Cross Road Health Ministries, Inc.	Glennallen and Delta Junction Rural Healthcare Workforce Development and Training Pipeline	AK	Healthcare workforce shortages remain one of the most significant challenges affecting rural healthcare delivery in Alaska. Clinics serving remote communities often struggle to recruit and retain providers, nurses, medical assistants, and other healthcare professionals needed to maintain consistent services. For rural clinics such as those operated by Cross Road Health Ministries in Glennallen and Delta Junction, workforce shortages can limit service availability and increase strain on existing providers. Geographic isolation and limited training opportunities make it difficult for local residents to pursue healthcare careers while remaining in their communities. At the same time, many rural residents are interested in healthcare careers but lack access to training opportunities that allow them to gain experience and enter the healthcare workforce. This project addresses these challenges by establishing a workforce development pipeline that provides internships, mentorship, and training opportunities for individuals interested in healthcare careers. By supporting the development of local healthcare professionals, the project will strengthen workforce stability and improve access to healthcare services across the region. In addition to hands-on internship experiences, the program will support pursuing recognized healthcare training and certifications.	Cross Road Health Ministries will implement a workforce development initiative designed to train and support healthcare professionals serving rural communities in Glennallen and Delta Junction. The first component of the project will establish internship and training opportunities that allow students and community members to gain hands-on experience in rural healthcare settings. Participants will work alongside clinic staff and learn practical skills related to patient care, clinic operations, and healthcare administration. In addition to hands-on internship experiences, the program will support participants pursuing recognized healthcare training and certification pathways where appropriate. These may include training programs for medical assistants, community health workers, rehabilitation support staff, and other rural healthcare support roles. By helping participants move toward recognized certifications and career pathways, the program will strengthen the long-term healthcare workforce serving Glennallen and Delta Junction. The second component will provide mentorship and professional development opportunities for individuals pursuing healthcare careers. Experienced providers and healthcare staff will guide participants as they develop skills and explore career pathways within healthcare fields. The third component will focus on training in areas where rural clinics experience workforce shortages, such as medical assistants, clinic support staff, rehabilitation services, and health program coordination. The final component will focus on retaining healthcare professionals in rural communities by creating pathways for local residents to build healthcare careers while remaining in their communities. The program will prioritize opportunities for local students and community members interested in healthcare careers and will expose participants to a variety of healthcare roles including clinical support, rehabilitation services, and health program coordination.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Southeast Fairbanks Census Area	Deferred or Not Advanced
Cube Mobile Imaging	Mobile MRI or CT trailer to deploy at rural imaging clinics	MI	Our company wants to help alleviate the backlog of hospitals and imaging clinics facing challenged with medical imaging	We would work with a hospital or imaging clinic to prep one of our mobile medical trailers for immediate deployment. we would then coordinate logistics to getting the mobile MRI or CT onsite and work with the site to provide service and other needs to ensure they can efficiently scan patients and work through backlog they may have	\$50,000-\$250,000	Hospital	Statewide	Anchorage (Municipality); Dillingham Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough	Deferred or Not Advanced

Curyung Tribal Council	Chythlook: A Culturally Grounded Peer Support Workforce for Rural Alaska	AK	Alaska's current peer support specialist training curriculum does not reflect the cultural, geographic, or service realities of rural Alaska. Existing curriculum draws from models developed outside the state by professionals unfamiliar with Alaska Native communities that are traditionally practiced across villages and small rural communities. These models assume access to treatment centers, therapists, and recovery meetings that simply do not exist in many parts of Alaska. More than 60% of Alaska communities are not connected to the road system. Alaska lost 357 people to drug overdoses in 2023 — the highest number ever recorded in the state. Alaska Native communities experience suicide rates two to three times higher than the national average, reflecting the long-term impacts of historical trauma and persistent gaps in culturally relevant services. Alaska Native communities are disproportionately affected by substance use and overdose deaths, yet Alaska Native leaders and rural residents remain significantly underrepresented in the systems that train and certify peer support specialists. Healing in many Alaska communities happens through relationship, connection, and accountability to community. Peer specialists are often the most trusted individuals to provide that support. Yet many rural Alaskans with lived experience and cultural knowledge have never had access to peer specialist training or certification. There is a disconnect that needs to be addressed.	This initiative will address the gap between Alaska's current peer support training system and the realities of rural communities by building a statewide, culturally grounded peer training infrastructure. Phase 1 — Curriculum Development: The first phase will convene rural Alaskan Indigenous leaders, elders, peer specialists, and rural behavioral health practitioners to redesign the Alaska Peer Support Specialist curriculum. The curriculum will be written by community experts whose knowledge comes from lived experience, cultural practice, and decades of recovery work in rural Alaska. The redesigned curriculum will integrate Alaska Native healing traditions, land-based wellness practices, traditional plant knowledge, community accountability models, and relationship-centered recovery alongside current best practices in peer support, trauma-informed care, and harm reduction. Phase 2 — Regional Trainings and Program Launch: Once the curriculum is developed, it will be delivered through six regional multi-day training events across Southeast Alaska, Southwest Alaska, and Northern Alaska. Training locations will serve as regional hubs for surrounding villages and rural communities. Participant travel support will ensure individuals from remote communities are able to attend. Trainings will be co-facilitated by experienced peer specialists and local cultural leaders. Phase 3 — Statewide Expansion: Following the initial trainings, the initiative will expand access to certification through a train-the-trainer model that builds regional training capacity. Graduates and partner organizations will be supported to deliver additional trainings within their own regions. Phase 4 — Sustainability and Integration: The final phase will focus on integrating the redesigned curriculum into statewide peer certification systems, tribal health programs, and regional behavioral health organizations, creating a sustainable pathway for growing Alaska's rural peer support workforce	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Dahl Memorial Clinic, Inc.	Remote Emergent Health Services the Skagway Borough	AK	Between 2024 and 2025, the volume in our emergency services department increased by 195%, exceeding the budget by \$1.5 million dollars. Only two months into 2026, we continue to see an increased pressure on emergent services (350% over last year in January and 174% in February). In order to sustain emergent healthcare in the north end of Lynn Canal, it is essential that the DMC hire at least one additional medical provider team (ie. Medical Provider, Registered Nurse, and a Medical Assistant) to remain on-call between May 1st and September 30th, 2026. The need is immediate and pressing. Without this, access to life saving medical care and the sustainability of that care will be compromised.	Dahl Memorial Clinic is a member of the Alaska Primary Care Association. Within that organization are 27 Federally Qualified Health Centers (FQHC) and 2 Look-Alikes. Of that membership, 7 Community Health Centers (CHC) face the same challenges and immediate need as the DMC as well all provide 24/7 emergent services with long distances between our clinics and a hospital and without the ability to bill properly for our services. Our approach, as a group, is twofold: first, we will submit a LOI as individual clinics to address the immediate need, and second, we will submit a larger LOI to ask for system change to address this critical need making it sustainable in the coming years. The issues faced by our clinics are identical: 1) reliance on emergency air transport, 2) limited billing capacity, 3) limitations in specialty care, and 4) the high cost of care in a remote area. Continuing to provide life saving medical services in remote areas through FQHCs is untenable statewide without significant change. This Letter of Intent, the "Remote Emergent Health Services the Skagway Borough" is to request immediate funding so that the Clinic can provide emergent medical services, including psychiatric and emergent behavioral health intervention, in a remote region of Alaska being overrun by medical need. The DMC has been in operation for 20 years and responded successfully to a fairly stable, annual demand of injury, disease, and emergency medicine. The Clinic is both the medical clinic, and morgue, and has never encountered sudden, massive increase in demand for emergent services as it has in the last two years. Historically, the DMC has three medical providers working daily in the winter months, and five in the summer months. The unprecedented increase in demand between 2024 and 2025 has provoked much concern from the Clinic and the Municipality of Skagway for emergent services in the Borough.	\$50,000-\$250,000	Federally qualified health center	Single Community	Skagway (Municipality)	Advance to Implementation Application

Dahl Memorial Clinic, Inc.	Remote Emergent Services Sustainability in Community Health Centers	AK	The Remote Emergent Services in Community Health Centers seeks to transform the current system of care in remote areas to provide sustainable access to emergent health and behavioral healthcare. FQHCs are not licensed Emergency Rooms and currently may only bill as clinics. Further, because they are not a 'destination point' of service according to insurance companies, even the ambulance ride to the clinic is not covered by insurance. They provide the services out of necessity, but cannot be reimbursed. Licensed Emergency Rooms are able to provide the level of care they provide because they can bill professional codes, facility codes, and Evaluation and Management Codes all on the same bill and insurance companies reimburse for those services. Further, because the clinics in question are remote, the vast majority of patients are sent by air to a higher level of care. Inclement weather, Civil Twilight airport limitations, and the availability of air assets are a significant barrier to these services, often leaving patients for extended periods of time being provided services, such as observation and management, for which the clinic cannot bill or be compensated. Medical professionals providing these services are on-call, providing a demanding level of clinical care, at extreme cost without the capacity for the clinic to bill for the life saving services provided.	The Remote Emergent Services Sustainability in Community Health Centers (CHC) is a multi-year proposal with a defined approach and the first phase ready for launch. The proposal is: 1. First Year System Adjustments and Data Collection: In 2026, a grant is designated specifically for remote Community Health Centers providing 24/7 emergent services. The fund will do two things: a. Clinics that provide remote (defined) 24/7 emergent care (defined) would be able to bill Current Procedural Terminology (CPT) and Healthcare Common Procedure Coding System (HCPCS) codes, facility codes, Evaluation and Management Codes, and professional services codes which are currently uncompensated, through the grant, and b. A contractor/monitor will be identified by the Department of Health (DOH), and paid, for financial auditing and collecting data on patients and medical outcomes. i. A dataset (defined) will be reported with each claim that will: 1. Compare current reimbursement with the extended reimbursement; 2. Specifically quantify actual cost of care (list of metrics); and 3. Provide specific demographics for the claims. ii. Each claim will be tracked and outcomes will be reported. c. An extensive cost benefit analysis will be compiled in the 4th quarter, with cooperation of the contractor/monitor, showing DOH/CMS cost effectiveness, outcomes, and sustainability. 2. Second Year System Adjustments and Data Collection: In 2027, based on the findings of 2026, the billing authorization process and flexibility will be adjusted for any further limitations, recommendations, or negative findings. a. Repeat Year One Process 3. Third Year Waiver/System Change: based on the findings of 2026/27, DOH and APCA will have information necessary to request a wavier to CMS and HRSA and, through this waiver, effect long-term system change. The waiver would introduce a facility type for CHCs that provide remote, emergent care. This wavier could look something like the Frontier Extended Stay Clinic (FESC) waiver but should include: a. The ability for CHCs providing this type of care to bill against facility codes, at a sustainable rate, for services provided and be reimbursed by insurance companies for the care. b. Funding for medical oversight of this wavier, potentially including payment for a Medical Doctor and specialty care.	\$1M-\$5M	Federally qualified health center	Statewide	Aleutians East Borough; Aleutians West Census Area; Bristol Bay Borough; Copper River Census Area; Haines Borough; Skagway (Municipality)	Advance to Implementation Application

Dahl Memorial Clinic, Inc.	Aging Alaskans in Community	AK	The envisioned senior center will have 1) a senior center offering senior lunches, activities, education, and engagement opportunities, 2) a pharmacy (already open), 3) a walk-in medical clinic for individuals over 65, 4) home health services delivered from the building, and 5) three ground-level assisted living home efficiency apartments for individuals needing non-complex, assisted living. The Portland House is a two-story, 5,000 square foot facility with apartments upstairs and offices, a pharmacy, and space for the senior center and clinic on the ground floor. The structure is on the corner of 5th and State Street and in the historic district of Skagway, AK. The Municipality of Skagway has designated funding furnishings for the senior center after the completion of the renovation, which is already underway. Additionally, this location has one of the few empty lots still available in the Skagway historic district. While the assisted living home apartments are envisioned to be built on that lot, this request is NOT for funding for those apartments, only the completion of the senior center itself so that services, including home health and the drop-in clinic, can begin.	In 2015, at the bequest of residents, the Municipality of Skagway commissioned a study through the Foraker Group (completed by Sheinberg Associates) to plan the building of a senior center. Further, they designated a site (a municipal lot on 11th and Broadway Street) as the site. While the study indicated a senior population growing at a greater rate than any other town in Alaska, greater than the average of the State of Alaska, and greater than the U.S. average with significant growth between 2025 and 2040, the funding eventually fell through and nothing was officially accomplished. A grass-roots movement has kept the discussion alive and with the donation of a structure and staffing provided by the Clinic, the potential to open for services this summer is very real. Unfortunately, there a few up-front costs that remain unfunded, namely: 1) a liability insurance policy to cover the first year of operations (after that, billing will pay for coverage), 2) a few remaining one-time cost renovation projects (ie. finishing the floor in the 1,200 square foot space, the purchase of computers and office equipment, and finishing the administrative office space of 300 square feet,) and 3) hiring an initial front desk staff to open the facility as gap funding prior to grants and billing providing income.	\$50,000-\$250,000	Federally qualified health center	Single Community	Skagway (Municipality)	Deferred or Not Advanced

Dahl Memorial Clinic, Inc.	Dahl Memorial Partnership	AK	Non-profit service providers often partner with non-profit real estate holding and development companies under Section 501 of the US Internal Revenue Code specifically to hold and maintenance property for a 'parent organization.' This removes the administrative and financial burden of property management, maintenance, risk of litigation, and insurance from the services provider (in our case a medical and behavioral health service) and places it on a non-profit organization with expertise in facility management. This is an imperative arrangement for many small clinics who, when they do not have such an arrangement, must hire or contract for maintenance services separately from the services they offer. In Skagway, this need is even greater as there are few blue collar professionals in the community (ie. there is no plumber or electrician that lives in Skagway) leaving staff at the clinic with the responsibility of fixing frozen pipes when their expertise and need is to see patients. Often, in clinics like Dahl Memorial, this leads to significantly higher costs in building maintenance and an inefficient use of personnel, reducing the number of patients that can be seen and putting the facility at risk of damage which often evolves into a barrier to seeing patients altogether.	Dahl Memorial Clinic has partnered with the Smith and Long Development Corporation as our property owner and manager. The Clinic will continue to provide medical, dental, and behavioral health care free from the cost and burden of maintenance, while Smith and Long will hold title and maintain those properties, and procure or develop new properties as programming at the Clinic expands.	\$50,000-\$250,000	Federally qualified health center	Single Community	Skagway (Municipality)	Deferred or Not Advanced

Dahl Memorial Clinic, Inc.	Three Eagles Recovery	AK	Alcohol misuse remains one of Alaska’s most pressing public health challenges. High prevalence of excessive drinking: According to the America’s Health Rankings 2023 data, 18.4% of adults in Alaska report excessive drinking (defined as binge or heavy alcohol use, the latter being more than eight drinks per week for females or 15 per week for males). Data from the National Institute on Alcohol Abuse and Alcoholism (NIAAA) indicates that in 2023, Alaska ranked 13th among all states in alcohol consumption. Disparities among Alaska Native communities: National data shows Alaska ranks high for excessive drinking among American Indian/Alaska Native adults, with roughly 20.6% reporting binge or heavy drinking—significantly above healthier state averages. In fact, The Recovery Village reports 17.5 percent of Native Americans and Alaska Natives needed alcohol or illicit drug treatment, compared to 9.3 percent of people of other races and ethnicities. Youth risk behavior indicators: Data from Recover Alaska’s DASH Printout shows that alcohol use initiation before age 13 and youth binge drinking remain serious concerns for Alaska communities—a leading indicator of long-term misuse in adulthood.	Skagway is a small community on the north end of Lynn Canal in Southeast Alaska, best known for its colorful history and the Klondike Goldrush. It is remote enough to offer a secluded space, away from the pace of city life, yet close enough to amenities, including medical services, to provide the perfect place for recovery. More importantly, for the treatment model, Skagway is situated ideally for spectacular outdoor access. During the Klondike Gold Rush, thousands of men and women completed the journey from Dyea, Alaska (in Skagway Borough) to Lake Bennett, British Columbia. Today, the Chilkoot National Historic Trail is a 33-mile recreational trail with oversight of the National Park Service and provides unparalleled outdoor experience with an emphasis on history and human endurance over hardship. The Three Eagles Recovery Center seeks to capitalize on this history and message of resilience as a backdrop for therapeutic recovery from the ravages of substance abuse. The program will use Nature Informed Therapy as the basis of treatment, and a partnership with the US Parks Service and the Municipality of Skagway for the provision of trail maintenance as employment training services. As an 3.1 Level Recovery program, Three Eagles Recovery will be staffed by qualified medical and behavioral health professionals with additional professional experience and certification in Trailbuilding and National Outdoor Leadership. Curriculum and treatment plans will be built around outdoor excursions that focus on individual resilience and giving back to the community through trail maintenance of the extensive trail network in and around Skagway. Physical work, licensed education (as appropriate), Medically Assisted Treatment (MAT as appropriate), environmental education, and Nature-Informed Therapy (NIT) will be blended to build self-esteem and social skills, helping individuals process emotions and develop the resilience necessary to overcome their addiction. This approach has been proven successful as published in many professional journals including Recovery Horizons: Nature-Based Activities as Adjunctive Treatments for Co-Occurring Post-Traumatic Stress Disorder and Substance Use Disorders, published through the National Institute of Health in 2024. Such programs currently exist in partnership with the US Parks Service and have a template and process for implementation.	\$50,000-\$250,000	Federally qualified health center	Statewide	Skagway (Municipality)	Deferred or Not Advanced

Dataflow/Alaska Inc	Help on Call	AK	The Problem: Demographics, Distance, Culture and Lifestyle Healthcare is about humans. Modern healthcare interaction and delivery is through a variety of outsourced systems such as patient portal accounts, mobile apps, providers often expecting the customer to do their own work of creating and maintaining accounts, medical records, understanding forms, medical terminology (Do you have signs of edema? What is edema?). Customers often get help from a variety of 1-800 numbers with varying limited office hours, sometimes answered by outsourced impatient people with heavy accents.	"Responsive Help on Call" - DataFlow runs help desk services focused on warm responsiveness. This means answering on the second ring, avoiding a caller queue, simplify interaction with complex systems and organizations via hand-holding, independent validation and verification of statistics related to effectiveness and closure. We will help establish or assist other organization in combined services to ensure a 7-day/week 6am-midnight, highly-responsive help center that assists users throughout rural Alaska with electronic forms, discuss the meanings of fields. We will experiment with voice-call routing technologies and partner with each tribal group for young candidates to create village-level internships in auditing and data processing-related employment in the village. The scope of services is similar to patient intake, offering over the phone hand-holding assistance completing online forms. In cases where a user does not have a computer or a system is down, we will interact with the user to complete the form for them on their behalf. When a healthcare practitioner with the same systems we'll also assist them with the forms or get the systems reset over the phone so they can get back to focusing on the patient.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Dataflow/Alaska Inc	Village Technology Sustainment Center	AK	Dataflow/Alaska would like to be instrumental in creating a "Village technology sustainment center", which would specialize in Health IT standards and related technical educational opportunities targeted to the population. This would assist in addressing the gap in knowledge and infrastructure frequently found in rural areas.	The Problem: Modern systems of processes assume continuous robust tethering to central data systems. (robust and affordable internet) Modern technology support and sustainment logistics (break-fix methods) assume tight standardization of configurations (typically configured for urban environments) and availability of overnight shipping to a user from a depot. The logistical assumptions don't accommodate exceptions or innovation well. The Rural Solution: The village technology sustainment center will publish and evolve common rural deployment standards in translation charts with side-by-side formal technical standards in the chart and parallel rules of thumb for the appropriate target population to improve the accessibility of the technical knowledge. For example: "the maximum bend radius of the network cable is 3.7mm" or "shall comply with ANSI 273492-3 paragraph B found in this QR-Code link" would translate to "Don't even come close to creasing the wire. The bends shall not be sharper than a loop around a soda can." Other technical guidance would be similarly translated.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Daybreak Inc.	Mat-Su Mobile Social Service Navigation Project	AK	The Matanuska-Susitna Borough (Mat-Su) is in Southcentral Alaska about 40 miles northeast of Anchorage. The Mat-Su is Alaska’s fastest-growing region, home to more than 117,000 residents across 25,000 square miles. Within the borough there are three incorporated cities – Palmer, Wasilla, Houston; 26 unincorporated communities governed by community councils. The Mat-Su is the state’s second-most populous borough and third largest by land. Talkeetna and Trapper Creek are the most distant communities from the economic center of the borough, 70 to 75 miles north of Wasilla. There are often disparities between rural and more urban locations closer to the Core. Population and demographic trends differ across the subregions of the borough. There are often disparities between rural and more urban locations closer to the Core. The focus of the project is to assist in connecting people living in remote areas of the Mat-Su to assess needs and promote the social determinants of health. Specifically, to improve/increase access to housing, improve/increase access to SNAP, Medicaid, Social Security, and housing assistance. Community health workers will also collaborate with medical, dental, mental health and substance use disorder treatment by assisting in the coordination of care. The community health workers will bring navigation services to remote communities in the Mat-Su to assist families and individuals to obtain benefits, connect with health care providers and basic resources.	In year one, the project will utilize two community health workers who will travel to selected communities in the northern region of the Matanuska borough (Willow, Talkeetna, Petersville and Trapper Creek). Community health workers will set up weekly or bi-weekly scheduling to meet with residents to assist in meeting the known and unknown needs of people living in the selected communities. The community health workers will focus on the social determinants of health to increase the feeling of belonging and reduce social isolation in the northern communities of the Matanuska Susitna borough. The social determinants the team will focus on will be: - o Health services-lack of access - o Health and Well-being psychological stress - o Social support networks – access to support & services - o Income and Social Status- low income - o Physical/environmental- housing stability, homelessness . Community health workers will assist in reducing isolation, increasing access to medical, mental health, dental, traumatic and acquired brain injury, and other health related needs. After a brief assessment to determine immediate needs, a plan of care will be developed and used to fulfill the identified needs. Some examples are: • Assistance in filing for Medicaid and/or Social Security benefits • Referral to a medical provider • Referral to mental health services • Referral to SUD treatment services • Assistance in completing housing applications, energy assistance applications, and Basic Housing Assistance programs • Connected seniors to Meals on Wheels, SNAP benefits, and healthy food prescriptions • Assistance coordinating multiple appointments for lab work, testing, specialist appointments and providing follow-up as needed to improve attendance at scheduled appointments • Coordinating transportation services to allow participants to attend appointments • Obtaining a State of Alaska ID or replacing a drivers license (this may include assisting a female consumer to obtain the documents needed to secure a Real ID. • Improving personal hygiene by providing - o Shower vouchers - o Hygiene kits - o Laundry vouchers and supplies The community health workers would utilize an electronic health record (EHR) that would be connected to HealthTIE to assist in developing a continuity of care approach to ensure that all of the providers are aware of the work being done by the community health worker, and the progress or regression of the participants health and social determinant needs.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Delta Community Library	Library Expansion for Increased Community Wellness	AK	According to 2020 Census data, the community is home to 4,774 residents. Twenty three percent of households include children under age five, and 59 percent include children ages 6–17. This substantial youth population underscores the community’s ongoing need for accessible, family centered services and support. The library has long served as a critical resource for these families, offering after school programs, summer learning opportunities, and preschool activities that promote family engagement, social development, physical activity, and supplemental education. In 2025 alone, 157 children participated in the library’s summer programs. However, the current library facility—constructed in 2004—can no longer meet the needs of a population that has grown 17.3 percent since the 2000 Census. The building lacks adequate space for recreation, safe shelter during long winter months, and areas that support physical and mental enrichment. It is also insufficient for providing nutritional and behavioral education programs that families increasingly rely on. The maximum seating capacity of the children's area is just 20. In addition, the community faces a growing need for private, technology-equipped spaces where residents can participate in remote medical consultations and distance learning sessions. The existing facility cannot accommodate these essential services.	To better serve the mental and physical wellness needs of the community, the library facility will be expanded. The current size is just over 5000 square feet with two staff offices and a small staff workroom providing the only "private" areas. This project will add an additional 2000 square feet to the east side of the facility. This building was built with this expansion in mind. A dual-purpose meeting and activity room to provide for small groups to hold educational or physical activity sessions, meetings for private medical consultations, or distance learning sessions. An expanded children's area with increased seating, a small cooking area for nutritional education, and more shelving area for resources such as books, home learning kits, and games. This will enable our institution to improve on the foundation we have built over the years to encourage healthy habits in our area. The library is already a hub for the people of this area and this project would allow it to further meet the needs of both the young and aging population.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Southeast Fairbanks Census Area	Deferred or Not Advanced

