emergency response sustainability in this geographically isolated coastal community.	\$250K-\$1M	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

City of Ketchikan	Ketchikan Full Time EMS Instructor and Workforce Development Coordinator	AK	Ketchikan’s EMS system is expanding its workforce development efforts through a High School EMT program, annual community EMT courses, enhanced simulation training, and Mobile Integrated Healthcare (MIH) clinical integration. However, these initiatives are currently supported largely by line staff who balance emergency response duties with instructional responsibilities. This creates scheduling conflicts, increases burnout risk, and limits the consistency and scalability of training programs. In a geographically isolated island community where EMS serves as a primary point of healthcare access, inconsistent training coordination can affect certification compliance, workforce retention, and overall system resilience. As workforce demands grow—particularly during seasonal population surges and disaster events—the need for structured, professionalized training oversight becomes critical. This project addresses the opportunity to establish a full-time EMS Instructor dedicated to coordinating student EMT programs, leading public certification courses, overseeing continuing education, maintaining regulatory compliance, and supporting MIH clinical training. By centralizing workforce development under a dedicated role, the City can ensure consistent training quality, reduce strain on operational staff, and build a sustainable, locally driven EMS workforce model for the long term.	The department will establish and fund a full-time EMS Instructor position for five years to centralize and professionalize EMS workforce development across all training programs. The EMS Instructor will serve as the dedicated coordinator and lead educator for: • The Ketchikan High School EMT program • Annual Community EMT certification courses • Continuing education and recertification for career and volunteer staff • Certification tracking and regulatory compliance • Simulation-based training integration • Clinical training support for the Mobile Integrated Healthcare (MIH) program This position will develop standardized lesson plans, skills verification processes, and scenario-based curricula aligned with Alaska and National Registry requirements. The instructor will coordinate clinical placements, manage training schedules, maintain certification records, and ensure all providers meet continuing education standards. By removing instructional responsibilities from line staff, reduces burnout risk and scheduling conflicts that occur when responders must leave shifts to teach. A full-time instructor ensures predictable course scheduling, improved instructional consistency, and expanded training capacity. The EMS Instructor will collaborate with Ketchikan Gateway Borough EMS, the School District, PeaceHealth Ketchikan Medical Center, local clinics, and regional response partners to align training standards and support joint exercises and mutual aid readiness. This centralized model will support student recruitment, volunteer certification growth, ongoing professional development, and MIH clinical competency. The approach builds a durable training infrastructure that strengthens workforce stability, improves certification outcomes, and enhances overall EMS system resilience in this geographically isolated community.	\$50,000-\$250,000	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

City of Kotzebue	City of Kotzebue EMS and Fire Safety Workforce Pathways	AK	The City of Kotzebue’s Fire Department and EMS first response team provide ambulance services, medevac coordination, and fire response for Kotzebue and the broader Northwest Arctic region. The problem is that emergency response capacity is strained by workforce shortages and training barriers, combined with outdated and unreliable radio communications (static/coverage issues) that reduce coordination, delay response, and increase safety risks during medical emergencies, fires, and disasters. This project opportunity is to strengthen the region’s emergency health care system by building a sustainable local workforce pipeline—creating clearer pathways to fire and EMS certifications, supporting training participation with temporary coverage, and engaging youth through an Explorer-style/high school training approach—while also improving response readiness through required testing and safety practices (e.g., hydrant/extinguisher hydrostatic testing). Together, these efforts will improve response time, coordination, and continuity of care for rural residents across the Northwest Arctic.	The City of Kotzebue will address this opportunity through a coordinated approach that strengthens both the systems and the people needed to deliver reliable emergency response for Kotzebue and the Northwest Arctic region. First, the City will improve emergency communications by upgrading Fire/EMS first response radios and installing a repeater to reduce static and eliminate coverage gaps. Reliable communications are essential for dispatch coordination, responder safety, and continuity of care during medical emergencies, fires, and medevac events—especially in rural Alaska where weather and distance can delay advanced care. At the same time, the City will focus on building a sustainable local workforce. The project will establish clearer pathways for residents to access training and certifications for fire and EMS roles, coordinating closely with Maniilaq Association and other regional partners to align training needs, testing requirements, and practical steps for participants to progress toward credentials. Because training often requires travel and time away from duty, the City will also support temporary coverage so emergency response services remain available while responders attend required trainings. To ensure long-term sustainability, the project will strengthen the pipeline of future responders by expanding youth engagement through an Explorer-style program and/or high school training opportunities that help students gain first response skills and see a realistic career pathway in fire and EMS. Finally, the City will include key readiness activities—such as hydrostatic testing and other safety checks for hydrants and extinguishers—so equipment and systems remain dependable and meet operational needs. Together, these efforts will improve response coordination and reliability today while building a stable, locally trained workforce for the future, strengthening emergency health care access and outcomes across Northwest Alaska.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Northwest Arctic Borough	Deferred or Not Advanced
City of McGrath	Upgrade fire department personal gear and fire hose for city volunteer fire department	AK	Both house fires and wildfires are a threat to the lives of our community members. The volunteer fire department is over 30 years old and the equipment is either worn out or needs improvements for the safety of the fire fighting crew. The coats and helmets are too old to be of primum safety to those who wear it.	When awarded with funding for new equipment, we will purchase coats and helmets which fit the fire fighters. We will purchase new fire hose to replace worn pieces in our fleet.	\$50,000-\$250,000	Single Community	Yukon-Koyukuk Census Area	Deferred or Not Advanced

City of Nenana	Nenana Healthcare Alliance	AK	Nenana faces health care challenges related to the lack of infrastructure that supports healthy activity, social connection, hygiene access, and the delivery of health-centered programming and services. Extreme cold and extended winter darkness limit outdoor activity, yet the community lacks indoor spaces where residents can safely walk, exercise, gather, or participate in health programs. Seasonal darkness in Interior Alaska contributes to seasonal affective disorder, depression, and increased suicide risk, and Alaska’s suicide rate is roughly twice the national average. Nenana also lacks space where organizations and providers can deliver behavioral health services, trauma-informed programs, wellness activities, food security services, and other community health supports. Youth, families, adults, and seniors all lack safe places to gather, particularly during winter months. Limited community space reduces opportunities for physical activity, social connection, and wellness programming, including support for residents managing physical or behavioral health conditions and those in recovery. Nenana has also lost many informal gathering places, a trend that accelerated after the COVID-19 pandemic, leaving few locations where residents can connect, access services, or participate in healthy activities. Some residents also live in housing without running water, creating barriers to regular hygiene practices that support health.	The project will renovate underutilized indoor and outdoor areas to create a year-round space where residents can gather, stay active, access hygiene resources, and participate in healthcare-related programs. It will include showers and a potable water filling station. Indoor space will support movement and wellness activities during winter months when outdoor activity is limited by extreme cold and darkness. Lighting designed to help address SAD will support mental well-being. Fitness equipment and open space will allow residents to participate in stretching, strength, and movement activities suitable for different ages/abilities. A recovery-oriented area supports wellness and recovery activities. Outdoor areas will include space and equipment that encourage safe movement, recreation, and healthy activity during warmer months. The space will support a range of health-related programming that currently has no suitable location in Nenana. Activities to include; movement classes, youth recreation opportunities, parenting groups, recovery support meetings, senior mobility activities, physical therapy, sports medicine, mental health, and wellness programs that encourage physical activity and social connection. The space will also support food distribution and other services that improve access to healthy food. Railbelt Mental Health plans to expand trauma-informed programming, behavioral health support, crisis outreach, and food bank services serving vulnerable residents. The project will also partner with the local school district to provide enhanced opportunities for P.E. classes, physical activity for students when outdoor recess or activities are not possible due to winter conditions. A TA provider will be hired to expand partnerships and coordinate programming within the facility. The TA will work with local organizations, service providers, tribal partners, and community groups to identify needs, recruit program providers, communicate opportunities, and ensure the space is actively used for health-related services and community wellness activities. Access to healthy activities and community connection can also help Nenana retain teachers, health care workers, and other essential staff who serve the community. By creating a welcoming place where hygiene access, health programs, and community services can operate locally, the project will strengthen prevention efforts, expand behavioral health support, and help residents stay active and connected.	\$1M-\$5M	Single Community	Yukon-Koyukuk Census Area	Advance to Implementati on Application

City of Palmer	Lifesaving Access Through Automated External Defibrillator Installation and Deployment	AK	Palmer Fire & Rescue serves the community of Palmer, Alaska and surrounding rural areas where access to immediate advanced medical care can be limited by distance, weather, and response times. Sudden cardiac arrest requires rapid defibrillation, yet not all department apparatus and facilities are currently equipped with standardized Automated External Defibrillators (AEDs), and some existing units are aging or nearing end-of-service life. Fire apparatus are frequently the first arriving resource to medical emergencies, creating an opportunity to significantly improve survival outcomes through expanded AED availability. Without consistent deployment across all response units and stations, there is a risk of delayed defibrillation during critical early minutes of cardiac arrest. This project will address these gaps by purchasing and deploying AEDs across all apparatus and facilities, ensuring consistent, reliable access to life-saving equipment. Standardizing AED placement will strengthen emergency medical response capability, improve patient outcomes, and enhance the long-term resilience of rural emergency care in our service area.	Palmer Fire & Rescue proposes to improve early cardiac arrest intervention across Palmer, Alaska and surrounding rural response areas by purchasing and deploying Automated External Defibrillators (AEDs) on all frontline apparatus and within all department facilities. This project will standardize access to defibrillation equipment, ensuring responders have immediate access to life-saving tools regardless of which unit arrives first on scene. The project will include the acquisition of AED units along with necessary accessories such as adult and pediatric electrode pads, spare batteries, mounting hardware, and protective carrying cases. Equipment selection will prioritize reliability, ease of use, and compatibility with current responder training practices. Once acquired, AEDs will be installed on all response apparatus and placed in accessible locations within department facilities. Implementation will be supported through structured training and integration into existing operational procedures. All personnel will receive refresher training on AED use, emphasizing rapid deployment during cardiac arrest incidents and reinforcing current medical response protocols. AED inspection and maintenance will be incorporated into the department’s routine apparatus and equipment check processes to ensure long-term readiness. To support sustainability, the department will integrate replacement consumables and future lifecycle costs into annual operating and capital planning. Data collection through incident reporting will allow the department to track AED utilization and support continuous improvement in response practices. By standardizing AED deployment and reinforcing responder training, this project will strengthen early intervention capabilities, reduce delays in defibrillation, and enhance the overall effectiveness and reliability of rural emergency medical response.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

City of Pelican	Community Wellness Center Planning and Feasibility Study	AK	The City of Pelican is a remote community with limited access to health and wellness infrastructure. Residents travel by boat or plane to reach larger communities for many health services and wellness opportunities. Like many rural communities, Pelican faces growing concerns related to chronic disease, aging population needs, behavioral health, and social isolation. At present, the city does not have a dedicated wellness or community health facility where residents can gather for physical activity, health programming, or educational resources. At the same time, Pelican owns a former school building that is not being used and presents a significant opportunity to serve community health needs. Renovating this existing structure into a Community Wellness Center will create a centralized space for fitness activities, health education programs, and community gatherings that promote community health and lifestyle changes. The proposed planning and feasibility study will evaluate how the building can be safely and efficiently renovated to support these functions while ensuring long-term sustainability. The project will lay the groundwork for developing a wellness facility that promotes preventive health, supports social connection, and improves quality of life for residents. Establishing a dedicated wellness center will help Pelican strengthen community resilience, support healthy lifestyles, and provide a foundational space for future health programming in a remote setting.	The City of Pelican will conduct a comprehensive planning and feasibility study to evaluate the conversion of an existing city-owned former school building into a multi-use Community Wellness Center. The study will assess how the facility can be renovated and operated to support community health, wellness programming, and educational resources while ensuring long-term sustainability for a rural community. Key components of the project include: 1. Facility Assessment of the existing building will determine renovation requirements, code compliance needs, and potential design options for the space. This assessment will evaluate structural conditions, accessibility improvements, energy efficiency opportunities, and building systems to identify the most practical and cost-effective approach for renovation. 2. Community Engagement and Needs Assessment will identify the types of wellness and community programs residents most want and need. Community input will help shape the design and programming of the facility, including potential uses such as fitness space, group exercise classes, youth activities, senior programming, health education events, and library services. 3. Conceptual Plans and Cost Estimates: These plans will evaluate how the facility could be configured to support a wellness center and library while maximizing the use of existing infrastructure. The study will also explore options for equipment needs, operational staffing, and potential partnerships with regional health organizations or community groups. 4. Sustainability Plan will support operational, asset management, and sustainability planning for the building. This will include identification of potential funding sources, operational models, and development strategies to ensure the facility can be successfully implemented and maintained over time. By completing this feasibility and planning effort, the City of Pelican will create a clear, community-driven roadmap for transforming an underutilized public building into a wellness and community hub that supports healthy lifestyles, social connection, and improved quality of life for rural residents. The project aligns with RHTP initiatives: Healthy Communities: Establish wellness centers to promote community health and lifestyle changes Health Care Access: Provide a dedicated space for community health and education programming	\$250K-\$1M	Single Community	Hoonah-Angoon Census Area	Deferred or Not Advanced

City of Port Alexander--Health Department	Remote Island Community Emergency Response System--Helicopter Pad, Flood Lights, and Alert Sirens	AK	We would like to be able to provide a safer, more reliable area for U.S. Coast Guard helicopters to land as they pick up patients in life or limb-threatening emergency situations. Often this may be when the conditions are not ideal, and the designation of an appropriate area with a well-engineered landing pad would make the incident safer for all and help get the patient to needed medical care more quickly. We are also a fishing port, and would be a destination for fisherman and other mariners in the area who need medical assistance and/or transportation to a higher level of care. The other problems include a lack of reliable and efficient way to alert the community to an emergency, where we don't have cell service and some also lack internet and landline, and a lack of lighting outdoors (ie. floodlights) for emergency incidents at night in our off-grid (and car-free) town, including fires, earthquakes, mass casualty or single casualty events.	This project would include the research and purchasing of flood lights and alert sirens for both sides of the bay along which our community is located. This could take place fairly quickly; consultation from other emergency response organizations would be sought. The creation of a helicopter pad would include 1) the selecting and securing of a site and design of a pad with consultation of the U.S. Coast Guard, 2) the hiring of an engineer, 3) a request for bids from contractors, 4) the purchasing of and arranging shipment for materials, 5) the receiving and stationing of materials, 6) the construction of the pad. The receiving of materials and construction should take place in the summer months, ideally. If clearing and leveling of a lot is required, this will add another phase.	\$50,000-\$250,000	Home- and community-based services provider	Single Community	Prince of Wales-Hyder Census Area	Deferred or Not Advanced

City of Saint Paul	Community Farm Design and Coordinator: Improving Rural Health Through Food Access and Sustainability	AK	The food system on Saint Paul Island faces challenges due to its isolation, reliance on imported goods, and logistical difficulties. Transportation is a major hurdle, with freight arriving by infrequent barges or air cargo, both of which are subject to delays and weather disruptions that affect the quality and availability of food. Limited food shipments have led to decreased availability of fresh food options and increased reliance on shelf-stable foods, all of which contribute to growing health concerns. The island has only one grocery store and it routinely carries reduced availability of fresh fruits and vegetables. Saint Paul Island functions as a food desert, with residents relying heavily on processed and packaged foods that are high in sugar, salt, and fat. In the 2023 Food Security Assessment of Saint Paul Island, 81% reported that the poor condition of available produce made it difficult for households to obtain healthy food from the local store. Limited access to nutritious foods contributes to broader health disparities in the community. Early childhood obesity is particularly concerning here where diet-related health conditions are more prevalent. On Saint Paul Island, residents experience high rates of chronic health issues such as high blood pressure, diabetes, asthma, and mental health challenges. The local school does not offer a lunch program, requiring students to go home for lunch, which can limit consistent access to balanced meals.	The City of Saint Paul seeks funding for two components to advancing the Saint Paul Island Community Farm: 1) completing 100% design and engineering of the facilities, and 2) hiring a full-time Coordinator. 1) Completing the remaining engineering and design plans is the next step in the City’s advancement of this project. With funding, the City is ready to hire a firm to complete design plans and produce construction documents for the greenhouse, chicken house, and compost facilities. The City has conducted community surveys, outreach and engagement of the project and received overwhelming support. A feasibility study, business plan, infrastructure plan and conceptual design have already been completed, as well as a strategic plan for incremental growing and expansion of farm. The site for the farm has already been secured. The City owns the 1-acre land parcel on which the Community Farm will be constructed, and the water, waste heat and electricity to which the farm will be connected. 2) Hiring a full-time Community Farm Coordinator is essential to ensuring the success and long-term sustainability of the Saint Paul Island community farm project and its impact on community health. The Coordinator ensures the farm is designed with the community, for the community. During the planning and design phase, the Coordinator will act as the bridge between the community, designers, engineers, and project partners to ensure the farm is designed to meet community needs and is practical to operate once built. Once design has been completed, the Coordinator will serve as Project Manager to coordinate communication between contractors, designers, and the community while preparing for launch. Once construction has been completed, the Coordinator will manage the day-to-day operation and long-term success of the community farm. The City also intends to partner with the local school, health clinic, and tribal government to promote nutritional education and healthy lifestyles. The Community Farm will include educational programs that teach people how to grow their own food, how to prepare healthy meals using fresh produce, and increase their knowledge and understanding of nutrition. These education opportunities can help people adopt healthier eating habits and make better food choices.	\$250K-\$1M	Single Community	Aleutians West Census Area	Deferred or Not Advanced

City of Saint Paul	Saint Paul Island EMS: Access, Quality, Sustainability	AK	Saint Paul Island, Alaska is a fishing community currently undergoing an economic crisis caused by the severe decline in the Bering Sea crab stocks. In normal years, the City of Saint Paul collects on average \$2,700,000 in fisheries taxes. For the past four years the City collected \$0 from fisheries tax revenues. As a result, the City has been forced to implement budgetary cuts, layoffs, hiring freezes, and other painful measures to withstand the loss of revenues and continue to provide essential municipal services. The City has reduced its staff from 42 to 16 employees since the crab closure began in 2021. We have taken out loans, requested emergency government funding, and written dozens of grant applications seeking funding for capital improvement projects, equipment, supplies, training, and personnel. The Aleutians/Pribilof Islands region of Alaska, characterized by its remote location and sparse population, typically has a limited presence of public safety officers compared to more densely populated areas of the state. Prevention of fatalities and rapid treatment of serious injuries is of critical importance to the Saint Paul Island community. The need for a full-time EMS Coordinator is further substantiated by a high volume of medical calls and medivacs that occur each year on Saint Paul Island, significant considering the small population.	By establishing a dedicated, full-time EMS Coordinator, Saint Paul Island will have a centralized, professional leader who ensures reliable emergency response, high-quality care, and sustainable EMS operations. This role directly mitigates the risks posed by limited personnel, remoteness, and environmental challenges, ultimately safeguarding community health and survival. 1. Enhancing Access to Emergency Care • Coordinate EMS staffing schedules to ensure consistent coverage despite limited personnel. • Develop and maintain relationships with regional hospitals and air transport providers, optimizing medivac coordination in the event of weather delays or limited essential air service. • Implement contingency response plans for times when travel is disrupted by storms or other environmental hazards. 2. Improving Quality of Care • Provide continuous training and certification management for EMS personnel, ensuring responders are prepared for high-acuity cases in isolated settings. • Establish and monitor evidence-based treatment protocols, including trauma stabilization, cardiac emergencies, and other critical care scenarios. • Conduct regular quality improvement reviews of medical calls and medivacs to identify gaps and implement corrective measures. 3. Increasing System Sustainability • Lead administrative and operational oversight, including compliance with state and federal EMS regulations, equipment readiness, and fleet maintenance. • Pursue grant funding and community partnerships to expand EMS capacity and resources, ensuring long-term program viability. • Implement preventive health initiatives and community outreach programs to reduce emergency incidents, supporting overall public safety. 4. Mitigating Geographic and Environmental Barriers • Develop strategies to address the challenges of limited transportation and unpredictable weather, ensuring rapid response even when standard evacuation routes are delayed. • Coordinate closely with regional medivac services to prioritize critical cases, improving survival outcomes for residents.	\$50,000-\$250,000	Single Community	Aleutians West Census Area	Deferred or Not Advanced

City of Seward	Expanding Rural Care Beyond the Hospital Walls – Integrated Home Health, DME & Home Oxygen Program	AK	Seward faces significant and interconnected gaps across the full continuum of home-based care. On the non-medical side, limited availability of home support services contributes to caregiver burnout, delayed discharges, and in many cases prevents patients from returning home to Seward altogether, driving avoidable emergency department use in the process. The gaps extend into clinical care as well. Without access to local skilled nursing or home therapy services, patients managing chronic conditions after discharge have no reliable support structure, increasing their risk of readmission and making continuity of care nearly impossible to achieve. Perhaps most critically, Seward has no local durable medical equipment or oxygen vendors. Patients requiring oxygen or essential equipment face significant delays in obtaining it, and in some cases are discharged without the safe supports they need simply because no other option exists. Taken together, these gaps produce outcomes that are harmful and costly: longer hospital stays, unsafe discharges, increased readmissions and emergency department visits, and a higher total cost of care. This project represents a clear opportunity to address all three layers of this problem through an integrated home-based model that meets patients where they are and keeps them safely in their community.	This project implements a phased, integrated model that combines home support services, medical equipment access, skilled clinical care, and care coordination into one unified system rather than a collection of separate programs. In Year 1, the focus is on building the foundational services Seward currently lacks entirely. A non-medical home support program will provide companionship, safety checks, meal preparation, light housekeeping, transportation, personal care, and medication reminders, giving patients the day-to-day support they need to remain safely at home. Alongside this, a local DME and home oxygen program will be launched, establishing community inventory of oxygen concentrators, nebulizers, respiratory equipment, walkers, and wheelchairs. Same-day or next-day oxygen setup will be available, with patient and caregiver education built in and direct integration into hospital discharge workflows. Together these two components enable safe and timely discharges, deliver immediate impact on patient safety, and build the workforce and operational foundation needed for the next phase. In Year 2, the model expands into licensed skilled home health services, including registered nurse visits, physical and occupational therapy, chronic disease management, and post-hospital recovery care. A unified referral and intake system will standardize discharge planning and formalize coordination across the hospital, primary care, and all home-based services. Telehealth and remote monitoring capabilities will support respiratory and clinical follow-up, with early intervention protocols for high-risk patients. The result is a fully integrated continuum: services, equipment, clinical care, and coordination working together to transform how Seward delivers care outside the hospital walls.	\$250K-\$1M	Single Community	Kenai Peninsula Borough	Advance to Implementation Application

City of Seward	Expanding Rural Diagnostic Access: MRI with Modular POD Infrastructure	AK	Seward currently has no local MRI access, leaving a critical gap in diagnostic capability for a community that is 125 miles from the nearest scanner. When patients require MRI for neurological, spinal, or soft-tissue conditions, they face significant travel burdens, transfer delays, and the fragmentation of care that comes with being evaluated in one facility and imaged in another. For emergency and inpatient cases where timely diagnosis directly affects outcomes, these delays are not merely inconvenient but clinically consequential. The financial impact compounds the clinical one. Advanced imaging revenue that should stay within the community currently leaves with every patient transferred elsewhere for MRI services. Beyond direct revenue loss, the absence of MRI capability creates a meaningful barrier to specialist recruitment. Physicians considering practice in a rural community expect access to the diagnostic tools their patients need, and without MRI, Seward is at a structural disadvantage in attracting and retaining the specialists that would strengthen its broader care capacity. This project addresses all of these dimensions at once by establishing local MRI services, closing the diagnostic gap, reducing transfer burden, retaining revenue, and creating the infrastructure needed to support a more complete and sustainable rural healthcare system.	This project will establish local MRI services through the installation of a 1.5T MRI unit housed in a modular POD, providing a practical and efficient solution for a rural facility without the construction demands of a traditional fixed installation. Implementation will begin with site preparation and the necessary utility connections to support the unit safely and reliably. Once operational, the service will be staffed by on-site MRI technologists who will perform scans locally, eliminating the need for patient transfers for diagnostic imaging. Image interpretation will be provided through remote radiology, leveraging telehealth infrastructure to deliver timely reads without requiring on-site radiologist coverage. An integrated referral pathway will connect the MRI service directly to the emergency department, inpatient care, and outpatient providers, ensuring that ordering, scheduling, and results flow efficiently into existing clinical workflows.	\$1M-\$5M	Single Community	Kenai Peninsula Borough	Advance to Implementation Application