Delve Group LLC	Alaska Healthcare AI Accelerator	AK	Alaska's healthcare and social service organizations face a widening AI capacity gap. AI task capabilities are doubling roughly every four months according to METR, an independent AI benchmarking organization. Organizations that build internal capacity now will harness that progress. Those that don't risk being inundated by it. Delve Group is an AI implementation practice headquartered in Anchorage, founded by lifelong Alaskans Kyle and Blythe Easterly. We see this gap up close across our Alaska clients, which include disability services nonprofits and healthcare organizations with locations across the state. AI adoption is ad hoc, driven by whatever tool came bundled with existing software, with no coherent strategy for evaluation or sustained improvement. Most organizations use a single AI tool by default and have no plan to do better. Commercial AI advisory models don't fit mission-driven healthcare organizations. These organizations need an approach that builds genuine internal capacity rather than vendor dependency, funded to serve organizations regardless of their ability to pay commercial rates. The Alaska Healthcare AI Accelerator delivers exactly that.	The Accelerator is an embedded advisory program. Delve Group works with each participating organization on an ongoing basis, modeled on the advisory engagements we already operate with commercial clients. This is not a workshop series or a one-time assessment. It is a sustained working relationship. All advisory work is delivered by teams of two. This is a core Delve Group operating principle: AI advisory work is creative problem-solving, and two people working together produce better results than one person working alone. A pair can observe meeting dynamics and track workflow details simultaneously, and challenge each other's thinking in real time. In Year 1, the two new AI Specialists funded by this program will be paired with Delve Group's founders as they onboard and develop applied expertise. As the Specialists ramp, they increasingly work together as a pair, with founder involvement shifting to oversight and cohort strategy. Each team works as a fly on the wall inside the participating organization, attending meetings virtually, observing workflows, and developing a deep understanding of where the organization's time and capacity are going. From that vantage point, the team identifies specific bottlenecks that AI tools can address and provides structured guidance on tool selection, adoption, and integration into daily operations. The emphasis is on building the organization's own judgment: teaching staff to evaluate AI tools, think through use cases, and sustain adoption as the technology evolves. The advisory relationship is virtual-first, so organizations anywhere in Alaska can participate. In year 1 we intend to enroll and work with between 4-5 organizations.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Denali Borough	Denali Borough Rural Health Care Transformation Project Coordinator	AK	A single rural health care coordinator role does not exist to convene partners to discuss challenges and explore solutions to providing sustainable health care access to Denali Borough residents. Many of the partners in our volunteer fire departments and clinical staff are already occupied with the delivery of basic medical services. This role will convene local organizations to collaborate and build community-driven solutions that improve health care access, quality, and sustainability. The coordinator will be responsible for sharing resources, creating plans to improve infrastructure, and expanding local capacity to develop solutions to barriers to accessing care, while also supporting community efforts in early childhood health and community health. The Coordinator’s scope and requested direct costs (e.g., IT equipment, basic furnishings, travel, and fringe benefits) will be tied to concrete project activities and outcomes, consistent with RHTP’s project-based budgeting approach and federal allowability rules.	The Denali Borough will address gaps in health care access and coordination by hiring a Rural Health Program Coordinator to lead a multi-sector, community-driven effort. The 2022 community health needs assessment included a preliminary analysis of the barriers and gaps in healthcare delivery. In the first year, the Coordinator will 1) formalize relationships with agencies and organizations and convene partners across primary care, behavioral health, oral health, specialty services, hospital/EMS, post-acute care, and social supports; 2) attend regional and statewide convenings to establish broader partnerships, networks, and advocate for programs that will improve health outcomes for Denali Borough residents; 3) serve as project manager for any additional projects funded by the RHTP program; 4) provide support to local organizations with limited capacity to ensure they can participate in programs to transform rural health care; and 5) develop and launch the application for the recently created Denali Borough Health Care Provider Services Loan Program. The proposed projects for RHTP funding that this role would manage represent a holistic approach to transforming health care in the Denali Borough. This includes proceeding with pre-development tasks for health care provider housing to address a housing shortage that affects the ability to staff health care provider positions, as well as projects to assess conditions of firehalls and community centers in our communities as the first step in identifying what renovations are needed for these essential facilities to ensure that they can meet the needs of the next generation. If funded for additional years, this position will focus on finding ways to address the top 5 health priorities identified in the 2022 Denali Borough health needs assessment: 1) access to health care; 2) mental health, alcohol, and substance use; 3) housing; 4) nutrition; and 5) physical activity and indoor recreation activities. We anticipate that one of the main approaches to ensuring health care access in our community in future years will be to identify a sustainable framework in which EMS teams are reimbursed. This will include examining local and regional options for sustainable funding sources through public-private collaboration.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough	Advance to Implementation Application

Denali Borough	Design for Health Care Provider Housing in the Denali Borough	AK	For two years leading up to the Interior Community Health Center (IHC) closing its satellite clinic in Healy in November 2025, the clinic operated without a permanent provider and offered significantly reduced services. During that time, residents frequently experienced weeks to months without access to in-person appointments, with only intermittent services available when a provider could travel to Healy. IHC shared that one of the significant barriers to staffing the clinic and recruiting a full-time provider was the lack of adequate housing available. The Denali Borough does not have affordable, year-round workforce housing to recruit/retain clinicians, leading to limited and seasonal health care access for residents. This project aims to strengthen and stabilize the workforce and reduce health vacancies to bring health care access back to Borough residents and make sure that access can be sustained in the future by creating housing devoted to health care workers. This request for pre-development funds for health care worker housing is a key first step in making health care provider housing a reality. The Borough intends to seek a multi-braided funding stream to construct the housing units.	To address the significant gaps in health care access in the Denali Borough, this project will plan and develop a dedicated, year-round housing complex for health care workers. The approach focuses on pre-development, design, and engineering activities that will lay the foundation for a sustainable workforce housing solution capable of attracting and retaining clinicians and other essential health personnel. The project includes 1) site analysis and feasibility studies to identify optimal locations for the housing complex, considering proximity to existing health facilities, utility access, and environmental factors, and 2) architectural and engineering design work to create housing units that meet professional standards, provide safe and functional living environments, and support long-term operational sustainability. The Borough will work closely with local health providers, community leaders, and potential resident staff to ensure the housing design meets operational needs, encourages retention, and aligns with workforce priorities. Input from these stakeholders will inform unit size, layout, shared spaces, and other amenities to foster a supportive, community-oriented living environment that promotes well-being and resilience among residents. This project is aligned with the RHTP initiatives: • Strengthen Workforce: The project directly grows a resilient health care workforce by reducing barriers to living in Denali Borough, pairing housing designs with RHTP supports such as time-limited housing or childcare stipends to accelerate recruitment and retention of skilled providers. • Health Care Access: Workforce housing underpins the reopening of the Healy clinic and integration with EMS programs, bringing essential health services closer to residents and reducing reliance on distant providers in Fairbanks. • Healthy Communities: Reliable housing supports sustained local health programming and preventive care initiatives, enabling clinics and community providers to offer wellness, education, and lifestyle support in safe, accessible environments. • Pay for Value / Fiscal Sustainability: Pre-development, design, and engineering planning ensures that housing investments are cost-effective, energy-efficient, and aligned with long-term capital planning, creating a sustainable model for workforce retention and reducing ongoing recruitment costs.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough	Deferred or Not Advanced

Denali Borough	Rural Health Care Facility Building Condition Assessments	AK	Rural communities in the Denali Borough depend on a small number of multi-use public facilities to deliver essential services, support emergency response, and provide space for community gatherings, health education, and wellness activities. These facilities are critical assets in a remote region where access to alternative infrastructure is limited. Aging buildings, deferred maintenance, and high energy costs pose risks to long-term operational sustainability and service reliability. These facilities are run by 3 non-profit organizations and the City of Anderson. These organizations lack comprehensive, up-to-date building condition assessments and energy audits for these facilities. Without an assessment, these organizations cannot effectively prioritize maintenance, plan capital improvements, or strategically invest limited funds. This reactive approach increases the likelihood of costly emergency repairs, service disruptions, and escalating utility expenses. This project seeks to address these challenges by conducting professional building condition assessments and energy audits for four key facilities. The assessments will identify maintenance deficiencies, safety concerns, and long-term capital improvement needs, enabling the non-profits to implement strong asset management practices and preventative maintenance planning. The audits will analyze energy consumption patterns, identify cost-saving measures, evaluate HVAC and ventilation performance, and recommend upgrades.	The proposed project supports rural health transformation by strengthening the physical environments that underpin emergency response, community wellness programming, preventive health initiatives, and maternal/child health supports. In rural Alaska, multi-use facilities are integral components of the broader health ecosystem. By improving environmental health, fiscal sustainability, and facility reliability, the Denali Borough is investing in the foundational systems that enable healthier communities and more resilient rural health infrastructure. This project seeks to improve the energy efficiency and infrastructure quality of community centers and fire departments by energy audits and building condition assessments. Specifically, the Denali Borough will conduct condition assessments and energy audits of four facilities – McKinley Village Community Center, Tri-Valley Community Center, the City of Anderson Fire Hall, and the Cantwell Fire Hall; the two community centers listed have volunteer fire departments co-located in their facilities. The Tri-Valley Community Center also houses a now vacant primary care clinic space and there is an organization interested in moving into the space to provide health care services – conducting a building-wide condition assessment is the first step in planning for potential renovations that ensure that this space remains sustainable for health care through the next 30 years. The Denali Borough’s proposed energy audits and building condition assessments align with RHTP initiatives by strengthening the infrastructure that supports health, safety, and emergency response in rural communities. By improving indoor air quality, identifying preventative maintenance needs, and reducing long-term energy costs, the project promotes healthier environments for families and children, supports reliable emergency medical response through well-maintained volunteer fire departments, and enhances community centers that host preventive health and wellness activities. The initiative advances fiscal sustainability through proactive asset management and energy efficiency, strengthens rural workforce resilience by improving working conditions for first responders, and lays the groundwork for technology and infrastructure modernization, collectively contributing to healthier, more sustainable rural communities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough	Deferred or Not Advanced

Denali Borough	Tri-Valley Community Center Renovations	AK	The Denali Borough’s Tri-Valley Community Center houses the Tri-Valley Volunteer Fire Department, which also offers EMS services, a currently unoccupied clinic site, mobile dental hygiene services, and the annual fall vaccine clinic. The community center is additionally being considered as a potential site where DOH public health nurses could provide reproductive health services or other mobile health services. The borough’s community centers also serve as resilience hubs where people can gather during emergency events, such as wildfires or severe winter storms. To continue offering clinical care or expand medical services, serve as a resilience hub, and safely house fire and EMS personnel, the Tri-Valley Community Center requires an HVAC system that ensures appropriate air quality and temperature control, especially for vulnerable populations. The existing air handler and boiler heating system are outdated, unreliable, and in need of replacement. The lack of effective and reliable air handling and heating is especially concerning during extreme weather events that are becoming more commonplace, including during wildfires or severe winter storms.	The proposed project will replace the outdated existing airhandler and boiler heating system at the Tri-Valley Community Center with an upgraded HVAC system that provides improved air circulation and filtration capacity, as well as reliable heat and air conditioning service. The updates would ensure the community center is a safe, modern facility that can support existing medical care and VFD/EMS personnel, as well as ensure the Borough can expand healthcare facilities or wellness services, activities, and programs at the community center in the future. Additionally, the infrastructure upgrades will ensure that facilities remain functional and provide heat, shelter, and essential services to vulnerable populations during power outages, wildfires, extreme winter storms, and other emergencies.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough	Deferred or Not Advanced

Denali Family Services	Behavioral Health Workforce Expansion & System Transformation Initiative	AK	DFS seeks to address the persistent shortage of qualified behavioral health professionals serving youth and families in Southcentral Alaska, which limits access to timely, high-quality care. Workforce vacancies, high turnover rates, and limited opportunities for advanced training create barriers to expanding services for youth with complex behavioral health needs, particularly those with co-occurring neurodevelopmental conditions such as FASD, ADHD, and Autism Spectrum Disorder. At the same time, early childhood and school-based programs increasingly require specialized behavioral health expertise to manage challenging behaviors and support healthy social-emotional development. This project represents an opportunity to strengthen Alaska’s behavioral health workforce by investing in targeted recruitment strategies, career advancement pathways, specialized clinical training, and consultation supports such as the Pyramid Model and neurodiversity-informed practices. By stabilizing and expanding the behavioral health workforce while improving clinical competencies, Denali Family Services can increase service capacity, reduce wait times, and improve outcomes for youth and families across Anchorage, the Mat-Su Valley, and surrounding rural communities.	DFS proposes a comprehensive workforce development and system improvement approach designed to expand recruitment pipelines, strengthen workforce stability, and increase specialized clinical capacity in youth behavioral health. The project includes four coordinated strategies. First, DFS will implement a targeted recruitment and workforce expansion campaign, including professional media outreach and partnerships with Alaska training programs, to increase the number of qualified clinicians entering the organization. Second, DFS will establish structured professional development pathways through a Clinical Career Accelerator model that supports licensure advancement, supervisory training, and leadership development for existing staff. Third, the initiative will expand specialized training and consultation to improve the quality of services delivered to youth with complex behavioral health needs. This includes neurodiversity-informed training through the FASCETS Facilitator program and implementation of the Pyramid Model with ongoing mental health consultation to strengthen behavior management strategies, classroom supports, and early intervention practices. Finally, the project will include workforce stabilization strategies such as service commitment incentives and relocation assistance to improve staff retention and reduce vacancy rates. Together, these strategies will strengthen workforce capacity, improve treatment quality, and increase access to behavioral health services for youth and families across Southcentral Alaska and surrounding rural communities.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Advance to Implementation Application

Denali Family Services	Backcountry Alaska: Therapeutic Outdoor Behavioral Health Expansion Initiative	AK	Many youth served by Denali Family Services experience complex trauma, behavioral health challenges, and disruptions in family stability. While traditional therapy remains essential, many youth—particularly adolescents—struggle to engage consistently in office-based services. Recreational therapy has proven to be an effective intervention for youth with behavioral health challenges, especially when delivered through experiential, outdoor-based programming that encourages connection, teamwork, and healthy risk-taking. Backcountry Alaska, operated through DFS’s School and Community Based Services (SCBS) Recreational Therapy team, provides structured outdoor therapeutic experiences that support youth development while reinforcing treatment goals. However, expanding access to this program is currently limited by the availability of appropriate equipment and resources required to safely operate year-round outdoor programming in Alaska. Expanding this initiative presents an opportunity to strengthen engagement in behavioral health services, particularly for teens participating in DFS’s Transitional Independence Program (TIP). The program also creates a powerful recruitment and engagement incentive for youth entering DFS services, helping providers connect youth to meaningful, strengths-based activities that encourage participation in treatment.	Denali Family Services (DFS) proposes to expand the Backcountry Alaska program by investing in outdoor recreation equipment and infrastructure that will allow Recreational Therapists within DFS’s School and Community Based Services (SCBS) program to deliver year-round therapeutic outdoor programming for youth with behavioral health needs. SCBS provides behavioral health services to youth in home, school, and community settings. Recreational therapists play a key role in this model, using activity-based interventions to help youth develop emotional regulation, social skills, and healthy coping strategies. Backcountry Alaska builds on this work by using Alaska’s natural environment as a therapeutic setting where youth can practice these skills through structured outdoor experiences. With this investment, recreational therapists will integrate activities such as hiking, camping, fishing, kayaking, biking, and cross-country skiing into youth treatment plans. These experiences are intentionally structured to reinforce treatment goals and support youth in developing teamwork, leadership, resilience, and problem-solving skills. Activities are supervised by trained staff and coordinated with clinicians and case managers to ensure alignment with each youth’s behavioral health plan. The program also strengthens engagement for adolescents participating in DFS’s Transitional Independence Program (TIP). Teens often struggle to engage consistently in traditional therapy settings, and outdoor recreation provides meaningful, age-appropriate opportunities that encourage participation in treatment. Activities such as overnight camping trips, biking excursions, and winter recreation help teens build confidence, independence, and positive peer relationships while strengthening connections with supportive adults. Many youth with complex trauma or system involvement are hesitant to participate in traditional behavioral health care. Outdoor therapeutic experiences provide a strengths-based entry point that encourages youth to connect with providers and remain engaged in treatment. Through this approach, DFS Recreational Therapists will serve multiple cohorts of youth each year while strengthening treatment outcomes. By combining recreational therapy, outdoor programming, and clinical support, Backcountry Alaska expands access to engaging, community-based behavioral health interventions that build resilience and improve long-term well-being for youth served by DFS.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Denali Family Services	Therapeutic Foster Care Expansion & Stabilization Initiative	AK	Youth entering Alaska’s foster care system disproportionately experience adverse childhood experiences, including exposure to domestic violence, substance misuse in the household, chronic neglect, and intergenerational trauma. A substantial number of these youth require trauma-informed, highly structured family settings with caregivers who can effectively collaborate with mental health providers, schools, and community resources. Traditional foster homes, though well-intentioned, often lack specialized training and support to meet these heightened needs. As a result, children with intensive behavioral or emotional challenges are frequently placed in higher-level residential treatment centers or sent out of state—settings that are more costly, more restrictive, and less conducive to long-term well-being. Because of this, Alaska faces an urgent and growing need for TFH capable of supporting children and youth with significant behavioral health challenges. Data collected by DFS and the Office of Children Services (OCS) have revealed that every year dozens of Alaskan youth that need TFC are turned away or kept on waiting lists due to a lack of capacity. With the shortage of homes, struggling youth are placed in environments not suited to their level of need.	The proposed project is comprised of three components: recruitment, retention, and community recognition. To recruit Therapeutic Foster Parents (TFP), DFS will employ a multi-media marketing campaign in Anchorage and the Mat-Su valley, implemented by Walsh Sheppard Advertising, a local advertising agency with an existing partnership with DFS. The campaign will include digital, audio, and video outreach through social media, podcasts, radio, interviews, and TV. The goals are (1) to educate the public on foster care and TFC, youth behavioral health, and trauma; and (2) to recruit full or part-time foster parents. The campaign aims to increase the number of TFHs, increasing the capacity for DFS and keeping more Alaska youth inside the state for behavioral health care. Rather than a one-time recruitment push, this proposal establishes a structured five-year expansion plan aligned with the lifespan of the Rural Health Transformation Program (RHTP). Year One will launch a targeted, multi-media recruitment campaign (June–August) designed to generate approximately 150 applications and license the first cohort of 8–10 new therapeutic foster homes. Subsequent years will build upon campaign analytics, community engagement data, and refined audience targeting strategies to sustain annual recruitment gains. To increase retention, DFS will deploy AI-powered note writing documentation and compliance technology to 70 therapeutic foster parents to reduce administrative burden and improve Medicaid documentation compliance. Foster Parents write daily Medicaid notes for each child in their care, resulting in upwards of 20 notes a week in addition to providing 24/7 care to youth. This will reduce burnout, improve retention, increase documentation quality and timeliness, ensure Medicaid compliance, and build a stronger sustainability of community-based models. To strengthen community recognition, RHTP funds will support professional logo wear, identification materials, recruitment signage, and outreach materials for foster parents, outreach staff, and youth engagement. This improves public trust and recognition, recruitment effectiveness, professional cohesion among foster parents, as well as safety and credibility in community-based services.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Denali Healthcare Advocates	We are a nonprofit group working to bring year-round healthcare to the Denali Borough.	AK	The Denali Borough, home to nearly 1600 residents, includes the communities of Anderson, Healy and Cantwell, as well as numerous unincorporated residential communities. There is a clinic on Clear Space Force Station near Anderson, that most residents of the Borough cannot access; a seasonal urgent care clinic near Denali National Park (open May-September), and a small clinic in Cantwell, that typically is only staffed by a single medical assistant. This area had a fully operational clinic in Healy starting in 1972, that provided primary, urgent, and prehospital emergency care throughout the Denali Borough. Ownership of the Healy Clinic changed hands to Interior Community Health Center (IHC), and over the past 18–20 years, services and equipment have been gradually withdrawn. Consistent mid-level provider coverage diminished significantly after 2017. In May 2023, in-person provider availability was reduced to approximately four hours per week, dependent on provider travel from Fairbanks and weather conditions. This level of access was inadequate for a rural, geographically isolated population and the nearly 500,000 seasonal National Park visitors. Community efforts to restore services through the IHC were unsuccessful, and near the end of 2025 the provider closed its doors in the Denali Borough permanently. We seek to open a year-round clinic to provide primary and urgent care to our communities, as well as seasonal visitors and employees.	Our Board of Directors includes three Physician Assistants with approximately 75 years of combined experience delivering rural healthcare in Alaska, a Registered Nurse with 15 years of experience, and two local business professionals with extensive administrative and civic leadership within the Denali Borough. This structure ensures strong clinical oversight, fiscal accountability, and operational competence. We have identified potential sites, including the recently vacated clinic facility. We have local healthcare workers interested in local employment, eliminating the need to recruit and find housing for new hires. The biggest challenge we have faced is securing start-up funds. Through the Rural Health Transformation Plan, we seek funding to support the return of a locally owned and operated clinic, returning healthcare to those who live, work and recreate within the community. There are currently 5 PA’s, 4 RN’s, a Physical Therapist, multiple medical assistants and EMT 3’s, within our community that either are not employed, or work in larger communities out of necessity. Ironically, some of the local providers already see local community members at clinics located in Fairbanks, a minimum of 110 miles away. We seek to recruit and retain these qualified clinical staff, remodel potential clinic locations, outfit exam rooms, restore diagnostic capacity, stock critical supplies, and implement a sustainable rural healthcare delivery model that is governed locally and responsive to community need. We have a comprehensive outline for anticipate start-up costs, and operation costs for the first three years. These estimates are based on current costs and rates, for similar clinic operations.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough	Deferred or Not Advanced

Denali Insight LLC	Nenana Community Health & Wellness Strategic Planning Initiative	AK	Nenana is a rural Interior Alaska community of approximately 350 year-round residents, but functions as a regional service hub. During the academic year, the Nenana Student Living Center houses nearly 100 high school students from surrounding villages, significantly increasing the community’s service population. Nenana also supports neighboring Denali Borough communities through shared clinic access and mutual aid emergency response. In addition, an elder care facility serves residents who are no longer able to live independently, adding to the complexity of local health needs. Despite this interconnected service environment, Nenana does not have a formal health and wellness committee, updated community health assessment, or shared strategic framework guiding cross-sector collaboration. Health-related services are delivered by dedicated agencies but there is no structured mechanism to collectively identify community-wide priorities or measurable outcomes. This lack of coordination leads to fragmented approaches and limits the community’s ability to pursue funding in a unified, strategic manner. Without a shared understanding of strengths, service gaps, workforce needs, and prevention priorities, efforts may remain reactive rather than proactive. The opportunity is to conduct a structured, community-led assessment that results in a coordinated strategic direction and cross-sector steering committee to guide sustainable, aligned health investments	Denali Insight Consulting will conduct a Community Health & Wellness Needs and Readiness Assessment for Nenana to identify community-driven health priorities and develop a clear strategic direction for future health-related investments. The purpose of this project is to ensure that future initiatives, funding applications, and system improvements are aligned with needs identified directly by the community, relevant health organizations and supported by measurable, targeted outcomes. The project will be implemented in two integrated phases. Phase 1: Community Health & Wellness Needs and Readiness Assessment. This phase will include broad community engagement through multiple facilitated community meetings, stakeholder interviews, and a community survey. Engagement will intentionally target representation across age groups, service sectors, Tribal and non-Tribal partners, schools, EMS, behavioral health, elders, and families. Existing data sources will be reviewed to complement community voice. The assessment will evaluate current service strengths, access gaps, workforce considerations, prevention opportunities, and system readiness for future health investments. A written report will synthesize qualitative and quantitative findings and identify key themes, priority areas, and cross-sector opportunities. Phase 2: Strategic Direction and Steering Committee Development. Following the presentation of findings, Denali Insight will facilitate the formation of a Community Health & Wellness Steering Committee composed of representatives across Nenana’s health-related sectors. Through structured meetings, the committee will review findings, confirm shared priorities, and establish a strategic direction with defined focus areas, roles, and measurable outcomes for health related agencies in the community. Deliverables will include a final assessment report, summary presentation, and a strategic direction document outlining priority initiatives and recommended next steps to be distributed to health organizations. This approach ensures the assessment leads to coordinated action, targeted outcomes, and a sustainable, community-led framework for advancing health and wellness in Nenana.	Under \$50,000	Single Community	Yukon-Koyukuk Census Area	Advance to Planning

Denali Preschool and Learning Center	Strengthening Rural Early Childhood Health & Workforce Capacity in Denali	AK	Denali Preschool and Learning Center (DPLC) serves young children and families in the rural Denali Borough, where access to pediatric care, behavioral health services, and early intervention supports is limited. Early childhood educators are often among the first adults outside the home to observe developmental, behavioral, or emotional challenges in young children. However, many rural child care providers lack the training and resources needed to confidently respond to concerns such as trauma exposure, ADHD, developmental differences, and family stress. At the same time, the well-being of early childhood educators directly affects the quality and stability of care available to families. Rural early childhood staff frequently experience high stress and burnout, yet many programs lack the capacity to provide health or mental health supports for employees. This project will strengthen early childhood health outcomes by increasing staff training in trauma-informed care, developmental supports, and pediatric wellness while also improving workforce well-being through access to telehealth and mental health services. By building educator capacity and supporting workforce resilience, DPLC aims to create healthier early learning environments and stronger support systems for rural children and families.	Year 1 funding will strengthen the capacity of DPLC staff to support early childhood health and well-being through targeted training, workforce wellness supports, and the development of in-house expertise in early childhood health topics. First, DPLC will provide professional development focused on early childhood health and behavioral needs. Trainings will include trauma-informed care, strategies for supporting children with ADHD and other developmental differences, recognizing early behavioral health concerns, and working with families experiencing stress or adversity. These trainings will equip educators with practical tools to better support children in the classroom and to recognize when additional services or resources may be needed. DPLC will also identify and train one staff member to specialize in early childhood wellness and pediatric health topics. This individual will receive additional professional development and serve as an internal resource for the DPLC team, providing guidance, coordination of training, and support for staff and families. Over time, this role will expand to include offering informational sessions and community trainings focused on early childhood wellness and development. Over the five-year span of the Rural Health Transformation Program, DPLC plans to continue investing in this role through additional professional development opportunities. Second, the project will support the health and resilience of the early childhood workforce by expanding access to health and mental health services for staff. Through resources available from AllyHealth or a similar provider, DPLC can provide employees with affordable virtual medical and mental health care. In rural communities like ours, telehealth offers a practical solution where geographic distance and limited provider availability make in-person care difficult. DPLC will cover approximately \$30 per employee per month to provide access to virtual care and will offer wellness subsidies to help offset co-pays and other out-of-pocket expenses. Staff working more than 20 hours per week will receive a \$150 monthly subsidy, while staff working fewer than 20 hours will receive \$50 per month. Together, these strategies will strengthen workforce stability, expand educator capacity to support early childhood health needs, and improve the quality of care available to young children and families in the Denali Borough.	Under \$50,000	Multi- Community or Participating in Regional Hub-and- Spoke	Denali Borough	Deferred or Not Advanced

Department of Doing Good LLC	Culture-Driven, Tech-Enabled Recovery: Preventing Suicide and SUD among Alaska Native Youth	AK	1. A Sustained Behavioral Health Emergency in a Remote, High-Risk Region In the Northwest Arctic Borough, where approximately 83 percent of residents are AN, suicide occurs at a rate of 71.6 per 100,000 people, compared to the national average of 12.32 per 100,000. The region experiences suicide at nearly six times the U.S. rate. Alcohol and other substance use disorders are significantly elevated, alongside higher rates of depression, trauma exposure, and related mental health concerns. 2. Access to Preventive Intervention Limited in AN Villages Access to early intervention and preventative care remains limited. Some villages have no local support. Others rely on fly-in services or telehealth encounters that lack consistent, culturally grounded local support. Youth and families may wait months for care or never connect to services. The current health system is reactive, mobilizing resources at crisis points rather than building upstream supports that prevent escalation. 3. Reactive Systems and the Opportunity for Culturally Grounded Early Intervention For decades, mainstream behavioral health systems have focused on diagnosing and treating individual pathology with standardized clinical models. While clinical services are necessary, this approach often proves insufficient in AN contexts because it relies on Western diagnostic frameworks and locates “the problem” within the individual, rather than acknowledging historical, relational, spiritual, and systemic dimensions.	1. Culturally Grounded Digital Platform for AN Communities In collaboration with AN communities and technology partner Applichat, we will develop a culturally grounded digital Youth Recovery and Resilience Coaching web-based platform. The platform will be co-designed with Tribal partners to ensure cultural relevance, community ownership, and trust. Features will include culturally resonant language, traditional healing perspectives, and video messages from Elders, youth in recovery, Peer Support Specialists, and mentors that reinforce identity, belonging, and relational healing. The platform, promoted by a marketing campaign, will be designed for low-bandwidth environments common in rural Alaska, with offline access to core resources and the ability to expand into multiple AN languages over time. 2. Early Intervention Tools that Strengthen Resilience and Prevent Crisis The platform will provide daily check-ins, mood tracking, and culturally relevant prompts that support early behavioral health intervention. Users will receive supportive messaging, reminders about local cultural gatherings, and connections to community resources that reinforce connection to family, land, and tradition. Integrated crisis line access and direct referral pathways to local behavioral health providers will ensure users can receive immediate support when needed. By promoting early engagement and self-awareness, the platform helps shift behavioral health support upstream, reducing crisis-driven care and strengthening community-based prevention. 3. Community-Based Peer Workforce and Leadership Development The platform will connect youth and families with trained Peer Mentors and Recovery Coaches recruited from AN communities. These roles will provide culturally grounded support focused on mentorship, accountability, and connection rather than clinical treatment. Coaches will assist participants with goal setting, relapse prevention planning, life skills development, and navigation of local services. Peer workforce roles to create 5 Recovery Coaches, 3 Peer Mentors, and 2 Cultural Support Specialist positions, with clear leadership pathways from Coach to Lead Coach to Community Coordinator. Competitive salaries, mentorship, and ongoing professional development will strengthen workforce retention while expanding AN-led prevention and recovery support across communities. View year-one and complete five-year strategy summary here: https://culture-driven-recovery-gd5u0w8.gamma.site.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Dillingham Census Area; Nome Census Area; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Develop Medical Group LLC	Scaling Proactive Medicine to Cultivate Strong, Healthy, and Capable Alaskans	AK	Alaska faces rising chronic disease, declining physical and metabolic health, and growing strain on an already limited healthcare workforce. Many rural communities are experiencing population loss as families and professionals leave due to rising costs, limited resources, and fewer opportunities. Much of the healthcare system responds to disease after it develops, leaving limited time for prevention and lifestyle education and creating growing demand for more proactive, patient-centered care. These challenges are amplified in rural and remote communities, where access to reliable health information, whole foods, safe training environments, and preventive services is limited. Many Alaskans lack consistent support to build daily habits that protect long-term health and prevent chronic disease. This project expands access to Proactive Medicine—a prevention-focused model emphasizing early intervention, lifestyle habits, and measurable functional health. In addition to coaching, the practice provides medical evaluation, chronic disease management, and timely low-acuity care. This model complements primary care by reducing workforce strain and coordinating referrals when higher-acuity services are needed. Low-bandwidth telehealth, community-based training and nutrition education, and standardized outcomes tracking will demonstrate a scalable approach for Alaska.	This project builds on a physician-led Proactive Medicine practice that is launching services to serve Alaskans. Rural Health Transformation Program funding will allow the organization to expand its reach to rural and remote communities, strengthen community engagement, and increase the number of patients who can access this prevention-focused model. The project will scale low-bandwidth telehealth services so patients across Alaska can access prevention-focused medical care, chronic disease management, and ongoing coaching without frequent travel. This expansion will increase membership capacity and extend proactive care to patients with limited access to lifestyle-focused services. Funding will support key roles needed to expand access and engagement. Project support will include physician time dedicated to expanding clinical capacity and statewide outreach. An administrative assistant will improve patient onboarding, scheduling, and coordination. A content production contractor will develop culturally relevant health education and statewide outreach materials. A fitness coach contractor will support strength and conditioning workshops and asynchronous training and nutrition classes delivered through regional hub communities. Together, these efforts will expand Develop Medical Group’s reach, strengthen community engagement, and accelerate adoption of prevention-focused care across Alaska, providing a practical and sustainable pathway to improve access, support the healthcare workforce, and reduce long-term healthcare demand.	\$50,000-\$250,000	Family or primary care	Statewide	Anchorage (Municipality); Bethel Census Area; Nome Census Area; North Slope Borough	Deferred or Not Advanced

Diametrics.ai	Access, Workforce, Innovation, Creating healthy & Self-Sustaining patients, Alaskans & Hospitals	FL	Alaska’s twenty-nine boroughs and communities are at a critical state facing poor medical and financial outcomes, including potential hospital closures, workforce shortages and rising rates of chronic metabolic disease progression. This, coupled with, geographic isolation, poor medical access, negative financial outcomes and higher costs, provides a reactive-based model for critical access hospitals and rural clinics to attempt to manage both the physical and fiscal problems it faces. Diametrics.ai (“truth engine”) creates sustainable opportunities using a proactive approach, a RaaS model, in which it showcases multiple customizable spokes to enhance care that reaches further geographically, strengthens and sustains the rural clinical workforce, creates rural health infrastructure and tech, drives structural efficiency, empowers the community providers, and provides advance innovative care models and payment reform. This grant, combined with our platform, is a one-time chance for Alaska’s hospitals and rural clinics to embrace the overall transformation from a reactive to a proactive financially sustainable model. A focus on the chronically ill patients, by improving their metabolic health will show significant healthcare savings over a twelve-month period and longer.	Diametrics.ai’s proven clinical interventions with a patent-pending analytics platform to address the root causes of chronic disease while strengthening the financial stability of rural providers. Our hub and spoke model includes a variety of spokes that can be easily customizable to fit the needs of each Alaskan community. Below are example spokes Diametrics.ai. Lined up beyond these are an additional 25+ partners to provide the medical and financial protocols to move Alaskan healthcare to self-sustaining status for years to come. Diametrics.ai Platform – A HIPAA-compliant Results as a Service (RaaS) system, repurposed from its original design to now supporting Critical Access Hospitals and rural health systems. Diametrics.ai integrates predictive analytics, outcome tracking, and cost-savings modeling, quantifies treatment impact in real time, and provides transparent, population-level reporting. By unifying the perspectives of patients, providers, and payers, it ensures measurable, scalable, and sustainable results. Restorvia – A core evidence-based protocol, directly addressing insulin resistance, the driver of metabolic syndrome. Restorvia’s IRT3 has demonstrated proven results for both reversal and improvement in Type 2 diabetes, hypertension, cardiovascular disease, and neuropathy. IRT3 reduces costly complications, ensuring hospital solvency. Workforce – With the anticipated collaboration with the Recruitment Squad, knowledgeable medical staff will be recruited and hired. This workforce opportunity for positions would welcome all Tribal organization members. Exosome Regenerative Health Program: A clinic-based regenerative medicine service that enhances wound healing, organ repair, and soft-tissue recovery while expanding reimbursable specialty service lines. BioMech Health– A Remote Kinematic Motion 3D Advanced Balance and Gait Program, funded by the Center for Medicare & Medicaid Services, and developed by Dr. Frank Fornari. Remote kinematic motion sensors and analytics prevent falls, which can avoid future hospitalizations. RESTORE Program– A supportive education, lifestyle curriculum that empowers patients to sustain long-term health improvements, while strengthening workforce capacity through clinician training and patient engagement tools. RESTORE aligns with workforce development by training clinicians in lifestyle medicine and technology. Medically Tailored Meal Service – Upon request, access to medically tailored needs will be accessible. Dillingham City School District	Healthy Students, Strong Futures: Expanding school-based health services in Dillingham	AK	Chronic health issues are impacting the Dillingham community. 38% of adults are obese, and 13% are living with diabetes. Teen suicide rates in rural Alaska are among the highest in the nation. Healthy communities begin with healthy children. Students in the Dillingham City School District face persistent barriers to timely and preventive healthcare due to geographic isolation, transportation challenges, and limited healthcare workforce capacity in rural Southwest Alaska. These barriers can delay the early identification and treatment of common childhood health concerns such as chronic conditions, developmental delays, behavioral health needs, and preventable illnesses. At the same time, the district has limited capacity to consistently deliver basic health instruction aligned with Alaska’s health education standards, leaving many students without regular access to foundational education on nutrition, physical activity, personal health, and disease prevention. Without both preventive care and health education, students are more vulnerable to avoidable health challenges that impact attendance, learning, and long-term wellbeing. 1. Centers for Disease Control, PLACES Interactive data. https://experience.arcgis.com/experience/22c7182a162d45788dd52a2362f8ed65	The Dillingham City School District proposes to establish a comprehensive school-based health support model centered on a dedicated school nurse position. This initiative will address gaps in healthcare access, preventive services, and health education for students in a rural, geographically isolated community. By embedding healthcare access and prevention within the school environment, the project will improve early identification of health needs, increase health literacy among students, and strengthen coordination between schools, families, and healthcare providers. The proposed approach supports the Rural Health Transformation Program initiatives of Healthy Beginnings, Health Care Access, and Healthy Communities by focusing on prevention, early intervention, and sustainable systems of care for rural youth. School-based health models are widely recognized as effective strategies for improving access to preventive care and early intervention, particularly in rural communities. By locating services where students already spend a significant portion of their time, schools reduce barriers associated with travel, scheduling, and healthcare system navigation. The school nurse will provide accessible, on-site health services during the school day. These services will allow students to receive timely assessment and care for minor illnesses and injuries without leaving the school environment. Providing basic health services on-site reduces disruptions to learning while ensuring that health concerns are addressed promptly. A second key component of the project is the implementation of routine preventive screenings and support for chronic disease management. Preventive screenings help identify health concerns that may otherwise go undetected, particularly in communities where access to routine healthcare visits may be limited. In addition to providing direct health services, the school nurse will support the delivery of health education aligned with Alaska’s health education standards. Strengthening health education is an important component of building healthier communities and promoting lifelong healthy behaviors. The nurse may support classroom instruction, provide age-appropriate health presentations, and collaborate with teachers to integrate health topics into existing learning activities. By introducing prevention-focused health education early, students gain the knowledge and skills necessary to make healthier choices throughout their lives.	\$50,000-\$250,000	Single Community	Dillingham Census Area	Deferred or Not Advanced

Disability Law Center of Alaska	Disability Access and Advocacy in Rural Alaska	AK	According to a 2025 Alaska BRFSS report, one in three Alaskans report living with a disability, which includes physical, cognitive, and behavioral health conditions. Alaskans with disabilities who live in rural locations can face challenges to receiving care, including access to and availability of treatment, care facilities, and care providers. The potential of the RHTP to create a significant expansion of health infrastructure and services into rural Alaska is a welcome development. However, as the RHTP is implemented, there will be a critical need to ensure its implementation takes place in a manner that is consistent with the consideration and protection of the rights of individuals with disabilities. This need is especially important for facilities that are licensed to provide services to individuals who are under involuntary commitment or in assisted living facilities who have an unfortunate history of facing instances of abuse, neglect, and rights violations by the institutions that are supposed to be caring for them. Given the time frame and unique logistical challenges that are presented by this major expansion of rural health service in our state, we propose to address this need by providing training, advocacy, and monitoring services to ensure that rural healthcare facilities and care providers have appropriate knowledge, policies, and training in place to protect the state and federal constitutional rights of individuals with disabilities.	The Disability Law Center of Alaska (DLC) is an independent non-profit law firm providing legal advocacy for people with disabilities throughout Alaska. Our mission is to provide protection and advocacy for Alaskans with disabilities through legal representation, education, and strategic advocacy to ensure their civil rights are protected. In 1977, DLC was designated by the Governor of our state as the official (and only) federally funded, Protection and Advocacy (P&A) agency for the state of Alaska. This designation gives us the legal authority to gain access to records and facilities as necessary to investigate complaints and reports of abuse or neglect, or to monitor the treatment and safety of residents and patients with disabilities. Our approach to protecting the rights of Alaskans with disabilities during the implementation of the RHTP is to provide training, advocacy and program/facility monitoring in rural Alaskan communities and to providers who plan to offer services in those communities. To achieve this goal, our project concept includes the following components: Outreach and Training for rural individuals with disabilities - DLC will make presentations and distribute educational materials on resident and patient rights at in-patient facilities and group homes in order to increase individuals’ understanding of their civil rights when living in congregate and clinical settings. Training and Technical Assistance for Families, Care Providers, and Health Care Professionals - DLC will provide education and information to family members, care providers, advocates, and facility staff and administrators around the state, assisting them to understand areas of the law related to disability rights relevant to RHTP implementation. Training will include sessions for facility staff and administrators as they review practices related to the care of individuals with disabilities. Monitoring Activities - DLC will travel to rural communities throughout the state to monitor health facilities that serve individuals with disabilities, including behavioral and other in-patient facilities and dual-licensed assisted living homes. The goal of monitoring will be to determine if facility infrastructure, policies, and practices comply with state and federal disability laws, that facilities are providing reasonable accommodations to individuals seeking services, and that facilities are not neglecting the health, safety, and rights of individuals with disabilities.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Discovery Southeast	Expanding children's outdoor opportunities for fitness and wellness	AK	The problem is a growing disconnect with the natural world, which negatively impacts our bodies and minds. Studies show, for example, that children spend averages as high as 8 hours a day viewing digital screens. This brings more indoor, sedentary lifestyles that are detached from the world around us, as well as detached from the traditions that allow Alaskan communities to thrive. With decreasing connections to the natural world, bodies are not nourished with natural foods or enriched with physical activity. Children have increased vision problems, lower vitamin D values, poorer immune systems, and worse sleep. Reduced fitness levels are tied to lower cardiovascular fitness, weaker muscle development, and higher rates of obesity. Perhaps even greater are the impacts on children's mental wellness, where we see increasing anxiety and depression, and decreasing resilience and attention - the latter of which often manifests in ADHD-related symptoms. Language and social development lags for children with less face-to-face interaction, children and adults experience greater isolation, and their problem solving and self-regulation functions are decreased when compared with children who experience more unstructured outdoor play. The opportunity is that we have awareness of this issue, in a place where cultures and traditions value outdoor connections. Discovery Southeast reliably provides local, outdoor place-based nature education, and is well positioned to expand it.	For almost 40 years we have provided nature education, predominately for elementary-age children, but including preschoolers to adults. Over the last decade - and particularly since the pandemic - the wellness benefits have been increasingly evident and important. This proposal will expand outdoor wellness and fitness region-wide. Everyday in our outdoor programs we watch children become more sure in themselves. We see them develop confidence and resilience, and reconnect to their bodies and nervous systems. We see them develop patience to sit at the base of a tree and map the sounds around them or sketch the veins in a devils club leaf. We watch then collaborate and problem solve to build a shelter or navigate a shore. And we watch them hike up a hillside happily, and come down tired. Learning like this has been fundamentally entwined with human development for tens of thousands of years, and has a formative, profound impact on wellbeing and cognition. This RHTP opportunity is a catalyst to improve and expand our outdoor programs in Southeast. We'll serve a broad age range from preschool to middle school, we'll ensure lessons are culturally and geographically relevant, and we'll expand the regional reach to the remote and rural communities in Southeast. This improved and expanded outdoor programming will benefit mental wellness and physical fitness of children and families, in ways deeply relevant for Southeast communities. In preschool, we'll develop our pilot outdoor preschool to be meaningful and replicable, so it can be used by every local preschool and care provider. We'll expand our own offerings, as well as provide outreach to local preschools and centers, and training and content for providers across the region in order to increase the quality and availability of preschool. We will expand our gardening program similarly, obviously bringing wellness benefits from meaningful time outdoors, but also orienting children and families to healthy foods. Finally our emerging middle school programs and extant elementary school programs will benefit from increased wellness components and culturally relevant themes. These improvements make stronger outdoor programs that are better situated for regional expansion. We will follow that through with enhanced outreach, regional collaboration, and professional development opportunities. Ultimately we intend to strengthen and expand our outdoor education programs in ways children region-wide benefit.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough)	Deferred or Not Advanced

District 49A Lions Foundation	District 49A Lions Sight Committee - bridging the eye care gap for Alaskans	AK	Healthcare in Alaska is broken. We are 31st state in avoiding care due to cost. Only six states have a higher percentage of uninsured residents. The US Institute of Medicine issued several reports in the early 2000s concluding that being uninsured is seriously hazardous to American health outcomes. A more recent (2014–2018) Commonwealth Fund survey discovered almost half of underinsured adults report medical bill and debt problems and 41% delay necessary care because of costs. For children, 80% of their overall learning is through sight. Parents who cannot afford eyecare for their child may not be aware of the vision issues that may exist. Specifically about eyecare, there is no sliding fee scale eye clinic in the entire state. Rotary International and Lions Club organizations are frequently approached by people who are uninsured or cannot afford copays for eye examinations, cataract surgeries, and corneal transplants. As of 2025, there no pro-bono surgical eye services for such procedures in the state. For example, one Homer teenager in Nov 2025 petitioned for a corneal procedure from multiple nonprofits to raise \$14,000 for it, as insurance did not cover the full amount. Only one eye clinic is involved with Project Access Alaska, and limits care to eight pro-bono, nonsurgical exams a year which is woefully inadequate. This is an opportunity for creating a resource to bridge that gap until a federally qualified health clinic adopts eyecare as a service.	The goal of the Lions Club 49A Vision Committee is directed toward Alaskans who: 1. Are “insured” yet cannot afford to access eyecare services because of high deductibles/copays. 2. Do not have vision insurance because their medical insurance does not provide for it. Our approach is to fund a preexisting committee of a charitable volunteer nonprofit. This Vision Committee (VC) is filled with community members of the local Lions Club chapters of Alaska. These members review requests for aid with consideration of insurance coverage, income and service type. The VC then determines whether to provide resources for their particular contextual need or assistance with funding for the purpose of vision care. Our unique model is the Alaskan premise of neighbors helping neighbors. It completely removes the barriers that stop so many Alaskans from accessing care: cost, and lack of knowledge. By addressing the acute need for vision services and treat issues promptly, we can improve health outcomes for hundreds of our friends, families, and neighbors, and improve the workforce who can resume reading and driving in their daily tasks. This also helps the children who cannot see their schoolwork so they can continue their education in whole.	\$50,000-\$250,000		Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Dillingham Census Area; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kuskilvak Census Area; Matanuska-Susitna Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality)	Deferred or Not Advanced
DMeyeCare, LLC	AI assisted retinal photos for diabetic patients within primary care offices	MT	In 2017, the CDC reported that only 47% of the Alaskan population was receiving a diabetic exam under medicare (https://www.cdc.gov/mmwr/volumes/68/wr/mm6845a3.htm#T1_down). My goal is to improve access and quality metrics by providing a fully autonomous retinal camera with AI driven retinopathy reports (FDA approved) in primary care offices and/or IHS facilities to increase the amount of diabetic patients getting retinopathy screenings.	I currently work at a community health center in Montana, and even with an eye care provider within the clinic we don't meet the target of 80%. There is a gap in care and my goal is to close that gap by workflow changes. I would like to place the camera right next to height, weight, vital station so within 1 minute the diabetic screening is accomplished. Any CNA, MA, nurse, or front reception can run this machine because it is a push of a button.	\$250K-\$1M	Specialist	Statewide	Bethel Census Area; Dillingham Census Area; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kuskilvak Census Area; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Docket Health, Inc.	Consumer Access to Preventive Health Data Using Docket	CT	Alaska has made progress in providing consumer access to immunization records through VacTrAK integration. However, many other preventive and early-detection results from public health programs remain difficult for rural families to obtain after testing is complete. These include newborn screenings, hearing tests, blood lead testing, and tuberculosis (TB) testing records. Rural and frontier communities face additional barriers, including workforce shortages, long travel distances, and fragmented documentation processes. Families may relocate between boroughs or transition between tribal and non-tribal providers, increasing the risk of delayed follow-up. Alaska’s Rural Health Transformation priorities emphasize Healthy Beginnings, Health Care Access, Strengthen Workforce, Pay for Value, and Spark Technology & Innovation. Expanding secure consumer access to verified preventive public health data directly builds on existing immunization infrastructure and represents a foundational step toward the broader modernization of rural preventive health systems.	Docket Health will lead a phased initiative to expand secure consumer access to selected preventive public health data domains held by the Alaska Department of Health. Alaska’s Health Information Exchange, healthEconnect Alaska, supports provider-to-provider exchange and public health reporting, including immunization registry exchange, electronic laboratory reporting, syndromic surveillance, cancer registry submissions, and behavioral health reporting through the Alaska Automated Information Management System (AKAIMS). This initiative complements those capabilities by extending verified public health data access directly to consumers. Phase 1 will focus on governance coordination with the Alaska Department of Health and alignment discussions with healthEconnect Alaska to ensure architectural consistency and policy alignment. Phase 2 will support secure integration, development, and deployment of consumer access workflows for: • Blood lead test results • Newborn bloodspot screening • Newborn hearing screening • Tuberculosis (TB) testing records This expansion builds directly on Docket’s existing VacTrAK integration in Alaska and leverages Docket’s demonstrated experience implementing statewide access to blood lead results in New Jersey. Phase 3 will focus on rural onboarding, communications, performance monitoring, and stabilization. Future expansion of additional preventive domains supported through HIE reporting channels may be evaluated in coordination with the Alaska Department of Health and healthEconnect Alaska, where legally permissible and aligned with state priorities. Where appropriate, SMART Health Links standards may be leveraged to enable secure, portable sharing of verified preventive records between families and authorized providers. This coordinated approach advances Healthy Beginnings, expands Health Care Access, strengthens Workforce capacity by reducing manual record retrieval burden, supports Pay for Value through earlier intervention, and advances Spark Technology & Innovation in alignment with Alaska’s Rural Health Transformation goals.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Docket Health, Inc.	Modernizing Alaska’s Annual School Immunization Reporting Infrastructure	CT	Rural and frontier communities face unique barriers to preventive health infrastructure, including limited workforce capacity, long travel distances, and inconsistent administrative support. Alaska’s school-based immunization compliance processes remain labor-intensive and inconsistent across districts, particularly in rural and frontier communities where staffing is constrained. School nurses must manually calculate grade-based compliance, reconcile documentation with VacTrAK, manage exemptions and enrollment conditions, and submit required reports during designated reporting windows. These processes vary across districts and rely heavily on manual interpretation of state requirements. This burden reduces the availability of school health personnel to provide direct student services and coordinate preventive care. In smaller rural districts, where a single nurse may support multiple schools, these demands place disproportionate strain and increase the risk of inconsistent tracking of compliance. Parents also often lack streamlined access to verified immunization records, leading to delays and duplicative documentation requests. There is a significant opportunity to modernize this infrastructure by expanding a proven, secure, IIS-integrated platform that automates compliance validation, improves parent access, enhances transparency in statewide reporting, and strengthens the sustainability of school-based preventive health oversight across Alaska.	This initiative will expand Docket for Schools statewide to modernize school-based immunization compliance workflows, aligned with Alaska’s Rural Health Transformation priorities, including Healthy Beginnings, Health Care Access, Strengthen Workforce, Pay for Value: Fiscal Sustainability, and Spark Technology & Innovation. The project team will prioritize early engagement with tribal community partners. Docket for Schools replaces manual reconciliation with automated validation tools that integrate directly with Alaska’s Immunization Information System (VacTrAK). The platform: • Automatically calculates immunization compliance using current state rules • Supports bulk roster uploads and structured exemption documentation • Applies enrollment conditions, including grace periods and other state-defined criteria • Generates multilingual parental follow-up letters with QR codes linking families directly to verified digital immunization records through the Docket consumer application • Automates CDC and state reporting requirements • Provides real-time dashboards enabling Alaska Department of Health staff to monitor trends by school, region, grade level, and immunization series Docket is live in production across multiple states and has onboarded over 150,000 students across more than 700 schools in Maine alone. Docket is under contract with 11 public health agencies nationally and has enabled access to more than 3.5 million IIS records through its consumer application, demonstrating both scale and adoption. The platform is designed to protect stability and support rural scale. Bulk school queries are processed asynchronously via a prioritized queue architecture to prevent disruption to consumer access. The system operates in read-only mode and does not write data back to IIS, minimizing technical risk. Security posture includes SOC 2 compliance, annual audits across security and privacy controls, third-party penetration testing, allow-listed email domains, and strict role-based access controls. A 24-month phased implementation will ensure disciplined statewide rollout. Phase 1 will focus on governance coordination and initial district onboarding. Phase 2 will prioritize rural and frontier expansion, training delivery, and performance monitoring. Phase 3 will focus on statewide stabilization and transition to low-cost, steady-state operations.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Dot Lake Village Council	TeeJuh Behavioral Health	AK	This project will strengthen early intervention, stabilize individuals and families, and build a sustainable rural behavioral health workforce. Rural residents in the Upper Tanana region face significant barriers to behavioral health care, including geographic isolation, limited local providers, high travel costs, and long wait times for services in urban centers. These gaps contribute to untreated trauma, substance misuse, domestic violence, and justice system involvement. TeeJuh Behavioral Health will address this disparity by expanding culturally grounded, community-based behavioral health services that integrate trauma-informed care, telehealth access, peer support, and coordination with Tribal justice and victim services	TeeJuh Behavioral Health will continue and expand our services through a culturally grounded, community-based behavioral health model designed specifically for rural and frontier Alaska. Our approach integrates early intervention, trauma-informed clinical care, peer support, and coordinated justice partnerships to address the root causes of instability and justice involvement. First, we will expand local access to services and implement new services to fill gaps in the existing Alaska health care system. These services will include individual and family counseling, substance misuse screening and intervention, domestic violence-related behavioral health support, and crisis response. By addressing unmet needs locally, residents can receive consistent care without prolonged delays or unnecessary travel. Second, we will embed culturally responsive practices into all services. Programming will incorporate Alaska Native values, Elder involvement, identity-strengthening activities, and land-based healing opportunities. This approach reinforces protective factors such as belonging, cultural connection, and intergenerational support, which are critical to long-term wellness in rural communities. Third, we will strengthen coordination with the Tribal Court, Sexual Assault Response Team, and local law enforcement to create clear referral pathways for survivors and justice-involved individuals. Integrated case management will ensure that clients receive behavioral health services alongside advocacy, safety planning, and accountability measures. Finally, we will build sustainability by training and mentoring local residents into behavioral health, peer support, and case management roles. Developing a local workforce reduces reliance on itinerant providers and increases long-term service stability. By aligning services with Medicaid reimbursement pathways and Tribal partnerships, TeeJuh will create a scalable and sustainable rural behavioral health infrastructure.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Fairbanks North Star Borough	Deferred or Not Advanced