City of Seward	Community Trauma and Emergency Simulation Training Center	AK	Rural Alaska healthcare systems face a fundamental tension: low patient volume paired with high-acuity, high-risk emergency events. Clinicians must be ready to respond to rare, life-threatening situations without the benefit of frequent real-world exposure to build and maintain those skills. Compounding this, access to consistent hands-on training in rural settings is extremely limited, and sending staff outside the region for training carries significant costs in travel, lodging, and backfill staffing while creating delays in skill development and refresher training. High workforce turnover adds further pressure, requiring repeated onboarding and skill validation with limited infrastructure to support it efficiently. At Providence Seward Medical Center, a Level IV Trauma Center, maintaining trauma readiness is not optional. Yet the current training model depends heavily on staff leaving the community, resulting in variability in emergency preparedness and virtually no opportunity for the interdisciplinary EMS and hospital joint training that rural emergency response demands. This gap between required readiness and practical, ongoing training access represents a clear and urgent opportunity. This project will establish the Community Trauma and Emergency Simulation Training Center as a regional hub for simulation-based training and workforce development, strengthening emergency preparedness, workforce capability, and patient outcomes across rural Alaska.	Providence Seward Medical Center proposes the development of a regional Simulation and Workforce Development Hub to deliver consistent, high-quality, simulation-based training and interdisciplinary emergency preparedness across the region. At the core of the program is a robust simulation-based emergency training curriculum built around high-fidelity scenarios reflecting the realities of rural emergency care. Teams will train on multi-patient and mass casualty events, rural-specific response challenges, and critical skills including obstetric emergencies, airway management, hemorrhage control, stabilization, and patient transfer. Real-time debriefing following each simulation will reinforce clinical decision-making, communication, and teamwork in ways that classroom instruction cannot replicate. Workforce development and continuing education will be delivered locally, eliminating the cost and delay of sending staff out of the region. Structured onboarding and competency validation for new staff will address the ongoing challenge of workforce turnover, while regular skill refreshers ensure that all team members maintain readiness in a low-volume, high-risk environment. The training model is designed to be scalable, allowing topics and complexity to expand over time. A dedicated EMS and hospital joint training component will bring these two teams together through integrated simulation exercises, standardized emergency response protocols, and regional drills focused on communication, handoffs, and coordinated response. Finally, PSMC will serve as a regional training hub, extending access to surrounding communities and partner organizations through shared scheduling models and regional infrastructure that no single rural facility could sustain alone.	\$250K-\$1M	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

City of Seward	Modernizing Rural Emergency Diagnostics: CT Scanner Replacement and Imaging Infrastructure Upgrade	AK	The hospital's current CT scanner is outdated and increasingly unable to meet the demands of modern emergency and inpatient care. Slow scan times, lower image quality, and failure to meet current trauma, stroke, and radiation dose standards increase the risk of delayed or inaccurate diagnoses in time-critical situations. Recurring equipment failures disrupt clinical workflows, delay care, and drive up operational costs. The existing scanner also cannot support expanded screening or preventive imaging programs, and its limitations create a meaningful barrier to recruiting and retaining the skilled physicians and technologists that rural communities depend on. Replacing the scanner presents a clear opportunity to address all of these challenges at once. A modern CT system would improve trauma and stroke evaluation through faster scan times and superior image clarity, enabling confident and timely clinical decision-making. Enhanced image quality would strengthen teleradiology and specialty consultation, reduce unnecessary patient transfers, improve throughput, and ensure compliance with current regulatory and accreditation standards. Upgrading this essential infrastructure would stabilize emergency services, expand local access to imaging and screening, and improve provider recruitment, keeping more care safely within the community.	This project will replace the hospital's outdated CT scanner with a modern 128-slice system, providing the diagnostic capability required to meet current standards for emergency and inpatient care in a rural setting. Installation will be accompanied by upgrades to the control room and workstation infrastructure to ensure the full capabilities of the new system can be utilized effectively. Advanced imaging protocols for stroke, trauma, pulmonary embolism, and cardiac evaluation where appropriate will be integrated into clinical workflows, standardizing the hospital's approach to time-critical diagnostic scenarios. PACS and image transmission capacity will be improved to support faster, higher-quality image sharing with teleradiology partners and consulting specialists, reducing the need for patient transfers for interpretive support. Comprehensive staff training on the updated technology will ensure that clinical and technical teams can operate the new system confidently from day one. A service contract will be established to maintain uptime reliability, protecting the investment and ensuring that equipment failure does not continue to be a source of care disruption.	\$1M-\$5M	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

City of Seward	Rural Hospital Safety: Security Remodel, Access Control & Triage Redesign	AK	The hospital’s current physical layout and security infrastructure were not designed to meet today’s rural healthcare safety, behavioral health, and infection prevention demands. Open access to clinical areas, lack of controlled entry points, unsecured nurse stations, and an inadequately designed triage and intake environment create increased risk of workplace violence, limit patient privacy, and hinder the ability to rapidly identify and isolate high risk or infectious patients. The absence of a designated waiting and intake area further contributes to uncontrolled patient flow, reduced staff visibility, and barriers to safe access to care. This project presents a critical opportunity to modernize security, access control, and triage spaces to protect staff, improve patient safety and dignity, strengthen infection prevention, and ensure safe, structured access to care from the point of entry through triage.	This project is a remodel and systems integration effort, not new construction. It modernizes the physical and operational security infrastructure of the hospital through a coordinated set of interconnected improvements. At the core of the project is the installation of an electronic badge access control system throughout inpatient and Emergency Department areas, establishing clearly defined and secured access points to all clinical zones. Nurse stations will be redesigned with enclosed or semi-enclosed configurations, shatter-resistant materials, and controlled entry points to protect staff while maintaining efficient care delivery. A controlled visitor access system will be implemented alongside upgrades to the security camera and monitoring system, with improved lighting and line-of-sight design to enhance situational awareness throughout the facility. Duress alarms and panic buttons will be integrated to give staff immediate access to support when needed. The triage area will be remodeled to include private, confidential patient assessment rooms, a clear workflow for rapid identification of infectious symptoms, and designated early isolation capability. This directly addresses both patient dignity and infection control in the highest-traffic area of the facility. The waiting area will be expanded and optimized to improve patient flow, allow separation of patients when needed, enhance monitoring and visibility, and support safe and controlled access into clinical care areas. The project will be completed with comprehensive staff training on both security protocols and infection control procedures, ensuring that physical improvements are matched by the knowledge and practices needed to sustain them.	\$1M-\$5M	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

City of Soldotna	Soldotna Creek Park Inclusive Play Renovation	AK	Opportunities for inclusive outdoor play are limited across much of rural Alaska. Many playgrounds are not designed for children who use mobility devices or who benefit from sensory-friendly environments, which can prevent some families from fully participating in community recreation. The City of Soldotna maintains several parks that serve residents across the central Kenai Peninsula, but there is currently no dedicated play space intentionally designed to accommodate children of all abilities in Soldotna or in surrounding communities. The proposed project site is located near a highly used Kenai River access point that draws families and visitors for personal use fishing and sportfishing. This location provides a unique opportunity to create a recreation space that encourages active outdoor lifestyles while supporting healthy food traditions common throughout Alaska. Increasing access to safe, inclusive places for children to be active is an important strategy for preventing chronic disease and supporting long-term community health. By creating a space where children of all abilities can play and families can gather outdoors, this project will help reduce barriers to physical activity, encourage healthy habits at an early age, and increase opportunities for social connection.	The City of Soldotna proposes to renovate an existing volunteer-built playground into an inclusive play environment that supports physical activity, social interaction, and healthy development for children of all abilities. Soldotna Creek Park features a well-loved and heavily-used community playground, built by and for community members in 2011, however the non-traditional volunteer-built structures lack the accessibility features and universal design that would make the playground accessible for children of all abilities. The project will incorporate key elements of inclusive playground design, which may include: - o ramp-accessible play structures and transfer platforms - o inclusive swings and motion-based play equipment - o sensory play features such as tactile panels - o accessible pathways and seating areas for caregivers and individuals with mobility devices - o gathering and rest areas that support family participation The park’s location adjacent to a popular Kenai River fishing access area will further support outdoor recreation by providing a family-friendly environment where visitors can fish, walk, play, and gather in one location. The park hosts frequent community events, festivals, live music, and other gatherings that create important opportunities for positive social connections. The park is already equipped with ADA accessible trails that connect the playground to the rest of the park amenities. These combined activities encourage healthy lifestyles that include physical activity, outdoor time, and access to locally harvested foods such as salmon.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

City of Togiak	Jake’s Place Satellite Facility: Renovating the Togiak Family Resource Center for SUD Treatment	AK	The Bristol Bay region faces an acute shortage of accessible SUD treatment, with demand far exceeding capacity. Jake’s Place in Dillingham, the primary regional provider, experiences chronic overcrowding that results in wait times of more than a year for residential treatment. For rural communities such as Togiak, this delay has serious consequences. Currently, 48 Togiak children are in out-of-home foster care due to parental drug and alcohol use, and community concerns related to impaired driving and alcohol-related harm remain high. In a recent public survey, 67% of respondents identified drug- or alcohol-impaired driving as a high-priority concern, reflecting widespread recognition that substance use is undermining health, safety, and family stability. The opportunity lies in re-purposing an existing community asset: the underutilized Family Resource Center in Togiak. The facility is structurally suited for renovation and is owned by a regional partner with a vested interest in long-term community benefit. Strategic investment through the Rural Health Transformation Program would allow this space to be converted into a satellite treatment facility, expanding regional capacity without new major construction. By leveraging existing infrastructure and established treatment providers, this project addresses an urgent health crisis, reduces regional bottlenecks, and prevents the displacement of rural residents seeking recovery by bringing services closer to home.	The project will implement a regional hub-and-spoke model that aligns directly with Rural Health Transformation Program priorities related to access, system integration, and behavioral health infrastructure. The City of Togiak will partner with the Bristol Bay Native Corporation, owner of the Family Resource Center building, and with Bristol Bay Area Health Corporation and Jake’s Place, the region’s established substance use treatment provider. The City of Togiak will lead project planning, coordination, and capital improvements, while Bristol Bay Native Corporation will provide the facility asset and support long-term stewardship of the building. The project has deep community support, and the City Council unanimously voted to move this initiative and LOI forward. Jake’s Place will operate the renovated facility as a licensed satellite program, delivering residential treatment, outpatient services, aftercare planning, and recovery education consistent with state clinical standards and regional practice models. Bed capacity will be allocated to meet Togiak needs while also serving regional overflow, directly relieving pressure on the Dillingham hub. The project will be completed in phased stages to ensure readiness and cost control. The first phase will focus on planning, developing partnerships, and a comprehensive needs assessment, including space programming, regulatory review, and community input. The second phase will include pre-development activities, architectural and engineering design, and final cost estimates. The third phase will complete renovation within the existing building footprint, consistent with RHTP guidelines that prioritize renovation over new major construction. Formal partnership agreements will define roles, operational responsibilities, and coordination protocols. This approach ensures the facility is clinically sound, culturally responsive, and fully integrated into the regional continuum of care while maximizing the impact of RHTP capital investment.	\$50,000-\$250,000		Multi-Community or Participating in Regional Hub-and-Spoke	Dillingham Census Area	Advance to Implementation Application

City of Togiak	Finalization of the Billy Blue Emergency Access and Safe Transport Route for the Community of Togiak	AK	Togiak faces an acute emergency access and public safety gap that directly threatens health outcomes for the entire community. The single route to the Togiak School, the designated safety zone and emergency shelter, is a danger year-round. When the route is unsafe or impassable, EMS and first responders are delayed and timely evacuation is threatened. This need is strongly documented through community planning. During the 2020–2025 TTSP public involvement process, finishing the Billy Blue Road was identified as the top community priority. In the community survey, 75% cited poor road design as a high priority concern, and 71% cited lack of an evacuation route and safety shelters. This letter of interest was approved and endorsed by the Togiak Common Council, and other community organizations were involved in crafting this narrative. The opportunity presented here is to finalize a heavily vetted, community-driven project that creates a direct, reliable route for emergency services and to the entire population’s emergency shelter site. Recent events in rural Alaska demonstrate the urgent need for safe and timely evacuation routes, and we have seen the real-life effects of weather events on communities. Because the project is fully engineered, environmentally vetted, and aligned across multiple funding partners, it represents a high visibility opportunity for RHTP to demonstrate the transformative impact the program will have on rural health care.	Our approach is to use RHTP funding to expand on existing design and engineering work and finalize the Billy Blue Road, moving a long-planned community priority into implementation with a clear pathway to near-term impact. The project is in the ready-to-launch phase. The Traditional Council of Togiak previously secured a Safe Routes to School grant through the Alaska Department of Transportation, and engineering and design have been completed. Environmental and permitting steps have also been advanced, including a U.S. Army Corps of Engineers public notice. Togiak is requesting \$2 million in RHTP funds to complement a larger \$4 million funding package and close the remaining construction gap. RHTP dollars will be used to mobilize quickly, procure materials, secure contractors, and complete the final stage of the 3,216-foot road that provides a direct route to the school and higher ground. The City of Togiak and the Traditional Council will jointly oversee implementation, coordinate local logistics, and ensure community communication and safety during construction. This is a coordinated, multi-agency effort designed to maximize impact and minimize duplication. We are collaborating with Senator Murkowski’s office, the Denali Commission, the Bureau of Indian Affairs, and the Bristol Bay Native Corporation to align funding, technical support, and delivery timelines. The project will be managed with clear milestones, including contractor procurement, material staging, construction start, substantial completion, and operational acceptance. Progress will be tracked through schedule and budget reporting, construction inspection documentation, and readiness checks for emergency access use. By improving the year-round reliability of the route to the emergency shelter and upper subdivision, the project advances Alaska RHTP Initiative 2 (Health Care Access) and Initiative 3 (Healthy Communities). It represents a structural change to the local emergency response system by removing a high-risk bottleneck that can delay EMS and evacuation, particularly during winter and coastal events, and by enabling safer access to higher-elevation land for future housing and community resilience.	\$1M-\$5M	Single Community	Dillingham Census Area	Deferred or Not Advanced

City of Togiak	Strengthening Rural EMS Response Capacity in Togiak	AK	Togiak’s EMS response system faces operational barriers due to the absence of climate-controlled storage for emergency vehicles and their equipment. The community’s primary EMS vehicles are stored outdoors year-round. Sub-zero temperatures expose vehicles and equipment to extreme cold and freeze–thaw cycles that degrade medical supplies and electronics. In warmer months, rain, humidity, and moisture intrusion increase the risk of corrosion, condensation damage, and deterioration of medical devices and vehicle components. EMS responders must store critical supplies separately and enter freezing vehicles when responding to emergencies. Cold starts, temperature-related equipment limitations, and time required to prepare vehicles in severe weather can delay response and limit providers’ ability to deliver care immediately upon arrival. These conditions have direct clinical implications. EMS personnel may be required to assess and stabilize patients in vehicles that remain at sub-zero temperatures while equipment reliability may be compromised by exposure. In emergencies such as trauma, cardiac events, and acute illness affecting vulnerable residents, these operational barriers can affect the timeliness and effectiveness of care. Addressing these infrastructure limitations presents an opportunity to strengthen the reliability and readiness of Togiak’s rural EMS system by ensuring emergency vehicles and critical equipment can be stored in stable, climate-controlled conditions.	This planning project will evaluate options for establishing climate-controlled EMS vehicle storage in Togiak. Because multiple potential sites exist within the community, the project will focus on evaluating 3 feasible facility strategies and identifying the most effective and sustainable location for implementation. Planning activities will include: site feasibility analysis for three potential locations; engineering and structural feasibility review; evaluation of space requirements for emergency vehicles and equipment staging; EMS operational workflow analysis; development of preliminary cost estimates for each option; permitting and regulatory pathway review; and preparation of an implementation roadmap for a future capital project. Option 1: Clinic-Connected Emergency Response Facility (Preferred): This option would expand space adjacent to the existing BBAHC clinic building to provide climate-controlled storage directly connected to the facility. Co-locating emergency vehicles with the clinic would allow EMS responders to deploy immediately from the primary point of medical care in the community while supporting equipment staging and potential integration with the clinic’s planned waste heat recovery system. Option 2: Municipal Facility: This option would convert an existing 1500 SF municipal building near the City administrative offices into a climate-controlled emergency vehicle storage facility supporting EMS and fire response operations. Co-locating public safety assets could improve coordination between emergency responders and provide shared operational space. Option 3: Old School Gym Conversion: This option would evaluate partial renovation of the unused 10,000 SF City-owned gymnasium to support heated emergency vehicle storage. Improvements may include installation of overhead vehicle access, insulation upgrades, heating systems, and interior space for emergency equipment staging. Project Timeline May–August 2026: Site evaluations, facility assessments, and EMS operational needs analysis. September 2026–February 2027: Engineering feasibility review, space planning, and evaluation of integration with clinic operations and energy systems. March–June 2027: Development of cost estimates, permitting pathway analysis, and comparative evaluation of the three facility options. July–October 2027: Selection of a preferred site and preparation of an implementation roadmap to support future capital funding and construction.	\$50,000- \$250,000	Single Community	Dillingham Census Area	Deferred or Not Advanced

City of Togiak	Technical Assistance for Togiak Health System Transformation	AK	The RHTP represents a once-in-a-generation opportunity to structurally stabilize and improve Togiak's health system. The primary barrier to executing this transformation is not a lack of vision or local leadership, but the administrative bandwidth and specialized grant management skillset required to navigate complex federal compliance, budgeting, reporting, and detailed proposal requirements, especially for staff who have not had the opportunity to attend trainings, work closely with federal grantors, or gain hands-on experience with large healthcare-related projects. The RHTP Applicant Resource Guide specifically allows funds to be used for "Technical assistance, planning, and project design support" as well as building internal systems for sustainable service delivery. The opportunity is to fund a contractor who is familiar with Togiak's unique logistical challenges and can provide structured training, tools, and coaching to City and Traditional Council staff so that grant administration and compliance functions are sustainable locally after the RHTP funding period.	Our approach is to retain a professional consultant or consulting firm to provide training and hands-on coaching that builds local capacity in grant management, compliance, and reporting, so that Togiak can sustainably administer funding after the RHTP funding period. The consultant will be familiar with Togiak's context and logistical realities and will focus on transferring knowledge, creating repeatable tools, and strengthening internal processes. The consultant will work with City staff, the Traditional Council, and the broader community to deliver training on RHTP and federal grants, develop practical templates and checklists, and support staff as they draft narratives, build budgets, outline sustainability plans, and secure essential partnership agreements. By treating project design and grant management capacity as a foundational step, we align directly with RHTP's allowable uses for capacity-building activities. This approach ensures our primary infrastructure projects are meticulously designed to meet federal standards while remaining community-led and culturally appropriate.	Under \$50,000	Single Community	Dillingham Census Area	Deferred or Not Advanced

City of Togiak	Togiak Early Childhood Health Access Facility Improvements	AK	In Togiak, access to preventive health services for young children is limited by geography, provider availability, and the absence of specialized pediatric services within the community. The Head Start facility where these activities occur faces environmental and infrastructure limitations that affect its ability to safely support these services. The building relies on aging mechanical systems and limited kitchen infrastructure that are increasingly difficult to maintain in a rural setting with constrained access to technical support and replacement equipment. Key building systems have reached the end of their useful life and require capital replacement rather than routine maintenance. The facility’s boiler system is aging and increasingly unreliable, creating risks for consistent heating in a region with extreme winter temperatures. The HVAC system provides limited ventilation and air exchange, resulting in poor indoor air quality and increased risk of respiratory illness transmission among young children. The kitchen lacks adequate equipment, ventilation, and sanitation infrastructure required to safely prepare and store food in compliance with federal nutrition program standards. These deficiencies cannot be addressed through routine maintenance because they involve full system upgrades, code-compliant infrastructure improvements, and structural rehabilitation necessary to restore the facility’s ability to safely support program operations.	The project will focus on three priority improvements that directly affect facility safety and functionality: kitchen modernization, ventilation system upgrades, and boiler system replacement. Together, these improvements will restore core building systems necessary to safely support Head Start nutrition services and early childhood programming. During the initial project phase, the City of Togiak and BBNA will complete project planning, procurement, and coordination with facility staff to ensure construction activities minimize disruption to Head Start programming. This phase will include final scope verification, contractor procurement, materials ordering, and scheduling of work during periods that reduce impacts on classroom operations. Kitchen upgrades will modernize food preparation infrastructure to meet Alaska Department of Environmental Conservation and federal sanitation, food safety, and temperature control requirements necessary for Head Start nutrition services. Improvements will include replacement or installation of compliant food preparation equipment, improved food storage capacity, and upgrades necessary to meet federal program standards. These improvements will allow staff to consistently prepare and serve meals that comply with federal nutrition guidelines for young children. Ventilation system improvements will restore the building’s air recirculation and filtration system. Work will include repair or replacement of ventilation components to improve air exchange and indoor air quality. These upgrades will reduce the transmission of respiratory illness in a congregate setting serving young children and improve overall environmental health conditions within the facility. Boiler system upgrades will replace aging glycol-based heating components that currently present reliability risks during winter months. Work will include removal of failing components and installation of updated heating infrastructure designed for reliable operation in extreme rural conditions. These improvements will ensure stable indoor temperatures and safe facility operation throughout the year. Construction and installation activities are expected to occur over approximately 12-16 months (ending prior to the October 2027 deadline), with key milestones including project procurement and contracting, system replacement and installation, final inspections, and return to full operational use of upgraded systems.	\$50,000- \$250,000	Single Community	Dillingham Census Area	Deferred or Not Advanced

City of Togiak	Togiak Rural Health Workforce Housing Renovation to Support Recruitment and Retention	AK	The Ayojiak and duplex properties require significant renovation to remain viable for workforce housing. Housing in remote Alaska communities reflects the challenges of rural construction and logistics. Materials must be transported long distances by air or barge, skilled contractors are limited, and buildings often operate for decades in harsh weather conditions with limited opportunities for major renovation. As a result, housing that may have functioned historically for local use can fall below modern code, safety, and livability standards expected by clinicians traveling from outside Alaska. The Ayojiak residence currently requires substantial repairs and system replacements to address health and safety concerns and bring the structure into compliance with applicable codes, including upgrades to interior finishes, kitchen and bathroom components, heating and ventilation systems, plumbing, lighting, and exterior elements such as roofing, windows, insulation, siding, and the fuel tank. The City-owned duplex faces similar challenges. The vacant unit requires interior improvements including flooring replacement, cabinetry, windows, and interior finishes, as well as exterior siding replacement. Completing exterior improvements across the full building would reduce long-term maintenance costs and extend the useful life of the property. Since housing units are in poor condition, they cannot reliably support the workforce positions they are intended to serve.	The City of Togiak will renovate two existing City-owned housing units: the Ayojiak residence and one unit of the City-owned duplex. Renovations will bring both structures into compliance with applicable safety and building standards and restore them as functional workforce housing. The Ayojiak residence renovation will follow the scope identified in a March 2026 contractor estimate from PTP Construction Services totaling \$512,125. Planned work includes replacement of flooring, kitchen cabinets and appliances, bathroom renovation, interior sheetrock repair and painting, interior door replacement, lighting and electrical upgrades, installation of a new Toyotomi heating system, plumbing upgrades, water heater replacement, and ventilation improvements. Exterior work includes roofing replacement, window replacement, insulation upgrades, wall and siding repairs, and replacement of the fuel tank. The duplex renovation will focus on the currently vacant unit of the City-owned building. Planned improvements include flooring replacement, cabinetry upgrades, interior finishes, window replacement, and exterior siding improvements. Because the structure shares a single building envelope and exterior systems, exterior improvements will be completed across the full duplex, simplifying construction and ensuring consistent protection of the building structure while extending the useful life of the property. The City is obtaining an updated construction estimate for the duplex renovation before the end of March 2026. Project implementation will follow the timeline below: May–June 2026: Finalize construction scope, confirm updated contractor estimates for the duplex, and complete procurement and contractor selection. July–September 2026: Order building materials and coordinate transportation logistics for delivery to Togiak. Fall 2026 – Summer 2027: Complete construction and renovation work on the Ayojiak residence and duplex unit, including interior system replacements, structural repairs, and exterior improvements. August–September 2027: Conduct final inspections, complete any remaining repairs, and prepare both housing units for occupancy. All work will be completed prior to the September 30, 2027 project deadline.	\$250K-\$1M	Single Community	Dillingham Census Area	Deferred or Not Advanced

City of Togiak	Tuyuryaq Youth Activities and Cultural Wellness Center Planning Initiative	AK	Youth and families in Togiak face increasing behavioral health challenges and limited access to structured prevention activities. Community assessments conducted through the Togiak Native Connections program identified strong community concern about youth mental health, loss of cultural connection, and the lack of safe spaces where young people can gather, learn from Elders, and participate in healthy activities. The community is also experiencing rapid loss of Yugtun language use and traditional knowledge transmission between generations. Local Elders continue to hold deep cultural knowledge related to subsistence, traditional practices, and healing, but opportunities for youth to learn directly from Elders are increasingly limited. Without intentional spaces that support intergenerational engagement, these connections—and the protective health benefits they provide—continue to decline. The City of Togiak owns the former Togiak School building, which includes a library and adjacent classroom space that are centrally located within the community and accessible to residents. These spaces present an opportunity to establish a dedicated community wellness environment that supports youth activities, cultural learning, and prevention-focused programming. Planning for the Tuyuryaq Youth Wellness and Cultural Center will position the community to transform existing unused infrastructure into a space that strengthens youth well-being, cultural continuity, and community health.	The City of Togiak will undertake a structured planning process to prepare for renovation of the library and adjacent science classroom within the former Togiak School building to create the Tuyuryaq Youth Wellness and Cultural Center. The planning phase will focus on developing facility design concepts, engineering assessments, and renovation scope documentation needed to support a future capital renovation project. The planning effort builds directly on priorities identified in the Native Connections Community Needs Assessment, which highlighted strong community support for youth activities, cultural learning opportunities, and dedicated spaces that support youth and family wellness. During Months 1–2, the City will initiate project startup activities and conduct procurement for professional services required to complete the planning work. This will include issuing requests for proposals and selecting qualified architectural and engineering professionals with experience in rural facility planning and renovation. During Months 3–8, the selected architectural and engineering team will conduct facility assessments and develop conceptual design options for converting the existing classroom and library areas into flexible community wellness spaces. This work will include building condition review, space planning concepts, and identification of structural, mechanical, or accessibility improvements needed to support future programming. During Months 8–10, the project team will develop preliminary renovation scopes and cost estimates based on the design concepts and engineering review. These estimates will provide the City and its partners with realistic construction budgets and allow refinement of renovation priorities. Throughout the planning process, the City will coordinate with key community partners—including the Togiak Traditional Council, Togiak Natives Limited, community Elders, and youth leaders—to ensure the facility design reflects how the space will support youth activities, cultural learning, and community wellness programming. During Months 9–12, the project team will finalize the planning package, including conceptual facility designs, engineering review, renovation scope documentation, and construction cost estimates. These deliverables will position the City and its partners to pursue renovation funding and move efficiently into implementation once capital funding is secured.	\$250K-\$1M	Single Community	Dillingham Census Area	Deferred or Not Advanced