Dr. Amy LLC	Expanding Rural Behavioral Health Capacity Through Trauma-Responsive Workforce Training	OR	Rural communities face persistent barriers to behavioral health access, including workforce shortages, long wait times, transportation challenges, and limited access to preventive and early intervention supports. These challenges are especially significant for children, caregivers, and the professionals who serve them. In many rural communities, families most often interact with trusted frontline providers such as pediatric teams, early childhood staff, family support workers, educators, and community-based professionals who want to help but may not have practical training in trauma-responsive care or brief behavioral health interventions. This project addresses that gap by strengthening the capacity of the existing rural workforce to respond earlier and more effectively. The opportunity is to expand access to meaningful behavioral health support by equipping professionals already embedded in local communities with practical, relational, and trauma-responsive tools they can use in everyday interactions. This approach helps rural communities build local capacity, improve family experience, and create broader system resilience without depending solely on hard-to-recruit specialty providers.	This project aligns with Alaska’s Rural Health Transformation Program priorities—particularly the Strengthen Workforce, Healthy Communities, and Healthy Beginnings initiatives—by expanding the capacity of the rural workforce to provide early behavioral health support for children and families. Dr. Amy King, LLC proposes a workforce development approach that strengthens behavioral health capacity across child- and family-serving systems in rural Alaska, improving access to support in communities where licensed behavioral health providers are limited. The project would provide trauma-responsive, relational health, and brief intervention training for professionals working in settings such as health care, behavioral health, early childhood, education, family support, and community-based services. The training model is designed to be practical, accessible, and immediately applicable in everyday work with children and families. Core activities may include direct training for frontline staff and supervisors, implementation support to help organizations apply the practices, and development of internal champions or train-the-trainer pathways to expand reach over time. Participants would build skills in understanding social-emotional development, recognizing the impact of stress and trauma, supporting regulation and felt safety, and using relational strategies that strengthen family engagement and resilience. Training will be delivered in partnership with Alaska organizations and adapted to reflect the cultural context of Alaska Native communities and rural service systems. The project is intentionally flexible so it can be adapted to local contexts while maintaining a focus on practical workforce tools. Rather than creating a new siloed service, the approach builds capacity within systems already serving rural families. This increases the availability of behavioral health support in trusted community settings and embeds these practices into workforce development, supervision, and daily service delivery, serving a workforce multiplier for rural Alaska. Rather than relying on expanding the limited number of licensed behavioral health providers, we will strengthen the skills of the broader workforce already interacting with children and families. By equipping frontline providers with practical relational and brief behavioral health tools, the project expands early support capacity in rural communities, allowing specialized providers to focus on highest-acuity needs.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

DRKUMO INC	Digital Health for Alaska Rural Health Transformation Program	CA	Rural Alaskans experience limited access to healthcare due to provider shortages and geographic challenges, leading to fragmented chronic disease management. This lack of continuous oversight results in preventable acute medical crises and high costs associated with emergency transport.	DrKumo will implement an end-to-end RPM program for 5,000 rural patients with hypertension, diabetes, or heart failure. Using our URAC-accredited, FIPS-compliant technology, local community health teams can monitor vitals "anytime and anywhere," with AI-driven analytics prioritizing high-risk alerts for immediate clinical review. Dub Diversified LLC dba Looped Solutions	ARISE: Alaska Response Initiative for Safety and Empowerment	PA	Alaska consistently ranks among the highest states in the nation for rates of lethal violence against women, with Alaska Native women experiencing disproportionately high rates of violence across the state, including in many rural and Tribal communities. In rural and remote regions, geographic isolation, constrained specialty services, workforce shortages, and fragmented cross-sector coordination intensify the health system burden associated with domestic and intimate partner violence. Violence contributes to behavioral health destabilization, emergency department utilization, and long-term trauma exposure among children and families. Yet rural health systems often lack standardized, culturally responsive coordination pathways to support early identification and safe referral across clinics, Tribal health organizations, shelters, and law enforcement. ARISE, led by Looped Solutions in partnership with Alaska-based partner iEXIST, LLC, the Gabby Petito Foundation, and McKinley Research Group, will develop an Alaska-specific integration framework and implementation roadmap designed to strengthen how rural systems identify, coordinate, and respond to domestic and intimate partner violence. By engaging diverse rural contexts during the planning phase, the project will produce a community-informed model that improves referral coordination, reduces fragmentation, and builds the operational readiness necessary for responsible future implementation.	ARISE will operate as a structured planning initiative designed to assess current response systems, identify integration opportunities, and develop implementation-ready planning outputs that strengthen coordination across existing health, Tribal, and community response systems addressing domestic and intimate partner violence in rural Alaska. The project will be organized into four primary phases during the Year One planning period. Phase 1: Project Initiation and Partner Coordination The project team will finalize partner roles, establish communication structures, and confirm engagement strategies with participating communities and stakeholders. Early coordination with Alaska-based partners will guide regional context considerations and help identify appropriate rural engagement approaches. Phase 2: Stakeholder Engagement and System Assessment Structured engagement will be conducted across selected rural contexts, including listening sessions, interviews, and cross-sector discussions with health providers, behavioral health organizations, Tribal health representatives, shelter leaders, law enforcement partners, and individuals with lived experience. Engagement will focus on identifying current screening practices, referral pathways, coordination gaps, and safety considerations. Phase 3: Analysis and Framework Development Findings from stakeholder engagement and regional analysis will inform the development of an Alaska-specific coordination framework. This phase will also evaluate how technology-supported safety tools can responsibly align with existing rural systems while respecting governance considerations, confidentiality protections, and cultural context. Phase 4: Planning Outputs and Implementation Roadmap The final phase will translate engagement findings into implementation-ready planning outputs. Deliverables will include cross-sector coordination guidance, rural screening and referral pathway recommendations, governance considerations, digital safety standards, and a phased implementation roadmap designed to support future adoption by participating partners. Throughout the planning period, Alaska-based partners will guide community engagement and contextual considerations to ensure the resulting framework reflects the needs and realities of rural communities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Kusilvak Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

Eagle River Missionary Baptist Church	Emergency preparedness, for health and wellness development of a Hope Center for Change.	AK	Beyond emergency preparedness, ERMBC is pursuing a long-term vision to transform our campus into a hub for community health and wellness through the development of a Hope Center for Change. Situated on available church-owned land, this future multi-purpose facility would support: Health education and emergency preparedness training Cooking and nutrition classes Youth life-skills education for independent living Community-based wellness and prevention initiatives	ERMBC is committed to responsible implementation and sustainability. Our plan includes: Designated leadership oversight for health and safety initiatives, CPR/AED training or awareness for church leaders and volunteers, and clear emergency response protocols. Coordination with local emergency responders, when possible, to offer training for low-income individuals and other groups in the community. Ongoing maintenance and accessibility of equipment. Our church leadership and congregation are unified in support of this effort and prepared to partner with organizations committed to strengthening rural health outcomes.	Under \$50,000		Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area	Deferred or Not Advanced
Eastern Aleutian Tribes, Inc.	Aleutian Peninsula Regional EMS & Remote Patient Monitoring Program	AK	Communities along the Aleutian Peninsula face persistent gaps in emergency medical response and preventative health monitoring. Many communities rely on volunteer responders with limited resources and inconsistent coverage. When emergencies occur, the local clinic becomes the response center, contributing to provider burnout and delayed care. At the same time, rural Alaska experiences high rates of chronic disease, behavioral health crises, and substance use disorders. Many of these emergencies could be prevented if changes in patient health were detected earlier. Advances in wearable health monitoring technology now allow rural clinicians and paramedics to monitor patient health remotely. Devices such as the BioButton wearable monitor provide continuous vital sign tracking that can detect early signs of infection, respiratory illness, cardiac stress, or other health changes. This project combines regional EMS deployment, community paramedicine, and wearable remote monitoring technology to create a proactive health safety system for the Aleutian Peninsula. Rather than only responding to emergencies, the program will allow clinicians to identify early health changes and intervene before emergencies occur.	The proposed project will establish a technology-enabled regional EMS system serving communities across the Aleutian Peninsula. Key components include: 1. Regional Paramedic Deployment Paramedics will rotate into communities using a 30-days-on / 30-days-off staffing model. During their off rotation, paramedics will maintain employment in Anchorage partner EMS systems, ensuring workforce sustainability and clinical skill retention. 2. BioButton Remote Patient Monitoring High-risk residents will be offered BioButton wearable monitoring devices that continuously measure: • Skin temperature • Heart rate • Respiratory rate • Activity and recovery patterns These devices allow clinicians and paramedics to monitor health remotely and detect early signs of infection, respiratory illness, cardiac stress, or medical deterioration. Paramedics will use this data to proactively conduct home visits and clinical check-ins before emergencies occur. 3. Community Paramedicine Paramedics will provide additional services including: • Chronic disease monitoring • Behavioral health stabilization support • Post-hospital follow-up care	Over \$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality)	Advance to Implementation Application

- Medication compliance checks
- Preventive health monitoring using wearable data

4. Regional EMS Training Center

A regional training hub will support:

- EMT and paramedic training for rural residents
- Continuing education for volunteer EMS responders
- Simulation-based emergency training
- Telemedicine integration with hospitals

5. Integrated Emergency Response Network

The program will coordinate with:

- Tribal health clinics
- EMS departments
- Regional hospitals
- Medevac providers

This integrated system combines emergency response, preventative care, and remote monitoring technology to transform rural health care delivery. This would be done in stages with EAT service area communities first, then increasing to other communities until the Aleutian Peninsula is covered by trained EMs program.

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: The EAT Hypertension/Tobacco Reduction Initiative	AK	Hypertension and tobacco dependency are two of the most significant contributors to preventable illness in rural Alaska. These conditions frequently occur together and dramatically increase the risk of cardiovascular disease, stroke, and other chronic health complications. In the Eastern Aleutian Tribes region, nearly half of individuals with hypertension are also tobacco dependent. Managing these conditions is particularly difficult in remote communities where geographic isolation, workforce shortages, and limited access to ongoing monitoring prevent consistent care. Eastern Aleutian Tribes approaches this challenge through its definition of health as the well-functioning of a living human being, recognizing that long-term health requires proactive monitoring, lifestyle support, and early intervention. Recent advances in wearable health technology provide new opportunities to transform rural health care delivery. Devices such as the BioButton wearable monitor allow clinicians to monitor physiologic indicators remotely and identify early signs of illness or stress before a medical emergency occurs. This project integrates wearable monitoring technology with hypertension management and tobacco cessation programs to support the well-functioning of individuals while advancing the State’s goal of Healthier Alaskans.	This initiative will implement a technology-enabled chronic disease management program focused on reducing hypertension and tobacco dependency while improving the well-functioning of individuals and communities. Key program components include: 1. BioButton Wearable Monitoring Participants will be offered BioButton wearable monitoring devices that continuously track physiologic indicators including heart rate, respiratory rate, temperature, and activity levels. These devices allow clinicians to monitor health remotely and detect early physiologic changes that may indicate worsening hypertension, illness, or stress related to tobacco withdrawal. 2. Hypertension Management Participants will receive enhanced hypertension care including: • Blood pressure monitoring • Medication management support • Nutritional counseling • Physical activity promotion • Lifestyle coaching These services support improved cardiovascular health and long-term well-functioning. 3. Tobacco Reduction and Cessation Individuals who use tobacco will receive targeted cessation support including: • Nicotine replacement therapies • Behavioral counseling • Peer support resources • Relapse prevention support Reducing tobacco dependency significantly improves long-term health outcomes and supports the well-functioning of individuals. 4. Care Coordination RN case managers, primary care clinicians, and behavioral health providers will coordinate care plans using both wearable monitoring data and clinical assessments. This integrated approach helps individuals maintain better health and supports the broader goal of Healthier Alaskans.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality)	Advance to Implementation Application

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Nelson Lagoon Community Wellness Center	AK	Many rural communities lack accessible infrastructure that supports regular physical activity. Limited access to indoor recreational facilities can contribute to sedentary lifestyles, increased risk of chronic disease, and fewer opportunities for youth engagement. In communities such as Nelson Lagoon, weather conditions often make outdoor activity difficult for extended periods of the year. Without indoor spaces for physical activity, residents may struggle to maintain healthy routines. At the same time, unused public facilities such as the former school building represent an opportunity to create valuable community health infrastructure. Repurposing the former school building into a wellness and fitness center would create a centralized space for physical activity, youth programs, and community events that promote both physical and mental wellness. Investing in community wellness infrastructure supports healthier lifestyles and strengthens community resilience.	Eastern Aleutian Tribes will collaborate with local partners to convert the former Nelson Lagoon school building into a community wellness center and gymnasium. Facility Renovation The project will renovate and adapt the existing structure to support safe indoor recreation and wellness activities. Potential improvements may include: • Gym flooring and activity space improvements • Fitness equipment installation • Lighting and electrical upgrades • Heating and ventilation improvements • Safety and accessibility upgrades • Storage areas for sports and activity equipment Fitness and Recreation Programming The facility will support a variety of wellness-focused activities, including: • Community fitness classes • Youth sports and recreation programs • Indoor walking and exercise opportunities • Wellness education activities • Community gatherings focused on health and wellness Youth and Community Engagement The wellness center will provide a positive gathering space for youth and families, encouraging healthy activities and strengthening social connections within the community.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Advance to Implementation Application

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Portable Digital X-Ray Access for Nelson Lagoon	AK	Rural clinics often face challenges related to limited diagnostic capabilities. In communities without imaging equipment, providers must rely on clinical judgment alone or arrange travel to another facility for imaging. This approach can lead to unnecessary travel, delayed diagnosis, and increased costs for both patients and the health system. In remote Alaska communities, travel for medical services frequently involves charter flights or complex transportation arrangements. Eastern Aleutian Tribes has already deployed Fuji portable digital X-ray systems at other clinic sites across the region, and these systems have significantly improved patient care by allowing clinicians to diagnose injuries and illnesses locally. These systems have also reduced unnecessary travel and associated medical transportation costs by enabling providers to rule out conditions that would otherwise require referral. Nelson Lagoon remains the only clinic site without this capability. Providing portable digital X-ray access will close this gap and ensure equitable access to diagnostic services across the region.	Eastern Aleutian Tribes will purchase and deploy a Fuji Portable Digital X-Ray system for the Nelson Lagoon clinic. Key components of the project include: Equipment Acquisition Funding will support the purchase of a portable Fuji digital X-ray unit, which includes: • Portable imaging device • Digital detector system • Integrated imaging software • Secure transmission capability for remote radiology interpretation Clinical Integration The new imaging system will integrate with existing clinic workflows and allow images to be transmitted electronically for review by consulting radiologists and medical providers. Provider Training Clinic staff will receive training on safe operation of the portable X-ray unit and appropriate imaging protocols. Improved Care Coordination The system will support better coordination with regional hospitals and specialists by allowing providers to share imaging results quickly and accurately.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Advance to Implementation Application

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Rural Medication Access and Automated Pharmacy Dispensing Modernization	AK	Rural clinics often face challenges related to pharmacy staffing, medication storage, and timely medication distribution. Automated pharmacy dispensing technology allows clinics to provide efficient and secure medication access even when pharmacy staff are not physically present. Eastern Aleutian Tribes has successfully used PickPoint dispensing technology to improve medication distribution across its clinic network. These systems allow medications to be securely stored and dispensed to patients using unique access codes. However, the current machines are aging and nearing the end of their operational lifecycle. Aging equipment increases the risk of system failures that could delay medication access and disrupt clinic operations. Replacing the machines with new PickPoint systems will ensure reliable medication access, reduce pharmacy workflow burdens, and improve patient experience across the region. This investment strengthens rural health infrastructure while supporting the broader goal of Healthier Alaskans.	Eastern Aleutian Tribes will replace nine Pharmacy PickPoint automated dispensing units across its clinic network. Each replacement unit will include: • Secure automated medication dispensing system • Integrated pharmacy management software • Secure patient access technology • Installation, shipping, and system setup The new units will integrate with existing pharmacy workflows and electronic systems used by the organization. Key Program Benefits The upgraded systems will: • Improve patient access to medications • Reduce wait times for medication pickup • Improve pharmacy workflow efficiency • Enhance medication security and tracking • Reduce operational disruptions caused by aging equipment These improvements strengthen pharmacy services and ensure reliable medication access for residents living in remote communities.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Advance to Implementation Application

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Rural Oral Health Access and Dental Infrastructure Modernization Initiative	AK	Oral health conditions remain one of the most common health issues affecting rural communities. Untreated dental disease can lead to pain, infection, difficulty eating, and increased risk of systemic health problems. Rural communities often face delays in dental care due to limited provider availability and aging equipment that restricts clinic capacity. In some cases, patients must travel to larger communities for care, which can create significant financial and logistical burdens. Eastern Aleutian Tribes operates dental programs in multiple communities across the region, with the primary dental suites located in King Cove and Sand Point. These facilities serve as central hubs for dental services but require modernization to maintain safe and efficient operations. Additionally, smaller communities benefit from portable dental equipment that allows providers to deliver preventive and basic restorative services without requiring permanent dental suites. This initiative will modernize dental infrastructure and expand portable service capacity, improving oral health access across the region and supporting the broader goal of Healthier Alaskans.	Eastern Aleutian Tribes will implement a comprehensive Dental Infrastructure Modernization and Oral Health Access Initiative. The project includes two major components. Dental Suite Modernization – King Cove and Sand Point Existing dental suites will be upgraded with modern equipment to improve care delivery and provider efficiency. Equipment upgrades will include: • Modern dental treatment chairs • Delivery units and instrument systems • Digital intraoral imaging systems • Digital panoramic imaging capability • Sterilization equipment and autoclaves • Dental cabinetry and clinical workstations • High-speed and low-speed dental handpieces • LED operatory lighting systems • Digital radiography sensors and imaging software • Suction and vacuum systems • Air compressor systems • Instrument management and sterilization systems • Patient monitors and ergonomic provider equipment These upgrades will modernize the dental clinics and improve patient safety, efficiency, and provider workflow. Portable Dental Units for Rural Clinics The project will also purchase eight portable dental carts to support service delivery in smaller communities and provide backup capability for the larger clinics. Portable dental units will include: • Mobile dental treatment systems • Portable suction and compressor units • Portable dental instrument systems • Portable lighting and delivery systems • Portable sterilization equipment These units allow dental providers to deliver preventive services, screenings, and basic treatments in communities without permanent dental suites. Portable equipment also provides operational backup for the larger clinics if equipment failures occur.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Advance to Implementation Application

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Rural Telebehavioral Health and Community Crisis Response Network	AK	Behavioral health access remains one of the most significant challenges in rural Alaska. Communities often have limited local behavioral health providers, and travel to larger regional centers for care can be difficult and costly. These challenges contribute to delayed treatment, untreated mental health conditions, and increased risk of substance use disorders, suicide, and other behavioral health crises. Telebehavioral health services provide a proven solution to these access barriers by allowing individuals to receive care from licensed providers without leaving their communities. At the same time, rural communities occasionally experience traumatic events that affect entire populations, such as accidents, deaths, or disasters. In these situations, rapid deployment of trained Critical Incident Stress Management (CISM) teams can help communities process grief and trauma in a healthy way. This initiative addresses both needs by creating a coordinated system that provides ongoing telebehavioral health care and crisis response support, ensuring that communities receive both preventive care and rapid response when needed.	Project Concept Approach Eastern Aleutian Tribes will establish a Rural Telebehavioral Health and Crisis Response Network that improves behavioral health access and strengthens community resilience. Key components of the program include: Telebehavioral Health Services The program will expand access to licensed behavioral health providers through telehealth platforms. Services will include: • Individual counseling and therapy • Substance use disorder counseling • Psychiatric consultation and medication management • Trauma-informed behavioral health services • Youth and family behavioral health support Telehealth services allow residents in remote communities to access care without traveling long distances. Critical Incident Stress Management (CISM) Deployment The program will support the ability to deploy CISM teams to communities during times of crisis. These teams provide: • Immediate psychological support following traumatic events • Community debriefings and support sessions • Individual crisis counseling • Guidance for local leaders and responders managing community trauma Rapid response support helps communities recover from difficult events and reduces long-term behavioral health impacts. Integration with Local Health Systems Telebehavioral health providers and CISM teams will work closely with: • Rural clinics • Behavioral health case managers • Primary care providers • Community leadership	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Advance to Implementation Application

This coordination ensures that individuals receive appropriate care and follow-up support.

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: School and Community Physical Activity Partnership Initiative	AK	Youth in rural communities often face limited access to organized sports and recreational programs compared to larger urban areas. Limited equipment, travel barriers, and funding constraints can restrict opportunities for regular physical activity. At the same time, physical inactivity contributes to increased risk of chronic disease, obesity, and mental health challenges among youth. Schools are one of the most effective environments for encouraging healthy behaviors and promoting active lifestyles. By partnering directly with schools, health organizations can help expand physical activity programming and support educators and coaches who work to keep students engaged in healthy activities. This initiative recognizes that collaboration between healthcare providers and schools can create stronger prevention programs that improve long-term health outcomes for youth and families. Investing in youth wellness today helps build healthier communities for the future.	Eastern Aleutian Tribes will collaborate with schools throughout the region to establish a School and Community Physical Activity Partnership Program. Physical Activity Programming The program will support expanded opportunities for physical activity through school-based and community activities, including: • Youth sports programs • Fitness and conditioning programs • Outdoor recreation activities • Community wellness events and competitions • After-school physical activity programs Equipment and Resource Support Funding may support the purchase of equipment and supplies that enable schools to offer more robust physical activity programs, including: • Sports equipment • Fitness training equipment • Indoor recreation supplies • Outdoor activity equipment School and Community Collaboration The program will work closely with school administrators, teachers, and community leaders to design activities that meet local needs and encourage participation among students and families. Activities will be designed to encourage participation across age groups and promote lifelong healthy habits.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Advance to Implementation Application

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Community Accounting & Finance Mentoring for Wellness and Resilience	AK	Financial stability plays a critical role in overall health and community resilience. In many rural communities, individuals and families face financial challenges related to high living costs, limited employment opportunities, and limited access to financial literacy education. Financial instability contributes to chronic stress, relationship strain, housing insecurity, food insecurity, and increased risk of substance use and other health challenges. Eastern Aleutian Tribes recognizes that improving health outcomes requires investing upstream in the factors that influence well-being. Providing practical financial mentoring can significantly improve the ability of individuals and families to manage resources, prepare for emergencies, and make informed financial decisions. This initiative addresses this opportunity by establishing a structured Community Accounting and Finance Mentoring Program that provides hands-on financial education and mentorship throughout the region. The program will strengthen financial skills, reduce financial stress, and support healthier individuals and families—advancing the broader goal of Healthier Alaskans.	Eastern Aleutian Tribes will implement a structured Community Accounting and Finance Mentoring Program designed to strengthen financial literacy, household stability, and community resilience. The program will deliver 12 mentoring workshops or camps annually, rotating across communities to ensure broad regional participation. Each workshop will include: • Hands-on budgeting sessions using realistic examples relevant to rural village economies • One-on-one mentoring opportunities for participants seeking individualized financial guidance • Practical tools and templates participants can take home (paper and digital formats) • Optional youth and family participation sessions to strengthen financial skills across generations • Resource navigation connecting participants to available social and community services Training topics will include: • Budgeting and cash-flow planning • Reducing high-interest debt and improving credit • Planning for travel expenses including medical travel and emergencies • Building savings habits and emergency funds • Understanding paychecks, benefits, and deductions • Protecting against financial scams and exploitation, particularly for elders Program coordination will be led by Program Manager Anita Moran, working with the EAT Accounting and Finance team to ensure practical and consistent delivery across communities.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Deferred or Not Advanced

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Community Beading for Wellness and Prevention	AK	Many rural communities experience limited access to structured wellness activities that promote mental health, cultural connection, and social engagement. Isolation, stress, and lack of positive extracurricular outlets can contribute to behavioral health challenges, particularly among youth and elders. Programs that provide meaningful activities and strengthen community relationships can significantly reduce these risks. Beading is a culturally grounded activity that supports both wellness and prevention goals. It provides a structured environment for learning, creativity, and intergenerational connection while strengthening cultural identity. Eastern Aleutian Tribes recognizes that prevention strategies that build community engagement and cultural connection can significantly improve overall well-being. This project establishes a consistent Community Beading for Wellness and Prevention Program that promotes social connection, reduces isolation, and strengthens community resilience while supporting the broader goal of Healthier Alaskans.	Project Concept Approach Eastern Aleutian Tribes will implement a structured Community Beading for Wellness and Prevention Program delivering 12 classes annually across the region. The program will be coordinated by Victoria Marquez, RN Case Manager, who will serve as the Beading Program Manager. Each class will be delivered in community settings and will include: • Supplies provided for each participant • Guided instruction and mentorship • Opportunities for intergenerational participation • Completion of a project participants can take home • Structured social engagement and wellness-focused participation Classes will rotate across EAT communities to ensure equitable access and consistent program delivery. EAT Designated employee (VM) will coordinate scheduling, participant outreach, supply ordering and distribution, class facilitation support, and outcome tracking. The program emphasizes participation across the lifespan, encouraging elders, youth, families, and working adults to participate together. This approach strengthens community relationships and promotes protective factors that support long-term well-being.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality)	Deferred or Not Advanced

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Rural Clinic Medical Equipment Modernization Initiative	AK	Rural clinics must maintain a wide range of medical equipment to provide essential healthcare services. Aging or limited equipment can restrict the ability of providers to diagnose conditions quickly, respond to emergencies, or perform routine clinical procedures. Because travel to larger regional medical facilities can be difficult and costly for patients, expanding diagnostic and treatment capabilities within local clinics significantly improves healthcare access. Eastern Aleutian Tribes operates seven clinics across remote communities, and upgrading equipment across the entire system ensures consistent standards of care throughout the region. Modernizing equipment will allow providers to deliver more comprehensive care locally while improving patient safety, clinic efficiency, and provider workflow. Investing in rural clinic infrastructure strengthens healthcare access and supports the long-term goal of Healthier Alaskans.	Eastern Aleutian Tribes is launching a Clinic Equipment Modernization Program across all seven sites to enhance diagnostic speed, patient safety, and emergency response. Key Upgrades & Investments ADA-Compliant Exam Beds: Improving accessibility and safety for elders and patients with mobility limitations. Ultrasound Systems & Training: Point-of-care units for rapid abdominal, cardiac, and musculoskeletal assessments. Cost: \$16,000 per site. LUCAS Chest Compression Systems: Automated devices providing consistent, life-saving compressions during cardiac emergencies. Cost: \$20,000 per unit. Point-of-Care CBC Analyzers: On-site blood count testing for immediate diagnosis of infections and anemia. Cost: \$11,000 per unit (plus \$2,000 annual consumables). IV Infusion Pumps: Ensuring precise delivery of medications and fluids. Cost: \$2,500 per unit. Oxygen Concentrators: Providing critical respiratory stabilization for emergency patients prior to transport. Unified Printing Systems: Standardizing infrastructure to streamline medical documentation and records management. Impact: This initiative replaces aging infrastructure with high-tech tools, ensuring our providers have the resources needed to deliver high-quality care in a rural clinical setting.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Deferred or Not Advanced

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Rural Community Garden and Healthy Food Access Initiative	AK	Access to healthy food remains a major challenge in many rural Alaska communities. The cost of fresh produce can be significantly higher than in urban areas, and transportation delays often reduce the availability or quality of fresh foods. These challenges contribute to diet-related health conditions such as hypertension, diabetes, and heart disease. Improving access to nutritious foods is a critical prevention strategy for improving long-term health outcomes. Community gardening programs have proven effective in increasing access to fresh foods while also promoting physical activity, social engagement, and community pride. This initiative will create opportunities for both community gardens and individual household gardens, helping residents grow vegetables and other healthy foods locally. The program will also provide education on nutrition and food preparation, helping families incorporate healthy foods into their daily diets. By improving food access and nutrition education, this project supports healthier communities and advances the vision of Healthier Alaskans.	Eastern Aleutian Tribes will implement a Community Garden and Healthy Food Access Program designed to strengthen food security and improve nutrition across the region. Key components include: Community Garden Development The program will support the development of community gardens in participating communities, providing space where residents can grow vegetables and other nutritious foods. Gardens may include raised beds, greenhouse structures, or protected growing systems suited to Alaska’s climate. Household Garden Kits Residents will have the opportunity to participate in household garden programs, receiving supplies such as soil, seeds, starter plants, and gardening tools. These kits allow families to grow healthy foods at home. Nutrition and Healthy Cooking Education The program will include workshops and community events focused on: • Nutrition education • Healthy cooking techniques • Meal planning with locally grown foods • Chronic disease prevention through diet Youth and Family Engagement Youth and families will be encouraged to participate in gardening activities, helping children develop healthy eating habits and practical food skills.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Deferred or Not Advanced

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Rural Elder Care Support and CNA Workforce Initiative	AK	Rural Alaska communities are experiencing growing needs related to elder care. As residents age, many require assistance with daily activities such as mobility, medication reminders, and basic health monitoring. In larger communities, these needs may be addressed through assisted living facilities or home health programs. However, in remote communities across the Aleutian region, such services are extremely limited or nonexistent. As a result, elders often face two difficult options: managing their health needs without adequate support or relocating to larger communities far from their families and cultural environments. Creating a small, community-based CNA workforce offers an effective solution that supports aging in place while strengthening local healthcare capacity. CNAs can assist elders with daily living needs, monitor changes in health status, and communicate with clinic providers when additional care is needed. This initiative recognizes that supporting elders in their homes is not only a healthcare priority but also a community priority that strengthens families and cultural continuity.	Eastern Aleutian Tribes will establish a Rural Elder Support Program that deploys Certified Nursing Assistants (CNAs) to provide support services for elders across the region. Key components include: CNA Workforce Deployment The program will employ two Certified Nursing Assistants who will travel across communities to support elders with basic health and daily living needs. Services provided may include: • Assistance with mobility and basic daily activities • Medication reminders and support • Basic health monitoring such as blood pressure and wellness checks • Assistance with transportation coordination for clinic visits • Support for elders recovering from illness or injury • Communication with clinic providers regarding changes in health status Integration with Clinic Care Teams CNAs will work closely with: • Primary care providers • RN case managers • Behavioral health staff • community health aides This coordination ensures that elders receive appropriate support and that emerging health issues are identified early. Community-Based Support By providing assistance directly in community settings, the program helps elders remain in their homes and maintain independence for as long as possible.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Deferred or Not Advanced

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Rural Environmental Health and Waste Backhaul Initiative	AK	Rural communities across Alaska often face unique challenges in managing solid waste. Limited land availability, aging landfills, and environmental risks make long-term waste storage difficult. In coastal communities across the Aleutian region, garbage accumulation can pose significant environmental and public health risks. Improper disposal or long-term storage of waste can contribute to water contamination, pest infestations, and exposure to hazardous materials. Waste backhaul programs provide a practical solution by transporting garbage and other waste materials to regional disposal facilities where they can be safely processed. However, the cost of transporting waste from remote communities is extremely high due to distance, transportation logistics, and limited shipping options. This initiative recognizes that environmental health is a critical component of community health. Supporting waste backhaul helps communities maintain safe living environments while preventing long-term environmental and public health risks.	Eastern Aleutian Tribes will collaborate with regional communities and partners to support a Rural Waste Backhaul Program that removes solid waste from remote communities and transports it to appropriate disposal facilities. Waste Backhaul Operations The program will support the transportation of garbage and other waste materials from participating communities to regional waste management facilities. Funding will support: • Waste containerization and staging • Transportation logistics and shipping costs • Coordination with waste disposal facilities • Environmental health oversight and planning Environmental Health Protection By removing waste from communities, the program helps reduce environmental health risks associated with waste accumulation, including contamination of land and water resources. Community Collaboration The initiative will work with community partners to ensure waste removal programs align with local environmental health priorities and community planning efforts.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Deferred or Not Advanced

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Rural Public Safety and Interdiction Partnership for Community Health	AK	Substance misuse remains one of the most significant contributors to poor health outcomes in rural Alaska. Alcohol abuse, illicit drug use, and related criminal activity contribute to injury, domestic violence, behavioral health crises, and chronic disease. In remote communities where resources are limited, the arrival of illegal drugs or large quantities of alcohol can rapidly destabilize families and communities. Clinics, behavioral health providers, and emergency responders frequently experience the downstream consequences of these issues. Interdiction efforts that prevent harmful substances from entering communities represent an upstream prevention strategy that protects community health. This initiative recognizes that public safety and public health are closely connected. By strengthening local law enforcement capacity to intercept illegal substances before they reach communities, this program helps reduce substance-related harm and supports healthier community environments. Investing in interdiction support allows communities to address substance misuse earlier in the chain of events, improving outcomes for individuals and families while supporting the broader goal of Healthier Alaskans.	Eastern Aleutian Tribes will establish a Rural Public Safety and Health Partnership that supports local law enforcement agencies in preventing harmful substances from entering communities. Key components of the program include: Interdiction Support Funding Funding will support local law enforcement agencies with resources needed to strengthen interdiction activities related to illegal drugs, illicit alcohol, and other harmful substances. Resources may include: • Specialized interdiction equipment • Training for law enforcement personnel • Operational support for targeted enforcement efforts • Travel and coordination related to interdiction activities Public Safety and Health Collaboration The program will strengthen coordination between: • Local law enforcement agencies • Tribal health organizations • Behavioral health providers • Community leaders Improved coordination ensures that prevention efforts align with broader health and wellness strategies. Prevention and Community Health Impact By preventing harmful substances from entering communities, the program reduces: • Substance-related injuries and overdoses • Domestic violence incidents • Behavioral health crises • Emergency medical transports related to substance misuse This prevention approach protects community well-being and supports healthier living environments.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Deferred or Not Advanced

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Sand Point Community Pool Restoration and Rural EMS Water Rescue Training Center	AK	Rural Alaska communities face significant barriers to maintaining infrastructure that supports both public health and emergency preparedness. Facilities such as community pools provide opportunities for physical activity, youth engagement, water safety education, and emergency responder training. Sand Point is a coastal community where residents regularly interact with the ocean through fishing, transportation, and recreation. Water-related accidents and cold-water exposure are real risks for residents, and many communities lack access to water rescue training facilities. Recent tragedies involving youth and water safety highlight the need for improved training and prevention efforts. Restoring the Sand Point community pool creates an opportunity to address multiple community health priorities simultaneously. The facility would support youth swimming education, drowning prevention, physical activity, behavioral health engagement, and EMS water rescue training. By investing in community infrastructure that promotes physical activity and safety education, this project supports Healthier Alaskans and strengthens the well-functioning of individuals and communities.	This project will restore the Sand Point community pool and establish it as a multi-purpose health, safety, and EMS training facility. Key components include: 1. Pool Restoration and Facility Improvements Funding will support repairs and upgrades necessary to restore safe operation of the pool facility, including equipment replacement, infrastructure repairs, and safety improvements. 2. Youth Swimming and Water Safety Programs Once restored, the facility will provide: • Youth swimming lessons • Water safety education • Drowning prevention programs • Structured recreational activities for youth These programs promote physical activity and injury prevention while strengthening community engagement. 3. EMT and EMS Water Rescue Training The facility will support training for EMTs and EMS responders across the region, including: • Water rescue techniques • Cold-water survival training • Emergency patient extraction • Team-based rescue scenarios This training is especially important for coastal communities where fishing, marine transportation, and ocean exposure are common. 4. Community Health and Physical Activity Programs The restored pool will also support community wellness programs that promote physical activity and overall health, particularly during winter months when outdoor activity options are limited. By combining community recreation, prevention programs, and EMS training, the facility supports both individual well-being and regional emergency preparedness.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough	Deferred or Not Advanced

Eastern Aleutian Tribes, Inc.	Healthier Alaskans: Tribal Culture Camps for Wellness, Resilience, and Healthy Living	AK	Culture camps have long served as important opportunities for Alaska Native communities to pass down cultural knowledge, traditional practices, and life skills from elders to younger generations. These gatherings often include activities such as subsistence education, outdoor skills, traditional crafts, storytelling, and community meals. Participation in these activities promotes physical activity, strengthens cultural identity, and creates meaningful connections between youth and elders. Research and community experience demonstrate that cultural engagement is strongly associated with improved mental health outcomes and reduced risk of substance use and other behavioral health challenges among youth. However, many tribes face financial barriers in organizing and sustaining these camps each year. This initiative will support tribal partners in hosting culture camps that promote physical activity, cultural education, and healthy eating. Investing in these programs strengthens protective factors for youth and families and contributes to healthier and more resilient communities.	Eastern Aleutian Tribes will collaborate with the seven tribes in its service area to support annual culture camps that promote health, wellness, and cultural resilience. Culture Camp Support The program will provide \$50,000 annually to support tribal culture camps across the region. Funding may support: • Camp supplies and materials • Transportation for youth and elders • Cultural instructors and knowledge holders • Outdoor and subsistence activities • Camp coordination and logistics These camps create opportunities for youth and families to engage in traditional activities while strengthening cultural identity and community connection. Healthy Food and Nutrition Component An additional \$10,000 annually will support healthy eating initiatives within culture camps. These funds may support: • Healthy meal preparation for camp participants • Traditional foods education • Nutrition education activities • Youth participation in food harvesting and preparation Providing healthy food options reinforces nutrition education and promotes lifelong healthy eating habits. Physical and Mental Wellness Activities Culture camp activities naturally incorporate: • Physical activity through outdoor engagement • Mental wellness through community connection • Cultural identity and resilience • Intergenerational learning These activities help strengthen protective factors that support long-term health.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area	Deferred or Not Advanced

eCare USA	Interior Alaska Virtual Care Network	AL	Healthcare delivery across Interior Alaska is challenged by vast geographic distances, small and widely dispersed populations, and limited access to specialty services. Rural clinics and critical access facilities often operate with minimal staffing and limited on-site resources, making it difficult to provide consistent specialty consultation, emergency support, pharmacy access, and coordinated follow-up care for patients living in remote communities. As a result, patients frequently must travel long distances or rely on costly emergency transport to receive services that could potentially be delivered closer to home. At the same time, rural providers are managing increasing patient needs with limited staffing and significant administrative burden, which can impact both workforce sustainability and continuity of care. These challenges create an opportunity to strengthen Alaska’s hub-and-spoke healthcare model by extending the capabilities of regional health systems into surrounding rural communities. Foundation Health Partners serves as a key regional hub for Interior Alaska and already supports a network of rural providers across the region. By leveraging technology-enabled care models and partnerships with Alaska-based implementation partner Vicinity, this project seeks to improve access to specialty consultation, emergency support, patient monitoring, and coordinated follow-up care for rural and frontier communities.	This project will establish a regional virtual care network that connects rural clinics and community providers across Interior Alaska with clinical expertise located at Foundation Health Partners. The approach focuses on expanding the reach of existing regional care resources rather than creating new standalone programs. Working with Alaska-based partner Vicinity, the project will deploy integrated virtual care capabilities that allow rural providers to access specialty consultation, emergency support, remote monitoring, and pharmacy services through secure digital connections. These tools will enable real-time collaboration between local providers and regional care teams, helping rural clinics manage more complex cases locally while ensuring patients receive timely specialty input when needed. The project will also introduce workflow tools designed to support rural clinical teams, including virtual nursing support, remote patient monitoring for high-risk patients, and technology that reduces documentation burden. These capabilities are intended to strengthen coordination across care settings and improve follow-up care for patients after emergency visits or hospital discharge. By building on the existing hub-and-spoke care relationships centered around Foundation Health Partners, this approach creates a scalable model that expands access to clinical expertise, supports rural providers, and improves continuity of care across Interior Alaska communities.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

ECHO Diabetes Action Network	Statewide Diabetes Specialty Access and Rural Care Transformation	AK	Diabetes is a high-cost, high-burden condition in Alaska, disproportionately affecting rural and medically underserved communities. Most Alaskans with diabetes—including those with complex conditions such as chronic kidney disease, retinopathy, obesity, and depression—are managed in primary care due to limited access to endocrinologists and other subspecialists across the state. Rural geography, workforce shortages, and specialty access gaps contribute to delayed treatment, avoidable emergency department visits, preventable complications, and significant travel burdens for patients who often must travel long distances within Alaska or out of state for specialty care. Primary care clinicians often lack timely specialty input for complex cases, leading to over-referral, under-treatment, or fragmented care. Alaska has strong Project ECHO infrastructure through the UAA, but a comprehensive diabetes-focused ECHO program has yet to be implemented statewide. This project pairs workforce development with real-time specialty consultation and virtual specialty care, strengthening diabetes management in primary care while reducing unnecessary referrals and patient travel. The initiative will establish a coordinated statewide diabetes specialty access model that strengthens primary care capacity, improves care quality, reduces avoidable costs, reduces clinician burnout, and advances sustainable rural health system transformation aligned with Alaska’s RHTP priorities.	This initiative complements EDAN’s RHTP proposal and partnership with UAA Alaska Project ECHO to launch statewide diabetes-focused ECHO programming for frontline clinicians and community health workers. EDAN will serve as the coordinating lead and implementation partner, aligning workforce development, specialty access, and quality improvement into a unified rural diabetes strategy. During recruitment and onboarding, participating clinics will also be introduced to a specialty consultation and referral platform (PicassoMD) to strengthen diabetes management and referral coordination. The project includes three integrated components: 1.Workforce Capacity Building through Diabetes Project ECHO In partnership with UAA, the project will launch an interprofessional Diabetes Project ECHO program. Through case-based learning and specialist mentorship, primary care teams will strengthen their ability to manage diabetes and related comorbidities locally, including CKD, obesity, depression, and retinopathy. This model expands local expertise, reduces professional isolation, and strengthens the rural workforce and care quality. Project ECHO will serve as the anchor statewide workforce development network. Clinics may participate in ECHO training, specialty consultation services, or both based on local needs. 2.Real-Time Specialty Consultation and Referral Optimization Participating clinics will gain access to a telehealth-enabled consultation and referral platform allowing primary care clinicians to obtain rapid specialist input through virtual curbside consultations, avoid unnecessary referrals, and co-manage high-risk patients with specialty support. 3.Virtual Specialty Access For patients requiring direct specialty evaluation, the project will deploy a Virtual Specialty Group model enabling tele-endocrinology visits with board-certified specialists. This allows rural patients to access specialty care without long-distance travel while maintaining care coordination through local primary care teams. Together, these components create a closed-loop specialty access model. Project ECHO builds long-term clinical capability, while consultation and virtual specialty care provide immediate support for complex cases. This approach improves diabetes outcomes, strengthens rural workforce capacity, reduces avoidable specialty utilization and travel, and advances RHTP priorities in Health Care Access, Strengthen Workforce, Pay for Value, and Spark Technology and Innovation.	\$250K-\$1M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

eClinicalWorks, LLC	eClinicalWorks and healow Support of the Rural Health Transformation Project (RHTP)	MA	The federal government has identified a problem that rural health populations nationwide face when trying to access affordable and accessible healthcare in their local communities. The RHTP is an unprecedented opportunity for the states and healthcare providers in rural areas of the country to design programs that will provide access to care to their patients using a variety of strategies, tools, and innovative technologies to bridge the gaps that they face. eClinicalWorks and healow bring innovate technology solutions that facilitate patient outreach, offer expanded access to care, and help manage populations of patients with chronic conditions. The use of these tools, along with Artificial Intelligence features in some of the products, are a workforce multiplier for those practices that are under-staffed and over-worked.	As States and rural health centers formalize their plans and determine how to execute on their state-funded programs, eClinicalWorks and healow are ready to provide technology tools that will streamline health center operations, give providers the tools they need to strategically manage populations of patients that are high risk patients, i.e., multiple chronic conditions, frequently admitted to the emergency room, at risk for readmittance, etc. The tools provide automation and intelligence to healthcare delivery, making patient management more efficient as well as effective. eCW and healow tools integrate seamlessly with the eClinicalWorks Unified Electronic Health Record and Practice Management (EM/PM) Solution; several of the healow products can also be used with other major EMR vendor products via a SMART on FHIR API. eClinicalWorks and healow provide end-to-end product implementation and training and ongoing customer service and technical support to all practices that adopt the products. Ecotrust	Four Winds Resource Center: A Community Wellness Hub for Healthy Food, Socializing & Recreation.	OR	For a decade, volunteers fundraised and labored to transform an abandoned state asset into a thriving Community Hub — with programs including food security, emergency preparedness, tool library, fitness classes, youth activities, and community gatherings. This Community Wellness Hub model has been validated by the National Recreation & Park Association (NRPA) as a demonstrably effective strategy for advancing health equity through trusted community gathering places. FWRC’s Wellness and Social Connection scope of work directly implements these evidence-based benefits: expanding fitness classes, educational workshops, intergenerational events, and programming for residents at risk of social isolation. Despite the FWRC receiving the Haines Borough inaugural Community Builder Award in 2024, current Borough Assembly deliberations reflect active pressure from some members to eliminate the facility subsidy, citing per-capita density — effectively arguing that distance from town justifies fewer services. Upper Chilkat Valley residents pay equal Borough taxes. This project ensures a facility the state built for this community — held but disinvested by the Borough for ten years — can finally function as a fully resourced Community Wellness Hub delivering health equity to the most rural and lower-income residents of the Haines Borough. RHTP investment hires staff, builds infrastructure, and begins correcting ten years of institutional neglect for a community with no other option.	Four Winds Resource Center will apply NRPA’s Community Wellness Hub model — which establishes that trusted community gathering places, when staffed and intentionally designed, demonstrably improve health equity and quality of life across seven interdependent dimensions of well-being: cultural, economic, environmental, intellectual, mental, physical, and social. FWRC already delivers programs touching all seven dimensions. To fully utilize the facility and amplify our programming impacts, we will hire a director and build our organizational infrastructure. The Director will be an independent paid staff position, not a Borough employee — to lead day-to-day Community Wellness Hub operations and create a sustainability strategy. The Director will work closely with the Chilkat Valley Food Hub Coordinator & Victory Garden Coordinator to maximize efficiency and lessen the burden of volunteers. An identified need for Upper Valley rural residents is Transportation Coordination. The FWRC Director will work in coordination with SAIL to develop ride-coordination for elderly and disabled highway-corridor residents to access medical appointments and essential services. Eventually, we hope to acquire a community van to ensure reliable quarterly commodity food runs from Juneau and continued delivery of fresh produce to Haines Assisted Living and Haines Senior Center— currently we rely on volunteers driving at personal expense. We hope to expand programs and improve critical infrastructure through careful planning led by the FWRC Director. The CVFH — one of only 7 food hubs in all of Alaska — is the backbone of FWRC’s food security mission and operates as a satellite of the SEAK food bank, distributes SA food boxes as well as fresh produce grown in the onsite community garden. We will fund a Victory Garden Coordinator position for the 2027 season. Since its inception the VG has produced more than 4,000 lbs of fresh produce and generated more than 2,000 volunteer hours. An important next step is to develop and formalize EOC protocols with the Klehini Valley Volunteer Fire Department, Klukwan EOC Commander, Haines Volunteer Fire & Police Department, and Haines Avalanche Center. In January 2026, five or more avalanche closures cut the corridor off from town for days at a time. Alongside staffing, the Board and Director will develop formal HR, financial, and volunteer policies using the Foraker Group’s frameworks and complete a sustainability-focused business plan.	\$250K-\$1M	Single Community	Haines Borough	Deferred or Not Advanced