City of Unalaska	Unalaska Fire Department Development of a Mobile Integrated Healthcare Program	AK	Communities throughout the Aleutian region face persistent disparities in access to healthcare services, particularly behavioral health care. Geographic isolation, transportation barriers, limited healthcare workforce availability, and the high cost and complexity of travel to regional medical centers contribute to delayed care and limited access to preventative health services. Because of these challenges, emergency medical services are frequently utilized as a primary point of entry into the healthcare system for individuals experiencing behavioral health crises, substance use disorders, or other unmet healthcare needs. First responders regularly encounter patients who require coordinated follow up care and connection to services beyond the traditional emergency response and transport model. In response, the City of Unalaska is developing a Mobile Integrated Healthcare program through the Unalaska Fire Department. Mobile Integrated Healthcare expands the role of prehospital providers to address both emergent and non emergent healthcare needs by integrating EMS with primary care, behavioral health services, and community based healthcare resources.	Our intent is to establish an Mobile Integrated Health program that integrates EMS providers with facility based healthcare partners to improve early behavioral health intervention, increase preventative healthcare engagement, and connect patients with appropriate services before conditions escalate to emergency situations. Our approach emphasizes integration with existing systems, partnerships with key local stakeholders, and future sustainability. The City has already begun early planning efforts to guide development of this model. Two ongoing studies are currently underway to inform program design and implementation. The first is a comprehensive Community Health Needs Assessment, and the second is a Behavioral Health Assessment focused on identifying service gaps, barriers to care, and opportunities for improved coordination between healthcare providers.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area	Advance to Implementation Application
City of Wasilla	Enhancing Emergency Medical Communications Across Rural Alaskan Areas with Radio Modernization	AK	Reliable radio communication is essential to the delivery of emergency medical services. Aging consolettes increase the risk of technical failure, reduced audio clarity, and limited redundancy between primary and backup facilities. As the central emergency response communication hub for the region, dispatch must maintain uninterrupted contact with field responders. Any communication disruption can delay medical care, compromise responder safety, and increase the probability of negative patient outcomes. Modernizing our radio infrastructure presents a critical opportunity to strengthen the resilience and effectiveness of emergency health coordination across the expansive and diverse service area.	We propose replacing radio consolettes in both our primary dispatch center and designated backup center to ensure operational continuity and redundancy. The project will include procurement of modern consolettes, installation, system integration, interoperability testing, and staff training. Updated systems will provide improved audio clarity, enhanced reliability, and failover capability between facilities to maintain uninterrupted service. By strengthening the communication link between dispatch and first responders, this project enhances coordination, reduces operational risk, and supports timely emergency medical response across the expansive and diverse service area.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Copper River Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

City of Wasilla	Implementing NG911 Core Services and ESInet for Rural Emergency Communications	AK	Emergency communications systems across the United States are transitioning to Next Generation 911 infrastructure designed to replace aging legacy systems and improve system resiliency. Alaska remains the only state that has not yet implemented Next Generation Core Services (NGCS), which provide the core routing and interoperability capabilities required for Next Generation 911. The MatCom Public Safety Communications Center proposes to implement NGCS and an Emergency Services Internet Protocol Network (ESInet) to modernize the region’s emergency communications infrastructure. As one of the largest regional communications centers in Alaska, MatCom is well positioned to serve as the first 9-1-1 center in the state to deploy these services. Implementation of NGCS would establish a modern call routing architecture that allows emergency calls to be dynamically routed based on the caller’s geographic location while also providing system redundancy. In the event of a system outage, infrastructure failure, or surge in call volume, emergency calls could be automatically rerouted through the ESInet to another Public Safety Answering Point (PSAP) with similar operational capacity. This capability eliminates single points of failure in the emergency communications system and ensures that 9-1-1 calls continue to be answered even during major incidents or infrastructure disruptions.	MatCom will implement Next Generation Core Services (NGCS) and an Emergency Services Internet Protocol Network (ESInet) through a phased deployment designed to ensure uninterrupted emergency communications services. The project will begin with system design, vendor procurement, and coordination with telecommunications providers and regional Public Safety Answering Points (PSAPs). Following procurement, NGCS and ESInet infrastructure will be deployed and integrated with MatCom’s existing call handling and computer-aided dispatch systems. This integration will enable location-based routing and secure IP connectivity between PSAPs. Once installed, the system will undergo comprehensive testing and operational validation. Dispatch personnel will receive training, and coordinated testing with partner PSAPs will ensure interoperability and system reliability. Upon completion, the system will transition to full operational use, providing a redundant emergency communications network capable of automatically rerouting 911 calls to another PSAP of similar capability during outages or surge events.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Copper River Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

City of Wasilla	Modernizing 911 Computer-Aided Dispatch (CAD) to Strengthen Emergency Health Response Across Alaska	AK	The Matanuska-Susitna Borough, Chugach and Copper River Census Areas continue to experience population growth and increased demand for emergency services. Our existing CAD system is aging and lacks the functionality required to support modern emergency medical coordination across large distances. It no longer meets the operational complexity required to coordinate emergency medical response across a large and geographically diverse service area. Maintaining outdated technology limits interoperability, slows data exchange, and reduces situational awareness for dispatchers and first responders. In rural areas, where distances are significant and resources may be limited, inefficiencies in dispatch coordination can directly affect patient outcomes. A new CAD system will improve call processing times, mapping precision, responder tracking, and interagency communication between EMS, fire, and law enforcement agencies service an expansive and diverse area. This project presents an opportunity to modernize critical emergency communication infrastructure to ensure reliable, coordinated access to emergency medical care.	We are proposing replacing our current CAD system with a modern, fully integrated platform designed to support high-volume emergency medical dispatch operations across a rural and regional hub service area. The new system will include enhanced GIS mapping, improved address verification, real-time unit status tracking, interoperability with partner agencies, advanced reporting capabilities, and system redundancy to ensure uninterrupted operations. Implementation will include procurement, system configuration, data migration, staff training, testing, and phased deployment to minimize service disruption. The project will also ensure integration with regional EMS providers serving the Matanuska-Susitna Borough, Chugach and Copper River Census areas. This approach strengthens the connection between community members in crisis and first responders delivering emergency health care. By equipping call takers and dispatchers with reliable tools, we improve response coordination, reduce delays, and enhance the quality and sustainability of emergency medical access across Alaska.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Copper River Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced
City of Wasilla	The Wasilla Public Library Expansion	AK	This is a capital improvement project to add to the Wasilla Public Library building in order to be able to have room to add staff, technology and additional materials and extend the open hours to the public. This is wanted by the community because right now the library is only able to be open to the public 40 hours a week, due to limited staffing ability. That is only 10-hours less than what the Alaska State Library recommends for a community our size.	An architect has been hired to design adding an additional 2,600 square feet to the current library to create 5-7 workstations, and an additional office, to increase capacity for staff. Once the design is complete, the City would move to hire a contractor to expand the building. This would allow the library to accommodate the expected area growth and public demand for the next 20-30 years.	\$250K-\$1M	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

City of Whittier	Whittier Rural EMS Access and Response Modernization Initiative	AK	The City of Whittier faces significant healthcare access challenges due to its geographic isolation, transportation limitations, & reliance on local emergency medical services as the primary point of care during emergencies & non-emergencies. Whittier is connected to the road system through the Anton Anderson Memorial Tunnel, a single-lane tunnel shared by rail & vehicle traffic operating on a controlled schedule. This infrastructure can delay emergency transportation & limits rapid access to hospital-based care as one transport to Anchorage can remove all responders from the city. The nearest hospital-based emergency department is more than 60 miles away, requiring over an hour of travel, one-way, under ideal conditions. Transport times may be further delayed by tunnel scheduling, weather conditions, or seasonal traffic congestion. As a result, Whittier Fire Department EMS personnel often serve as the community’s frontline healthcare providers for extended periods while patients await transport to definitive care. In addition to serving approximately 260 year-round residents, Whittier experiences large seasonal population increases from tourism, charter fishing, & cruise ship traffic. These factors increase demand for emergency medical services & highlight the need to strengthen local EMS response capabilities, improve coordination with regional healthcare providers, & ensure reliable emergency care for residents & visitors in this remote community.	The City of Whittier will address barriers to healthcare access in this isolated coastal community through the Whittier Rural EMS Access and Response Modernization Initiative, a coordinated effort to strengthen emergency medical response, expand access to clinical support, and improve long-term sustainability of rural emergency medical services. The project will expand telehealth-enabled EMS capabilities, allowing personnel to consult with physicians and advanced medical providers in real time during emergency and non-emergency responses. This capability will support improved clinical decision-making, enhance patient stabilization during extended response or transport intervals, and improve coordination with receiving hospitals prior to patient arrival. The initiative will also improve emergency communications and interoperability by upgrading equipment and strengthening connectivity with regional healthcare providers and emergency response partners. Reliable communication systems will improve information sharing, patient care coordination, and emergency response effectiveness in Whittier’s mountainous and maritime environment. To support long-term sustainability of rural healthcare services, the project will invest in workforce development through advanced EMS training, recruitment, and retention efforts. In partnership with the Chugach School District, the department will also expand student exposure to EMS and healthcare career pathways, helping develop a future local workforce pipeline. Together, these efforts will strengthen Whittier’s emergency medical system, improve patient outcomes, and expand reliable access to emergency healthcare for both residents and visitors in Prince William Sound.	\$250K-\$1M	Single Community	Anchorage (Municipality); Chugach Census Area	Deferred or Not Advanced

ClaimExcel	ClaimExcel: Precision Revenue Recovery & Protection for Rural and Critical Access Hospitals	OH	Alaska’s rural and critical access hospitals face a compounding financial challenge: they are systematically underpaid by insurance payers, yet lack access to the specialized staffing, technology, and bandwidth to detect and recover these losses. Industry data indicates that 1 to 5% of net patient revenue is lost annually to claim underpayments alone. The root causes are structural. Payer reimbursement rules are complex, payer-specific, and change frequently. Bundling logic, modifier requirements, and contract terms vary by payer and region. Payers apply undocumented processing patterns not reflected in contracts. For resource-constrained rural facilities, auditing every claim against these moving targets is not feasible. The consequences are severe. Zero-pay and underpaid claims are written off. Low-dollar underpayments, uneconomical to pursue individually, accumulate into material losses. Preventable denials consume staff time on rework instead of collections. Readmission clawbacks cost hospitals an average of \$15,500 per event with zero Medicare reimbursement. Meanwhile, billable Transitional Care Management visits go uncaptured. This project addresses a clear opportunity: deploying automated claims analysis technology purpose-built for rural hospital revenue cycle challenges, requiring no upfront investment, no new system integration, and minimal operational disruption – converting overlooked reimbursements into recovered and protected revenue.	ClaimExcel’s approach is a phased, low-burden implementation designed for facilities with limited IT and revenue cycle resources. Phase 1 – Claim Recapture & Underpayment Recovery: Each hospital provides 18-24 months of 837/835 data via secure SFTP. Our AIDA engine performs comprehensive retrospective analysis, examining every line item. AIDA sequences each line item, checks modifiers and groupers, validates quantities against proprietary databases, matches NDCs with J-codes for pharmacy claims, documents unique payer processing patterns, and notes payer-specific reimbursement modifications. Within 2 to 3 weeks, hospitals receive preliminary findings; actionable rebilling reports follow by weeks 4 to 5, and more detailed and specialized reports thereafter. Phase 2 – Proactive Scrubbing & Editing: Once recovery is underway, we activate front-end claims scrubbing that identifies and corrects billing errors before initial payer submission. Each claim is verified against thousands of coding and billing requirements using a continuously updated database, with customizable configurations tailored to each facility’s payer mix. This shifts hospitals from reactive denial management to proactive prevention, delivered via seamless EMR/PM/RCM integration without disrupting operations. Phase 3 – Readmission Revenue Protection (powered by Reveleum): Using 837/835 data plus a daily Medicare discharge file (HL7), this service automatically flags high-risk discharges and generates call lists for timely PCP follow-up. It eliminates readmission clawbacks and captures previously unbilled TCM revenue through automated post-discharge workflows. Across all phases, hospitals receive ClaimExcel’s Advanced Analytics & Reporting Portfolio – including denial root-cause heatmaps, timely filing risk radar, PLB takeback reconciliation, 340B opportunity detection, observation hours accuracy checks, modifier audits, and contract variance analysis, among others. We are developing additional report modules with other rural and critical access hospitals, and wish to continue doing so with Alaskan facilities, to address reimbursement patterns unique to their settings. Our goal is to onboard at least 5 to 10 Alaska hospitals in Year 1, expanding each subsequent year.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Coastal Villages Region Fund	Weather Data Infrastructure for Healthcare Access in Western Alaska	AK	Coastal Villages Region Fund (CVRF) serves twenty rural communities along the Bering Sea coast of Western Alaska, offering economic development programming to over 9,000 residents. Our communities are primarily accessible by air (and boat during the summer), relying on gravel airstrips as the most direct connection to hospital-based medical services. These airstrips lack reliable weather observation stations (where they exist, FAA weather stations are often out of service). Without real-time weather data, it's difficult for pilots to accurately assess conditions before departure. Without this data, it is unrealistic to utilize instrument landing procedures, which can result in pilots being restricted to visual flight rules and make them unable to land when ceilings drop. The result is a systemic gap in healthcare access: flights (including air ambulance services, at times) are routinely grounded or diverted during adverse weather, which can delay or even prevent medical evacuations that can mean the difference between life and death. This same infrastructure gap limits routine transport for patients needing specialty care, prenatal visits, or behavioral health services available only at regional hubs. Our project proposes to address this challenge by deploying community-based informational infrastructure that will increase the availability of quality weather data. Our goal is to make this data available to help facilitate better access to healthcare.	Our project will expand healthcare access our region by addressing a critical gap in aviation infrastructure: the lack of reliable, near real-time weather data. We will install high-fidelity weather stations in communities across the CVRF service area. These stations will continuously measure and report essential meteorological conditions. This data will be available to pilots, air ambulance dispatchers, and healthcare coordinators, enabling significantly more informed decisions about flight safety and feasibility. Coastal conditions along the Bering Sea can vary dramatically over short distances due to terrain, proximity to water, and localized fog and wind patterns. With reliable weather reporting in place, pilots will be equipped to make better go/no-go decisions before departure, reducing both unnecessary cancellations during flyable conditions and risky attempts during genuinely unsafe weather. Air ambulance dispatchers will have the information needed to route aircraft efficiently and plan realistic transport timelines. CVRF will serve as the lead applicant and primary implementing organization. We anticipate contracting with aviation weather specialists and meteorological equipment providers experienced in Arctic and coastal deployments.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area	Deferred or Not Advanced
College Gate Elementary	College Gate School Garden	AK	This project directly addresses food insecurity for the students of College Gate Elementary. The school garden will supply fresh produce to families with students at this Title 1 school, provide educational opportunities and empower children with the knowledge of how to grow food.	College Gate Elementary is a neighborhood school that also houses a Yup'ik immersion language school. Yup'ik is one of 20 distinct indigenous languages of Alaska. There is ripe opportunity to bring Alaska Native elders to the school garden to work alongside the children, sharing knowledge and stories. We plan to do things like plant sour dock and teach our Yup'ik language students about a tradition from the village of Chevak in which children play a game of chewing on the leaf while trying to not make a face at the sour taste.	Under \$50,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Comagine Health	Alaska Value Based Care Specialty Learning Collaborative to Improve Access, Outcomes, Cost	WA	Alaska faces ongoing challenges in engagement and ability to effectively implement Value Based Payment. This is due to multifaceted issues, including high costs of providing care, geography, lack of adequate access made worse through workforce shortages and turnover, difficulty providing consistent access to specialty and behavioral health care, and low patient volumes in rural locations. The Alaska Value Based Care (VBC) Specialty Learning Collaborative is a proposed learning, communication, and engagement model for organizational leaders, primary and specialty clinicians, and diverse health-related professionals, Tribal health partners, and other sectors to improve the delivery and coordination of care for Alaskans needing specialty care, and to facilitate readiness and success of Value Based Pay and Care implementation across the state. The overarching strategy is to launch a collective impact initiative that organizes and incentivizes healthcare organizations to collaborate rather than compete in addressing specialty care and coordination needs of Alaskans. This statewide effort will be operationalized through a phased, multi-year roadmap that integrates four mutually reinforcing domains: Clinical Care Delivery, Workforce Expansion, Technology Adoption, and Payment Innovation. This holistic approach ensures that improvements in one area support and accelerate progress in others and will provide a foundation for VBP spread, including participation in federal models.	The Alaska VBC Learning Collaborative would be structured to facilitate multidisciplinary and cross-sector voices and perspectives and borrow from successful learning models and approaches that have been used in Alaska and elsewhere, such as the ECHO Model; All Teach, All Learn; and other didactic and case-based learning methods. It would include topics that are specific to certain audiences or groups within complex care, and topics that cross sectors and roles. It would integrate technological solutioning and implementation guidance in alignment with VBC contracts and participation in federal VBP initiatives. The first phase of designing and developing the learning collaborative will include assessing needs of state partners, multidisciplinary provider groups, caregivers and people with lived experience, and other key stakeholders to inform the overall content and structure of the collaborative and to enable more effective recruitment for participation. This phase may include a brief survey of community partners, key informant interviews, and other avenues for collecting diverse voices and perspectives. A planning group or steering committee would be selected at this phase to guide planning elements. A second phase would be recruiting organizations and individuals to participate in the collaborative and to work with identified partners to prepare learning materials and content. Goals of the VBC Learning Collaborative include: - Coordinating and harmonizing multidisciplinary voices and perspectives to design, create, and implement a statewide, cross-sector approach to supporting Alaskans in need of specialty care and coordination. - Supporting cross-sector providers to operate within, and at the top of, their scope of practice to coordinate care efficiently and effectively. - Improving understanding of resources and effective strategies across state- and community-level perspectives to improve care for Alaskans with complex care needs. - Promoting evidence-based, VBP-aligned interventions through the expanded use of telehealth and other emerging technologies. This includes deploying Remote Patient Monitoring (RPM) for high-risk patients. - Establishing virtual specialty networks to improve access to key specialists such as cardiology, endocrinology, nephrology, and behavioral health clinicians which all provide unique access challenges and virtual care opportunities and also provide opportunities to pilot VBP strategies in focused, high-impact ways.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Comagine Health	Building Alaska's Maternal Health Data Infrastructure for Rural Hospitals	WA	Rural hospitals in Alaska face significant challenges maintaining maternal quality improvement infrastructure due to limited staffing, low birth volumes, and constrained analytic capacity. These barriers make it difficult for small facilities to efficiently collect, analyze, and use maternal health data to guide clinical improvement and participate fully in statewide quality initiatives. At the same time, Alaska has identified improving maternal and infant outcomes, particularly in rural communities, as a critical priority. This project proposes the creation of an Alaska Maternal Data Center (AMDC), a proven and shovel-ready solution designed to strengthen rural hospitals' ability to participate in statewide maternal quality improvement efforts. The AMDC will build on the Maternal Data Center platform developed by the California Maternal Quality Care Collaborative (CMQCC), which is already successfully operating in multiple states, including Oregon where Comagine Health oversees statewide implementation and supports participation from small and rural hospitals. Through partnerships with the Alaska Perinatal Quality Collaborative and the Alaska Hospital & Healthcare Association, this project will deploy an automated data platform that reduces reporting burden while generating timely, actionable insights to support maternal safety initiatives and improve maternal and neonatal outcomes across Alaska.	Comagine proposes to support Alaska's rural hospitals improving maternal and neonatal outcomes by creating the Alaska Maternal Data Center (AMDC) - a proven, shovel-ready solution designed to strengthen participation in statewide maternal quality improvement (QI) efforts. The AMDC will leverage the Maternal Data Center platform developed by the CMQCC. This secure, web-based platform is in use in California, Oregon, and Washington to provide hospitals timely, standardized maternal and newborn quality data. By automating data collection and reporting processes, the platform reduces administrative burden while enabling hospitals to participate more effectively in statewide maternal safety and quality initiatives. Comagine is an active CMQCC partner and oversees and operates the Oregon Maternal Data Center (OMDC). We manage statewide hospital recruitment, onboarding, and engagement, including participation from small and rural hospitals. We work closely with the Oregon Perinatal Collaborative to use OMDC data to support maternal safety initiatives, identify disparities in maternal outcomes, and guide hospital-based QI. Our work has resulted in reduced maternal morbidity and mortality from underlying drivers such as severe hypertension and obstetric hemorrhage. This experience provides a tested operational model that can be readily adapted for Alaska. In partnership with the Alaska Perinatal Quality Collaborative and the Alaska Hospital & Healthcare Association, Comagine will recruit hospitals, implement the AMDC platform, and provide hands-on onboarding, training, and ongoing analytic support. Participating hospitals will receive performance reports and practical guidance to help teams interpret data, identify opportunities for improvement, and implement evidence-based maternal safety practices. The project will prioritize rural and critical access hospitals that have limited internal analytic resources but play a critical role in providing maternity care in remote communities. By strengthening access to timely, actionable maternal health data and providing tailored technical assistance, the AMDC will help hospitals reduce reporting burden, strengthen participation in statewide initiatives, and support safe, high-quality maternity care close to home for Alaska families. Comagine will facilitate peer learning and collaboration among participating hospitals, accelerating shared improvement and spreading best practices across Alaska's maternal health system.	\$250K-\$1M	Statewide	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Comagine Health	Chronic Disease and Behavioral Health Management Learning Platform and Collaborative	WA	Alaska’s rural healthcare system faces ongoing challenges related to workforce knowledge, skill application, resource availability, and inconsistent outcomes of care. While several established training and education programs exist, and some organizations have quality improvement infrastructure or staff, these efforts often operate in silos and are difficult to sustain. This results in duplicated costs, variable effectiveness, inadequate health team support, and uneven patient experiences and outcomes across care settings. A unified, coordinated, sustainable Alaska-specific collaborative learning structure and training platform structure focused on culturally and age-appropriate care is needed to better support providers and ensure consistent, high-quality care for key chronic disease prevention and management, including behavioral health issues such as depression and substance use. There is also a need for structure in determining effective interventions including technology. This opportunity encourages engagement of key community partners related to workforce development/upskilling/quality improvement work and expand multi-modal workforce effectiveness and impact. Our approach aims to improve care quality, outcomes, and costs around high impact issues, by streamlining resources, reducing duplication, and enabling a consistent, culturally responsive, technology-enabled, improved standard of care that results in better health outcomes across Alaska’s rural health system.	Through convening a broad cross-section of Alaska stakeholders and other partners, and by leveraging existing partners, including a qualified training platform provider, Comagine would work with existing and new Alaska partners to establish: • Collaborative group learning structure for organizations to ensure effective and sustainable improvement around chronic disease prevention and management, including behavioral health care. • Evidence-based learning strategies that will enable participants to overcome common barriers collectively as well as leveraging and spreading best practices. • Learning topics that reflect needs identified by stakeholders, include emerging technology-related issues (such as effective integration of RPM and patient wearables), as well as specifically targeting the cardiovascular “risk triad”—hypertension, diabetes, and chronic kidney disease (CKD)—and integrating support for co-occurring behavioral health conditions like depression and substance use disorder. • Functional assessments and individualized organizational facilitation to support: - o Workflow redesign - o Structured quality improvement coaching – including helping each organizational participant to develop a defined improvement plan with measurable objectives, timelines, performance indicators. - o Data review and performance tracking • Centralized training and resource repository focused on chronic disease prevention and management, complex care management, and behavioral health management topics. • Curated culturally and age-appropriate learning to support health workers across multiple rural care settings, reflecting the uniqueness of providing healthcare in rural Alaska settings. The first phase of designing and developing the learning collaborative and platform will include assessing needs of state partners, multidisciplinary provider groups, caregivers and people with lived experience, and other key stakeholders to inform the overall content and structure of the collaborative and learning platform beyond the issues identified above. This phase may include a brief survey of community partners, key informant interviews, and other avenues for collecting diverse voices and perspectives. A planning group or steering committee would be selected at this phase to guide planning elements. A second phase would be recruiting organizations and individuals to participate in the collaborative and to work with identified partners to prepare learning materials and content.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Comagine Health	Telemedicine Facilitated by Community/Behavioral Health Aides, Peer Support Specialists, and Doulas	WA	Telemedicine can increase health care access in areas with geographic, workforce, and other barriers to care. Many underserved populations, however, experience technical challenges (such as lack of digital technology or broadband strength) or lack experience with this modality. Facilitated telemedicine is an approach successfully used to address these challenges. In this approach, healthcare associates who do outreach directly to underserved populations, such as community health aides, behavioral health aides, peer support specialists, and doulas facilitate in-person connectivity between patients and off-site clinicians. The approach can be particularly helpful with regions experiencing specialty care gaps and populations that experience barriers to traditional in-office care. For example, our team provides implementation support to a project that utilizes peer recovery support specialists to facilitate telemedicine for hepatitis C and other infectious diseases in Oregon, reaching people who use drugs or are in early recovery in rural and remote areas as well as urban underserved populations disconnected from care. The proposed concept provides the opportunity to connect Alaska’s existing networks of community-based health workers with large Alaska-based telemedicine clinicians to increase access to care.	In the Concept Formation phase, we will engage partners and gather information to identify key gaps, needs, and resources relevant to facilitated telemedicine implementation. The aim is to ensure the implementation approach is tailored to the specific needs of communities and populations in Alaska and plan a staged implementation rollout. We will interview relevant organizational representatives to collect formative information about care gaps and local staffing resources, rooted in geographic, demographic, and community characteristics. Interviews will inform development of a draft implementation plan, including recommended priorities (e.g., specialty/health concerns, community worker types, geographic areas). We will provide the draft to interest holders for feedback and host group sessions to revise the draft using a community-engaged participatory approach. The proposed facilitated telemedicine project could require clinical workflow modifications, training and technical assistance for clinicians and community health workers (CHWs), and potential technology upgrades. CHWs engage people through outreach or home visits and mediate trusting relationships with remote clinicians (often specialty providers). Community health workers facilitate telemedicine appointments by coordinating with clinicians, helping patients prepare questions and understand what to expect, and bringing technology or technology assistance to patients. Other responsibilities include supporting patients in medication adherence, communicating with clinicians about side effects, and addressing resource barriers. Clinical/systems workflow changes are often necessary, such as listing the community health worker as a delegate to facilitate information exchange and telemedicine visit linkage. Remote clinicians and local community health workers form trusting relationships as part of a care team; for example, local doulas work closely with OB/GYN telemedicine clinicians, and local peer support specialists work closely with telemedicine infectious disease and addiction medicine clinicians. When the project is ready to launch, we will use the EPIS (Exploration, Preparation, Implementation, Sustainment) Framework to guide implementation, as we have in a facilitated telemedicine initiative with partners in Oregon. The proposed project once launched will include focused planning with participating organizations, tailored guidance materials, training, and ongoing technical assistance.	Under \$50,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

CommuniCare Technology, dba Pulsara	Pulsara TOTAL CARE	MT	Pulsara is a secure, HIPAA-compliant communication and logistics platform designed to unite the entire care team—including Emergency Medical Services (EMS), hospital staff, Tribal Health Organizations (THOs), and specialty providers—onto a single, real-time patient channel. By replacing fragmented communication methods like radio reports and multiple phone calls with a simplified digital workflow, Pulsara significantly reduces treatment times for time-sensitive conditions. Key Focus Areas aligned with Alaska's RHT submission: Maternal & Child Health: Connects remote village clinics with urban Maternal-Fetal Medicine (MFM) specialists via live video for imaging reviews and consultations. Acute Care Access: Speeds up stroke and STEMI response by linking pre-hospital teams directly to neurologists and cardiologists. Behavioral Health: Facilitates secure video consultations between field providers and specialized centers for immediate crisis intervention or MAT support. Community Paramedicine: Links paramedics with medical control to reduce high-cost, unnecessary transports from isolated areas accessible only by air or water. Innovation in Frontier Medicine: Utilizes Virtual Consult Centers and secure image sharing to provide immediate specialist expertise in remote settings.	Our proposed approach transforms the patient journey from a series of fragmented "one-to-one" handoffs into a unified, many-to-many communication ecosystem. Instead of information being locked in silos—like radios, faxes, or isolated phone calls—we place the patient at the center of a dynamic digital channel. The Three-Step Workflow: Create, Build, Communicate The solution is operationalized through a scalable workflow that adapts to any scenario, from routine transports to mass casualty events: Create: The Patient Channel A clinician (EMS, rural nurse, or GP) initiates a dedicated, time-stamped channel for a specific patient. This replaces the traditional "radio report" that often only reaches a single dispatcher. Build: The Dynamic Team As the case evolves, the necessary specialists are added with a single tap. This includes internal teams (Radiology, Cath Lab) and external partners (Flight crews, urban specialists). This creates a "virtual hallway" where every stakeholder sees the same data simultaneously. Communicate: Real-Time Multimedia Exchange The team uses the channel to share mission-critical data that traditional tools cannot handle: Live Video: For immediate "eyes-on" specialist consultations. Instant Messaging: For rapid coordination and ETA updates. High-Res Imagery: For secure sharing of ECGs, wound photos, or medication lists. Shift from "Push" to "Pull" Coordination In traditional rural healthcare, a facility must "push" a patient through the system by making dozens of phone calls to find an available bed. Our approach enables a "Pull" Model: Regional centers post patient status and needs on the platform. Specialty hubs view this data in real-time and "pull" the patient to them, using telehealth to confirm care capabilities before the transfer even begins. Infrastructure-Light Deployment Because this is a SaaS (Software as a Service) approach, it requires no proprietary hardware. It turns existing smartphones and tablets into powerful medical hubs, ensuring that a frontier clinic has the same communication capabilities as a Tier 1 Trauma Center.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Community Based Coordination Solutions	Alaska Community Crisis Follow Up Navigation	WA	Crisis events such as high ED utilization, hospital admissions, EMS calls and incarceration, are often a result of unmet healthcare and psycho-social needs. By being available to individuals and service providers immediately after these crisis events, our staff will help individuals navigate through these gaps to decrease recycling through these crisis events. Year 1 focuses resources where volume and impact are greatest (Anchorage & Fairbanks North Star Borough) using boots on the ground field navigation teams that: • Engage crisis individuals in the field and at the ED bedside • Provide appropriate post crisis follow up after referral • Address SDOH barriers (transportation, benefits, housing coordination) • Link and accompany individuals to primary care and BH/SUD care • Maintain 24/7 on call availability for enrolled members and partner providers Years 2-5 we would expand to additional areas of the state with the same approach.	CBCS will staff and provide direct field navigation. We will use a team-based approach with multiple navigators and one program manager and can adjust the size of the navigation team based on the volume of referrals. We would engage individuals for one month after referral from each crisis event. We would be available 24/7 to the individual and community resources. We are going to identify and fill the gap by navigating enrollees between the crisis event and their ultimate needs after the crisis. Field navigators will meet people where they are, as referred by the crisis responder, (home, ED, shelters, street outreach, encampments) identify the gaps in care (ex-transportation, social needs, housing etc.) and help them navigate to needed resources such as primary care, behavioral health providers, available housing resources, substance use resources and more. After one month we will provide warm hand-off to needed resources as identified. CBCS will hire locally and with a cultural and lived experience focus. Possible enrollment criteria for the program include but are not limited to the following: • 4+ ED visits in the past 12 months • Recent BH/SUD crises • Repeat 911 utilization • Homelessness/unstable housing • Target cases as identified by EMS providers • Target referrals as identified by local Jail staff	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough	Deferred or Not Advanced

Community Based Coordination Solutions	Alaska Community Navigation for Unserved Populations	WA	Frequent emergency department (ED) use in rural Alaska reflects untreated behavioral health conditions, unmanaged chronic disease, and social determinant barriers that make routine care difficult to access—especially for populations who currently lack structured follow up after a crisis event. CBCS’s proven national field navigation model directly addresses these gaps by meeting individuals where they are, resolving immediate medical, behavioral, and social needs, and stabilizing them before they return to crisis-level utilization. This program is going to target cohorts often underserved such as children experiencing behavioral health crises, individuals released from jail, postpartum mothers at heightened clinical risk, and psychiatric hospital discharges who routinely fall through care transitions. Across multi state implementations, CBCS’s trauma informed, boots on the ground navigation model has achieved approximately 60% reductions in ED visits, targeted 50% reductions in hospital admissions, and \$40,000 in annual cost avoidance per enrollee, with several programs demonstrating 2:1 ROI and 80% reduction in psychiatric readmissions. These outcomes highlight a strong opportunity to bring CBCS’s standalone model to Anchorage and Mat-Su region, scaling proven results to new populations who have historically lacked access to consistent crisis-to-care navigation.	CBCS will independently implement a high-impact field navigation model designed to reduce ED overuse by addressing medical, behavioral health, and social determinant needs among high-risk individuals. CBCS navigators will provide 24/7 community based engagement, meeting participants at the point of crisis or referral—homes, EDs, shelters, encampments, jails, or psychiatric hospitals—and offering transportation, appointment accompaniment, advocacy, housing navigation, benefits support, and rapid linkage to behavioral health and medical services. CBCS will refine referral pathways (ED alerts, EMS, corrections, hospitals, providers), create real time communication loops, and operate continuous quality improvement cycles. Navigators will address immediate stabilization needs—behavioral health linkage, detox referrals, housing and utility support, food resources, transportation—ensuring participants move toward consistent outpatient follow through. Core Methods 1. Identify & Engage: Real time ED/EMS alerts plus community, jail, hospital, and crisis referrals. 2. Enroll & Assess: Individualized plans integrating medical, behavioral health, and SDOH needs. 3. Coordinate & Accompany: Intensive appointment support, advocacy, and consistent follow up. 4. Stabilize: Rapid resolution of transportation, housing, benefits, and basic-needs barriers. 5. Track & Improve: CBCS monitoring dashboards tracking utilization, follow through, SDOH resolution, and outcomes.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Community Based Coordination Solutions	Alaska Community Navigation Workforce Development Initiative	WA	Costly crisis events across Alaska stem from: • Behavioral health challenges • Chronic disease • Siloed communication • Geographic barriers • Unaddressed social determinant needs CBCS has traditionally addressed these issues by establishing boot on the ground programs, such as with the HUMS program in the Matsu Burrough. We recognize that some communities already have established staff that would like training in our proven Navigation model. Through this proposal, CBCS will train Alaska’s existing workforce to scale and sustain successful outcomes using CBCS’s model, proven across multiple regions nationwide, but designed to be particularly effective in rural communities in which traditional training opportunities may be limited.	CBCS will not provide field navigation. Instead, CBCS will build and support Alaska’s workforce, including tribal, rural, justice-involved, and urban teams. CBCS supplies the infrastructure, training, and performance model; Alaskan organizations supply the boots on the ground workforce. CBCS Responsibilities: • Initial & ongoing training that includes trauma informed engagement, SDOH navigation, crisis follow up, care planning, motivational interviewing, field safety. • Coaching & supervision support, including weekly case review, fidelity monitoring, and continuous quality improvement. • Operational toolkits, workflows & templates • Coaching on CBCS' 24/7 availability model • Monthly reporting tied to measurable outcomes like ED reduction, outpatient linkage, SDOH resolution. • Workforce recruitment support, emphasizing local hiring and lived experience Alaska Staff Will Learn: • Direct field engagement • Appointment support • Transportation coordination • Assisting enrollees with access to available benefits • Crisis follow up • Relationship based navigation We would seek DOH’s assistance in identifying partners with existing staff that would benefit from this training. We can adapt our capacity to meet a variety of needs, but a recommended approach would be to target one large community and/or partner in year 1, along with 1-2 remote communities and/or partners, to allow for proof of concept. Subsequent years would focus on targeted expansion over the rest of the state.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Community Connections	Building a behavioral health workforce pipeline: Internship, supervision, and Housing supports	AK	Community Connections’ accredited Children’s Mental Health program historically served ~130 youth at a time; today, workforce shortages limit us to ~80 with long waiting times. The binding constraint is the supply and retention of master’s level behavioral health therapists (and some SLP/OT roles). Caseloads have stretched to ~17 per clinician under a wraparound model with high Medicaid documentation demands. Despite competitive pay, licensing supports, supervision, and robust recruitment efforts (bonuses, relocation, search firms), relocation to island communities remains a barrier—chiefly due to scarce, expensive, and often low quality housing. Opportunity: Build a durable, local pipeline that keeps care close to home by (1) launching a structured internship to employment pathway with tele supervision for Master’s clinicians; (2) creating stackable “grow your own” credentials (Direct Support Roles → UA occupational endorsements → BSW/BA Psych → Case Managers → MSW/MS Psychology) with tuition supports and limited paid study time; and (3) offering time limited housing supports that remove an immediate barrier to recruitment and early retention. This right sized, rural strategy restores capacity, stabilizes access for families in Ketchikan and on Prince of Wales Island, and creates long term resilience in our local workforce.	1) Internship to Employment (Master’s level): • Routine graduate placements (e.g., UAA MSW; UAA Psychology) with tele supervision by licensed LCSW/LPC; weekly individual + group supervision; competency rubrics; hour tracking; documented evaluation. • Conversion ladder: Internship → provisional hire → supervised hours toward licensure; structured mentorship in Ketchikan and POW communities. 2) Stackable “Grow Your Own” Pathway: • Entry via Direct Support Professional roles; enroll staff in NADSP e Badge. • Transition to Occupational Endorsements (OE) in Behavioral Health/IDD (UAS/UAA/UAF), then BSW/BA Psychology, then MSW/MS Psychology (in state). This aligns with AK workforce infrastructure and provides multiple on-ramps. Tele-supervision will also be provided concurrently to clinicians and other direct care roles, including case managers. • Supports: targeted scholarships/tuition, test fees, and limited paid study time aligned to performance. • Cultural grounding: Orientation and ongoing consults with Ketchikan Indian Community (KIC); CHAP/BHA alignment where appropriate. 3) Time Limited Housing Supports (recruitment/early retention): • Limited 6–12 months’ tenancy for interns/new hires at 60–70% of fair market value, tied to a 5 year service commitment (with prorated repayment for early departure). • Approach: master lease or set aside units; explore co use with RYC/KIC to maximize throughput and equity. 4) Spark Youth Engagement in Behavioral Health Roles (High schools in Ketchikan and POW): • Classroom talks/career fairs, site visits/shadow days, and a short summer BH assistant intro workshop hosted by Community Connections; dual enrollment into UA OEs for interested seniors. 5) Partnerships & Governance: • Universities: UAA, UAS, UAF (MOUs; academic liaisons). • Local/Tribal partners: Ketchikan Indian Community; Residential Youth Care (shared supervision/placements/housing coordination). • Management cadence: Bi weekly reviews; monthly steering; clear Standard Operating Procedures for supervision, documentation, and housing eligibility; KPI dashboard. 6) Timeline (first 18months): • Q1–Q2: finalize MOUs/manuals; Operating Procedures; enroll first DSP/NADSP cohort; stand up tele supervision; secure initial housing units. • Q3–Q4: host 4–6 graduate interns; 6–10 staff in OEs; begin tenancy; provisional hires. • 18 Months: maintain 4–6 interns; expand OEs/BSW/BA cohorts; 2–3 admissions to MSW/MS Psych; reach ≥70% intern→hire conversion.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Advance to Implementation Application

Community Connections	EHR Optimization and acquisition/implementation of scheduling software	AK	Community Connections’ ability to deliver timely BH services in the remote island communities of Ketchikan and Prince of Wales Island is limited by two technology gaps. First, our EHR (CareLogic) was selected because RHTP emphasizes interoperable, configurable systems that support reporting, coordinated care, billing accuracy, and value based participation. Yet without specialized configuration, we cannot access utilization reporting, progress toward goals data, or automated billing exports—functions explicitly prioritized in RHTP’s Spark Technology & Innovation initiative. As a small rural provider, our limited internal IT capacity means these features remain unused, forcing reliance on spreadsheets and manual work that increases administrative burden and reduces access—barriers the RHTP State Application highlights as major challenges for rural Alaska. Second, our Children’s Mental Health program requires fast, reliable, multidisciplinary scheduling across homes, schools, foster homes, and community settings. RHTP acknowledges that providers must adopt technology that improves communication, reduces delays, and supports coordinated care near home. Our current paper scheduling system cannot support this, resulting in missed appointments, inefficient staffing, and delayed care. Together, these technology gaps reduce access, quality, and operational efficiency in communities already experiencing significant behavioral health workforce and service shortages.	Our two part project directly reflects RHTP’s emphasis on strengthening rural health systems through modern technology, technical assistance, workflow redesign, and improved data infrastructure. 1) CareLogic EHR Optimization (Consultant Led) • Hire a CareLogic experienced consultant—an approach explicitly permitted as “technical assistance” and “project planning/data/reporting” support across RHTP initiatives. • Conduct discovery, data mapping, and define minimum viable reporting aligned with RHTP’s call for interoperable systems and actionable analytics. • Build automated EHR→billing exports and reconciliation logs, consistent with RHTP’s value based payment readiness and fiscal sustainability goals. • Create dashboards for utilization, authorizations, caseloads, and engagement—matching RHTP guidance to improve access, reduce burden, and enable data driven care. • Add outcome/goal tracking features that align with RHTP’s targeted outcome and quality improvement expectations. • Train staff with SOPs and quick reference tools, advancing RHTP’s workforce support objectives. 2) Scheduling/Coordination Software for CMH Program • Identify simple, mobile friendly scheduling tools that improve real time communication, consistent with RHTP’s Spark Technology initiative prioritizing digital tools that enhance access and coordination. • Pilot 2–3 options with field based staff; select the most reliable across rural settings. • Configure core features: team calendars, automated text alerts, cancellation notices, crisis slot flags, and appointment reminders—aligned with RHTP’s aims to reduce care delays and strengthen community based service delivery. • Provide short, hands on training; deploy super users to support transition. • Monitor early adoption to ensure usability and sustained impact. Together, these two components reduce administrative burden, improve care coordination, and enable rural Alaska families to receive services closer to home—core priorities of the RHTP Vision and State Plan.	Under \$50,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Advance to Implementation Application

Community Connections	Prevention and Telehealth HUB for Children	AK	In our rural island region, the most significant gaps for young children occur before they enter kindergarten. Many 3–5 year olds show social emotional and behavioral challenges yet do not meet the criteria for special education preschool or our Medicaid funded behavioral health program. As childcare disruptions rise, families lose stability and children miss the chance to benefit from early, structured support. At the same time, after school hours remain the most vulnerable time of day for school age children, with many families lacking safe, enriching options. Across all ages, children frequently wait for months or years for evaluations or specialty therapies due to shortages of local clinicians and dependence on off island travel. This results in avoidable escalation—issues that could be addressed with early intervention are instead left to grow until they trigger larger crises. The opportunity is to create a single, prevention first entry point for young children: expanding the Little Sprouts therapeutic group, launching KAP Littles for after school support, and establishing a telehealth hub that brings specialists directly into our community through a shared space model. By blending early childhood enrichment with timely access to behavioral health and developmental specialists, families get help sooner, and children receive the consistent support they need for healthy development.	1) Expand and Enhance Little Sprouts (3–5 years) • Lease a dedicated child friendly space to run daily therapeutic groups. • Open enrollment to the broader community, including children who struggle socially or emotionally but are not eligible for behavioral health services. • Add a peer buddy model, offering pro bono participation for typically developing children who can serve as trained peers and support group dynamics. • Embed parent coaching, warm handoffs, and coordinated transitions to preschool or other services. 2) Launch KAP Littles (ages 5–13) • Design and pilot a structured after school program focused on social emotional learning, physical activity, enrichment clubs, community building, and homework support. • Offer a safe, engaging alternative during the hours when many youth lack supervision or structured activities. • Integrate children with diverse needs—BH eligible youth, children with disabilities, and those needing additional support but not meeting eligibility criteria. 3) Establish a Rural Telehealth Hub • Create two multi use telehealth rooms equipped for behavioral health, OT, PT, SLP, ABA, and social work services. • Use trained paraprofessionals to facilitate remote sessions, reinforce therapeutic recommendations, and support follow through. • Reduce the need for inter island travel and compress wait times for evaluations and therapy. • During start up, use time limited locum tenens clinicians to provide rapid access while permanent hires are recruited and credentialed. 4) Systems Integration and Value Readiness • Develop coordinated workflows linking Little Sprouts, KAP Littles, Early Learning, and Children’s Mental Health. • Build referral pathways, scheduling processes, and analytics needed for future value based pilots. • Provide training for paraprofessionals, supervisors, and partners (schools, Tribal organizations, university programs). This approach immediately increases capacity for early prevention while building the infrastructure for sustainable, long term access.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Advance to Implementation Application

Community Connections	Increase Healthcare access through Advocacy and Navigation	AK	Community Connections serves individuals from birth through adulthood across three major service systems—Early Intervention, IDD, and Children’s Mental Health—each with its own eligibility, timelines, and documentation requirements. Families often struggle to navigate these complex pathways, especially during key transitions: toddlers losing Early Intervention eligibility at age 3, youth shifting between BH and school services, and adults entering or leaving IDD programs. Too many families give up before completing eligibility steps, leading to long delays or crisis driven re engagement. RHTP emphasizes that Alaska’s rural communities need prevention-focused, early-connection strategies, streamlined access, and supports that help families enter systems before needs escalate. Our current processes are fragmented—each program manages its own referrals, denials, and handoffs. We lack structured ways to follow discharged clients or track whether they successfully connected to alternative services. Missed follow-through translates into preventable crises, unmet service needs, or loss of developmental progress. The opportunity is to establish a Family Advocate & Navigator (FAN) who ensures earlier identification of needs, consistent follow-through, and warm handoffs across programs and partner agencies. This position will bridge program silos, reduce preventable crises, and help families access the right service at the right time.	1) Prevention-Focused Intake & Early Connection • Create a single, proactive entry point for families; provide early screening, simplify eligibility steps, and reduce delays. • Track all denied or deferred referrals; ensure successful connections to internal or external services (schools, tribal health, EI, BH, IDD). • Use early relationship-building and routine follow ups to keep families engaged. 2) Navigation Across Developmental Stages • Support critical transitions: – Age 3 Early Intervention exits → preschool/BH supports – Youth moving between BH levels of care – Adults entering or exiting IDD services • Provide persistent, trauma informed navigation through complex eligibility pathways. 3) Coordinated Care Planning • Facilitate cross program huddles when individuals receive services in more than one program. • Align treatment/goal plans to avoid duplication or conflicting protocols. • Strengthen communication among providers, schools, OCS, foster families, and tribal partners. 4) Data Tracking & Learning • Build simple intake and discharge tracking tools—core RHTP expectations for data-enabled improvement. • Track time to service, dispositions, lost-to-follow-up cases, and preventive connections. 5) Rural Emphasis • Use phone/text/tele-navigation to reach families in remote villages and foster placements on Prince of Wales Island. • Provide warm handoffs that do not require families to navigate systems alone. RHTP Fit: • Mirrors Initiative #3: early intervention, prevention, family support, locally tailored community health work. • Advances Initiative #2: coordinated access, navigation for IDD/BH, improved rural care pathways. • Follows Evaluation Framework guidance: clear need, measurable outcomes, rural impact, sustainability.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Deferred or Not Advanced

Community Connections	Increased Access: Pediatric Speech Therapy Expansion in Southern Southeast Alaska	AK	Today, families across Ketchikan, Metlakatla, and Prince of Wales Island have almost no access to pediatric speech language pathology. The only option is two itinerant SLPs who fly in for a few days each quarter, serving only 0–3 year olds due to grant restrictions, and unable to successfully bill many insurers. Children over 3, including those with speech delays, hearing loss, autism, developmental disabilities, or academic language needs, currently have no local provider. The result is long delays, missed early windows for intervention, and widening gaps in communication skills that affect social, emotional, and academic functioning. The lack of local SLP capacity also increases costs. The travel model is expensive, inconsistent, and not reimbursable at scale. It is fully grant dependent and the travel does not allow billing to private insurance or Medicaid. Families in rural villages and remote communities are disproportionately affected because they rely on limited transportation and cannot benefit from brief itinerant visits. The opportunity is clear: recruit and hire a full time pediatric SLP to serve ages 0–18 across the region. A permanent clinician removes the 3 year old cutoff, expands access to underserved school aged youth, creates continuity, and establishes a stable reimbursement base that supports long term sustainability.	1) Recruitment and Hiring of a Full Time Speech Language Pathologist • Conduct a national search focused on rural experienced pediatric SLPs. • Offer relocation assistance, supervision support, and rural practice incentives to attract qualified candidates. • Onboard the SLP into Community Connections’ interdisciplinary team, serving Ketchikan, Metlakatla, and communities across Prince of Wales Island. 2) Immediate Expansion of Access • Begin providing evaluation and therapy for ages 0–18. • Remove the 3-year-old eligibility cliff by opening services to school aged youth who currently have no local options. • Offer speech language care in homes and clinic settings, and via telehealth where appropriate. 3) Integrated Care Across Programs • Work directly with Early Learning, IDD, behavioral health, and school partners to coordinate care, share developmental insights, and ensure consistent support. • Provide ongoing parent coaching and home-based strategies to reinforce gains. 4) Financial Sustainability and Billing Expansion • Credential the SLP with major insurers, or Medicaid. • Implement billing workflows that allow reimbursement for all eligible services, including for youth ages 3–18. • Use standardized and/or criterion reference documentation and CPT codes to ensure consistent, compliant billing. 5) Optional Regional Partnership Capacity • If caseload allows, the SLP may contract with Sitka’s Infant Learning Program (including Hoonah and Kake) to provide supplemental services, further strengthening regional sustainability and workforce efficiency. This approach replaces an unstable, costly, grant dependent model with a comprehensive, sustainable, year-round speech language service that meets the needs of rural children and families.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Deferred or Not Advanced