Ecotrust	Produce Prescription Program: Addressing food access and chronic disease in Southeast Alaska	OR	Southeast Alaskan communities face compounding challenges at the intersection of geography, food access, and health. Residents contend with high rates of diet-related chronic disease — including diabetes, hypertension, and cardiovascular disease — while lacking reliable access to fresh produce and high-quality protein foundational to prevention and disease management. Remote islands, coastal geography, and dependence on expensive barge and air freight make nutritious food not just scarce, but cost-prohibitive for many families. Yet Southeast holds significant untapped opportunity. The region has a rich subsistence harvesting tradition, a growing network of local producers, and strong tribal and community health infrastructure — a robust foundation for Produce Prescription / "Farmacy" models. This proven approach bridges food access constraints and preventative wellness while directing resources into local food systems. The opportunity is to formalize connection between food systems organizations, regional medical entities, local growers and harvesters, tribal organizations, and community members through a dedicated steering and planning committee. Intentional coordination is needed to bring stakeholders together around regional and community-specific pilot projects. This concept formation effort will build the cross-sector relationships, shared vision, and administrative readiness needed to create culturally grounded, community-led programs.	Addressing food access and chronic disease in Southeast Alaska requires community-specific approaches recognizing the region's strengths, geographic realities, and existing community infrastructure. Our programmatic planning will consider the following components: First, Tribal and Indigenous Food Sovereignty as a Health Strategy: For Southeast Alaska Native communities, access to traditional foods is not simply a nutritional issue — it is a matter of cultural continuity and identity, intergenerational health, and food security. We will pursue partnerships with Tribal entities to integrate traditional harvesting and distribution networks and subsistence foods into our programming and identify infrastructure that enables community-scale food sharing and distribution. Framing cultural food practices as a protective health factor positions this work squarely within health equity — and reduces community reliance on expensive imported goods. Second, Local Food Production as Health Infrastructure: In rural communities where transportation and logistics are challenging, a local food supply is critical. We will explore clinic - and school-based greenhouses and garden programs, and mobile processing and distribution units — investments that reduce supply chain vulnerability, strengthen emergency preparedness, and build long-term food system resilience. Third, Community-Led Coordination: Placed-based, community rooted, and culturally relevant programming is the priority. Southeast communities are uniquely distinct from each other with varying assets, needs, priorities, and limiting factors. A multi-disciplinary, multi-organizational steering committee — inclusive of Tribal governments, healthcare providers, local producers, and community members — will ensure that every element of the pilot program is grounded in local need, cultural values, and community-defined priorities. This collaborative structure is critical to the approach.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Edge Logistics Inc., DBA Aerolane	Rapid Air-Delivered Disaster Relief Using Pre-Positioned Aerocart Systems	TX	Alaska faces increasing disaster risk while many rural communities have limited infrastructure and medical capacity. When disasters occur, communities can rapidly exceed their local ability to provide emergency shelter, medical triage, and essential supplies. Rapid response is critical. However, traditional aviation-based disaster response requires dedicated aircraft, specialized crews, and pre-loaded cargo planes that remain on standby. This model is expensive and limits the number of response assets that can realistically be maintained. As a result, the ability to deliver rapid relief packages to remote communities is constrained by cost and aircraft availability. This project addresses the opportunity to dramatically reduce the cost of standby disaster readiness while expanding the number of rapid-response delivery points across Alaska.	The project proposes deploying Aerocart disaster relief trailers, glider-based cargo units that can be towed behind existing aircraft. Each Aerocart unit would be pre-positioned and loaded with disaster relief supplies. When a disaster occurs, any qualified pilot flying a compatible aircraft can tow the unit toward the affected area. Key features of the approach include: 1. Pre-positioned relief stations Aerocart units are stored with supplies ready for dispatch, allowing response within minutes rather than hours required to assemble cargo. 2. Distributed aviation participation Instead of requiring a dedicated aircraft and crew, many existing aircraft and pilots can participate in disaster response by towing the relief unit. 3. Attritable delivery system The Aerocart can be released and glide autonomously to a landing zone such as a rural airstrip or unimproved surface. 4. Lower standby cost Because the system uses existing aircraft rather than dedicated cargo planes, the cost of maintaining disaster readiness can be reduced significantly. This approach enables Alaska to maintain multiple rapid-response relief units distributed across the state while leveraging the aviation capacity already operating in rural regions.	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Dillingham Census Area; Kusilvak Census Area; Nome Census Area; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Education Services of Alaska	Alaska Statewide School Mental Health Access Initiative	AK	Education Services of Alaska (ESA), part of the Alaska Council of School Administrators (ACSA), in partnership with Hazel Health, proposes to address a major gap in access to timely behavioral health care for Alaska students, especially in rural and remote communities. Across Alaska, youth face high rates of depression, anxiety, trauma exposure, substance misuse, and suicide risk, while families often encounter major barriers to care including provider shortages, long waitlists, weather, travel burdens, and high turnover in local systems. In many parts of the state, school-based mental health access is uneven, and over 25% of school districts do not have access to a counselor or mental health professional. This creates a clear RHTP opportunity. Schools are one of the few trusted, consistent institutions that reach children and families across urban, rural, and village Alaska. By using schools as an access point for licensed behavioral health services, Alaska can intervene earlier, reduce delays in care, and help prevent concerns from escalating into higher-acuity and more costly crises. Rather than replacing local providers, the proposed model is designed to augment existing capacity where it exists and fill gaps where services are limited or absent. Through ACSA’s statewide network and Hazel’s school-centered clinical model, this project would create a scalable, Alaska-grounded pathway to expand behavioral health access for students and families statewide.	ESA and Hazel Health propose a statewide, school-linked behavioral health access model for Alaska students and families. Hazel has been a trusted school-based healthcare provider since 2015. Hazel will deliver the clinical platform through Alaska-licensed behavioral health professionals, offering a structured telehealth model that includes referral intake, parent or guardian consent, clinical assessment, individualized treatment planning, therapy, family engagement, crisis protocols, and outcomes reporting. Therapists address a broad range of student needs, including emotional distress, anxiety, depression, suicidality, anger management, trauma, eating disorders, substance use, bullying, and challenges affecting academic success and social development. Treatment goals focus on measurable outcomes for symptom reduction and skill development. Services can be accessed by students at school or at home, reducing delays caused by travel, weather, scheduling, and limited local providers. Hazel’s model provides timely access while complementing local systems and transitioning students to community-based resources when appropriate. It is not a software-only referral marketplace and is not intended to displace existing Alaska providers. Services are provided at no cost to students and families, and uninsured students receive full care. Hazel Health maintains compliance with FERPA, HIPAA, CCPA, CIPA, and other relevant mandates. ACSA and ESA are critical to the success of the Alaska model. Rather than relying solely on a district-by-district market approach, the partnership uses ACSA’s statewide credibility, communications network, professional development capacity, and relationships with school leaders to create a trusted implementation channel. ESA will promote awareness, educate district leaders and administrators, support onboarding, address concerns, troubleshoot implementation, and provide ongoing professional development and feedback loops to support successful use across diverse school settings. The partnership also enables a more strategic rollout. ACSA’s deep knowledge of Alaska’s school landscape—including regional needs, school readiness, technical capacity, cultural considerations, and local risk factors—will help Hazel tailor implementation, referral pathways, communications, and district engagement strategies in ways difficult to replicate through a conventional outside-vendor approach.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Education Services of Alaska	Stronger Together: Safe and Healthy Schools in Alaskan Communities	AK	Many students and families in Alaska, particularly in rural communities, face a lack of connection and support within their schools. High rates of staff turnover make it difficult for students to establish lasting relationships with adults, which can contribute to misbehavior, risky behaviors such as substance use or unsafe sexual activity, disengagement from learning, and negative mental health outcomes like isolation, anxiety, and depression. Alaska Native children are disproportionately affected due to historical and ongoing trauma. The legacy of forced removal to boarding schools, cultural suppression, and systemic inequities has created high adverse childhood experiences (ACEs) scores and elevated dropout rates. Current school systems often fail to recognize Alaska Native culture, language, and ways of life, perpetuating these disparities. Trauma also affects other at-risk populations, including children in foster care, the juvenile justice system, LGBTQ youth, recent immigrants from conflict zones, and those living in high-poverty or high-crime areas. Strengthening belonging and school connection, encouraging regular school attendance, fostering discipline that is rooted in restorative practices and trauma-engaged environments, and ensuring consistent adult support are essential to improve the opportunity for increased student well-being, promoting positive behaviors, and supporting long-term academic and community success.	Schools and districts across Alaska are uniquely positioned to support the safety, health, and well-being of students, families, and communities by implementing trauma-engaged practices. This project strengthens four research-supported indicators of student well-being: (1) belonging and relationships, (2) school attendance, (3) restorative discipline, and (4) school crisis response and planning. Together, these indicators form a durable framework that fosters positive school environments and remains resilient even with staff turnover. The initiative uses a cohort model in which school leadership teams collaborate to guide implementation. Teams begin by developing a shared vision for trauma-engaged practices—why this work matters for their students and communities and how it benefits educators, families, and partners. This shared vision anchors improvements in school culture and supports stronger relationships across the community. With guidance from project partners and a dedicated coach, schools assess their readiness and capacity to implement trauma-engaged strategies. Teams identify existing strengths, resources, and systems that can support the work and determine where to begin—at the school, classroom, or community level. This approach ensures strategies are responsive to local needs and sustainable over time. Building trust among stakeholders is essential. Teachers, administrators, families, tribal leaders, elders, and community organizations will be engaged through clear communication, collaborative planning, and shared learning opportunities. These partnerships help ensure that practices reflect cultural values, community priorities, and local expertise. To support implementation, the project provides ongoing professional learning through webinars, asynchronous micro-credentials, and on-site consultation. Additional learning opportunities will be offered through statewide conferences and collaborative gatherings. These supports reinforce the four indicators of well-being and help schools integrate trauma-engaged practices into daily routines and systems. Continuous reflection and review of student data—including attendance and discipline trends—will help schools refine strategies and strengthen a sustainable culture of connection, resilience, and student success.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Effective Health Design	Alaska Healthcare Cost and Policy Commission	AK	Effective health care policy and reform require policymakers to understand cost drivers and market pressures while promoting efficient, evidence-based practices. Sound decision-making depends on access to accurate and comprehensive information on health care utilization, quality, and pricing. This information is necessary to evaluate programs and monitor efforts to improve access, reduce costs, and strengthen health care quality and population health. Alaska faces persistent challenges in these areas. Data from the Commonwealth Fund show that the percentage of Alaska residents over age 18 with a usual source of primary care has remained among the lowest in the nation since 2015. At the same time, Alaska continues to experience some of the highest health care costs in the United States. Implementing durable health policy under these conditions requires sustained, multi-year efforts that often extend beyond the terms of elected and appointed officials. These challenges are compounded by limited analytic and policy capacity within state government. The Department of Health and legislative health policy advisors operate with constrained staff resources while managing complex oversight responsibilities, limiting the state’s ability to fully evaluate policy options and plan for long-term system transformation.	The establishment of a public entity with a legal existence separate and independent from the state would provide a durable foundation for ongoing health policy analysis, development, and implementation in Alaska. Such an entity would support the evaluation and advancement of proven strategies that promote innovation in health care delivery while also providing a stable structure for the continued exploration of emerging health system models and long-term direction-setting for Alaska’s health care system. The Alaska Healthcare Cost and Policy Commission is proposed to be created as a public entity and an instrumentality of the state within the Department of Commerce, Community, and Economic Development, but with a separate and independent legal existence. This structure would allow the commission to maintain analytic continuity across administrations, conduct objective and transparent evaluation of health system performance, and support long-term planning necessary for effective system transformation. The purpose of this entity is to: (1) collect and analyze existing health care cost and quality data; (2) create an objective, reliable, and comprehensive central repository of health care information; (3) provide researchers, policymakers, and the public timely and transparent access to health care information while protecting individual privacy and proprietary data; (4) enable researchers, policymakers, and the public to make informed health care decisions and identify opportunities to reduce unnecessary health care costs; and (5) support ongoing evaluation of health system performance and emerging health care delivery models that improve access, quality, and sustainability of care. By strengthening Alaska’s analytic infrastructure and policy coordination capacity, this project would improve the state’s ability to design and implement strategies that expand access to care, address workforce shortages, and support sustainable service delivery models. These benefits are particularly important for rural, remote, and frontier communities where geographic isolation, limited provider availability, and higher service delivery costs create persistent barriers to care. Establishing this capacity will help ensure that future reforms are informed by reliable data, coordinated planning, and a long-term strategy that benefits all Alaskans.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Eko Health, Inc.	Expanding Access to Cardiac Disease Detection in Alaska with Eko Health and AI-Enabled Screening	CA	Rural and frontier communities across Alaska face significant barriers to timely cardiovascular care due to geographic isolation, limited healthcare infrastructure, and shortages of specialty providers. Many Alaskans rely on small rural clinics, tribal health organizations, and critical access hospitals where access to cardiologists, interventional specialists, and cardiac diagnostics are limited or require long-distance travel to regional centers. As a result, frontline clinicians must often manage cardiac and respiratory care with limited tools and resources and, often, without specialized training or consultation. These challenges can lead to delayed detection of cardiac disease, missed diagnoses, and avoidable transfers or complications. This project presents an opportunity to strengthen frontline cardiac capabilities in rural Alaska by equipping primary care providers and emergency clinicians with simple, accessible, and AI-enabled screening tools. Using Eko, providers can make more informed decisions about patient care and treatment options. Supporting rural providers with enhanced cardiac screening can help reduce gaps in access to specialty care, improve early detection of cardiovascular disease, and strengthen the ability of local healthcare systems to deliver high-quality care closer to home for underserved Alaskan populations.	This project aims to strengthen cardiovascular screening and care coordination across Alaska’s rural healthcare system by equipping frontline providers with accessible cardiac screening technology. The initiative will focus on equipping all ~25 Alaskan Community Hospitals and Critical Access Hospitals with Eko digital stethoscopes and SENSORA software, with primary care and emergency departments as the sites of care. Clinicians will be able to screen for cardiac conditions during routine visits and acute care encounters, improving early detection and helping guide appropriate referral decisions. Eko also seeks to partner with Alaskan health systems to deploy Eko stethoscopes, SENSORA licenses and Eko’s telehealth platform across their networks. System-level implementation will support cardiac screening during annual wellness visits and primary care encounters, while strengthening referral pathways and care coordination with cardiology and interventional specialists. Together, these efforts aim to expand access to early cardiac detection and improve continuity of cardiovascular care for patients across Alaska’s geographically dispersed communities. Initial efforts will focus on continued partner engagement and new partner acquisition with rural Alaskan hospitals and clinics to further identify priority sites and align implementation with local care workflows. In parallel, the Eko will support site readiness assessments, technology deployment, and integration into existing clinical and telehealth digital infrastructure (EHRs). Eko will provide clinician training, clinical education, and change management support to ensure successful adoption in primary care and emergency department settings. During the go-live phase, Eko will work closely with partner organizations to provide onboarding, technical support, and workflow optimization to ensure clinicians can effectively use the technology for cardiac screening.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Nome Census Area; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Wrangell (City and Borough)	Deferred or Not Advanced

Ekwok Natives Limited	Regional Behavioral Health & Cultural Wellness Access Planning in Bristol Bay	AK	Across Bristol Bay, substance use and alcohol-related mortality remain persistent challenges. Statewide data from the Alaska Native Epidemiology Center show disproportionately high alcohol abuse rates in the region. Rural communities across Bristol Bay face persistent geographic and infrastructure barriers that limit access to structured, multi-day behavioral health and culturally grounded wellness programming. While behavioral health providers operate within hub communities, many surrounding villages lack facilities that can safely and appropriately accommodate overnight stays, extended group programming, or multi-day intensives. Existing community buildings are often not configured for residential use, lack adequate safety systems, or are already fully utilized for other essential functions. Services are often centralized in regional hub communities such as Dillingham. This creates scheduling bottlenecks, limits participation from smaller villages, increases travel costs for residents seeking behavioral health support, and disrupts family and subsistence responsibilities. For many residents, these logistical barriers reduce participation in recovery-oriented or culturally grounded programming that requires engagement over multiple days. Expanding the number of rural communities capable of hosting these gatherings would strengthen the regional care delivery network by increasing the number of locations where behavioral health and prevention services can occur closer to home.	The Ekwok Lodge—located along the Nushagak River on a traditional site—previously hosted culturally influenced recovery camps incorporating subsistence activities, traditional practices, and community-based healing. However, deterioration of lodge structures has rendered the site unusable for safe, code-compliant programming. A facility assessment was completed in 2024, and a feasibility study/business plan are underway, due to be completed in June 2026. The project will support planning and design for renovation of the Ekwok Lodge facility to enable its use as a regional gathering site capable of hosting multi-day behavioral health, recovery, and cultural wellness programming for rural Bristol Bay communities. The Lodge will not provide clinical services directly. Instead, the planning effort will define the technical, engineering, and operational requirements necessary to restore the site as safe, compliant, overnight-capable infrastructure that regional partners can utilize for multi-day behavioral health and culturally grounded programming. The approach focuses on closing the gap between completed facility assessment and renovation readiness. Planning activities will include preliminary engineering and scoping to define renovation objectives; architectural refinement and space configuration aligned with multi-day programming needs; updated, inflation-adjusted cost estimates; ADA compliance integration; mechanical, electrical, and safety system planning; and development of a phased renovation pathway. This work will result in an implementation-ready package suitable for permitting, capital stacking, and future construction. In parallel, the project will engage regional partners—including Tribal organizations, community-based nonprofits, and behavioral health entities—to define utilization needs and ensure the facility’s design supports itinerant providers and locally convened programming. Engagement will inform spatial layout, overnight capacity assumptions, and operational considerations necessary to support structured, multi-day use. By the end of the planning period, the project will produce a defined renovation scope, updated capital estimates, and a clear pathway to implementation. This ensures that future investment results in safe, functional, and access-oriented infrastructure capable of expanding programming capacity beyond a single regional hub and strengthening access pathways for rural and frontier communities.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

ELLKAY	Expanding Secure Health Data Exchange for Rural and Remote Alaska Communities	NJ	Many rural and remote healthcare providers in Alaska operate across multiple systems that do not easily share health information. This lack of interoperability can create delays in accessing patient data, increase administrative burden, and make care coordination more difficult. This project addresses the opportunity to improve healthcare delivery by enabling secure and efficient exchange of clinical and administrative data between systems, helping providers access the information they need to deliver timely, coordinated, and high-quality care while supporting better-informed clinical decisions and improved patient outcomes for rural communities.	The proposed approach is to implement ELLKAY’s LKOpera interoperability platform to enable secure, reliable exchange of healthcare data between disparate systems used by rural healthcare providers. LKOpera will facilitate the integration and normalization of clinical and administrative data from multiple sources, allowing healthcare organizations to securely share and access patient information across systems. By supporting industry standards such as HL7 and FHIR, the platform enables efficient connectivity between providers, health systems, and other healthcare partners. This approach improves care coordination, reduces administrative burden, and helps ensure clinicians in rural and remote communities have timely access to the information needed to support informed clinical decisions and high-quality patient care.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

ELLKAY	Statewide Clinical Data Archiving to Modernize Alaska’s Health Data Infrastructure	NJ	Many healthcare organizations across Alaska continue to maintain legacy electronic health record (EHR) systems solely to retain access to historical clinical and administrative data. These systems are costly to maintain, difficult to support, and may no longer receive security updates. Maintaining aging technology creates financial and operational burdens, particularly for healthcare organizations serving rural and remote communities with limited resources. At the same time, historical patient information remains essential for clinical care, compliance, and operational needs. Providers must be able to access prior medical records and documentation even after transitioning to newer health information systems. Without an effective solution, organizations may be forced to keep outdated systems running indefinitely simply to preserve access to legacy data. This project addresses the opportunity to modernize how healthcare organizations across Alaska manage and access historical patient information. By implementing a centralized clinical data archiving platform, organizations can securely store and access both clinical and non-clinical data while retiring unsupported legacy systems. This approach improves sustainability, strengthens data security, and ensures continued access to critical patient information across the state.	Our proposed approach focuses on improving access to clinical information, strengthening care coordination, and modernizing health data infrastructure across rural healthcare facilities in Southeast Alaska. Many rural providers rely on multiple electronic health record systems, legacy platforms, or disconnected data sources, which can make it difficult for clinicians to access a complete patient history when delivering care. These challenges are amplified in remote communities where patients may receive services from multiple providers or travel between locations for specialty care. This project will implement a secure, centralized clinical data repository and interoperability framework that enables participating healthcare organizations to aggregate, manage, and access patient information from multiple source systems through a single, unified platform. Historical and current patient data can be securely consolidated and made available to authorized clinicians, improving visibility into a patient’s full medical history while reducing reliance on legacy systems that are costly to maintain. The proposed solution will leverage industry-standard interoperability technologies and secure cloud-based infrastructure to support reliable, scalable access to health data across geographically dispersed facilities. The platform will support common healthcare data standards and enable secure exchange of clinical information between participating providers, improving continuity of care for patients who receive services across multiple locations. By improving the availability and accessibility of clinical information, the project will help providers make more informed clinical decisions, reduce duplication of services, and support more coordinated care delivery. The solution will also help rural healthcare organizations modernize their health IT infrastructure while reducing operational burdens associated with maintaining aging systems. Ultimately, this initiative will strengthen healthcare delivery across Southeast Alaska by enabling better data sharing, improving care coordination, and creating a sustainable, scalable foundation for future healthcare innovation and system modernization.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

EM Consulting	Increasing Access to High Quality, Culturally Concordant Mental Healthcare in Alaska	CA	Alarming scarcity and disparities mark the current mental health landscape in Alaska: Mental Health Emergency: We are in the midst of a grave mental health emergency in this country, exacerbated by the COVID-19 pandemic, isolation, and the current socio-political turmoil in our country. Severe Shortage of Providers: There is a profound shortage of licensed behavioral health providers nationwide, and Alaska is no exception. There are reliable projections to 2033, demonstrating that this shortage will not improve. Disproportionate Impact on Communities of Color: Those who bear the brunt of this shortage are often people of color, including Indigenous Alaskans, Asian Pacific Islanders, LatinX communities and more, who have the least access to high-quality mental health care that meets their cultural and linguistic needs. Delayed Action on Workforce Development: While efforts to increase and incentivize a licensed behavioral health workforce are crucial, any influx of licensed providers is years away and will never fully meet the growing demand. This pathway is simply too slow and too inequitable to address our current crisis. Risk of Perpetuating Disparities: Without immediate and innovative solutions, we risk perpetuating existing disparities in access to and equity in mental health services in Alaska.	Lay counselors are trained helpers who do not have advanced mental health education, master’s degrees, or licenses, who are trained to provide mental health and substance use counseling, comparable to licensed clinicians.: Lay counseling practices are widespread in low and middle-income countries, demonstrating effectiveness in addressing mental health and substance use conditions amidst severe resource gaps. South Africa, India, Ghana, Ecuador, Kenya, and just a few other countries have been using lay counseling models for decades; for this reason, they have also given the field a deep and broad research base, demonstrating the effectiveness of this model. There is a large body of research showing unequivocally that lay counselors can be as effective as licensed clinicians. Lay counseling can be integrated into various direct-service positions, including various health and social care roles, such as case managers, health coaches, peer support specialists, first responders, legal aides, educational staff and wellness coaches. Lay counselors are supervised by licensed clinicians; while not regulated in any state, ethically and clinically, this is deeply important. If organizations that have sent staff to the LCA do not have licensed clinicians to supervise them, EM Consulting’s team provides this.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Emergency Care Research Institute (ECRI)	Technology-Enabled Solutions: Decision Making, Implementation, Assessment, and Evaluation	PA	ECRI is pleased to propose this project as a multifaceted approach to building a foundation to support responsible adoption of technology-enabled solutions in rural health centers to meet a variety of specific needs of rural communities and patients. This project will focus on supporting healthcare organizations in designing a robust infrastructure that will allow them to responsibly assess, adopt, and implement new technology-enabled solutions, including AI-enabled devices, mobile medical units, telehealth options, patient remote monitoring, and falls prevention video surveillance. Through a combination of technical assistance, education, training, and data insights, healthcare organizations will become better equipped to: (1) make well-informed decisions around procurement and implementation; (2) perform proactive risk assessments; and (3) utilize patient reported outcomes to inform the use of technology-enabled solutions. Since RHTP funds require timely investments, ECRI’s capabilities enable us to make decisions quickly, while still ensuring quality and safety. Using an approach that supports healthcare staff as well as patients and families can help reduce dissatisfaction, burnout, and the risk of preventable harm. Creating staff resiliency and patient engagement around the use of technology-enabled solutions is essential to success.	A. Decision Making, Procurement, & Implementation Planning of Technology-enabled Solutions Aim: Strengthen healthcare decision making by providing unbiased technical assistance, education, and training to assess the need, value, safety, and operational aspects of implementing technology. Objectives: 1. Virtual education and training activities for biomedical engineers, risk managers, quality and performance improvement professionals, supply chain management, healthcare leaders and clinicians Training topics: human factors engineering for health device and technology procurement safety, value analysis in the age of AI, creation of an AI governance structure, and essential change management concepts 2. Technical assistance activities: Monthly office hours staffed by ECRI subject matter experts Clinical evidence assessments and value analysis reports to assist in benefit analysis and decision making Resources on best practices to implement AI use governance structures Guidance on the safe integration of innovative uses of technology B. Proactive Assessment of Technology-Enabled Solutions Aim: Use of human factors approach to increase awareness and understanding of clinical- and safety-related risk factors and potential usability concerns when implementing technology-enabled solutions by providing hands on simulated learning and technical assistance. Objectives: 1. On-site, hands-on simulated learning activities: Simulation learning curriculum led by human factors engineers focusing on how to perform proactive assessments of both usability and safety for technology Guidance for healthcare staff to conduct proactive assessments and reactively learn from near miss and adverse events 2. Technical assistance activities: Monthly office hour sessions staffed by ECRI human factors experts Examples of safety risk assessments on various topics Strategies to conduct a needs assessment to identify current gaps in health information technology C. Evaluation of Patient Reported Outcomes Related to Technology-Enabled Solutions Aim: Create a web-based portal to collect and analyze patient reported outcomes related to the use of technology-enabled solutions, with a focus on both positive and negative outcomes that patients have experienced. Objectives: 1. Collect and analyze patient-reported outcomes on the use of technology-enabled solutions 2. Publish consumer alerts around safety concerns related to the use of technology-enabled solutions	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Envoy Integrated Health	Envoy Community Care Technology Enablement Initiative	AK	Alaska’s community-based organizations (CBOs) provide essential services that address health-related social needs, chronic disease support, care coordination, housing stabilization, transportation access, food security, and wellness navigation. These organizations are an essential piece of rural and frontier health care delivery, yet they lack consistent access to electronic documentation systems, interoperable tools, and affordable technology infrastructure. Instead, many CBOs rely on spreadsheets and paper files which do not allow for compliant data sharing. CBOs that do have electronic platforms often cannot integrate with statewide systems such as the health information exchange (healthEconnect). This creates fragmented information flow, duplicative efforts, high administrative burden, and inconsistent data quality. As Alaska advances value-based care and coordinates patient care statewide, the technology gap between clinical and community partners continues to widen. This gap is especially wide for small rural CBOs with limited resources. The existing Envoy Community Care Hub serves as a collaborative between CBOs and health care providers. This creates an opportunity for a shared, scalable, and sustainable CBO technology infrastructure, by expanding the existing Envoy Community Care Hub to include shared technology infrastructure and support.	Envoy proposes to build a centralized technology enablement program that equips Community Based Organizations with a standardized, health care compliant documentation platform. We will create economy of scale through group purchasing, shared implementation, and coordinated support. This project builds on the Envoy Community Care Hub, leveraging a trusted entity to work towards a statewide referral network and multi-sector partnerships. This initiative will reduce administrative burden and enhance interoperability by integrating directly into Envoy’s proposed statewide referral and coordination systems (Envoy Statewide Population Health Services Organization, separately proposed LOI). This project will also seamlessly integrate into Alaska’s health information exchange (healthEconnect). Our approach includes assessment, vendor procurement, platform configuration, integration development, onboarding, training, and ongoing support throughout the process. Cohorts of CBOs will be onboarded in phases, ensuring readiness and sustainability. This structured model positions Alaska's CBO network for long-term success in value-based care through high quality, interoperable technology infrastructure. Alternative payment models support folding community organizations into clinical work because of their recognized impact on health outcomes. This system will empower community partners to participate as peers in whole person care delivery, strengthen coordination between clinical and community sectors, and advance equitable access to services across Alaska.	\$250K-\$1M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Envoy Integrated Health	Medicaid Accountable Care Organization Pilot	AK	Alaska is preparing to shift toward pay-for-value but remains without a value-based model for its Medicaid program. Alaska Medicaid’s fee-for-service structures offer no incentive for prevention, coordination of care, or shared accountability. This leads to inconsistent, inefficient care and poorer health outcomes for beneficiaries. An Accountable Care Organization (ACO) is a group of providers working together to improve the quality and reduce the cost of caring for their patients. This is a tried-and-true value-based care model operating on the concept of shared savings: if costs are reduced while keeping quality high, the ACO and payer share in the cost savings. There are over 500 ACOs in the lower-48, and in 2022 ACOs saved Medicare \$4.3 billion dollars. Many states utilize an ACO model for their Medicaid programs, with studies demonstrating improvements in health care quality and decreased cost. In 2024, Envoy Integrated Health created Alaska’s first locally based ACO which outperformed quality benchmarks while saving Medicare \$7.6 million in its first year. Expanding Envoy’s proven ACO model to Alaska’s Medicaid population represents an opportunity to improve the quality and lower the cost of care in Alaska while encouraging participation in pay-for-value arrangements.	Envoy Integrated Health Network proposes a multi-year Medicaid Accountable Care Organization (ACO) pilot designed to modernize Alaska’s Medicaid incentive structure and payment system. This pilot project will translate our ACO model to Alaska’s Medicaid population using a shared savings model and national best practices to encourage keeping health care local, coordinated, and sustainable. As Alaska’s first ACO and the state’s largest Clinically Integrated Network, Envoy is uniquely positioned to adapt our successful model to Medicaid in a way that reflects Alaska’s geography, workforce realities, and care delivery ecosystem. The proposed pilot will establish a Medicaid ACO anchored in local primary care, specialty, and community partnerships. Our model emphasizes coordinated chronic disease management, telehealth-enabled access, and shared accountability for cost and quality outcomes. By retaining financial accountability and shared savings within Alaska, the pilot supports long term system sustainability and reinvestment in local clinics and care teams. Envoy is an Alaska-based physician-led collaboration between more than 40 primary care and specialty practices serving hundreds of thousands of Alaskans. Our network includes partnerships with both Anchorage non-tribal hospitals and their emergency departments. This places Envoy in an excellent position to be successful on a timeline that aligns with the RHTP. We propose this project under the “Defined Approach” designation to allow for the intensive planning and actuarial analysis needed for a successful ACO shared-savings approach. While Envoy’s ACO is operationally ready to participate in a Medicaid shared-savings program now, establishing a program with Alaska’s Medicaid will be the focus of the first year. Envoy’s first year activities will focus on data readiness assessment, evaluation, governance establishment, and model design to prepare for phased implementation in subsequent years. We will look to national best practices and adapt successful models from other states into Alaska’s unique healthcare system. We will work closely with the Department of Health to establish workflows for claims data and benchmark creation. This work plan is intentionally phased to allow for thoughtful design, measured implementation, and responsible expansion as capacity grows.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Matanuska-Susitna Borough	Advance to Implementation Application