Community Connections	Southeast Alaska Early Intervention Expansion & Outcomes Project	AK	Under current Part C rules, a child must show a 50% developmental delay to receive Early Learning services. Many children with meaningful, emerging delays—especially in language and social emotional development—fall below this threshold and receive no support until struggles become severe. In rural Southeast Alaska, this often leads to preventable special education placements, higher family stress, and missed opportunities for early skill building. This problem reflects several statewide gaps that RHTP explicitly aims to fix: fragmentation in early identification, lack of coordinated developmental monitoring, long delays in accessing supportive services, and insufficient preventive strategies in rural communities. Children involved with OCS, children with mild to moderate speech and/or motor delays, and those experiencing trauma are particularly vulnerable to falling through the cracks. The opportunity is to build a regional prevention and early intervention demonstration—alongside Sitka’s Center for Community and Juneau’s REACH—that evaluates outcomes for children with 25–49% delays who currently receive little or no support. This aligns directly with RHTP priorities to enhance preventive care, improve early childhood development, strengthen navigation, and reduce long term system costs.	1) A Prevention First Regional Early Learning Demonstration (Primary: Healthy Communities) • Serve children with 25–49% delays who currently fall below eligibility but are at elevated developmental risk. • Use state accepted assessments, quarterly monitoring, parent coaching, and warm handoffs to create a continuous early connection pathway. • Expand developmental monitoring and support for children involved with OCS and those living in remote communities. 2) Strengthen Regional Partnerships (Community Connections, REACH–Juneau, Center for Community–Sitka) • Establish MOUs in the first 3–6 months outlining shared goals, data responsibilities, referral pathways, confidentiality protections, and coordination expectations. • Develop uniform protocols across all three organizations for standardized assessments, quarterly progress monitoring, documentation, and follow through into kindergarten. • Conduct a joint regional training series for Early Learning staff and supervisors to ensure fidelity in assessment, parent coaching, data collection, and developmental tracking. • Create a shared “minimum dataset” for tracking outcomes across sites and aligning learning cycles. 3) Longitudinal Tracking Into Early Elementary School (Secondary: Health Care Access) • Build a unified multi year dataset following children from enrollment through K–1 to examine reductions in special education referrals and gains in school readiness. • Track outcomes by delay category (25–49% vs. ≥50%) and monitor results for OCS involved children. • Strengthen coordination with school districts and pediatric partners to ensure continuity of supports. 4) Improve Access and Navigation • Streamline referrals, follow through, and transitions across Early Learning, preschool, behavioral health, disability services, and school based supports. • Use telehealth supported coaching and remote case consultation to reach families throughout Southeast Alaska. 5) Build Sustainable Billing and Funding Pathways • Expand private insurance billing through staff credentialing, appropriate CPT code utilization, and documentation aligned with insurer requirements. • Use blended funding to sustain developmental monitoring and family coaching long after the RHTP period. 6) Continuous Improvement & Regional Learning • Quarterly regional review sessions among Ketchikan, Juneau, and Sitka teams to refine assessment fidelity, share trends, and make course corrections based on data.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Community Inclsusion Services	Tech Enabled Therapeutic Homes for Complex Care in Rural Communities	AK	Across Alaska’s rural communities, individuals with complex medical, behavioral, or developmental needs who meet institutional levels of care often lack access to coordinated services close to home. Geographic isolation, limited specialty providers, workforce shortages, and infrastructure gaps leave rural systems unable to consistently deliver the intensity of care needed. As a result, preventable hospitalizations, emergency visits, and costly institutional placements far from home occur, separating people from their families, cultures, and communities. The long-standing problem of people living in rural communities with complex, nursing facility–level needs face multiple barriers: limited local providers and specialists, long travel distances, frequent facility closures, and fragmented home and community based services. As a result, they are often forced into institutional care far from home, experience preventable hospitalizations and emergency visits, and lose the social, cultural, and environmental supports that ensuring well being. Workforce shortages and underfunded rural systems mean that even motivated local providers cannot consistently deliver the intensity and coordination of care these individuals require. Addressing this gap creates an opportunity to advance institutional diversion and deliver coordinated, technology-enabled care that allows people with complex needs to remain safely in their homes while strengthening rural health system sustainability.	The project makes it possible for people who meet an institutional level of care (e.g., nursing home or hospital at home criteria) to remain safely in their own homes and communities, supported by a coordinated, technology enabled interdisciplinary care team. By integrating virtual specialty care, remote monitoring, and locally delivered in home supports, the model advances institutional diversion and enables people with complex needs to receive high-acuity services close to home. The approach seeks to reduce avoidable hospitalizations and institutional placements, improve quality of life, and strengthen the stability and sustainability of rural health and social care systems This rural healthcare transformation project will create a technology enabled, home based model that delivers institutional level, person centered care in a therapeutic home environment so that people with complex needs in rural communities can remain safely in their own homes despite limited local professional resources. The model combines telehealth platforms, remote monitoring and supervision, virtual companionship and specialty consultation, shared digital care plans, and secure messaging to enable continuous coordination among providers, caregivers, and family members. Technology also allows staff to remain available remotely 24 hours a day for supervision, consultation, and rapid response when needed. The Project builds a therapeutic home environment by integrating family involvement, cultural strengths, and community resources into each person centered plan of care. Local direct support staff provide in-home assistance while technology enables clinical oversight, interdisciplinary collaboration, and access to specialists who may not be physically present in rural communities. This coordinated model supports both client stability and workforce sustainability by extending the reach of rural providers, improving care coordination, and enabling safe, high-quality care delivery in home and community settings.	Under \$50,000	Single Community	Kodiak Island Borough	Advance to Implementati on Application

Commure	AI-Powered Clinical Intelligence for Rural Alaska: Documentation, Billing & Provider Retention	CA	The promise of technology has often failed rural healthcare. Nationally, administrative costs exceed \$1 trillion, and providers spend nearly six hours daily on non-clinical tasks. In Alaska, these challenges are magnified by geographic isolation and workforce shortages. Alaskans face high costs of care and severe clinician burnout, as providers spend significant time on documentation rather than patient care. Commure addresses this opportunity with an AI-native platform designed to remove administrative waste and optimize financial performance. We specialize in Ambient AI Scribing, which provides passive listening during encounters to automatically generate structured clinical notes with 92% accuracy. This directly mitigates clinician burnout and reduces documentation errors by 31%. Furthermore, our Financial Platform automates the revenue cycle, achieving a 97% first-pass rate and a 53% reduction in filing denials. By integrating these Agentic AI solutions into existing workflows, we ensure rural clinics capture every dollar earned while freeing clinicians to focus on care. With a proven footprint of 55+ clinicians in 14 Alaska cities, Commure is uniquely positioned to strengthen the economic and operational foundation of Alaska’s rural health system.	Commure addresses the administrative and financial fragility of Alaska’s rural healthcare through an integrated, AI-native approach that automates the most burdensome aspects of care delivery. Our solution targets three critical pillars: clinical documentation, revenue cycle stability, and patient access. (1) Eliminating Documentation Burdens with Ambient AI: To solve the crisis of clinician burnout, we deploy Ambient AI Scribing. This technology uses passive listening to transcribe patient encounters into structured clinical notes in real-time. - The Solution: Our AI engine achieves industry-leading accuracy (F1 Score >0.92), reducing documentation errors by 31%. - The Impact: This returns hours to the clinician’s day, allowing them to focus on the patient rather than a screen, directly addressing the retention challenges in frontier communities. (2) Strengthening Financial Stability via Autonomous RCM: Rural clinics often operate on thin margins and suffer from undercoding or filing denials. Commure’s Financial Platform creates an autonomous revenue cycle that bridges the gap between the clinic and the payer. - The Solution: We automate claim generation, appeal creation, and reconciliation. - The Impact: Our partners see a 53% drop in timely filing denials and a 97% first-pass claim rate. This ensures that Alaska's rural facilities capture every dollar earned to remain operationally viable. (3) Bridging Geographic Gaps with AI Navigation: To address the geographic isolation and patient coordination hurdles, we implement an AI Call Center and Intelligent Care Navigation. - The Solution: Conversational AI agents handle 70–90% of scheduling calls and guide patients through care needs assessments and eligibility checks. - The Impact: This streamlines the patient journey across vast distances, reducing no-shows by 10–15% and ensuring patients are prepared for care before they arrive at a regional hub. By embedding these agentic AI solutions directly into existing EHR workflows, such as Epic, Athena, and Oracle Health, Commure transforms routine operations into a proactive, data-driven ecosystem. This approach doesn't just add another tool; it creates "digital connective tissue" that makes rural health systems more human-centered and economically resilient.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Sitka (City and Borough)	Deferred or Not Advanced

Compass Therapy LLC	Alaska Speech, Swallow & Cognitive Access Initiative	AK	Rural, remote, and frontier Alaskan communities face significant barriers to accessing specialized neurologic speech-language pathology services. Individuals living with Parkinson’s disease, stroke, dementia and other neurologic conditions commonly experience progressive voice disorders, swallowing impairment, and cognitive-communication decline, yet many rural areas lack clinicians trained in evidence-based neurologic treatments provided by speech language pathologists. Geographic isolation, high travel costs, severe weather, limited specialty workforce capacity, and mobility limitations related to neurologic disease frequently delay care. Many individuals with these conditions have difficulty traveling long distances for appointments, contributing to delayed treatment, avoidable hospitalizations, aspiration-related complications, and reduced functional independence. Caregivers in rural communities also assume complex medical responsibilities with limited training or support. This project addresses the gap in accessible neurologic speech, swallow, and cognitive services by expanding telehealth-based treatment and caregiver training for rural Alaskans. By bringing specialized care directly into patients’ homes, the initiative reduces travel burden while improving safety, independence, and quality of life.	The Alaska Speech, Swallow & Cognitive Access Initiative will provide telehealth services in three areas: voice therapy, swallowing management, and dementia support. Voice therapy will address neurologic voice disorders, including treatment such as LSVT LOUD to improve vocal loudness and speech clarity. Swallowing services will include screening, swallow safety education, compensatory strategies, and coordination with medical providers to reduce aspiration risk. Dementia support will include caregiver training, such as evidence-based dementia communication strategies from the Positive Approach to Care® program. Services will be delivered through secure telehealth to reduce travel burden and weather-related barriers. To address technology limitations, the project will establish a telehealth equipment loan bank including tablets (e.g., iPads), adjustable tripods, and portable sound level meters to support therapy participation and voice practice. Outcome measures—including vocal intensity data, functional swallow indicators, and goal attainment—will guide quality monitoring. Three Medicare-enrolled clinicians are preparing to complete LSVT LOUD certification and the Positive Approach to Care® training. The organization plans to hire an additional 2–5 speech-language pathologists over the next year to expand neurologic rehabilitation access across rural Alaska. COOK CENTER FOR HUMAN CONNECTION	Helping Alaska’s Helpers: Healthy Beginnings for Every Community	UT	Alaska has built innovative Tribal and rural health systems, yet most mental health support for children and families still depends on scarce clinicians and crisis-driven care that many rural families cannot reliably reach due to barriers like workforce shortages, distance, weather, and roadless communities. In practice, the adults who are with children every day, including parents, caregivers, and school staff, are asked to respond to depression, anxiety, trauma, and suicidality with little preparation, few tools, and strong stigma in small villages and communities. They also rarely receive health literacy training that links mental health to everyday drivers of wellbeing, such as nutrition, physical activity, sleep, and stress management, even though these “root causes” are central to Alaska’s strategy for preventing chronic disease and suicide. This gap between formal services and everyday helpers is especially stark in roadless villages and frontier districts, where travel is costly and school-based mental health staff are limited or absent. The opportunity is to treat these adults not as an afterthought, but as a primary lever for upstream prevention. We can give every rural district and community a practical, Alaska-proven way to build family efficacy, health literacy, and educator capacity around mental health and wellness. This work aligns with RHTP’s Healthy Beginnings and Healthy Communities initiatives and is woven into existing school and Tribal efforts.	Cook Center's “Helping Helpers Help” model is grounded in credible research and backed by a federal Education, Innovation and Research (EIR) grant from the U.S. Dept. of Education, which carefully vetted the project's logic model, research rationale, and outcomes. Helping Alaska's Helpers adapts this evidence-based framework for a fully virtual, school-hub suite of supports across all 53 rural school districts. PROMOTING PREVENTION THROUGH SCHOOL-ANCHORED SUPPORTS Districts place Cook's ParentGuidance.org medallion on their websites giving every family free, confidential 24/7 access to 70+ therapist-led courses. The website’s 300+ Ask-a-Therapist film clips feature FAQs submitted by parents and answered by licensed therapists to provide immediate answers and tools related to parents’ most urgent concerns. Live, interactive Mental Health Series webinars for families and school staff build mental health literacy and parenting skills. All resources preserve parent anonymity. STRENGTHENING FAMILY AND COMMUNITY RESILIENCE WITH EVIDENCE-BASED COACHING Because local services are scarce and waitlists long, families need timely, individualized help. ParentGuidance.org provides confidential parent coaching with weekly 30-minute tele-health sessions, secure messaging, and an app-based curriculum grounded in a cognitive-behavioral framework. Coaches use skills-based strategies and proven approaches to help caregivers recognize warning signs, strengthen routines, set healthy boundaries, and respond constructively to challenges such as anxiety, depression, and conflict. Coaching provides timely, personalized support that strengthens caregiver-child relationships and bolsters family and community resilience. BUILDING HEALTHY COMMUNITIES THROUGH EDUCATOR CAPACITY Fully virtual educator professional development is selected by each district from a menu including Trauma-Sensitive Environments, QPR Suicide Prevention, and Self-Care for Teachers, equipping school adults to recognize distress, respond with confidence, and connect families to resources. Implementation follows a statewide structure with local flexibility: Cook Center and district leaders plan PD, webinar themes, and outreach aligned with Tribal and community priorities. As the trusted voice for rural school leaders, the Alaska Council of School Administrators (ACSA) builds on Cook's existing partnerships to coordinate launches across all 53 rural districts and sustain engagement through ongoing collaboration.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Cook Inlet Counseling	Cultivating Impact- Responding with Care- Linking Effective strategies	AK	Through various collaborations and community coalitions, Cook Inlet Counseling has participated in several activities and ongoing meetings that have assessed access to behavioral health services on the Kenai Peninsula. We have found that three populations have the greatest disparity in access to behavioral health services — youth, people 65+ , and justice involved women. In recent years, our community has seen a significant spike in youth mental health issues and based on the Alaska Youth Risk Assessment Survey, Kenai Peninsula students have drug/alcohol use rates that are 5-10% higher than state average. We currently do not have the capacity to address these issues, but through expanding services and increasing preventative measures we can better serve our youth. Men 65+ are another demographic on the peninsula that are high risk for mental health issues and often do not have support systems in place. In 2025, of the 2811 calls received by 988 on the Kenai Peninsula, 2262 of them were from men over 65 in the Soldotna area. Our community needs to find new strategies to engage these individuals who often socially isolate themselves. A third group that often falls in the gaps of the continuum of care is women incarcerated at Wildwood Pretrial. Most resources are directed at the male sentenced population which leaves justice involved women without access to services that would reduce recidivism, including assessments. Evaluation and collaboration is needed to bridge these gaps.	Initial concept includes targeted outreach and advertisement, focus group/information gathering, and creating a targeted action plan to engage with each group. We will identify needs and determine which services would be most beneficial for each population. We use a person-centered care approach to all services, so input from individuals and their families will guide the formation of programs and support to follow. Additional recruitment and training of staff to ensure all clinicians, support staff, and community partners are qualified to address the specific needs of each group will be completed based upon information gathered. Partnerships with Parents, adult children, medical providers, in home health providers, and others to be identified will be established to support efforts in the youth and elder populations. Advocacy and coordination with DOC, District Attorney, Public Defender, DOJ and medical/behavioral health providers will be established to improve outcomes for the pretrial population. We expect to address the behavioral health needs of youth and 65+ populations, using information collected in the initial phase, with targeted interventions, population specific programing, and building community supports through our coalitions. We will partner with the 100% Communities Alaska to increase community supports and with the 100% Behavioral Health action team and its RHTP program, if it is funded, to address many needs of justice involved individuals.	Under \$50,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Cook Inlet Tribal Council	Chanlyut Residential Behavioral Health Renovation & Integrated Care Expansion	AK	Chanlyut was built in 2011 as a men's reentry housing unit. In the years since, it has evolved into a co-ed, trauma-informed ASAM 3.1 residential behavioral health program, but the physical facility was never redesigned to match this clinical evolution. Today, participants sleep in open, dorm-style rooms with a male and female wing of up to seven individuals each, with no meaningful privacy for sleeping, changing, or rest. Group therapy spaces are undersized and inadequate for evidence-based therapeutic interventions, fundamentally inconsistent with the trauma-informed, culturally responsive care that CITC's model requires, particularly for Alaska Native individuals arriving from rural communities already navigating the stress of an unfamiliar urban environment. These physical conditions directly suppress treatment engagement and enrollment. In the most recent fiscal year, Chanlyut served only 45 unique individuals against an annual capacity of 56 at full census. When participants need basic medical care, they must leave for outside appointments, disrupting therapeutic schedules and increasing dropout risk. CITC's psychiatric nurse practitioner manages psychiatric services but lacks nursing infrastructure to address routine medical needs on-site. The opportunity is to transform Chanlyut into an integrated, high-quality, culturally responsive residential facility where Alaska Native people experience belonging, connection, and healing.	Working from 35% construction documents already developed in partnership with the Alaska Mental Health Trust and an architectural and engineering firm, CITC will renovate Chanlyut using a phased approach that keeps the program fully operational throughout construction. The renovation scope reconfigures dorm-style sleeping areas into semi-private rooms, right-sizes group therapy and meeting spaces, and upgrades medication management and staff support areas. Cultural design will be incorporated through a separate engagement with a cultural design contractor, such as SALT or a similar firm specializing in Alaska Native design. This work will be reflected entirely in furnishings, fixtures, and equipment (FF&E) and requires no changes to construction documents or structural scope. This component aligns with the RHTP Health Care Access initiative's call to strengthen Tribally led Traditional Healing within the care environment. CITC's dual-certified family and psychiatric nurse practitioner will be supported by a newly hired nurse case manager to provide on-site medical assessment and basic acute care for residential participants. This capacity, functioning like an embedded walk-in clinic, will manage minor illness, post-hospitalization monitoring, medication reconciliation, and preventive health screenings without requiring participants to leave the facility, keeping them continuously engaged in the therapeutic environment. This directly advances the RHTP Health Care Access goal of improving primary care access and creating multidisciplinary teams that integrate medical and behavioral health services. In parallel, CITC will configure its CareLogic EHR system and train staff to extend behavioral health billing to currently non-billable programs including Reentry, Family Wellness, and Victim Services, programs expanding access to behavioral health care. This billing infrastructure investment positions CITC for long-term financial independence and aligns with the RHTP Pay for Value: Fiscal Sustainability initiative's call to invest in IT infrastructure and team-based care workflows. CITC will also evaluate AI-assisted clinical documentation tools to reduce provider documentation burden, consistent with the RHTP Spark Technology and Innovation initiative's priority to empower providers' use of appropriate AI tools for care delivery.	\$1M-\$5M	Single Community	Anchorage (Municipality)	Advance to Implementation Application

Cook Inlet Tribal Council	Pre-Development Planning for Cultural Center	AK	Cook Inlet Tribal Council (CITC), headquartered in Anchorage, serves Alaska Native individuals and families whose home communities span virtually every rural, remote, and frontier region of Alaska. CITC proposes pre-development activities for the construction of a Cultural Center on CITC-owned land in Anchorage to address the need for culturally grounded spaces that promote wellness, connection, and access to services for Alaska Native people living in or traveling through Alaska’s largest urban hub. While Anchorage has athletic and cultural facilities, few spaces intentionally combine cultural programming with physical activity in an Alaska Native-centered environment, leaving many residents without a welcoming, culturally grounded gathering space. The proposed Cultural Center will address this gap by creating a space where cultural engagement, physical activity, and community connection occur together. Programs such as Native Youth Olympics, traditional dance, and intergenerational cultural activities will promote active lifestyles, strengthen identity, and support knowledge sharing among youth, families, and Elders. The Cultural Center will also serve as an entry point to CITC’s services for underserved populations, connecting them to education, workforce, and behavioral health programs. This aligns with RHTP’s Healthy Communities and Health Care Access Initiatives.	The CITC Cultural Center will serve as a vibrant, wellness-focused gathering place for Alaska Native people and the broader community. Building a Cultural Center has been a long-imagined community vision, and CITC is ready to bring it to life. The proposed Cultural Center will be an innovative facility designed to promote healthy lifestyles and strengthen cultural identity through “Culture as Prevention” programming. Unlike facilities that are associated with illness or crisis, the Center will represent a positive, community-centered space focused on wellness, connection, and cultural pride. CITC currently serves more than 12,000 people annually, including more than 1,200 youth who participate in the Native Youth Olympics (NYO) Games program each year, and all participants will benefit from the opportunities the Center provides. The facility will include: • A multi-purpose gymnasium designed to host traditional games that promote physical fitness in Arctic environments, youth recreation, traditional dance practices and performances, family activities, and community events such as craft fairs or film showings. • A commercial kitchen and cafeteria will allow for demonstrations and hands-on learning opportunities for fish and wild game processing, cooking classes, preparation of food for gatherings, and meal kit distribution. • An exercise room will provide training space for traditional games and physical preparation for subsistence activities. • Shower and laundry facilities will promote hygiene and self-care, with exploration of a sauna to support traditional wellness practices. • Dedicated craft rooms will enable instruction and collaborative work in sewing, basketmaking, drum making, and other traditional arts. • Classroom spaces will support CPR and first aid training, traditional healing, outdoor survival skills, gardening instruction, vocational learning, and potential expansion of childcare programming. • Office space will support facility operations, event planning, and program enrollment counseling, while display areas will showcase traditional tools, games equipment, and cultural artifacts. • Outdoor areas will support gatherings, gardening instruction, and cultural activities. Existing CITC programs will support staffing through an expanded Cultural Department. By integrating culture, physical activity, and community gathering, the Cultural Center will improve health outcomes and create a lasting hub for Alaska Native wellness in Anchorage.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Advance to Implementation Application

Cook Inlet Tribal Council	Cook Inlet Tribal Council's Healthcare Professions Training Initiative	AK	Alaska faces a persistent shortage of trained healthcare professionals and behavioral health providers. Workforce reports estimate the state needs more than 9,400 new healthcare workers every year to meet demand, yet training programs produce far fewer graduates—for example, only about 346 new registered nurses graduate annually despite a need for roughly 1,400. This gap strains the healthcare system and limits available services, particularly in rural communities where recruitment and retention are more difficult due to geographic isolation and high living costs. Cook Inlet Tribal Council proposes a healthcare training initiative designed to expand the supply of licensed, high-demand healthcare professionals through credential pathways that can be completed in two years or less. The program would provide tuition assistance, structured case management, employer partnerships, and means-tested living stipends to ensure participants successfully complete training, obtain licensure, and secure employment in Alaska. The model builds on CITC’s successful implementation of the Health Profession Opportunity Grants (HPOG) Program from 2011–2021, during which more than 730 participants enrolled in healthcare training and nearly 300 were placed in healthcare employment. The program directly supports the goals of the Alaska RHTG program by strengthening the healthcare workforce and expanding access to essential health services in rural, remote, and frontier communities across the state.	Cook Inlet Tribal Council proposes the Healthcare Professions Training Program to expand Alaska’s healthcare workforce by preparing participants for licensed, high-demand healthcare careers through credential pathways that can be completed in two years or less. Priority occupations include Licensed Practical Nurse (LPN), Registered Nurse (RN), Certified Medical Assistant, Phlebotomist, Diagnostic Medical Sonographer (Ultrasound Technician), and Emergency Medical Technician (EMT)/Paramedic. These occupations were selected because they are in critical shortage across Alaska and represent accessible career pathways that offer strong wages, long-term advancement opportunities, and the ability to serve communities in need. Participants enrolled in the program will receive comprehensive supports designed to ensure successful completion of training, licensure, and employment. Services include tuition assistance, payment of required books and equipment, licensure exam costs, and means-tested living stipends for up to five months to help participants maintain housing and household stability while completing intensive training programs. Each participant will receive dedicated workforce case management and develop an individualized success plan that identifies strengths, career goals, and potential barriers. Case managers will provide ongoing guidance and connect participants to supportive services such as childcare, housing assistance, and other stability support to ensure students remain on track and successfully complete their training. The program will be housed within CITC’s Career Development Department, which has a proven track record in providing comprehensive workforce training and employment services that help individuals obtain meaningful, sustainable careers. Recruitment will occur through multiple channels including CITC’s website, social media, job fairs, community and health events, and partnerships with organizations such as the Alaska Primary Care Association and Tribal health providers. CITC will work strategically with the tribes in the Cook Inlet region to promote this opportunity and recruit enrollees. CITC will also recruit from within its own workforce, creating opportunities for employees to obtain healthcare credentials that increase employees’ earning potential while filling critical positions within the organization—ultimately increasing service delivery and improving access to care for the communities CITC serves.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Cook Inlet Tribal Council	Generative Leadership Fellowship Initiative	AK	Cook Inlet Tribal Council is Alaska's largest tribal nonprofit, serving over 13,000 Alaska Native and American Indian people annually through health, education, employment, and social services. Despite this scale, a small percentage of CITC's AN/AI employees hold formal leadership roles; a gap that mirrors a statewide pattern. Across tribal organizations in Alaska, leaders consistently identify the absence of structured, culturally relevant leadership development as a barrier to organizational resilience and succession. When leadership roles turn over or go unfilled, the impact lands directly on the consistency and reach of health services, especially at smaller tribal organizations operating health clinics or wellness programs with lean administrative teams. To date, this work has existed as a recurring board goal; resourced year to year, dependent on existing staff capacity, and not yet institutionalized into a permanent operational structure. This project funds the infrastructure that changes that: a dedicated FTE, a formal Fellowship with competitive selection, and a regional tribal partner pipeline that current operating budgets cannot support. The goal is not to fund what already exists, but to build what makes it permanent.	CITC launched the foundational elements —the Supervisor Essentials cohort and Leadership Development Planning (LDP) framework — in FY26 to meet a board goal. These are operational but not yet institutionalized: no dedicated staff, no formal Fellowship, no mechanism to reach partner organizations. The components below represent genuinely new infrastructure that current budgets do not support. Nine Generative Leadership Competencies form the program foundation: Strategic & Transformative Leadership, Emotional Intelligence & Respectful Leadership, Financial Acumen & Resource Management, Operational Excellence & Results Delivery, Stakeholder Engagement & Communication, Connection to CITC Mission & Vision, Business Acumen, Code & Standards of Conduct, and Ethics. Each is anchored in Tribal Wisdom and embedded in CITC’s job descriptions and performance reviews. The Supervisor Essentials cohort (16 sessions over 4 months) expands to half-day formats with applied workplace assignments and scenario-based workshops. Curriculum includes dedicated sessions on urban-rural leadership dynamics, exploring distinct communication norms, management approaches, and workplace realities across village and urban environments, including flexibility for subsistence practices, always grounded in Tribal Wisdom. Tribal leaders join as guest presenters, bringing lived perspective into sessions. Two cohorts annually, capped at 10 participants, preserve small-group quality. The Fellowship launches as a formal, competitive program for AN/AI leaders within CITC and at Cook Inlet tribal partner organizations, with planned expansion to additional regions as the model matures. CITC’s Tribal Partnerships Manager will conduct targeted outreach through established contacts. Selection requires a nomination letter, personal statement, resume, HR review for good standing, and one year of continuous service. Fellows receive stipends and travel support for in-person milestone events, with the majority of sessions delivered virtually. Participants earn completion certificates tracked in CITC’s internal tracking systems. LDPs establish 12-month SMART goals reviewed quarterly with supervisors, creating a documented growth record and built-in evaluation data. A dedicated FTE manages curriculum development, Fellow coordination, and outcome tracking.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Cook Inlet Tribal Council	Nat'uh Commerical Kitchen Renovation	AK	CITC's main facility, Nat'uh, houses a kitchen that cannot support food and nutrition programming. It has storage and refrigeration but lacks core food preparation infrastructure: no commercial stove, no exhaust hood, and no commercial dishwasher. Without commercial licensure, all food-based programming is limited to demonstrations using pre-prepared ingredients; participants may observe but cannot cook, eat, or take home what is produced. CITC's Family Wellness classes, serving Alaska Native families, many recently relocated from rural communities, are constrained to demonstration-only format, preventing the hands-on experience that builds lasting nutrition skills. The facility's most accessible ground-floor space is leased to a cafe tenant whose lease expires in May, leaving prime community real estate underutilized for health purposes. CITC participants, many in a recognized food desert, have consistent demand for healthy food access and culturally relevant nutrition programming. Interest in expanded food distribution, elder meal support, and youth nutrition programming is strong, and the absence of a licensed kitchen is the single structural barrier to all of it, a direct missed alignment with Alaska's RHTP Healthy Communities priority.	CITC proposes a two-component project: (1) capital renovation of its existing kitchen and adjacent cafe space into a fully operational, commercially licensed facility, and (2) launch of food health programming made possible by that infrastructure. Kitchen renovation core improvements will include: installation of a commercial stove and code-compliant exhaust hood (routed through the south exterior wall); a commercial sanitizing dishwasher; reconfiguration of the ground-floor cafe space into a CITC-operated food distribution counter and community wellness hub; acquisition of a delivery vehicle; and all permitting and inspection work required to achieve commercial kitchen licensure under Alaska DEC requirements. With a licensed kitchen in place, CITC will expand and launch: • Upgraded from demonstration-only to fully hands-on cooking instruction, incorporating traditional Alaska Native foods, subsistence practices, and culturally grounded nutrition education. Participants will prepare and eat what they cook. • Regular bulk food distribution, with sourcing partnerships prioritizing Alaska-grown and culturally appropriate foods. • A Meals on Wheels-style delivery program for elders and families in reunification, phased in as operations stabilize. • Meals and food education for afterschool programs, camps, and youth services in CITC's network. • Entry-level kitchen roles as an employment pathway for CITC workforce development participants. • Connecting kitchen use to locally harvested foods, reinforcing cultural identity and food self-sufficiency.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Cook Inlet Tribal Council	NYO Video and Coach Development for Rural Alaska	AK	CITC’s NYO program is among the most established Indigenous youth wellness programs in the state. With more than 1,000 athletes competing annually across Junior (grades 1–8) and Senior (grades 7–12) statewide games, and hundreds more participating in school and community programs year-round, NYO is a proven, community-trusted vehicle for delivering the protective factors most critical to rural health: physical activity, cultural identity, belonging, mentorship, and resilience. The instructional video library that enables this statewide reach is now significantly out of date. Rules and best practices have changed since the original videos were recorded. Rural coaches who depend on these videos as their primary training resource are working from information that may disadvantage athletes and increase injury risk, while urban athletes with access to experienced officials in person bear none of this cost. The coach network that supports NYO is also informal and inconsistently resourced. Many community coaches are passionate volunteers with deep cultural knowledge but limited access to structured training. This project addresses both gaps: restore the equity of the video library and invest in the coaches who bring it to life in communities across the state.	This project has three integrated components: a re-shoot of the Junior and Senior NYO event videos, a new whole-athlete wellness video series, and a statewide coach development program, in direct support of the RHTP’s Healthy Communities initiative and its call for scalable, culturally grounded prevention programming in rural and frontier Alaska. For the event videos, Junior content (grades 1–8) will emphasize foundational form, safe technique, and joyful participation, while Senior content (grades 7–12) will address advanced execution, competitive standards, and biomechanical precision. Both sets will reflect current official rules, feature athletes across skill levels and backgrounds, and be produced for low-bandwidth delivery, distributed free through YouTube and thumb drive, consistent with the RHTP’s Spark Technology and Innovation initiative. A new whole-athlete wellness video series will ground NYO participation in holistic health. Content will cover event-specific warm-up and mobility sequences, nutrition guidance emphasizing whole foods and traditional Alaska Native foods, and mental preparation strategies. These videos connect the physical practice of NYO to the broader healthy lifestyle and chronic disease prevention goals of the RHTP’s Healthy Communities initiative, and create a natural integration point with the Alaska Tobacco Cessation Program. The coach development program will bring 30–50 rural coaches to Anchorage for multi-day, in-person training led by CITC’s Head Official. Curriculum will cover updated rules, safe coaching, evidence-based youth mentorship, and early identification of youth in distress, positioning coaches as an extension of the rural behavioral health and Traditional Healing workforce, aligned with RHTP’s Health Care Access initiative. A train-the-trainer framework and potential formal certification will build self-sustaining local capacity.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Copper River Basin Child Advocacy Center	Child Advocacy Center - Prevention Education and Access to Services	AK	The CRBCAC is an existent program, established in 2009 and a nationally accredited CAC since 2015. The CRBCAC's mission is to unify a community approach to child abuse prevention and response. Access to the CRBCAC, medical services and other community service provider locations, such as behavioral health, pharmacy, food bank, etc., in regards to transportation may be a challenge for families, especially that live furthest in the service area, and are more isolated with minimal financial resources. This is especially difficult in the winter, with rugged and inclement weather and road conditions, where income and resources are minimal due to seasonal employment. Furthermore, the CRBCAC has been providing school prevention/health programs to grades K-12, throughout each School District in all three service areas, through established collaborative agreements. Throughout the last few years, the CRBCAC has been understaffed due to various issues. This has been a difficult endeavor for the existing two full-time and two part-time staff that are each located throughout the three different locations.	Alleviating the transportation shortage or lack there of, in our vast rural locations is the purchase and use of a company vehicle. This approach will not only allow for kids and their families to access the CRBCAC for services, with the assistance of staff, but will also allow for further follow-up supports, in-home visits, behavior health, other medical and health services. Review the job description, advertise and hire a CRBCAC Prevention Coordinator/Specialist who's schedule will be dedicated to providing the prevention/health programs to students in all three School Districts, including the home-schoolers, to ensure continuity of this mandated educational service. Staff has the expertise in this subject matter, making this a more supported environment for students and teachers.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Chugach Census Area; Copper River Census Area; Southeast Fairbanks Census Area	Deferred or Not Advanced

Copper River Emergency Medical Services Council Inc	EMS Led Sustainable Transformation of Rural Health Care in Alaska’s Copper River Census Area	AK	The rural Copper River Census Area's only certified ambulance service is a local non-profit EMS Council (CREMS) with a 45-year track record of sustainability. This longevity belies a complete lack of dedicated EMS funding from local, regional, state or federal sources. CREMS very existence requires and demonstrates its continuous focus on long-term sustainability. However, maintaining fiscal sustainability without baseline funding often requires CREMS to sacrifice the planning and implementation of advancements, expanded services, additional training, and critical equipment. CREMS must adapt sustainably even while facing a dramatic spike in demand for services. The volume of 911 EMS dispatches in the Copper River Census Area has more than doubled since 2018. Access to urgent & emergent services decreased sharply in 2022 when the only local after-hours medical facility within a 120 mile radius ended all after-hours care. The entire region also lacks any clinical after-hours stabilization or treatment for SUD, behavioral health, or other crisis intervention needs, aside from 911 (or 988). Despite being under-resourced and facing existential challenges, EMS has no choice but to provide all of these significant and necessary services because no-one else is available and EMS is required to respond when dispatched through the 911 system. EMS is uniquely positioned to leverage its increasing roles in rural health care as increased opportunity for sustainable transformation.	CREMS approach to the EMS led sustainable transformation of rural health care in the Copper River region will focus on developing a model of care that includes after-hours telehealth based medical direction, expanded training programs, and a local workforce of cross-trained, multi-disciplinary personnel for EMS, Mobile Crisis response, Critical Care, MIH and local SUD treatment. CREMS will pilot additional and expanded EMS based services with the potential for self-sustaining revenue streams to include non-emergent medical and SUD treatment; non-ambulance medical transportation; interfacility ground transport by ambulance; and ground transport by ambulance directly to the Emergency Room (instead of relying on a rendezvous with medevac or ground intercept). CREMS will proactively expand a growing network of existing partnerships outside of traditional EMS based organizations in order to expand services, increase training opportunities, and deploy telehealth alongside advanced medical technologies. CREMS will also facilitate mutually beneficial and sustainable partnerships among willing Emergency Services organizations especially within the Copper River and Southeast Fairbanks Census Areas. Expanded collaboration among regional EMS services and first responder groups will yield unique, transformative and sustainable efficiencies, expand access to services, improve shared technical assistance, reduce waste, increase resilience, and increase the sustainability of EMS while it adapts to an expanded role in the healthcare system throughout the Copper River and Southeast Fairbanks Census Areas. If successful in the Copper River and/or Southeast Fairbanks Census Areas, this project will have a high probability of replicable success and sustainability in other rural service areas throughout AK and the US. CREMS will also support innovative and transformative local, regional, and statewide training programs. Specifically, CREMS hopes to partner with other organizations working towards the vision of a “rural health technician” and “paramedic practitioner” training program (informally introduced to CREMS by the Alaska Prehospital Education Consortium).	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

Copper River Native Association	CRNA Health System Analytics Platform for Rural Population Health Management	AK	Copper River Native Association (CRNA) provides integrated health services to rural communities throughout the Copper River region of Alaska, including primary care, behavioral health, dental services, and community wellness programs. However, CRNA’s operational, clinical, and financial data exist in separate systems that do not communicate easily, limiting the organization’s ability to conduct timely analysis and support effective decision-making. Currently, staff must manually compile reports from multiple systems and analyze spreadsheets to understand patient trends, service utilization, and program performance. This process can take weeks and delays CRNA’s ability to identify emerging health issues or respond quickly to community needs. The lack of integrated data infrastructure also limits CRNA’s ability to stratify patients by risk level and identify individuals or populations at higher risk of poor health outcomes. Without this capability, it is more difficult to design targeted interventions that improve chronic disease management and behavioral health services. This project will address these challenges by developing an integrated analytics platform that consolidates clinical, operational, and financial data into a centralized dashboard. Improved access to actionable data will allow CRNA to identify high-risk patients, monitor community health trends, and implement data-informed strategies that improve health outcomes across its rural service region.	Copper River Native Association (CRNA) proposes to develop and implement an integrated population health analytics dashboard that consolidates clinical, operational, and financial data into a single reporting platform to support data driven decision making and improved health outcomes. Currently, CRNA’s data systems operate independently, requiring staff to manually compile information from multiple sources to analyze patient trends, service utilization, and program performance. This project will establish a centralized analytics infrastructure that enables leadership and clinical teams to access timely, actionable information. CRNA will begin by selecting a healthcare analytics platform capable of integrating with the organization’s electronic health record (EHR) system and other operational data sources. Once a platform is selected, CRNA will engage a qualified data developer through a contract or consulting agreement to configure the system, establish data connections, and build customized dashboards tailored to CRNA’s operational and clinical needs. The dashboard will integrate key datasets across CRNA programs, including patient encounters, clinical indicators, behavioral health services, and operational metrics. These dashboards will allow staff to monitor trends in chronic disease management, behavioral health needs, and service utilization across the communities served by CRNA. The platform will also support patient risk stratification, allowing CRNA to identify individuals and populations at higher risk and design targeted interventions to improve care. CRNA will partner with the Alaska Native Tribal Health Consortium (ANTHC) to support integration between the analytics platform and CRNA’s electronic health record system. ANTHC will assist with development of secure data interfaces and provide technical support to maintain interoperability between systems. Implementation of the dashboard is expected to occur over approximately twelve months and will include vendor selection, system configuration, data integration, and dashboard development. Once operational, the platform will support ongoing population health management, quality improvement initiatives, and strategic planning to improve healthcare access, outcomes, and sustainability for rural communities in the Copper River region.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Denali Borough	Deferred or Not Advanced

Copper River Native Association	Strengthening Rural Health Access Through Provider Housing	AK	CRNA serves rural and frontier communities in the Copper River region where recruiting and retaining health care providers is difficult due to geographic isolation and limited housing availability. In recent years, CRNA has relied heavily on locum tenens providers to maintain services, increasing operational costs and reducing continuity of care for patients. Frequent provider turnover also affects patient engagement. When providers change frequently, patients must repeatedly share their medical history and rebuild care relationships, which can reduce trust and participation in care. A primary barrier to recruiting long term providers is the lack of adequate housing in the Glennallen area. The challenge is not affordability but the overall shortage and condition of available housing. CRNA currently leases apartments from the housing authority, but many units are small or in poor condition and are not suitable for providers or families seeking longer stays. For example, a recent septic failure in leased housing left providers without functioning housing for several weeks, forcing CRNA to secure temporary lodging at additional cost. Planning and developing dedicated provider housing near the health center will strengthen CRNA’s ability to recruit and retain providers, improving continuity of care and supporting long term access to health services for rural residents in the Copper River region.	CRNA will address the provider housing barrier by advancing a structured planning and design effort to develop dedicated provider housing on CRNA owned undeveloped land adjacent to the health center. This project period will focus on defining a feasible housing concept that directly supports recruitment and retention of long term clinical staff and reduces reliance on short term staffing. The goal is to establish a ready to implement plan that CRNA can use to pursue construction financing and begin development. CRNA will begin by confirming the desired housing scope based on workforce needs, including the number and type of units most likely to support recruitment, such as family appropriate units that can accommodate providers relocating with spouses and children. CRNA will then complete site planning activities to assess utility access, site conditions, and development requirements on the parcel, including any needed surveys, environmental considerations, and permitting pathways. During the project, CRNA will develop preliminary architectural concepts and cost estimates to determine an appropriate unit design for rural Alaska conditions. Planning will include a focus on durable construction, livability for long term stays, and proximity to the health center to support provider safety, accessibility, and quality of life. CRNA will also evaluate operational policies for housing use, including eligibility, occupancy terms, maintenance responsibilities, and how housing will be incorporated into recruitment packages. To ensure the project advances beyond concept, CRNA will use this project period to complete key pre development deliverables needed for implementation. These deliverables include a defined development plan, preliminary design and site layout, realistic construction cost estimates, and a phased implementation strategy. The project will also position CRNA to pursue follow on capital funding, including identification of potential construction funding sources and preparation of a competitive application package. By the end of this project period, CRNA will have a clear and actionable plan to develop provider housing that strengthens workforce stability and improves access to consistent care for rural residents in the Copper River region.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Denali Borough	Deferred or Not Advanced

Copper River Native Association	Sustainable Emergency and Urgent Care Access Planning for Rural Ahtna Communities	AK	CRNA serves the rural Ahtna region of Alaska, providing primary care, behavioral health, dental, and other essential services to approximately 2,700 residents across a large and geographically isolated service area. Although the community is connected by road, access to emergency and urgent care remains limited, with the nearest hospital emergency departments located several hours away. As a result, many patients requiring urgent or emergency treatment must be transported by medevac, which is costly and often dependent on weather and aircraft availability. CRNA currently receives ambulance transports and provides emergency stabilization for patients prior to transfer. However, because CRNA is enrolled with CMS as a group practice rather than a facility designation that supports urgent or emergency care reimbursement, the organization cannot fully recover the costs associated with providing these services. Moving forward, CRNA seeks to evaluate sustainable service delivery models that would allow the organization to continue providing emergency stabilization and urgent care services while maintaining financial viability. This project will explore options that strengthen local access to care, reduce reliance on medevacs, and ensure residents of the Ahtna region can receive timely emergency care closer to home.	CRNA will conduct a comprehensive feasibility and impact analysis to determine the most effective and financially sustainable model for improving emergency stabilization and urgent care services in the Ahtna region. This effort will focus on identifying practical solutions that allow CRNA to address the current gap in care, reduce reliance on costly medevac transports, and lower the overall cost of patient care while maintaining long-term operational sustainability. To support this effort, CRNA will engage an experienced rural health care consulting partner with expertise in rural emergency care delivery, CMS enrollment and reimbursement pathways, and rural facility planning. The consultant will work closely with CRNA leadership, clinical staff, and local EMS partners to review current patient utilization patterns, stabilization practices, transfer volumes, and financial impacts associated with emergency transports. The feasibility analysis will evaluate several potential service delivery models that could improve access to timely care while creating a sustainable reimbursement structure. One option includes establishing an urgent care service enrolled with CMS as Place of Service 20, supported by telehealth providers and enhanced diagnostic capabilities such as on-site CT imaging. Another option will explore the feasibility of developing a critical access–style stabilization model with limited bed or swing-bed capacity supported by telehealth hospitalists or emergency physicians. These models would allow patients requiring urgent assessment or stabilization to receive care locally before transfer when appropriate. In addition to evaluating these specific options, CRNA will request that the consultant identify other innovative models suitable for frontier health systems that could help the organization meet its goals of improving local care access and reducing avoidable medevacs. The analysis will also include a review of CRNA’s existing facility layout to determine what space modifications or infrastructure improvements may be necessary to support expanded emergency or urgent care capabilities. The final outcome of the project will be a detailed feasibility report and implementation roadmap that outlines the most viable service model, identifies operational and capital needs, and provides clear recommendations for CRNA to strengthen emergency care access for the rural communities it serves.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Denali Borough	Deferred or Not Advanced

Cordova Community Medical Center	Close-to-Home Cancer Care: Expanding Safe Chemotherapy, Infusion, and Pharmacy Services in Cordova	AK	Cordova Community Medical Center (CCMC) serves a remote, weather dependent community where patients needing advanced pharmacy services or chemotherapy/biologic infusions must travel by plane or ferry, creating delays in care, financial strain, and avoidable risk. We propose a phased expansion of pharmacy and nursing capabilities to (1) meet USP <797> and <800> standards for hazardous drug handling and sterile compounding, (2) launch select outpatient chemotherapy/infusion services on site, and (3) implement an automated dispensing system (ADS) to strengthen medication safety, security, and efficiency. In parallel, we will formalize tele oncology consults and shared care protocols with Anchorage based specialists so patients can initiate and continue indicated regimens in Cordova. This project reduces costly travel, mitigates weather related delays, and establishes a sustainable, high value service line that strengthens our CAH’s operational stability while improving continuity of care for elders, people with chronic and complex conditions, and Alaska Native residents.	Phase 1 – Readiness (months 0–12) • Infrastructure & Safety: Design and install modular clean room components and environmental controls to achieve USP <797>/<800> compliance for hazardous drug receipt, storage, and preparation. • Medication Safety Technology: Procure and deploy an Automated Dispensing System (ADS) to improve inventory control, reduce diversion risk, and streamline nurse workflows in a low staffing CAH environment. • Workforce Upskilling: Credential and competency validate pharmacists and nurses in hazardous drug handling and chemotherapy administration (e.g., didactic training, simulation, precepted cases at partner sites). • Tele Oncology Setup: Execute MOUs with Anchorage oncology/rheumatology clinics; configure a dedicated telehealth consult space and workflows for treatment plan review, virtual consults/follow ups, and shared care oversight. Phase 2 – Service Activation (months 12–24) • Go Live: Begin select outpatient chemotherapy/biologic infusions locally under remote specialty oversight; expand to other hazardous medication infusions (e.g., rheumatology) as competencies mature. • Quality, Data, and Billing: Implement checklists, sterile compounding audits, and event reporting; align coding/billing, payer pre auth, and prior approval pathways; integrate telehealth and infusion data with hospital IT/HIE workflows where feasible. RHTP Alignment & Allowable Uses: • Health Care Access: Expands access to specialty infusions “as close to home as possible” through targeted facility/IT upgrades and tele specialty programs. • Enhance statewide pharmacy capacity: Supports pharmacist training, medication management, and technology enabled dispensing solutions. • Spark Technology & Innovation: Funds telehealth enabled specialty care, IT upgrades, and interoperability/HIE participation. • Strengthen Workforce: Funds upskilling, rotations, and retention for rural providers. This approach advances the State’s key objective to increase specialty service access in rural hub communities, with foundational milestones falling in RHTP’s first 18–24 months.	\$1M-\$5M	Hospital	Single Community	Chugach Census Area	Advance to Implementation Application

Cordova Community Medical Center	Cordova Community Medical Center Behavioral Health Integration	AK	Through this grant we have the opportunity to integrate our Community Behavioral Health and Primary Care clinics offering increased access to health care, reducing duplication of effort and documentation, lowering the cost of offering care, reducing stigma and allowing for early intervention and team based care. This approach has been shown to positively impact the high correlation between chronic diseases and mental health. and improves treatment responses for deiabetes, heart disease, depression and eanxiety. These are all leading causes for long term disability and early mortality. Our project offers the opportunity to help with the issue of provider shortages: we have been unsuccessfully recruiting for a Behavioral health Clinician for 3 years. In an integrated model behavioral health specialists can support PCP's allowing for better care coordinations, faster treatment, icreased satisfaction and better overall health outcomes. This oppportunity would allow us to transition form grant funded behavioral health services to a more sustainable model. This request seeks planning funds to support design, engineering, education, staff training, and operational planning that will strengthen health care delivery and community well-being in Cordova and the surrounding region. This initiative aligns with the RHTP goals of expanding access to care, strengthening workforce capacity, improving integrated health services, and leveraging technology to improve rural health outcomes.	Our proposed approach has the following components: Facility & Construction: Design and renovations to create dedicated behavioral health treatment rooms within the primary care space which would include soundproofing and trauma informed design, private intake/waiting/calming room, telehealth space and secure medication and documentation storage. Workflow Integration: Design of workflow integration to include shared scheduling and referral pathways, warm handoffs from primary care to behavioral health, care coordination for clinic ED and community providers and clear escalation protocols for high-risk patients. Staff Education and Training: Training for staff to include integrated model training, MAT training, trauma informed care training, deescalation training, work flow changes for referrals and warm handoffs documentation standards, and use of telepsychiatry and telehealth tools. Technology and Telehealth: Design to provide secure telehealth platforms to access specialists not available in Cordova, shared EHR workflows and remote supervision and consults when on site staff are not available.	\$50,000-\$250,000	Hospital	Single Community	Chugach Census Area	Advance to Implementation Application