Envoy Integrated Health	Specialty Care Coordination and Navigation Hub	AK	Health care in Alaska is a complex and poorly coordinated system. A large amount of health care spending is wasted on inefficiencies between rural primary care providers and specialty care providers who are primarily located in urban areas. Patients living in rural areas, regardless of payors, are tasked with coordinating and navigating these systems largely on their own, which can result in fragmented, delayed or missed care, poor health outcomes, increased financial burden, and emotional stress. To address the persistent challenges rural Alaskans face in accessing specialty care, we propose the creation of a Specialty Care Coordination and Navigation Hub. This hub will serve as a centralized system that streamlines communication, referrals, and care planning across geographic and institutional boundaries. By focusing on condition-based enrollment rather than insurance status, the hub ensures access for all patients diagnosed with complex conditions such as congestive heart failure, diabetes, or cancer. Envoy already plays a vital role in supporting rural health care by leveraging our network of specialty providers. In rural Alaska, where access to specialists is often limited, Envoy works to bridge the gap by facilitating consultations and ensuring that patients receive care that is timely and appropriate. This model not only enhances the quality of care for rural residents but also reduces the need for costly and logistically challenging travel to urban centers.	The hub will provide Alaskans with personalized care coordination through dedicated care managers who help patients navigate complex conditions, schedule all necessary appointments, and ensure that when patients travel to urban centers, they can complete multiple specialty visits in a single trip. Care managers can also coordinate essential screenings such as mammograms or colonoscopies during the same trip. The hub supports primary care providers through a specialist consultation line and a centralized referral system, reducing the burden of navigating fragmented networks and helping rural clinics quickly connect patients with appropriate specialists. To reduce unnecessary travel and improve continuity of care, the hub will integrate remote patient monitoring (RPM) and telehealth tools. These technologies allow providers to track and manage patient health metrics in real time, enabling Alaskans to remain in their home communities whenever possible. This model enhances safety, improves satisfaction, and lowers costs for patients and payors by minimizing emergency visits, hospitalizations, and duplicate testing. The hub will also collaborate with rural communities to establish local specialty clinics where Alaska-based specialists can travel to see patients on a scheduled basis. Combining in-person visits close to home with telehealth, RPM, and coordinated support from local providers creates a proactive system of care for people with complex needs. The hub represents a transformative approach to bridging the health care gap between rural and urban Alaska. By beginning with high-need conditions and expanding to other chronic and complex illnesses, it will create a seamless, patient-centered system that reduces travel, improves timely access to care, and strengthens collaboration between providers. Through integrated coordination, remote monitoring, and a single-call referral model, patients will experience fewer delays, better outcomes, and a more supportive care journey, regardless of insurance status. This approach addresses long-standing health disparities between urban and rural communities while offering a sustainable financial path forward. By reducing avoidable hospitalizations, emergency visits, and redundant services, the hub will generate meaningful cost savings for patients and payors. This project will synergize with other RHTP projects proposed by Envoy, including the Statewide Population Health Services Organization.	\$1M-\$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Envoy Integrated Health	Statewide Population Health Service Organization	AK	Alaska’s healthcare system is fragmented and siloed. Providers need high-quality, interoperable electronic health records and tools to manage the health of their patients. These services are essential for delivering coordinated and cost-effective care but are often too complex and expensive for provider practices to implement on their own. This barrier is even greater for small practices where access to affordable, interoperable electronic health records, population health analytics, care management tools, and automated quality reporting is out of reach. Without this critical healthcare infrastructure, Alaska’s goal of transitioning to pay-for-value will remain unattainable. If individual practices attempted to contract with vendors for these services separately, it would be cost prohibitive and worsen the fragmentation of care. High performing healthcare systems centralize these services to create economy of scale and ensure interoperability. A shared services model that makes services available and affordable to provider groups of all sizes does not currently exist in Alaska.	We will create a statewide Population Health Services Organization (PHSO) that provides shared electronic health records and population health tools for providers. The PHSO’s shared services may include high quality electronic health records systems, population health data aggregation and analytics, standardized quality metric reporting, centralized care management and coordination, electronic referrals, a remote patient monitoring and chronic disease management platform, contracting support for value-based care arrangements, risk modeling and actuarial support to evaluate participation in pay-for-value programs, and technical assistance to support providers transitioning to value-based care models. The statewide PHSO will work closely with Alaska’s state health information exchange (healthEconnect) and be interoperable with other Alaskan healthcare systems (e.g., tribal, hospital based, or federally qualified health centers). This will support and protect the investments the Department of Health has already made without being redundant or inefficient. Envoy Integrated Health is uniquely positioned to be successful in this project. Envoy is an Alaska-based physician-led collaboration between more than 40 primary care and specialty practices serving hundreds of thousands of Alaskans. Envoy’s mission is to establish a more coordinated healthcare delivery system and to improve population health. Envoy houses the largest Clinically Integrated Network (CIN) and started the first Alaska-based Accountable Care Organization (ACO), which has consistently outperformed benchmarks and saved Medicare millions of dollars each year. Envoy is a trusted entity among providers and has a built-in customer base committed to utilizing the services of the PHSO. Leveraging the size and reach of Envoy will allow the PHSO to attain success quickly, which is essential for the timeline of RHTP. Envoy is ready to begin immediately in standing up governance, technology, and operational frameworks that will support statewide participation and multi-payer alignment. The PHSO will focus on recruiting primary care practices, and Envoy membership will not be required to participate. The PHSO will maintain strong state alignment to ensure all tools and workflows support broader Rural Health Transformation Program goals including chronic disease management, access to telehealth, and sustainable participation in value-based payment models.	Over \$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Envoy Integrated Health	Alternative Payment and Value-Based Care Model Feasibility Assessment	AK	Alaska is at a pivotal moment as national value-based care models evolve to strengthen rural access, expand primary care services, and transition providers toward pay-for-value. However, Alaska lacks organizations that have participated in Advanced Alternative Payment Models (AAPMs) or taken advantage of emerging CMS models such as ACCESS, LEAD, and risk-bearing arrangements. Participation in these programs is vital for the future of Alaska’s shift to pay-for-value, but requires identification of their risks, opportunities, and operational implications. Alaska’s unique geography, cost structure, workforce capacity, and rural population make careful evaluation of these models essential prior to adoption. Alaska’s providers must prepare for participation in emerging alternative payment models. A structured feasibility assessment is needed to evaluate readiness, financial implications, operational impacts, and multi-payer alignment. This work positions Alaska to lead in value-based innovation while respecting local control. As Alaska’s largest Clinically Integrated Network (CIN), Accountable Care Organization (ACO), and pioneer in value-based care, Envoy Integrated Health is well positioned to lead this effort.	Envoy will lead a comprehensive, multi-model feasibility assessment to evaluate organizational readiness, financial sustainability, operational impact, and clinical implications of ACCESS, LEAD, REACH and other value-based risk-bearing programs. We will also assess the feasibility of provider participation in statewide models such as the CMS AHEAD model. This implementation-phase initiative begins immediately and includes onboarding actuarial, financial, and operational consulting partners. The assessment will include benchmarking, gap analysis, risk modeling, provider engagement, policy alignment, and readiness scoring across all models. The process will culminate in a clear, state-aligned recommendation for phased participation, future preparation, or deferral. The approach ensures decisions are data-driven, Alaska-specific, and clinically grounded. We believe our work will be generalizable to providers across Alaska and help guide them in transitioning to pay-for-value models.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Envoy Integrated Health	Value-Based Care Technical Assistance Program	AK	Alaska’s health care system operates on a fee-for-service model that is financially unsustainable. While the rest of the United States has shifted towards value-based care models that incentivize healthy communities, Alaska has lagged behind. Rural providers in particular stand to benefit from innovative care models that incentivize care coordination and chronic disease management. However, the transition to pay-for-value models requires significant expertise for providers to be successful. There are many lower-48 based organizations that provide technical assistance (TA) for value-based care, but they lack the local knowledge necessary to serve Alaska’s unique geography and health care delivery system. Value-based care expertise within Alaska is limited and needs to be scaled to be available to all providers, especially primary care providers. Creating local, trusted expertise in value-based care aligns directly with Alaska’s RHTP initiative of Pay For Value: Fiscal Sustainability.	Envoy Integrated Health will create a Value-Based Care Technical Assistance Program for health care providers and clinics across the state. This program will build the core competencies required for providers to participate in value-based care. As the largest and most successful Alaskan value-based care entity, we have the local knowledge and expertise needed to support Alaska’s Pay for Value initiative. Alaska’s unique care environment requires a technical assistance (TA) provider that understands national value-based care models and Alaska’s health care delivery system. We will achieve this by leveraging our current local value-based care experts, cultivating and supporting growth of new Alaskan value-based care leaders, and curating relationships with trusted national experts. Together, this “home team” will implement a two-pronged approach to TA: 1.) Targeted Technical Assistance: We will provide targeted TA to provider organizations with an emphasis on building capacity for primary care practices to participate in value-based care arrangements. We will start with readiness assessments and co-develop action plans with individual clinics. Our support will include value-based contract review and negotiation support, implementation planning and change management, performance benchmarking and attribution, financial modelling, and revenue-cycle and billing for primary care. TA will be delivered through on-site and virtual visits with individual clinics, group “office hours,” and webinars to engage rural clinics. 2.) Rural Provider Accelerator: We will use a rural accelerator model to quickly close the gap in value-based care participation between rural and urban centers. Cohorts of rural and frontier providers will engage in a 6–9-month accelerator featuring shared-learning “sprints” on data integration, care coordination, attribution accuracy, and population health tools. We will build partnerships and encourage information sharing with rapid cycle quality improvement and peer benchmarking. The accelerator will advance value-based care transformation and statewide standards while respecting local practices. This project is a cornerstone of Alaska’s RHTP Pay For Value initiative and will synergize with other RHTP projects proposed by Envoy, including the Statewide Population Health Services Organization and Specialty Care Coordination and Navigation Hub.	\$1M-\$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Eric Noll OD PC	Rural access to optometric care and staff recruitment	AK	Not enough exam availability. Unable to competitively recruit providers while maintaining enough income to cover day-to-day expenses secondary to reduced insurance reimbursements.	Use a 'head-hunter' to find and recruit more optometrists, and pay relocation bonuses. Any overage would be applied to travel costs in order to perform rural village exams.	\$50,000-\$250,000	Other	Statewide	Aleutians East Borough; Anchorage (Municipality); Chugach Census Area; Denali Borough; Juneau (City and Borough); Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced
Erotic Service Provider Legal, Educational, and Research Project, Inc	Who Rescued Who: Indoor Community Dog Park	CA	Dog ownership in Alaska has grown by leaps and bounds since COVID. Science continues to produce studies lauding the mental health and wellness impacts of pet ownership, so it is no surprise that, today, 38% of Alaskans own at least one dog – and among Alaskans over 60, dog ownership has increased by 77%. Unlike most other housepets, dogs must be frequently exercised. For Alaskans who work on the frontlines, such as hospital staff, late working hours means walking their dogs in the dark after work – a safety risk. For older Alaskans who own dogs, walking on ice poses a clear and present danger during the winter months. Outdoor dog parks are unregulated/unstaffed and can pose safety issues for both dogs and humans. Many low-income families who own dogs can benefit from material community support. Dog ownership is a wholesome avenue for community building. Community dog adoption events miss an opportunity when they take place in corporate pet store environments. People new to sobriety can be turned away from 12-step meetings that don’t accommodate dogs; by contrast, those in recovery can experience rehabilitative impacts, including durable recovery in finding common ground through dog ownership within the recovery community and with the community at large. Worker-ownership is an evidence-based approach to employment for populations that struggle to find living-wage jobs, including re-entry populations, sex workers transitioning out of the sex trade, and survivors of trafficking.	The proposed place-based brick-and-mortar indoor dog park, designed as a worker co-op employing re-entry populations, will offer fair wages and a safe wellness space for dog owners from many walks of life. Innovative community-building elements of the project include a coffee and ice cream bar, with a dining area specially designed to accommodate the presence of many dogs (e.g., dogs may sit near their owners, but will be separated by a wrought iron gate to prevent snack attacks) with seating designed to support conversation among the dog-owning community. As is customary for indoor dog parks, the floor will be engineered for washdown/drainage and covered with safe, washable antimicrobial turf. Our private park membership model requires vaccinations, spay/neuter, and temperament checks. With flexible play zones and webcam access for all, this community third space is designed to be inclusive and a place to connect with others. Located in a 5,000+ square foot warehouse, the indoor dog park will include benches, colorful fire hydrants, and social media-ready wall murals for selfies and our livestreaming social media dog content for Alaskans experiencing isolation. The project will employ a low-bandwidth “Arctic-friendly livestream” that works with satellite internet for Alaskans who live in rural, remote, and frontier locations. To serve low-income populations, the indoor dog park will offer discounted memberships as well as a pet food pantry and a dog toy library. To build geographically-specific community through place-based activities, we will build out the space as a community hub resource that offers social opportunities through sober dog events (Mutts & Mocktails), trivia nights, singles nights, monthly breed-specific meetups (Senior Sundays, Pittie Playgroups), event space rental (e.g., dog birthday parties), DogTalks (structured like TED Talks and featuring educational sessions with trainers, groomers, and veterinarians), family-oriented summertime “Dogapalooza” local dog product vendor pop-up events (including sponsorships, vendor fees, business signage, promo decals) monthly showcases for pet-friendly makers and artists, and community-based meet-and-greets with dog rescue partners on Saturdays. Anchorage has a high dog ownership: the Alaska State Veterinary Medical Association reports 105,000 dogs in Anchorage. With over 20 doggy daycares and dogboarding in the Anchorage area, we will partner with dog-serving businesses to cross-promote services.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced	

ES Digital Health, inc	Alaska Provider DSCSA Compliance & Medication Access Initiative	AZ	The Drug Supply Chain Security Act (DSCSA) became fully enforceable on November 27, 2025. The law requires healthcare providers involved in prescribing, ordering, or dispensing prescription medications to maintain traceable transaction documentation across the pharmaceutical supply chain and produce those records within 48 hours during a regulatory audit. Civil penalties for non-compliance can reach up to \$100,000 per violation. Many rural healthcare providers remain unaware that these requirements now apply directly to prescribing and procurement workflows. As a result, numerous rural facilities operate and treat patients without automated DSCSA documentation systems. Physicians commonly issue 20–30 prescriptions per day. Without automated documentation tools, each transaction can represent potential regulatory exposure, which may accumulate rapidly across rural healthcare networks. Our proposal addresses this need by deploying WATTS, a fully operational DSCSA e-procurement and compliance platform integrated with a HITECH-certified, MACRA/MIPS-compliant EMR and a consumer-facing mobile application. The system automatically generates and stores required transaction records during prescribing and procurement activities, allowing providers to maintain audit-ready compliance while continuing normal clinical operations. Statewide deployment would equip Alaska’s rural providers with infrastructure to support DSCSA compliance while strengthening digital health systems.	We propose an immediate statewide deployment of the WATTS DSCSA Compliance Platform, a fully operational digital infrastructure designed to ensure providers can document prescription drug transactions in accordance with DSCSA requirements. The system comes integrated in a bundled package with three core components: 1. DSCSA e-procurement and documentation platform 2. HITECH-certified EMR system for clinical workflow integration 3. Consumer-facing patient mobile application Together, these technologies create a seamless data flow connecting prescribing physicians, healthcare facilities, vendors, and patients while automatically generating required compliance documentation. The platform can be deployed in two ways depending on facility needs: • As a primary HITECH-certified EMR system • As an add-on compliance and reporting layer for facilities that already operate an EMR Unlike most EMR systems, this platform utilizes structured data architecture, meaning clinical data is captured in standardized formats across specialties. This allows healthcare providers and state agencies to generate structured reporting outputs that support RHTP program reporting requirements, performance tracking, and regulatory oversight. Deployment would prioritize Alaska’s rural hospitals and clinics currently lacking DSCSA documentation infrastructure. Because the technology is already built, operational, and interoperable, the project focuses on rapid implementation and provider onboarding rather than software development, allowing providers to begin addressing compliance requirements quickly. Technology Certifications & Compliance Infrastructure The proposed system includes the following certifications and capabilities: • ONC HITECH Certified for Interoperability • MACRA/MIPS Certified for billing and quality reporting • FHIR / HL7 compliant for health data exchange • Web-based deployment architecture • Integrated Patient Portal • Consumer-facing mobile application • Live-time patient monitoring and real-world data capture (RWD/RWE) • Referral management and care coordination tools • Staff and workflow management systems The platform also supports • Improved clinical documentation • Structured outcome reporting for RHTP programs • Reduced billing errors and fraud, waste, and abuse risk • Enhanced patient engagement through mobile technology • Improved workforce efficiency and provider retention	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

ES DIGITAL HEALTH, INC	ES DIGITAL HEALTH INC AND EVENT MODULES DEPLOYMENT OF MOBILE CLINIC SPECIALTY CARE ROOMS	AZ	Event Modules proposes the deployment of 20 rapidly deployable Flex Space modular medical units that can be configured to create immediate two-room sterile clinics. Each unit can be transported easily, carried through standard doorways, and deployed by two people in approximately 15 minutes. Designed for Arctic conditions, the units include 4-inch foam insulation, HEPA filtration, positive or negative pressure airflow, pathogen-resistant materials, and climate control to maintain sterile environments for both patients and medical personnel. Rural communities in Alaska face significant challenges in accessing timely healthcare due to geographic isolation, limited infrastructure, and extreme weather conditions. In emergency situations such as disease outbreaks, natural disasters, or mass casualty events, many communities lack the physical medical infrastructure necessary to provide triage, treatment, or isolation care. The modular units support critical use cases including mobile clinics, triage and surgical rooms, infectious disease isolation units, patient intake offices, and emergency housing for non-ambulatory patients. Integrated connectivity—including bonded cellular communications, satellite connectivity, and AI-enabled monitoring ensures capability in remote regions. This will significantly improve rural healthcare resilience, enabling state agencies to deliver rapid medical response capabilities wherever they are needed. https://eventmodules.com/videos/	Event Modules' project will deploy 20 Flex Space modular medical units to support rapid healthcare response in underserved rural communities across Alaska. The units will be manufactured, configured, and delivered in coordination with state and local emergency management and public health agencies to ensure alignment with regional healthcare needs. We will provide training and oversight as well as User Manuals and Instructional Videos to train personnel for deployment of our modules. Each modular unit is designed for rapid transport and field deployment, allowing a two-person team to set up a sterile medical environment in approximately 15 minutes. The units can be transported via truck, air cargo, or barge to remote communities and positioned at clinics, emergency response sites, or temporary medical facilities as needed. Once deployed, the modules can be configured for a range of medical uses including triage and treatment rooms, infectious disease isolation units, surgical support areas, patient intake offices, or emergency housing for non-ambulatory patients. Built with Arctic-grade insulation, HEPA filtration, positive and negative air pressure capabilities, and pathogen-resistant materials, the units maintain safe, climate-controlled environments suitable for patient care in extreme weather conditions. Connectivity systems—including bonded cellular networks, optional satellite connectivity, and AI-enabled monitoring—will allow healthcare providers and emergency responders to maintain communication and operational awareness even in remote locations. Through coordination with public health agencies, these deployable units will serve as a flexible and scalable healthcare infrastructure solution that can be rapidly mobilized during emergencies, seasonal health surges, or disaster response situations.	Over \$5M	Clinic	Statewide	Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

ES DIGITAL HEALTH, INC	ES DIGITAL HEALTH INC and LIIFEID INC to avoid Fraud, Waste and Abuse in Medicaid and Medicare.	AZ	Rural, remote, and frontier communities in Alaska face persistent challenges in accessing timely, high-quality healthcare due to geographic isolation, workforce shortages, limited connectivity, and fragmented medical records. These gaps result in missed preventive care, delayed chronic disease management, and inefficiencies in Medicaid administration. This project addresses these challenges by deploying ES Digital Health record as the core clinical platform, integrated with LiifeID’s biometric identity verification. ES Digital Health record consolidates clinical encounters into actionable, patient-centered longitudinal care plans across providers, telehealth, and mobile health deployments. LiifeID secures patient identities, eliminates duplicate or fraudulent Medicaid enrollment, and maintains verified identity across the care continuum. Both platforms are interoperable, CMS-compliant, and aligned with federal Health Technology Ecosystem and ASTP/ONC criteria, ensuring secure, auditable, HIPAA-compliant data exchange. The initiative strengthens healthcare access, care coordination, and patient engagement in underserved communities while protecting program integrity and reducing Medicaid fraud, waste, and abuse. By combining biometric identity verification with a modern digital health record, this project delivers a scalable, flexible, and sustainable solution that improves access, quality, and outcomes for Alaska’s most vulnerable populations.	Our approach leverages the cloud-based ES Digital Health record integrated with LiifeID biometric identity verification to strengthen healthcare access, quality, and sustainability for rural, remote, and frontier Alaskans. Once funded by the State of Alaska, patients establish their own accounts, ensuring secure, longitudinal health records linked to verified identities. Biometric verification prevents duplicate or fraudulent Medicaid enrollment, preserves coverage continuity, and provides an auditable identity layer across the care continuum. The implementation has three components: 1. Patient and Provider Activation – Patients set up accounts with guided onboarding supported by local clinics and Community Health Aides/Practitioners (CHA/Ps). Providers access consolidated care plans for follow-up, chronic disease management, preventive care, and remote monitoring. LiifeID’s biometric verification removes duplicate identities and ghost enrollees at the point of enrollment—preventing recurring fraudulent payments before they enter the system 2. Operational and Clinical Workflow Integration – The platform consolidates encounters from multiple providers, mobile clinics, and telehealth into a single, patient-centered record. Mobile units for triage, maternal health, emergency response, or preventive screenings operate seamlessly with cloud-based records, supporting real-time documentation, follow-up alerts, and secure provider communication. Verified identity infrastructure extends to provider-side enrollment, reducing fraudulent billing tied to unverified or compromised provider identities This approach combines cloud-based, patient-controlled records with verified identity to enable scalable, sustainable healthcare delivery. It reduces administrative burden, strengthens Medicaid integrity, empowers patients, and supports evidence-based interventions. The solution is designed for rapid adoption, long-term maintenance, and measurable improvements in access, quality, and outcomes across Alaska’s underserved communities.	Over \$5M	Statewide	Anchorage (Municipality); Bethel Census Area; Denali Borough; Fairbanks North Star Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