Cordova Community Medical Center	Cordova Community Medical Center Kitchen Remodel, Multi Use Dining and Senior Technology Space	AK	CCMC proposes a planning initiative to modernize the hospital kitchen, enhance nutrition service capacity, increase operational efficiency, and transform the adjacent dining room into a flexible multi-purpose community space for seniors. This space will serve daily patient, senior, and staff dining needs while functioning as a senior gathering area and education and technology training hub, enabling internet access, basic digital skills training, and telehealth support for older adults as well as health and nutrition education activities. Our Community Health Needs Assessments, for at least the last 12 years, have identified a need for increased supports for our elders. This project offers the opportunity to do so. Our project plans to leverage technology to improve 1) supply purchasing, 2) meal planning and preparation 3) senior health literacy, 4) access to senior benefits including Medicare and Social Security and 5)to create a space for seniors to get assistance with technology, nutrition and health education and to participate in sevents and activities. This request seeks planning funds to support design, engineering, education, staff training, and operational planning that will strengthen health care delivery and community well-being in Cordova. This project aligns with RHTP goals of workforce training, technology innovation, and community health engagement, especially for aging populations and prevention activities.	This initial request for the first year would include: Architectural and engineering design assessments for kitchen modernization Planning and workflow design for energy-efficient, tech-enabled kitchen systems Space planning for dining area redesign with senior-focused technology learning zone Operational assessments for new equipment, workflows, and digital nutrition systems Year two would include: Renovations of the existing space based on the designs generated in year 2 Development of staff training plans for kitchen technology, digital inventory, and senior tech support Year 3 Focus on use and implementation of added services, assessment of impact and outcomes to ensure goals are met	\$50,000-\$250,000	Hospital	Single Community	Chugach Census Area	Advance to Implementation Application

Cordova Family Resource Center	Healthy Beginnings & Safe Communities: Cordova Youth and Family Wellness Initiative(SART/CAC)	AK	Rural and remote communities such as Cordova face significant barriers to accessing timely health, behavioral health, and victim support services. Cordova is not connected to the road system, and residents must rely on limited local providers or costly travel by air or ferry to access specialized medical and behavioral health care. When incidents of domestic violence, sexual assault, or child abuse occur, the availability of trained responders and specialized medical or forensic services can be limited or delayed. As a result, survivors may wait extended periods for care, travel long distances during a crisis, or choose not to access services at all. Youth in rural communities also often have limited access to prevention programming that builds mental health resilience, healthy relationship skills, and other protective factors that reduce violence and trauma. Without consistent prevention efforts and coordinated response systems, communities face increased risks of untreated trauma, long-term health impacts, and reduced community wellbeing. This project will address these challenges by expanding youth prevention programming and strengthening coordinated, trauma-informed response services through CFRC’s Sexual Assault Response Team (SART) and Child Advocacy Center (CAC). By increasing trained on-call advocates and expanding telehealth connections to medical and forensic professionals, CFRC will improve timely access to care and strengthen coordination among community partners.	CFRC will address these challenges through a coordinated approach that strengthens youth prevention programming and improves access to trauma-informed response services in Cordova. Under Healthy Beginnings, CFRC will expand youth-focused prevention activities in partnership with local schools, tribal partners, and community organizations. Programs will include evidence-informed education that promotes mental health resilience, healthy relationships, bystander awareness, and protective factors that help prevent violence and trauma before it occurs. Youth programming will be delivered through school-based activities, community events, and ongoing engagement opportunities that encourage positive peer connections and supportive adult mentorship. Under Healthy Communities, CFRC will strengthen its Sexual Assault Response Team (SART) and Child Advocacy Center (CAC) coordination to ensure survivors of violence have timely access to advocacy, medical care, and supportive services. The project will expand recruitment and training of on-call advocates to increase response capacity and ensure advocates are available when incidents occur. CFRC will also work with regional partners to expand telehealth options, allowing survivors to connect with medical and forensic professionals when local providers are unavailable. CFRC will continue to coordinate closely with local law enforcement, health providers, schools, and tribal partners to ensure a collaborative and trauma-informed response system that improves access to care and supports long-term community health and safety.	\$50,000-\$250,000	Single Community	Copper River Census Area	Advance to Implementation Application

Core Kinetics DBA PlayWorks Pediatric Therapy Services	Expanding Access to Pediatric Occupational Therapy Services for Alaska Children	AK	Alaska children frequently experience delays in accessing pediatric occupational therapy services due to geographic isolation, limited provider availability, and travel barriers. Early intervention is critical for children experiencing developmental delays, sensory processing challenges, and difficulties with motor coordination or daily living skills. When services are delayed or unavailable, children may struggle to succeed in school, participate in play, and develop essential life skills. This project seeks to address the gap in accessible pediatric occupational therapy services for rural communities. By expanding service capacity and implementing telehealth-supported therapy, Core Kinetics DBA Pediatric Therapy Services can reach families who would otherwise go without care. The opportunity lies in leveraging workforce and technology. Recruiting and retaining more providers allows more delivery of needed services to Alaska children. Telehealth, when appropriate, allows access to children who otherwise might face barriers such as weather restrictions, limited travel opportunities or local access to OT services. Utilizing community partnerships to deliver effective therapy services that fit the unique needs of remote communities is also imperative. This project will allow Core Kinetics DBA Pediatric Therapy Services to build a scalable model of pediatric therapy delivery that improves early access, reduces wait times, and supports families in helping their children thrive.	Core Kinetics DBA Pediatric Therapy Services will implement a multi-component approach to expand access to pediatric occupational therapy services for rural Alaskan communities. First, the project will expand telehealth occupational therapy services, enabling children and families to receive therapy sessions remotely. Telehealth will include individualized therapy sessions, caregiver education within the session to improve follow through of OT strategies, and home-based activity planning designed to support children's development within their natural environments. Secondly, Core Kinetics DBA Pediatric Therapy Services will continue strong partnerships with schools, early intervention programs, pediatric clinics, and referral sources such as Help Me Grow Alaska to improve referral pathways to other needed services and identify children who may benefit from occupational therapy services earlier. These partnerships will help ensure families are aware of available services and can access them more efficiently. Third, Core Kinetics DBA Pediatric Therapy Services will seek partnership with other disciplines such as Speech Language Pathologists and Physical Therapy providers to increase delivery of high-quality care as a team to improve specific discipline oriented outcomes. Fourth, the project will include in-person visits when feasible to provide direct assessment, hands-on therapy, and collaboration with other provider partnerships. These visits will help strengthen relationships with community partners and enhance service delivery. Finally, Core Kinetics DBA Pediatric Therapy Services will monitor program outcomes through service utilization data, caregiver feedback, and developmental progress measures. This data will inform ongoing improvements and help demonstrate the effectiveness of the expanded service model. Through this integrated approach, the project will increase access to therapy services, empower caregivers, and promote positive developmental outcomes for children in rural Alaska.	\$50,000-\$250,000	Private practitioner	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bristol Bay Borough; Copper River Census Area; Dillingham Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced
Core Kinetics DBA PlayWorks Pediatric Therapy Services	Expanding Access to Pediatric Occupational Therapy Services for Children in Rural Alaska	AK	Children in Alaska experience delays in accessing pediatric occupational therapy services due to geographical isolation, limited provider availability, lack of partnership with other aligned disciplines including SPL and PT, and travel barriers. We have recently taken measures to address these care delays in our small clinic, adding expansion of services to Fairbanks. We see an opportunity to assist more Alaska children through the development and management of a hearty occupational therapy team, strong partnership with SLP and PT, and continuation of diligent work with other stakeholders/referrals sources such a Help Me Grow Alaska. Ongoing and growing attention to these opportunities will greatly influence future Alaska generation's participation in meaningful functional activities in all areas of life which is the foundation of occupational therapy.	Core Kinetics DBA PlayWorks Therapy Services proposes the acquisition and retention of additional OT staff and other administration, partnership with SLP and PT if available, expansion/maintenance of existing facilities and equipment, implementation of telehealth when necessary and travel and lodging when needed for services in Anchorage and Fairbanks. These are high-value endeavors requiring funding.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough	Deferred or Not Advanced

CorVent Medical	Transforming Rural Care: CorVent Medical's Next-Gen Telehealth Tools	ND	Alaska's frontier geography, severe weather conditions, extended transport distances, and limited access to specialty care create persistent clinical and operational challenges. Critically ill patients may deteriorate during interfacility transfers, lack access to necessary specialty services locally, or experience clinical decline while awaiting transfer to a higher level of care. This Letter of Intent (LOI) aligns closely with two Alaska Rural Health Transformation Program (RHTP) initiatives—Health Care Access and Spark Technology and Innovation—and outlines a coordinated, statewide strategy to strengthen healthcare delivery across rural and frontier communities. The proposed approach focuses on standardization, improved clinical support, and innovative technology solutions to address the unique challenges of providing timely, high-quality care in Alaska's remote settings.	Project Approach: Action Plan: Modernize the State Ventilator Stockpile Replace twenty (20) aging, end-of-life HT-70 ventilators currently managed by the Alaska Department of Health (DOH) Division of Public Health – Rural and Community Health Systems with fifty (50) CorVent RESPOND stockpile ventilators. Per Karl Edwards, Warehouse Manager, and Nathan Wormington, Emergency Program Manager, current devices are no longer serviceable due to Medtronic discontinuing its ventilator portfolio. In addition, traditional PHEP/HPP funding has not supported replacement of this outdated technology. Enabling these devices with CorVent RPM will standardize equipment across Critical Access Hospitals (CAHs) and support statewide remote patient monitoring and telehealth initiatives. Standardize Ventilation and Monitoring Across CAHs Equip all thirteen (13) Critical Access Hospitals with RESPOND mechanical ventilators and Barnacle RPM gateways capable of connecting to the RESPOND ventilator and up to four additional clinical technologies, including systems such as Stryker LIFEPAK monitors. This integration supports real-time clinical oversight and improved coordination of care. Enable Continuous Monitoring During Transport Equip all twenty (20) CAH ambulances and emergency transport vehicles with mobile RPM kits designed for transport and frontier connectivity. These systems will enable continuous physiological monitoring and remote clinical oversight during interfacility transport. (Air transport readiness planning and associated budget considerations may be incorporated into the final proposal.) Project Implementation: The project will deliver all core hardware technologies in 2026, followed by a phased activation and expansion of RPM capabilities from 2026 through 2030. This structured deployment approach will support measurable adoption, clinical integration, and long-term sustainability, with full statewide operational maturity anticipated by the end of 2030.	\$1M-\$5M	Statewide	Bethel Census Area; Chugach Census Area; Dillingham Census Area; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Sitka (City and Borough); Wrangell (City and Borough)	Deferred or Not Advanced

Council of Athabascan Tribal Governments	Council of Athabascan Tribal Governments Traditional Healing Program	AK	CATG delivers primary healthcare in 4 interior villages. These Gwich'in Villages are remote and fly-in only with access that can be intermittently affected by weather. Recent economic challenges have cut back on air flight services to these communities. The Gwich'in people have traditional territory and family relationships that extend from Alaska to the Yukon Territory and into the Northwest Territories Canada. The health status of Gwich'in in Alaska is disproportionately affected by high rates of chronic disease such as obesity and heart disease, and behavioral health issues. These issues are compounded by limited access to primary care and behavioral health services. Traditionally Gwich'in have a wealth of knowledge related to managing health across these remote and extreme regions to live and thrive in. These traditional medical practices have been affected by ongoing imposition of western education and medicine practices. There is interest in learning, practicing and rejuvenating these practices that can have significant impacts on health especially mental health of our communities. There are a few Elders left that have the training and wealth of knowledge of these practices and they are eager to mentor and train the next generation of healers. Developing a traditional medicine program delivered alongside the allopathic primary care medicine delivered in the region presents an opportunity to have a profound impact on the health of the people in the interior.	The Council of Athabascan Tribal Governments Traditional Healing Program will provide land-based learning opportunities that allow community members to learn directly from recognized Gwich'in knowledge holders and traditional healers. The program will focus on experiential learning, cultural teachings, and mentorship to support the revitalization of traditional healing knowledge and strengthen culturally grounded approaches to health and wellness in CATG communities. CATG will contract a recognized traditional healer and knowledge holder from across Gwich'in country to share their knowledge and expertise within CATG villages. Training opportunities will be open to community members of all ages, including youth, adults, and Elders. Participants will have opportunities to learn through hands-on experiences that may include traditional stories, cultural teachings, and the collection, preparation, and use of traditional plant medicines. The traditional healer and teaching team will spend one week in each participating village, including Fort Yukon, Arctic Village, Venetie, Beaver, and Birch Creek, establishing temporary land-based learning camps. Instruction will primarily occur outdoors and on the land, allowing participants to learn within the natural environment where traditional healing practices developed. Teachings may include plant medicine identification and preparation, cultural storytelling, sweat lodge ceremonies, and other traditional practices depending on what is appropriate and seasonally available in each community. CATG will work closely with Tribal leadership, Elders, and community members to guide program planning and ensure activities reflect the unique cultural knowledge and priorities of each village. CATG staff will coordinate travel logistics, community outreach, and program scheduling to ensure training opportunities are accessible to community members. Subsequent years of this program will evolve from the teachings and expand to mentorship and apprenticeship opportunities for those interested. Participants who wish to pursue additional learning opportunities will have the option to travel to a permanent traditional healing camp on the Dempster Highway in the Yukon Territory. Throughout the project, CATG will gather feedback from participants and community leaders to guide future program development and explore ways traditional healing practices may complement existing health services provided through CATG clinics.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Yukon-Koyukuk Census Area	Advance to Implementation Application

Council of Athabaskan Tribal Governments	EMS Infrastructure: Mechanical CPR and Ventilation Equipment	AK	Fort Yukon, located 145 air miles northeast of Fairbanks in Alaska's interior, faces critical challenges in emergency medical response due to extreme geographic isolation, limited EMS personnel, and harsh environmental conditions. During cardiac and respiratory arrest scenarios, the current reliance on manual CPR, use of the AED, and bag-valve-mask ventilation is compromised by minimal staffing—often requiring a single provider to manage multiple critical interventions simultaneously. This creates dangerous gaps in care quality during the most time-sensitive emergencies. The opportunity exists to leverage mechanical resuscitation technology (LUCAS mechanical CPR device and portable automated ventilators) to augment limited human resources, maintain consistent high-quality resuscitation during prolonged transport times, and free providers to perform other critical interventions. This equipment addresses Fort Yukon's unique challenges where transport times to definitive care in Fairbanks may exceed 60 minutes, weather conditions frequently limit air evacuation, and the volunteer/minimally-staffed EMS agency struggles to provide continuous manual CPR during patient movement and extreme cold conditions.	The project will equip Fort Yukon EMS with LUCAS mechanical CPR devices and portable automated ventilators as force multipliers for limited personnel. Implementation includes: (1) Capital equipment procurement—LUCAS-2 or LUCAS-3 device and compact transport ventilator suitable for cold environments (2) Streamlined training protocols designed for Fort Yukon's volunteer and part-time EMS providers, utilizing online modules and on-site hands-on sessions to minimize time burden; (3) Development of simplified deployment protocols that account for single-provider scenarios; (4) Integration with existing telemedicine infrastructure connecting to Fairbanks hospital or ANMC to provide remote physician guidance during device use; (5) Cold-weather equipment modifications and heated storage solutions; (6) Quality improvement tracking through Alaska's EMS data systems. The approach recognizes that while randomized trials show mechanical CPR does not improve survival in well-staffed urban systems, guidelines specifically identify rural settings with limited personnel, prolonged transport, and challenging environments as appropriate use cases where manual CPR quality cannot be sustained.	\$50,000-\$250,000		Multi-Community or Participating in Regional Hub-and-Spoke	Yukon-Koyukuk Census Area	Advance to Implementation Application

Council of Athabascan Tribal Governments	Growing Health in the Yukon Flats: Expanding Food Security, Safe Water, and Diabetes Prevention	AK	The Council of Athabascan Tribal Governments (CATG) proposes to expand its Special Diabetes Program for Indians (SDPI) prevention activities by improving water quality, increasing local food production, and providing nutrition education in the Yukon Flats region of Interior Alaska. CATG serves remote Alaska Native communities including Arctic Village, Beaver, Fort Yukon, and Venetie. These villages are not connected by road and rely on air transportation for most goods. The high cost of food and limited availability of fresh produce create barriers to healthy eating and contribute to chronic disease, including diabetes. This project will address these challenges by improving access to safe drinking water and healthy foods while increasing community knowledge of nutrition and food preparation. CATG will provide household water filtration systems in Beaver where water quality concerns exist. To improve food security, CATG will supply indoor gardening systems with seeds and plant nutrients so residents can grow vegetables year-round. CATG will also provide gardening supplies, healthy cooking classes, nutrition education, and food preservation training focused on foods commonly available in rural Alaska, including canned, frozen, and locally harvested foods. Staff or contracted educators will conduct these classes in participating communities. These activities will strengthen diabetes prevention efforts while improving food security and overall community health.	CATG will implement this project through collaboration with community members, Tribal leadership, and local health staff. The program will be coordinated through the CATG Health Department and will build on existing diabetes prevention and health education activities currently supported through the Special Diabetes Program for Indians (SDPI). Community Health Aides, behavioral health staff, and health educators will assist with outreach, participant recruitment, and delivery of education sessions. These staff already serve residents in the participating villages and have strong relationships with community members, which will help ensure participation and program success. CATG will also work with local Tribal governments and community organizations to host gardening demonstrations, cooking classes, and food preservation workshops in accessible community spaces. These activities will provide hands-on opportunities for residents to learn practical skills for improving nutrition and increasing food security. Local residents with experience in gardening, food preservation, or traditional food preparation may be engaged as instructors or mentors to support community participation and share knowledge. When needed, CATG will hire or contract qualified educators to deliver nutrition and gardening training. Distribution of water filtration systems and indoor gardening units will be coordinated through CATG staff working directly with households in Beaver and other participating communities. Staff will provide training on how to install and maintain water filters and how to use indoor gardening systems to successfully grow vegetables throughout the year. CATG has extensive experience managing federally funded health programs and delivering services in remote Alaska communities. The organization operates health clinics in Fort Yukon, Arctic Village, Beaver, and Venetie and has established systems for community outreach, program management, and reporting. This project will build upon CATG’s existing infrastructure and trusted community relationships to deliver practical, culturally relevant programs that support healthier lifestyles and improved access to nutritious foods.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Yukon-Koyukuk Census Area	Advance to Implementation Application

Council of Athabascan Tribal Governments	Yukon Flats Behavioral Health & Community Wellness Initiative	AK	The Council of Athabascan Tribal Governments (CATG) proposes the Yukon Flats Behavioral Health & Community Wellness Initiative to expand access to behavioral health services for remote Alaska Native communities through an integrated model combining tele-behavioral health, digital cognitive behavioral therapy (dCBT), youth prevention programming, and culturally grounded community wellness activities. CATG serves rural communities in the Yukon Flats region of Interior Alaska including Arctic Village, Beaver, Fort Yukon, and Venetie. These communities are not connected by road systems and residents must travel by small aircraft or river transportation to access specialty health services. Geographic isolation, behavioral health workforce shortages, and economic barriers significantly limit access to mental health care. Behavioral health conditions such as depression, anxiety, trauma, and substance misuse are among the most urgent health concerns in the region. Traditional therapy models alone cannot meet the growing demand for services in rural Alaska. This project will expand behavioral health screening, telehealth services, and digital CBT treatment within CATG clinics while strengthening prevention through youth programming, family engagement, and cultural healing activities led by elders and community leaders. Together these strategies will improve access to care, strengthen community resilience, and support long-term behavioral health outcomes across the Yukon Flats region.	The Yukon Flats Behavioral Health & Community Wellness Initiative will implement an integrated behavioral health model that expands clinical services, increases access to telehealth and digital mental health tools, and strengthens prevention through culturally grounded community programming. CATG will expand behavioral health screening within its primary care clinics using standardized tools such as PHQ-9 and GAD-7. Patients identified with mild to moderate depression or anxiety will be referred to digital cognitive behavioral therapy (dCBT) programs, while individuals requiring more intensive services will receive counseling or referral to specialty behavioral health providers. To address workforce shortages and geographic barriers, CATG will expand tele-behavioral health services connecting patients with psychiatrists and behavioral health specialists outside the Yukon Flats region. Telehealth consultations will support psychiatric evaluations, medication management, and follow-up care while allowing patients to receive services locally at CATG clinics. The project will also implement a digital cognitive behavioral therapy platform providing structured, evidence-based treatment for depression and anxiety. Patients will access guided therapy modules using clinic-based tablets or personal devices when internet connectivity is available. Clinic staff will assist with patient enrollment and provide brief support to ensure successful participation. Prevention programming will focus on youth and families by strengthening protective factors and increasing awareness of mental health resources. Activities will include youth leadership programs, after-school wellness activities, and prevention education addressing substance misuse, stress management, and suicide prevention. Family workshops will support parents and caregivers in recognizing behavioral health challenges and promoting healthy coping strategies. Culturally grounded wellness activities will also be incorporated to strengthen resilience and community connection. Elders and cultural leaders will guide cultural education, storytelling, and traditional knowledge sharing. Healing circles, cultural gatherings, and land-based activities will provide opportunities for community members to connect, support one another, and reinforce traditional approaches to wellness. Together, these strategies create a coordinated system of care that expands access to behavioral health services.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Yukon-Koyukuk Census Area	Deferred or Not Advanced

Council of Athabaskan Tribal Governments	Yukon Flats Community Based CPR Education Programs	AK	Out-of-hospital cardiac arrest (OHCA) survival in rural areas is approximately 50% lower than in urban settings, with rural patients having reduced odds of return of spontaneous circulation and survival to hospital discharge. Rural Alaska faces unique challenges including prolonged EMS response times, geographic isolation, and limited access to advanced medical care, making immediate community response critical. Community-wide CPR training programs are an evidence-based strategy to address this disparity. Studies show that community CPR initiatives can increase bystander CPR rates by up to 126%, improve AED use by 108%, and increase survival by 59%. Bystander CPR and AED use improve outcomes across both urban and rural settings, with rural communities showing particularly strong benefits. Targeted, community-based CPR training, delivered through instructor-led sessions and culturally appropriate approaches has demonstrated 10–19% increases in bystander CPR rates and improved neurological outcomes. Brief 30-minute trainings can be as effective as traditional multi-hour courses, making widespread dissemination feasible. Because rural patients experience longer EMS response times (7.5 vs 5.9 minutes), empowering community members to act as first responders through CPR training is one of the most impactful strategies to improve survival in rural Alaska.	Core Training Elements 1. Hands-Only CPR Emphasis The American Heart Association recommends hands-only CPR as an acceptable alternative to traditional CPR for bystanders, addressing two commonly cited barriers: fear of performing CPR incorrectly and fear of infection from mouth-to-mouth ventilation. This simplified approach is particularly appropriate for rural communities where rapid skill dissemination is essential. 2. Competency-Based Training Model Current recommendations emphasize competency-based models focusing on learner outcomes rather than just course participation, with contextualized learning that prepares rescuers for the stressful cardiac arrest environment. 3. Multiple Delivery Modalities Effective programs should incorporate: - Instructor-led sessions for hands-on practice with feedback - Video-based self-instruction for broader reach - Brief 30-minute sessions to reduce time barriers - Spaced learning (shorter, more frequent sessions) for better skill retention 4. AED Training and Placement Given the particularly strong association between bystander AED use and survival in rural settings, programs should include AED training and strategic placement of public-access defibrillators in high-traffic community locations. Implementation Strategies Community Engagement: Successful programs involve community members in program design, taking into consideration the uniqueness of each community's barriers and opportunities. Training should address community-specific concerns including accessing emergency services in remote areas. Partnerships with Existing Infrastructure: Incorporating CPR education into existing community structures (schools, workplaces, public safety departments, tribal organizations) enhances sustainability and reach. Cultural Adaptation: Programs should be tailored to Alaska Native	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Yukon-Koyukuk Census Area	Deferred or Not Advanced

communities, incorporating cultural values, language considerations, and traditional community structures to maximize engagement and effectiveness.

Covenant House Alaska	Holistic Care Navigation & Wellness Engagement for homeless, systems-involved transitional age youth	AK	Young adults ages 18–25 who are system-involved, aging out of foster care, or experiencing housing instability face significant barriers accessing preventive health care, behavioral health services & primary care. These barriers are particularly pronounced for youth connected to rural and remote communities where geographic isolation, provider shortages, and transportation limitations reduce access to timely care. As a result, many delay seeking care until health concerns escalate, contributing to behavioral health crises, avoidable emergency department utilization, and untreated physical and mental health conditions. Youth who relocate to Anchorage from rural regions, or who are aging out of systems in the city, often lack support to navigate the health system, enroll in Medicaid or other coverage programs, or connect with primary care and behavioral health providers. At the same time, few prevention and wellness platforms are designed to engage young adults in health education and healthy lifestyle activities. Digital wellness platforms that use gamification offer a scalable approach to health promotion and prevention. By leveraging mobile technology that many young people already use, these tools can deliver education, behavior tracking, and incentives that reinforce healthy choices. This project addresses an opportunity to strengthen prevention and early intervention through holistic care navigation, primary care engagement, and technology-enabled wellness participation.	This project will implement a coordinated model designed to increase access to preventive care, behavioral health services, and primary care while promoting healthy lifestyles among at-risk, vulnerable, and system-involved youth ages 18–25 in Anchorage, many from rural areas. The proposed approach integrates structured health navigation, clinic engagement, wellness outreach, and technology-enabled prevention and health promotion tools to address barriers to care and improve health engagement among vulnerable youth who are connected to rural communities. The project includes several integrated components. First, CHA will establish a Holistic Care Navigation team to support youth in accessing primary healthcare services and navigating the health system in Anchorage. Navigators will assist youth in scheduling appointments at CHA’s onsite Wellness Clinic (FQHC), operated by Southcentral Foundation, as well as other health providers in the community. Navigators will also help youth enroll in Medicaid or other health payor programs, arrange transportation, provide appointment reminders, facilitate behavioral health referrals, and support access to telehealth services when in-person care is unavailable. This structured navigation approach will increase utilization of primary care & behavioral health services while strengthening continuity of care. The project will also deploy a digital wellness engagement platform (Software-as-a-Service) that uses an “out of the box” solution with gamified wellness activities to promote wellness, healthy life style choices, education, physical activity, and mental wellness engagement. Youth will participate in wellness challenges and short health education missions designed to reinforce healthy lifestyle behaviors. A Youth Design Team comprised of CHA’s Youth Advisory Board will beta test the platform prior to launch to ensure the user experience is responsive to youth needs. An incentive management platform will also be integrated with the wellness engagement platform so that youth earn points for completing verified wellness activities, education modules, or skill-building tasks. Points can be redeemed for things such as gift cards and prizes, reinforcing sustained engagement in healthy behaviors. Finally, the project will incorporate the ACEs Aware Stress Busters framework, an evidence-based approach that helps young people build resilience and develop practical strategies for managing stress and improving mental well-being.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Covenant House Alaska	Planning for Rural Expansion of the Holistic Care Navigation & Wellness Engagement in the Y-K Delta	AK	Young adults ages 18-24 in Alaska who are system-involved, aging out of foster care, or experiencing housing instability face significant barriers accessing preventive health care, behavioral health services, and primary healthcare. These barriers are particularly pronounced for young people who are connected to rural and remote communities where geographic isolation, provider shortages, and transportation limitations reduce access to timely care. As a result, many young people delay seeking care until health concerns escalate, contributing to increased behavioral health crises, avoidable emergency department utilization, and untreated physical and mental health conditions. CHA has long standing relationships in the Bethel region through partnerships with Tundra Women’s Coalition, Bethel Community Foundation, and the Lower Kuskokwim School District. These relationships create an opportunity to explore how CHA’s Holistic Care Navigation and Wellness Engagement model could be adapted to rural settings. This planning project will assess community needs, strengthen partnerships, and design a coordinated approach that improves access to care, prevention resources, and wellness engagement for youth living in the Y-K Delta.	This planning project will develop a framework for expanding CHA’s Holistic Care Navigation and Wellness Engagement model into Bethel and rural communities in the Yukon–Kuskokwim Delta. The project will focus on partnership development, community engagement, and service model design rather than direct implementation. First, CHA will conduct structured planning conversations with regional partners including YKHC, Tundra Women’s Coalition, Bethel Community Foundation, the Lower Kuskokwim School District, and other local organizations that serve youth. These discussions will explore current service gaps, barriers to healthcare access, and opportunities to coordinate services for transitional age youth (ages 18-24) with regional health and service systems. Second, the project will explore how a care navigation model can support young adults in accessing preventive care, behavioral health services, and primary healthcare. Planning will assess whether a paraprofessional navigator or community health worker model can help increase utilization of primary health care services, assist youth in scheduling and keeping appointments, enroll in Medicaid or other healthcare payors, access telehealth services, and follow through with referrals. These roles may be embedded within community-based organizations or school systems depending on local capacity. The planning process will also explore how technology enabled wellness engagement tools can support prevention, health promotion and adopting healthy behaviors. CHA will assess the feasibility of deploying a digital wellness platform that allows young people to participate in wellness challenges, health education activities, and mental wellness engagement regardless of location. Input from end users will be solicited to help shape the design of these tools so that they reflect the interests and priorities of young people in the region, and to identify challenges and solutions for implementation. Finally, CHA will develop a rural implementation roadmap that includes defined partnerships, staffing models, technology requirements, and evaluation metrics. This planning process will ensure that any future implementation is grounded in community input, culturally responsive approaches, and strong cross sector partnerships.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area	Deferred or Not Advanced

Covenant Youth of Alaska	Aarigaa House: Fairbanks	AK	Rural Alaska young adults often leave home to pursue education or employment in hub communities like Fairbanks. In doing so, they lose daily connection to family, elders, and cultural anchors that sustain mental and physical health. Without stable housing and relational support, many struggle to establish healthy routines, access preventive care, or build resilience. Aarigaa Fairbanks represents an opportunity to intervene at this pivotal transition. By combining affordable housing, mentorship, shared meals, outdoor recreation, and trauma-informed leadership, CYAK addresses the root causes of poor health — isolation, instability, and disconnection — while strengthening lifelong habits of physical activity, nutrition, and mental resilience. This upstream investment supports both Healthy Beginnings and Healthy Communities priorities.	CYAK is in the process of purchasing and renovating a residential property (previously a bed and breakfast) in Fairbanks to expand the proven Aarigaa House model previously operated there and currently thriving in Anchorage near UAA's campus. The approach includes five integrated elements: 1. Safe, Flexible Space Renovations will ensure code-compliant, welcoming residential space with areas adaptable for wellness workshops, shared meals, physical activity, and visiting mentors. The home will function as dual-purpose living and community space. 2. Relational Workforce Development A full-time Resident Director will live on-site, providing daily mentorship, structured rhythms, and accountability. Staff will receive training in trauma-informed care, suicide prevention, de-escalation, and intercultural competency — strengthening Alaska’s rural-support workforce pipeline by providing residents with support and encouragement as they pursue education or employment. 3. Healthy Habit Formation Residents participate in shared meal planning and preparation, outdoor recreation, service projects, and structured community gatherings that build mental resilience, nutrition awareness, and active lifestyles consistent with prevention-focused health goals. 4. Strategic Partnerships CYAK will coordinate with UAF, local organizations, Tribal organizations, and health providers in Fairbanks and rural communities to create referral pathways and collaborative programming. 5. Technology & Statewide Connection Secure connectivity will allow tele-mentoring, remote engagement with Alaska Native leaders and elders, and facilitate access to behavioral health or primary care consultations when needed. This model strengthens community-based preventive infrastructure while preserving local voice and cultural identity.	\$250K-\$1M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough	Deferred or Not Advanced

Covenant Youth of Alaska	Community and Wellness Catalyst	AK	Many rural Alaska communities continue to experience the long-term effects of historical trauma, cultural disruption, and rapid social change. Early 20th century epidemics dramatically reduced populations and disrupted the transmission of cultural knowledge, family structure, and community leadership. Subsequent economic and cultural shifts further accelerated these changes. Today, many communities are actively seeking ways to strengthen wellness, prevent substance abuse, and restore healthy community rhythms rooted in culture, relationships, and shared responsibility. This project responds to that opportunity by supporting community-led wellness efforts that strengthen protective factors and interrupt destructive coping patterns. Through cultural gatherings, mentorship, service to elders, and weekly community connection practices, the project aims to restore bonds of trust, strengthen identity and agency, and promote healthy lifestyles across generations.	This project focuses on prevention, collaboration, and strengthening community-based wellness practices. The initiative will begin with a culturally grounded entry process that honors local leadership and prioritizes listening, relationship building, and collaboration with Tribal, church, and community leaders. The program will launch with a regional cultural gathering designed to catalyze a movement of wellness. Participants from multiple communities will come together to share cultural practices, explore personal and community identity, and strengthen bonds of trust. The gathering will include cultural exchange through songs, dances, storytelling, outdoor activities, and small-group talking circles that create space for reflection, connection, and healing. Activities will emphasize culturally meaningful practices such as gathering food from the land and water, serving elders, and participating in traditional forms of community life. These activities promote physical activity, cultural identity, and intergenerational connection. Following the gathering, participants will enter an eight-week season of weekly wellness practices supported through local gatherings, mentorship relationships, and digital connection. Participants will be encouraged to identify personal goals related to health, sobriety, relationships, and community service. Seven community coordinators will be hired to facilitate weekly potlucks or gatherings in partnership with local institutions such as schools, churches, or Tribal facilities. Coordinators will help participants stay connected, encourage mentoring relationships, and assist individuals who wish to access professional behavioral health services. The program will conclude with community feasts celebrating progress and reinforcing community bonds.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Kenai Peninsula Borough; Kusilvak Census Area; Matanuska-Susitna Borough; Nome Census Area	Deferred or Not Advanced

Covenant Youth of Alaska	Connected Communities: Rural Alaska Behavioral Health Access Initiative	AK	Rural Alaska communities face significant barriers to accessing behavioral health care. Alaska Native youth experience some of the highest rates of suicide, depression, trauma exposure, and substance abuse in the nation. Yet many villages have limited or inconsistent access to behavioral health professionals, prevention training, and early intervention resources due to their geographic isolation. Making in-person training, services, and professional collaboration difficult and costly. As a result, youth, families, and community leaders often lack access to practical mental health education and tools that could help address challenges before they escalate into crisis. Research consistently shows that youth in distress are most likely to confide in peers before approaching professionals. This creates an opportunity to equip youth and young adults with skills to recognize warning signs, respond appropriately, and connect peers with trusted adults or professionals. Additionally, rural Alaska faces a critical shortage of practitioners. Many communities rely on visiting providers or services that are difficult to access. This project addresses both challenges by expanding community access to behavioral health education while intentionally exposing youth and young adults to behavioral health career pathways. By strengthening prevention skills and inspiring future professionals, the project supports both immediate community needs and long-term workforce development in rural Alaska.	This project expands behavioral health education, training, and workforce exposure for youth, young adults, and families in rural Alaska through a technology-enabled community model. Participating villages will receive a technology package and technical support that enables them to host virtual trainings, peer support groups, and professional engagement in a shared community space. Each community will also identify a local coordinator responsible for organizing gatherings, promoting participation, and supporting program activities. Once infrastructure is established, the program will operate through four core components: 1. Community Behavioral Health Training Regular virtual training sessions will provide practical education for youth, families, and community leaders. Topics may include grief and loss, suicide prevention, trauma awareness, substance abuse prevention, Adverse Childhood Experiences (ACEs), and Mental Health First Aid. These trainings help communities recognize warning signs early and respond effectively to behavioral health concerns. 2. Peer-to-Peer Youth Support Training Youth leaders will receive Mental Health First Aid and suicide prevention training, equipping them to recognize warning signs among peers, offer appropriate support, and connect individuals with trusted adults or professionals when needed. 3. Annual Rural Alaska Virtual Behavioral Health Summit A statewide virtual summit will connect rural communities with behavioral health professionals, educators, and prevention resources. The summit will share current research, practical tools, and culturally responsive strategies for supporting behavioral health in rural communities. 4. In-Person Rural Behavioral Health Provider Summit An annual in-person gathering will bring together behavioral health providers serving rural Alaska to share best practices, strengthen collaboration, and explore innovative approaches to care delivery in remote communities. Youth and young adult participants will engage with providers to learn about education pathways and career opportunities in behavioral health. Together, these components strengthen prevention, increase access to training and professional expertise, and help develop the next generation of behavioral health professionals serving rural Alaska communities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Kenai Peninsula Borough; Kusilvak Census Area; Matanuska-Susitna Borough; Nome Census Area	Deferred or Not Advanced

Criterion Healthcare	Statewide Rural Hospital Facility Assessments and Management Technology for Sustainable Access	SC	The State of Alaska’s RHTP priorities, specifically Initiative #2 Health Care Access, emphasize the urgent need to identify and prioritize rural facility renovations for completion by 2030. Currently, rural infrastructure decisions often occur in a vacuum; the opportunity is to replace fragmented, reactive maintenance with a standardized, statewide evaluation framework. By utilizing a consistent team of experts to perform FCAs, we ensure that infrastructure deficiencies are measured against the same yardstick across all 13 CAHs. This comparable data is essential for the DOH to effectively and equitably prioritize the 20% of RHTP funds capped for capital expenditures. Furthermore, the integration of Maintenance Management Software (MMS) provides a bridge between high-level state planning and local hospital operations. By providing hospitals with active data and unlimited software access through 2030, we empower administrators to shift from emergency repairs to proactive capital planning across 2, 5, and 10-year horizons. This foresight is critical for remote facilities, where the logistical costs of "urgent" procurement are often prohibitive and unavoidable. The Project culminates in the annual "Condition of Rural Hospitals in Alaska" report. This deliverable provides the DOH with a robust, data-backed investment plan to allocate RHTP funds to the most financially critical hospitals, ensuring that facility health never becomes a barrier to patient care.	Criterion utilizes a technology-driven, six-step framework to establish a comprehensive facility management and capital planning process. This approach is designed to evaluate and prioritize critical repairs at both the individual hospital and state levels through the following phases: Phase I: Strategic Alignment and Baseline Discovery • The project begins with direct engagement with the DOH to align objectives and confirm the scope, which primarily focuses on the 13 CAHs, but may expand to regional centers like the 39-bed rural hospital in Bethel. • To ensure site visits are high-impact, the Team first surveys the hospitals to collect existing data on facility conditions, capital initiatives, and any renovation or expansion plans, and if a facility management software is used. Phase II: The Technical Deep-Dive (Facility Condition Assessments) • Criterion deploys a specialized team of senior-level engineers and design professionals to conduct week-long, on-site Facility Condition Assessments (FCAs). Unlike standard visual inspections, this technical evaluation investigates concealed infrastructure—including systems above ceilings, exterior walls, roofs, etc. —while benchmarking diagnostic and treatment rooms against national Facility Guidelines Institute (FGI) standards. Phase III: Digital Integration and Operational Sustainability • The data gathered during the FCAs forms the foundation of a customized Maintenance Management Software (MMS) implementation for each hospital. This system automates and documents preventive maintenance, repairs, and replacement activities. By digitizing these workflows, hospital administrations gain a transparent overview of facility needs and associated costs, moving away from reactive "emergency" repairs and toward active capital planning. Phase IV: Statewide Synthesis and Long-Term Oversight • In the final phase, Criterion aggregates data from all individual FCAs to produce a landmark statewide report: “The Condition of Rural Hospitals in Alaska”. This report provides the DOH with a prioritized roadmap of critical capital needs, timelines, and cost estimates across the rural health system. To ensure this data remains actionable, Criterion will monitor these facilities and deliver updated annual reports to the DOH through 2030.	\$1M-\$5M	Statewide	Bristol Bay Borough; Chugach Census Area; Dillingham Census Area; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Sitka (City and Borough); Southeast Fairbanks Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

Cross Road Health Ministries, Inc.	Glennallen Rural Clinic Infrastructure and Medical Staff Housing Renewal	AK	Rural healthcare facilities in Alaska must operate in extreme weather conditions and remote environments where reliable infrastructure is essential to maintaining healthcare services. The Glennallen clinic campus provides healthcare services to residents of the Copper River Basin and surrounding communities but relies on aging infrastructure systems and building components that require replacement and rehabilitation. The campus includes the primary healthcare clinic as well as housing used by medical staff. In rural Alaska communities where housing availability is extremely limited, staff housing is essential for recruiting and retaining healthcare providers. Aging building components—including windows and doors in both the clinic and housing units—must be replaced to maintain safe, energy-efficient facilities capable of withstanding severe winter conditions. Critical infrastructure systems serving the campus are also approaching the end of their useful life. These include the central boiler system serving the clinic and aging water and sewer lines that support both the clinic facility and staff housing. This project will also support engineering and architectural assessment of the clinic facility to guide additional improvements needed to sustain healthcare services in the future. Addressing these infrastructure and facility needs will help ensure the Glennallen clinic remains a reliable healthcare hub for rural communities.	Cross Road Health Ministries will implement a phased infrastructure improvement project at the Glennallen clinic campus designed to strengthen the reliability of healthcare services and medical staff housing. The first phase of the project will address critical building and infrastructure systems that have reached the end of their useful life. This work will include replacement of aging windows and exterior doors at both the clinic facility and staff housing units. These improvements will strengthen building integrity, improve energy efficiency, and ensure facilities can withstand severe winter conditions common in Interior Alaska. This phase will also include replacement of the central boiler system serving the clinic facility, as well as replacement of water and sewer lines that support both the clinic building and staff housing units. These upgrades will improve system reliability and reduce the risk of service disruptions caused by infrastructure failure. During the first year, engineering and architectural assessment of the Glennallen clinic will also be conducted to develop plans for a future renovation project intended to modernize the clinic facility and improve clinical space functionality and patient flow. If funding becomes available, the second phase of the project would implement renovations identified through the engineering and architectural planning process. These improvements would support long-term sustainability of healthcare services at the Glennallen clinic. Construction activities will be coordinated carefully to minimize disruption to clinic operations. If necessary during limited construction periods, temporary use of mobile clinic capability may be utilized briefly to ensure patient services remain available. Together, these improvements will strengthen the reliability of the Glennallen clinic campus and support continued healthcare access for rural communities across the region.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Southeast Fairbanks Census Area	Advance to Implementation Application

Cross Road Health Ministries, Inc.	Rural Clinic Access, Technology, and Communications Resilience Project	AK	Rural communities served by Cross Road Health Ministries’ clinics in Glennallen and Delta Junction face significant barriers to timely healthcare due to geographic isolation, long travel distances, severe weather conditions, and limited healthcare infrastructure. Residents across the region often travel several hours to reach hospitals or specialty providers in Fairbanks or Anchorage, and transportation disruptions can delay access to care. Rural clinics must also maintain reliable clinical equipment, communications systems, and power infrastructure to coordinate patient transfers, consult with specialists, and respond to emergencies. Aging equipment, limited telecommunications redundancy, and power interruptions can create operational vulnerabilities that disrupt care delivery. In addition, many remote communities within the service region have limited ability to travel to clinic locations for preventive screenings or routine healthcare services, further contributing to delayed diagnosis and treatment. This project addresses these challenges by modernizing clinical equipment, expanding telehealth capability, deploying mobile clinic units to reach remote communities, and strengthening operational resilience through emergency communications systems and backup power infrastructure. These improvements will expand access to care, improve coordination with regional healthcare partners, and help ensure clinics remain operational during disruptions.	Cross Road Health Ministries will implement coordinated technology, infrastructure, and access improvements at its Glennallen and Delta Junction clinics to expand healthcare access and strengthen operational resilience across the region. The first component will modernize clinical equipment used for patient assessment and preventive screening. New equipment—including blood pressure kiosks, vital signs monitors, audiology screening equipment, ADA-accessible exam tables, and updated laboratory chairs—will improve diagnostic capability, increase patient accessibility, and support earlier identification of chronic health conditions. The second component will expand healthcare access through deployment of two mobile clinic units equipped with laboratory capability. These mobile clinics will allow providers to deliver preventive care, screenings, and basic diagnostic services directly in remote communities that cannot easily travel to Glennallen or Delta Junction. To support these services, the project will include two service vehicles at each clinic location to transport medical staff, equipment, and supplies for mobile clinic operations and community outreach. These mobile clinic services will allow Cross Road Health Ministries to expand preventive and diagnostic care beyond traditional clinic walls and strengthen healthcare access throughout the broader service region. The third component will strengthen clinic technology systems by improving electronic health records, telehealth connectivity, and secure data exchange with specialists and referral providers. The fourth component will improve operational resilience through installation of High Frequency (HF) radio communications systems and backup electrical generators at both clinic locations. These systems will allow clinics to maintain communication with referral providers and emergency medical services and continue clinical operations during telecommunications or power disruptions. The final component will implement upgraded accounting and supply management software to improve financial oversight, inventory management, and supply tracking across both clinic locations. Together, these improvements will expand healthcare access, strengthen clinic operations, and improve reliability of healthcare delivery for rural communities served by the Glennallen and Delta Junction clinics.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Southeast Fairbanks Census Area	Advance to Implementation Application

Cross Road Health Ministries, Inc.	TeleSpecialist Access and Rural Urgent Care Stabilization Model	AK	Rural communities served by Cross Road Health Ministries face significant barriers to accessing urgent and specialty care due to geographic isolation, long travel distances, and limited local medical resources. Residents across the Copper River Basin often travel several hours to access specialty providers or higher levels of care in larger communities such as Fairbanks or Anchorage. Severe weather, transportation delays, and seasonal road hazards can slow travel and medical transport. When patients experience urgent medical conditions, local providers must assess and stabilize patients while coordinating transfer to higher levels of care when necessary. Rural clinics often operate without on-site specialty expertise. Providers must make complex clinical decisions without immediate access to specialist consultation, which can delay treatment decisions and increase the burden on rural providers. This project addresses these challenges by implementing a TeleSpecialist-supported care model that allows providers to consult with specialists and referral providers in real time. Telehealth consultations will support clinical decision-making, help stabilize urgent care patients, and reduce unnecessary patient travel. HF radio communications capability will also ensure clinics maintain coordination with referral providers, emergency medical services, and healthcare partners during telecommunications disruptions.	Cross Road Health Ministries will implement a TeleSpecialist-supported care model at its Glennallen and Delta Junction clinics to improve access to specialty consultation and strengthen the clinics’ ability to manage urgent care situations. The first component of the project will establish telehealth consultation capability within each clinic. Existing clinical rooms will be equipped with telehealth technology that allows providers to connect with specialists and referral providers located in Fairbanks, Anchorage, and other locations. During normal clinic hours, providers will be able to consult with specialists in real time to support diagnosis, treatment planning, and patient management. The second component will focus on strengthening the clinics’ ability to stabilize urgent care patients when transfer to higher levels of care is required. Providers will use telehealth consultation with specialists to assist with clinical decision-making and patient stabilization while coordinating transport when needed. The third component will establish resilient HF radio communications capability at both clinic locations. HF radio communications systems will ensure clinics maintain communication with referral providers, emergency medical services, and healthcare partners during telecommunications disruptions. Staff training will ensure providers and support staff are comfortable using telehealth systems, stabilization protocols, and communications equipment. Regular testing of communications systems will be incorporated into emergency preparedness and continuity-of-operations planning.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Southeast Fairbanks Census Area	Advance to Implementation Application

Cross Road Health Ministries, Inc.	Glennallen and Delta Junction Community Health, Prevention, and Rehabilitation Initiative	AK	Rural communities across Interior Alaska face higher risks of chronic disease due to limited access to preventive healthcare services, rehabilitation resources, and wellness programs. Residents served by the Glennallen and Delta Junction clinics often travel long distances to access physical therapy, preventive health programs, and education that supports chronic disease prevention and recovery from injury. Without local access to rehabilitation services and preventive health programs, individuals recovering from injury or surgery may experience delayed recovery, reduced mobility, and increased risk of long-term disability. Limited access to preventive care also contributes to higher rates of chronic conditions such as diabetes, tobacco-related illness, and cardiovascular disease. Food insecurity also affects some rural households and can make it difficult for residents to maintain healthy diets needed to manage chronic health conditions. This project will address these challenges by expanding physical therapy and rehabilitation services, strengthening prevention programs focused on diabetes prevention, tobacco cessation, and weight management, and supporting community partnerships that promote wellness, healthy activity, and improved access to nutritious foods. These combined efforts will improve health outcomes and strengthen long-term community wellness across Interior Alaska.	Cross Road Health Ministries will implement a coordinated community health initiative that expands prevention programs, rehabilitation services, and wellness education across Interior Alaska communities served by the Glennallen and Delta Junction clinics. The first component of the project will expand rehabilitation and physical therapy services by adding equipment and resources that allow patients to receive therapy locally. These services will help individuals recovering from injury, surgery, or chronic conditions improve mobility and maintain independence without traveling long distances for care. The second component will strengthen prevention programs focused on reducing chronic disease risk. Education and support services will address diabetes prevention, tobacco cessation, weight management, and healthy lifestyle choices. These programs will help residents better manage health risks and improve long-term health outcomes. The third component will support community wellness initiatives including youth physical activity programs, community fitness activities, and health education partnerships with local schools and community organizations. The fourth component will support local food security partnerships that help improve access to nutritious foods for rural residents. By improving access to healthy food options and providing nutrition education, the project will help support healthier diets and improved management of chronic conditions. Together, these coordinated efforts will strengthen prevention, rehabilitation, and wellness services available to residents of Interior Alaska. Community wellness programming may also include peer-support groups and behavioral health support activities that provide additional resources for individuals managing stress, lifestyle changes, and chronic disease prevention goals. These activities will complement prevention programs focused on diabetes prevention, tobacco cessation, weight management, and healthy living.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Southeast Fairbanks Census Area	Deferred or Not Advanced