ES Digital Health, inc	Financial Solvency and Sustainability through Value Based Models & Alternative Payment Methods.	AZ	Rural healthcare providers face growing financial pressures from declining reimbursements, workforce shortages, and limited access to capital, leaving many facilities vulnerable. Simultaneously, hospitals and clinics generate large volumes of clinical and operational data that currently carry no recognized balance sheet value, creating unrecognized economic asset value through what is now documented as an expense. This project introduces a two-phase model to unlock and activate that value. Phase 1 – Data Asset Appraisal: Qualified third-party valuation under FASB ASC 805/350 identifies and appraises seven or more years of historical healthcare data. Until appraised, the data carries zero financial value; once recognized as an intangible asset, it strengthens provider balance sheets and solvency. Phase 2 – Commercialization Facilitation: We help eligible providers to responsibly license the de-identified data for research, regulatory submissions, and real-world evidence. The project supports compliant partnerships with research institutions and industry seeking rural healthcare data. For example, if ten rural providers identify datasets valued at \$20M–\$40M each, Alaska has an ROI of \$200M–\$400M in new healthcare assets in year 1. Similar assets exist across thousands of urban providers nationwide. If successful state-wide, this project could establish a scalable model for unlocking healthcare data value and strengthening financial sustainability across rural America.	The Powell Firm and ESD propose a structured program to identify, appraise, and responsibly commercialize de-identified healthcare data generated by Alaska healthcare providers. The project uses a two-part operational model designed to unlock asset value and support ongoing monetization. Part 1 – Data Asset Appraisal and Recognition: Participating providers identify eligible datasets from routine care delivery. Independent third-party valuation specialists perform appraisals consistent with FASB ASC 805 and ASC 350 to establish Fair Market Value (FMV). Until appraised, these datasets carry no recognized financial value; once appraised, they can be recorded as identifiable intangible assets. This strengthens provider balance sheets, improves debt-to-asset ratios, and enhances borrowing and investment capacity. For example, a rural clinic with \$10M in revenue and 2% operating margin may see its longitudinal dataset valued at \$40M, transforming its financial profile. Part 2 – Commercialization Facilitation and Sustainability: After appraisal, the project establishes compliant partnerships with research institutions, pharmaceutical companies, biotechnology firms, and healthcare technology developers seeking de-identified real-world data. Ongoing support includes quarterly FMV reassessments, financial reporting guidance, training for CFOs, and continued partnership development, ensuring long-term governance and maximized asset value. Together, this model transforms routine healthcare data into a recognized financial asset, strengthening rural provider balance sheets, enabling access to capital, and supporting innovation in healthcare research and technology. If five participating sites each identify datasets valued between \$20M and \$60M, the program would unlock more than \$100M in newly recognized healthcare assets across Alaska in Year 1, creating immediate solvency, financial sustainability and profitability- ultimately improving the entire delivery of care throughout Alaska. ES DIGITAL HEALTH, INC	Patient Facing Digital Health App-secure for Patients Interoperable Data Infrastructure Initiatives	AZ	Alaska faces one of the most challenging healthcare delivery environments in the United States. Vast geography, extreme weather, and a widely dispersed population create significant barriers to coordinated medical care. Many rural communities rely on small clinics, rotating physicians, and telemedicine services for primary care. Patients frequently receive treatment across multiple facilities, including community clinics, regional hospitals, imaging centers, and laboratories. These providers often operate separate electronic medical record systems with limited interoperability, resulting in fragmented patient health information across institutions. When patients seek care at new facilities or require specialized treatment, providers may not have immediate access to critical medical data such as diagnostic imaging, laboratory results, medication histories, or prior diagnoses. This lack of access can delay diagnosis and treatment, increase healthcare costs, and reduce clinical efficiency. In some cases, procedures or surgeries are delayed while providers attempt to collect records from multiple locations. These challenges disproportionately affect rural Alaskans who must travel long distances for specialty care. Without timely access to complete medical records, providers may repeat diagnostic tests or postpone treatment, increasing both healthcare costs and risks to patient safety.	Project Concept and Approach ES Digital Health Inc. proposes statewide implementation of its secure, patient-facing Digital Health record to empower Alaskans to manage, maintain, and share their health information. The initiative aligns with federal priorities under the 21st Century Cures Act, CMS Interoperability and Patient Access Rule, and ONC information blocking provisions, supporting patient access, health data portability, and digital health innovation. Over five years, the project will enroll residents, provide education, and assist patients in creating and maintaining secure digital health records. The first-year budget will fund training, outreach, patient support, and integration of best practices for secure API interfaces with healthcare data silos. Educational resources include instructional videos, step-by-step guides, demos, and a hotline to assist patients with setup, document uploads, and sharing with providers. The platform enables patients to securely store and manage key medical information, including diagnostic imaging, lab results, physician notes, surgical reports, medication histories, and chronic disease records such as A1C and blood pressure tracking. Unlike mass EMR migrations, the focus is on clinically relevant data selected by patients, ensuring portability and usability. This data is private to the patient and in the patient control and maintenance. By consolidating records from hospitals, clinics, laboratories, and imaging centers, the system reduces inefficiencies, prevents repeated testing, and improves provider decision-making. It also reduces information blocking and ensures compliance with federal interoperability standards. Rural and mobile populations benefit particularly, as patients can carry a complete cloud-based health history between communities or facilities. Patients can send their records via QR codes, encrypted email, or secure links, to their providers improving continuity of care and supporting rural health equity. Patients can also tell their health story, and record their personalized records of nutrition, blood pressure, exercise or any other health care markers or attributes from their own personal digital health records. This initiative strengthens compliance with federal digital health requirements, enhances patient engagement, improves care coordination, and ensures lifelong, secure access to medical records, addressing Alaska’s unique geographic and rural healthcare challenges. ESO Solutions, Inc.	Alaska Rural EMS and Alternative Care Access Transformation Project	TX	The EMS/trauma model is under strain in rural communities. Many EMS requests are not time-sensitive, yet the default path is still ambulance response and long-distance transport, which can leave a community without coverage for true emergencies. Frequent callers and low acuity patients further strain local systems, while EDs become crowded with low-risk, high-utilizer visits. EMS and ED care are among the costliest access points for non-emergent medical needs, regardless of payor, and Medicaid patients disproportionately over-utilize EMS and emergency departments for non-emergent care. Options exist today for integrated care paths, treat-in-place, community paramedicine/mobile health, telehealth, behavioral health, and non-emergent transportation to alternative care sites. ESO data services and technologies can align EMS, hospitals, and payors with these alternative care paths and create a path to sustainable funding through enduring value to hospital and payors. Coordination is also needed for rural hospital patient transfers for air/ground transports, plus patient outcomes can be shared with EMS, hospitals, tribal health, and payors to improve care, quantify the impact on access, quality and costs. This ESO project will drive “transformation of the statewide EMS/trauma systems by enabling safer patient routing, stronger transfer coordination, statewide measurement that supports alternative payment models and long-term EMS sustainability” (page 39 of AK’s RHT application).	We propose a statewide data solution to align with AK RHPT initiatives 2, 4, and 6. We offer a proven, vendor-agnostic and standards-based interoperability technology framework that links 911 dispatch, EMS, hospitals, alternative care (telehealth, community paramedicine, mobile health, behavioral health, substance abuse), and payers in near real time. Our systems, proven in more than 1,500 hospitals today, can serve as the backbone of Alaska’s EMS and trauma modernization plan and support RHTP goals, metrics, and long-term sustainability by year five. Four ESO components work together to support operations, data sharing, and measurement. ESO Health Data Exchange (HDE) enables bi-directional exchange between EMS, hospitals, clinics, and other partners. It reduces manual handoffs and supports outcomes loop closure so partners can see what happened next. This linked data helps modernize EMS and can support sustainability as hospitals underwrite ongoing exchange once they see value. Our vendor agnostic approach integrates with many electronic medical record (EMR) systems, so EMS, MIH/CP, hospital, and other providers can keep their existing EMR. ESO EHR documents alternative care encounters and MIH/CP follow-ups outside the ED, including treat-in-place care, telehealth encounters, and field referrals. ESO Logis manages referrals, scheduling, follow-ups, and dispatch of MIH/CP resources when used. It also tracks status end-to-end for interfacility air/ground hospital transfers and low-acuity 911 navigation. ESO Data Studio provides statewide and regional dashboards for diversion, ED avoidance, transfer times, program reach, and outcomes, and supports stakeholder reporting and payment model analysis over time. We will implement a Medical Coordination Center program with two connected activities. Activity 1 (Transfers) establishes one workflow for rural transfers and patient placement, including interfacility air/ground transport. Logis runs intake, routing, and status; HDE shares required outcomes data to continuously optimize the model and ensure safety surveillance; Data Studio provides the operations picture and supports quality improvement. Activity 2 (Medical triage and patient diversion) adds safe 911 triage and navigation that supports treat-in-place, telehealth, MIH/CP follow-up, and alternate destinations, with documented encounters in EHR, coordinated workflows in Logis, exchange and loop closure through HDE, and ongoing measurement in Data Studio.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Esvyda Inc	Expanding RPM, CCM, Telehealth and Diagnostic & Coordinated Care Across Rural and Tribal Communities	CA	Alaska’s Rural Health Transformation Program identifies Initiative #6: Spark Technology & Innovation as a foundational strategy for strengthening care delivery across frontier, rural, and tribally diverse communities. The state’s focus on leveraging technology-enabled platforms to expand care as close to home as possible while improving diagnostic capabilities and coordination across hub-and-spoke systems directly aligns with Esvyda’s remote clinical infrastructure model.	Esvyda’s proposed approach to supporting Alaska’s Initiative #6 is to deploy an AI-enabled Remote Patient Monitoring (RPM), Chronic Care Management (CCM), and telehealth infrastructure tailored to frontier, rural, and tribal communities within Alaska’s hub-and-spoke healthcare system. Our bluetooth and cellular-enabled devices function in low-bandwidth environments, expanding chronic disease monitoring for conditions such as hypertension, diabetes, COPD, and heart failure without reliance on home broadband. Real-time data transmission strengthens coordination between village-based providers and regional hubs, improving diagnostic visibility and enabling earlier clinical intervention. Beyond technology, Esvyda provides structured escalation workflows, secure EHR interoperability, CMS-aligned reporting, and operational support including onboarding, training, documentation alignment, and billing readiness to ensure sustainable program implementation. We prioritize culturally responsive deployment by collaborating with local providers to adapt engagement strategies for Alaska Native and rural communities. Drawing from experience supporting tribal communities in Nevada, our goal in Alaska is to launch scalable pilots that strengthen coordination, reduce avoidable transfers, and expand high-quality care as close to home as possible.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Everbalance Wellness	Preventative Maternal and Pediatric Health Initiative for Alaska	AK	Many chronic health conditions begin developing during pregnancy and early childhood, yet most healthcare systems focus primarily on treating illness after symptoms appear rather than preventing dysfunction early. Families frequently struggle to access preventative guidance related to nutrition, gut health, environmental exposures, and metabolic balance during pregnancy and childhood. Pediatric concerns such as digestive issues, sleep disturbances, immune dysfunction, and behavioral challenges are increasingly common, but parents often receive fragmented care that addresses symptoms rather than underlying causes. In rural regions such as Alaska, access to preventative health services and specialized pediatric support is even more limited due to geographic barriers and healthcare workforce shortages. This project addresses an opportunity to implement a preventative, root-cause focused health program for mothers and children that combines early screening, education, and personalized interventions to support optimal development and long-term health. By focusing on pregnancy and early childhood, the program aims to intervene during the most influential window for lifelong health outcomes.	The project will establish a preventative health program designed to support families during pregnancy and early childhood through three core components. 1. Early preventative screening Participants will have access to targeted health assessments and functional laboratory testing that can help identify early imbalances before they develop into chronic conditions. These assessments may evaluate factors such as: nutritional status gut health and microbiome balance metabolic health indicators hormone balance during pregnancy and postpartum environmental and lifestyle factors influencing health Early identification allows families to take preventative action rather than waiting for symptoms to worsen. 2. Family-centered education Participants will receive structured education designed to help parents build foundational health knowledge and practical skills. Educational topics will include: nutrition for pregnancy, childhood development, overall wellness and longevity. Education will be delivered through group workshops, digital learning modules, and written resources, allowing families to revisit information and implement changes gradually. 3. Personalized prevention plans Based on screening results and lifestyle assessments, each participating family will receive individualized recommendations designed to support long-term health. These may include: nutrition and meal planning guidance targeted supplementation lifestyle interventions supporting sleep, stress regulation, and metabolic health early interventions for common pediatric concerns Care delivery will occur through telehealth and digital platforms, allowing participation from rural communities across Alaska. With cost being another major barrier to care, having the screening machine in office would drastically cut down on cost and therefore greatly improve access.	\$50,000-\$250,000	Private practitioner	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Evergreen Health LLC	Evergreen Health, expanding access to primary care	AK	Communities in and around Fairbanks, Alaska face limited access to consistent primary care, long wait times for appointments, and significant travel burdens to obtain routine and preventive services. Workforce shortages, lack of primary care physicians, and increasing demand for chronic disease management have placed strain on existing providers and emergency departments, resulting in fragmented and episodic care. Establishing Evergreen Health addresses this gap by expanding local access to comprehensive, relationship-based primary care, improving continuity of care, and reducing unnecessary reliance on higher-cost acute services.	Evergreen Health will address limited access and fragmented care in Fairbanks by establishing a patient-centered, relationship-based primary care clinic that serves as a consistent medical home for individuals and families. The clinic will expand appointment availability, prioritize preventive care and early intervention, and provide comprehensive chronic disease management to reduce avoidable emergency department use and specialty referrals. Evergreen Health will implement flexible scheduling, care coordination, and appropriate use of telehealth to improve access for patients traveling from remote areas. By focusing on continuity of care, patient education, and whole-person wellness, the clinic will strengthen long-term health outcomes while supporting a more efficient and sustainable local healthcare system.	\$50,000-\$250,000	Family or primary care	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced
Everts Air Cargo	Improved Medical and Food Safety through proper Storage and Transportation Phase I	AK	The addition of appropriate refrigeration equipment at transportation hubs allows carriers to properly store medical supplies and food items that are shipped via bypass mail or cargo. The installation of refrigeration systems also helps to eliminate issues that arise when air carriers are not able to move materials from the hubs to downline locations in rural areas. Currently, air carriers are forced via the bypass mail system to move cargo to the hubs as bypass mail is dated and requires it to move within a given time frame. Additionally, downline carriers cannot store large volumes of perishables properly and will deny the primary carrier delivering cargo to them during weather events that prevent flights. The addition of increased refrigeration capacity allows the transportation to occur without adding risks to the perishable items as well as allows carriers to not have to return the materials to the point of origin. Potentially, decreasing transit time and reducing shipping costs that are ultimately passed on to the consumer of the medical supplies or perishable food items. Ultimately, the goal of this project is to ensure safe medical supplies and wholesome food to rural Alaska all at a lower cost than current situation allows.	Phase I of the approach is to install modular refrigeration equipment that can be expanded at a later point in an effort to minimize overall costs while matching location needs. The Phase I stage will be monitored to ensure that perishable or temperature sensitive medical and food items are stored appropriately with equipment available.	\$250K-\$1M		Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Fairbanks North Star Borough; Lake and Peninsula Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Exit Glacier Greenhouse	Feeding Seward and Alaska with a Year Round Commercial Greenhouse	AK	Across Alaska we face significant barriers to accessing fresh, nutritious produce. Because food must be transported long distances by truck, barge, or air, produce often arrives in poor condition and is unaffordable. Those most impacted are families, low income households, elders, and those facing chronic health conditions. Many people across the Kenai Peninsula have limited or no access to healthy food options. As a result, many households rely heavily on processed and shelf-stable foods that are less nutritious. These conditions contribute to poor community nutrition and limited exposure to fresh vegetables, especially among children.I have witnessed local children who have never tried common vegetables such as broccoli. Without early access and exposure to fresh produce, it becomes difficult to build lifelong healthy eating habits. Increasing the availability of fresh produce is a foundational step toward improving nutrition. When healthy foods are accessible, affordable, and culturally accepted, families are more likely to incorporate them into everyday meals. This project recognizes that improving rural health requires addressing the underlying systems that shape food availability. Rather than relying solely on imported goods, the greenhouse model builds local capacity for sustainable food production. It strengthens the food system, supports community wellbeing, and provides a practical and sustainable solution to longstanding challenges in rural nutrition.	These outcomes can be achieved by operating a year-round arctic greenhouse that produces fresh vegetables in the Kenai Peninsula. By growing food within the communities it serves, the project will directly improve access to fresh, nutritious produce while reducing the cost and quality issues associated with long-distance transportation. A local greenhouse allows vegetables to be harvested at peak ripeness and delivered quickly, ensuring the community can access the full nutritional value and flavor of fresh food. The greenhouse will focus on consistently producing nutrient-dense produce that are often difficult to obtain in good condition in rural Alaska, including leafy greens, herbs, and fast growing common vegetables such as zucchini, snap peas and cherry tomatoes. Energy efficiency and sustainability are central to the design of the greenhouse in order to keep operating costs manageable over time. The structure will be highly insulated to retain heat during colder months while maximizing the use of Alaska’s seasonal sunlight. In addition, it will incorporate simple but effective sustainable technologies such as climate batteries, heat sinks, and solar panels. Climate batteries capture excess daytime heat from the greenhouse and store it underground, allowing that heat to be released at night to stabilize temperatures. Heat sinks provide additional thermal stability, and solar panels help offset electricity needs. Together, these systems reduce and eliminate energy consumption and support long-term operational sustainability and keep produce affordable. The greenhouse will also serve as an educational and community resource. It provides an excellent partnership opportunity with local schools by demonstrating local food production and sustainable technologies in action. This exposure helps introduce children to fresh produce while building awareness of healthy eating and sustainable agriculture. By combining local food production, energy-efficient greenhouse technology, and community education, this project creates a practical and sustainable approach to improving community access to fresh produce. The greenhouse will strengthen food security, improve the quality and affordability of vegetables, and help build a healthier food system in Alaska.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Fabric Labs, Inc	Connected Care Alaska: Statewide Rural Health Transformation	NY	Alaska has an opportunity to reimagine rural healthcare delivery through the Rural Health Transformation Program (RHTP), creating a statewide framework that strengthens providers, improves outcomes, and empowers patients. Rural health facilities—including critical access hospitals, rural health clinics, and Tribal health organizations—play a vital role in their communities but often operate with limited provider capacity and fragmented care coordination. Addressing these challenges requires modern infrastructure that expands clinical reach, improves care coordination, and enables providers to deliver care more efficiently. Connected Care Alaska addresses this opportunity by creating a patient-facing digital access point that simplifies how residents find and receive care across Alaska’s healthcare system. For example, the platform could be embedded within the Alaska State Office of Rural Health (SORH) website as a simple “Get Care Now” button under related services, allowing residents to locate clinics, schedule visits, access asynchronous care, or connect with providers virtually. By expanding virtual care and enabling statewide provider coordination, the initiative strengthens healthcare access, improves workforce capacity, and modernizes digital health infrastructure—directly supporting Alaska’s RHTP priorities.	Connected Care Alaska establishes a statewide digital access point that simplifies how residents locate and receive care. Built on Fabric’s Digital Front Door platform, the initiative provides a unified entry point where patients can access virtual care, receive digital triage, and connect with providers across Alaska’s healthcare network. Through Connected Care Alaska, AKDOH can implement statewide care access infrastructure integrating rural providers, Tribal health organizations, regional hospitals, and virtual clinicians into a coordinated network capable of delivering timely care regardless of patient location. The platform can be embedded within State of Alaska websites and participating rural provider websites, allowing residents to access services through familiar digital channels while reducing the burden of navigating multiple healthcare systems. A central component of the initiative is a statewide provider directory integrating rural clinics, Tribal health organizations, regional hospitals, and telehealth providers. Leveraging credentialing oversight through the Alaska Medical Assistance Health Enterprise System (AMHES), AKDOH can accelerate development of a comprehensive provider directory while ensuring accurate provider credentialing. Through this shared network, clinicians can serve as virtual “floaters,” supporting multiple communities when local provider capacity is limited. This model extends provider reach while directing patients to the most appropriate and available care. Fabric’s nationwide clinician network can also serve as a backstop when needed—providing overflow capacity during demand surges, supporting 24/7 coverage, and maintaining continuity of care. For an initiative of this scale to succeed, statewide coordination requires a neutral steward focused on equitable access and system efficiency. As both system steward and Medicaid payer, AKDOH is uniquely positioned to guide implementation, shape policy, and ensure equitable access across communities. Enabling residents to choose the appropriate venue of care—particularly for routine visits suited for asynchronous and virtual care—expands provider capacity while helping reduce per-member-per-month Medicaid costs and supporting long-term RHTP sustainability.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Facing Foster Care in Alaska	Alaska OCS Youth Orientation Initiative	AK	Foster youth enter the child welfare system without clear information about what is happening, who is involved in their case, or how to access the services meant to support them. This lack of orientation is especially hard on youth in rural areas or those moving among communities, where distance, limited staffing, and infrequent contact make it even harder to understand the OCS process, court expectations, or available resources. Many young people describe feeling confused, intimidated, or left out of decisions that affect their safety and well-being. This project creates consistent, youth-friendly orientation videos that explain the OCS case process, the roles of key adults, how court works, what rights youth have, and how they can advocate for themselves and access resources important to their care. The videos will be shaped with input from foster youth and alumni so the content is relatable, accurate, and grounded in lived experience. These videos offer a reliable way to provide consistent information to foster youth. They help bridge communication gaps created by geography, turnover, and limited access to in-person support. Clear, accessible information empowers youth to participate in case planning, understand how to access telehealth and behavioral health services, and know how to reach out when they have specific needs. This project builds a statewide, consistent foundation that helps young people feel informed and more in control from the moment they enter care.	This project will develop consistent, youth-friendly orientation videos that explain the OCS case process, the roles of key adults, what youth can expect in court, their rights, and how to access services and supports. The approach centers on co-design with youth, statewide consistency, and accessibility across Alaska’s diverse geographies. The first phase focuses on collaborative content development. Foster youth and alumni will shape scripts, identify priority topics, and ensure the tone reflects real experiences. FFCA will also partner with the Alaska Impact Alliance (AIA), which is creating parallel orientation videos for parents and kinship caregivers. Aligning the two projects strengthens shared messaging, reduces duplication, and improves consistency for families and youth. The second phase centers on production and accessibility. Videos will use clear, plain language and visuals that support comprehension for youth of different ages and learning styles. Modular content will allow youth to access information relevant to entering care, preparing for court, understanding case plans, or navigating placement changes. All materials will be optimized for low-bandwidth environments and available offline to address connectivity barriers in rural and frontier communities. The third phase focuses on statewide implementation. OCS will integrate the videos into early touchpoints such as entry into care, placement transitions, and pre-hearing preparation. Foster parents, kinship caregivers, and residential programs will receive guidance on using the videos to support youth understanding. Legal partners and tribal representatives will be encouraged to incorporate the materials into youth-facing interactions. Coordination with AIA’s project will help ensure youth and adults receive aligned, complementary information. Finally, the project will establish feedback loops to refine and update content. Youth and alumni will provide ongoing input, and OCS staff will report on usability and gaps. This continuous improvement process keeps the videos current, culturally responsive, and aligned with policy and practice changes. This approach builds a reliable, statewide foundation that helps foster youth understand their case, participate meaningfully in decisions, and feel more prepared and supported from the moment they enter care.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Facing Foster Care in Alaska	Communication Access for Foster Youth in Transition	AK	A major challenge is that cell phones are often tied to the foster family instead of the youth, leaving young people disconnected during placement changes—and even more so when they have no foster family at all. Transition-aged foster youth across Alaska, often lack reliable access to a phone, cutting them off from the systems meant to keep them safe. Without a phone, youth can’t participate in case planning, access telehealth, stay connected to family and friends, reach crisis support, or secure employment and housing. What this project addresses; • Connection to essential services such as virtual case meetings, telehealth, and remote education or employment. Youth without phones can’t access these consistently. • Safety and stability for youth facing placement changes or unsafe situations to call for help or reach trusted adults. • Participation in case planning to attend hearings, meetings, and opportunities for youth to advocate for themselves. • Connection to natural supports. Family, friends, and mentors are protective factors, yet many youth lose these connections simply because they lack a device. Providing foster youth in Alaska with a reliable cell phone is a simple, high-impact intervention that expands access to health care, safety, and opportunity. It ensures no young person is left behind because of geography or system involvement and creates a more equitable path for youth statewide.	Making sure foster youth in Alaska have a reliable cell phone that stays with them through every placement, transition, and move into adulthood. The first year is dedicated to building a strong foundation so the project is safe, sustainable, and ready for statewide use. This includes identifying a bulk phone and data plan that works across regions, creating simple digital-safety practices with OCS, and securing long-term support through discounted plans and corporate sponsorship. Once the system is in place, phones will be provided at key transition points—entering care, changing placements, or preparing for adulthood—so youth are never without a way to stay connected. A reliable phone allows youth to attend telehealth appointments, join virtual case meetings, and stay in regular contact with caseworkers, GALs, mentors, and family. It also supports daily needs like applying for jobs, communicating with employers, accessing online learning, and coordinating transportation. FFCA’s Peer Navigators and alumni leaders will stay connected with youth statewide, offering coaching, crisis support, and help using the phone as a tool for safety and independence. Their lived experience ensures youth get support that is practical, relatable, and grounded in what works. By bridging the distance between rural communities and the services concentrated in hub cities, this approach creates a more equitable, youth-centered system where every young person has a direct line to care, support, and opportunity.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Facing Foster Care in Alaska	Healthy Futures Through Strong Youth Advocacy	AK	Alaska is one of the few states that does not guarantee an attorney for every youth in foster care, relying instead on a mix of mandatory and discretionary appointments and a statewide network of GALs often supervised by an attorney. Foster youth depend on these advocates to protect their rights and elevate their expressed wishes. The Office of Public Advocacy (OPA) contracts for attorneys and GALs beyond their capacity for full time staff and in cases of conflict. Contract attorneys and GALs lack consistent access to foundational training in CINA law, trauma-informed practice, and ICWA. This results in uneven representation and can contribute to delays and poorer outcomes. By funding access to the Court Improvement Program’s digital CINA 101 and ICWA 101 trainings, this project builds a consistent baseline of knowledge across the contractor workforce. It strengthens the capacity of attorneys and GALs to provide effective, informed advocacy and supports better health, safety, and permanency outcomes for youth statewide, including those in rural and remote communities.	The project strengthens the quality and consistency of legal advocacy for Alaska’s foster youth by providing 31 contract attorneys and Guardians Ad Litem with access to two foundational digital trainings, CINA 101 and ICWA 101, developed by the Alaska Court System’s Court Improvement Program (CIP). CINA 101 provides 24 CLE credits (24 hours) of comprehensive instruction, and ICWA 101 provides 8.75 CLE credits (8.75 hours) focused on the Indian Child Welfare Act and culturally responsive practice. The project begins by coordinating with the Office of Public Advocacy and the Court Improvement Program (CIP) to ensure all contractors receive access to these trainings and accompanying materials as part of ongoing professional development. Access to high-quality, standardized training strengthens overall health outcomes for foster youth by ensuring that every child, regardless of where they live, has an advocate who can identify health needs early, push for timely services, reduce harmful delays, and maintain stability through the transitions that shape their physical, emotional, and behavioral well-being. A more prepared and consistently trained workforce improves the system’s ability to deliver equitable, effective advocacy across Alaska’s rural, remote, and urban communities.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Fairbanks Children's Museum	Fairbanks Wellness Coalition and Fairbanks Children's Museum Partnership	AK	As Fairbanks sole wellness and prevention agency, the Fairbanks Wellness Coalition currently rents an office from its fiscal sponsor, the United Way of the Tanana Valley, and does not have a location to offer consistent programming. There is a dire need for a safe community space for young adults to congregate without any risks of drug or alcohol use, and with the support of professionals who can connect them with resources. The Fairbanks Children's Museum is in the process of becoming the fiscal sponsor for the Wellness Coalition in order to provide a permanent location for them to expand their wellness and prevention programming to better serve Fairbanks and improve community health.	The Fairbanks Children's Museum recently secured a 50-year lease through a competitive RFP process to move into City Hall. Over 1,100 square feet of the space is going to be allocated to giving the Fairbanks Wellness Coalition a permanent home to significantly increase and improve their operations in Fairbanks. The Wellness Coalition is severely limited in its ability to fundraise and apply for grants with the United Way as its fiscal sponsor, and moving operations under the Children's Museum will significantly increase its ability to obtain funding to support its growth.	\$50,000-\$250,000		Single Community	Fairbanks North Star Borough	Deferred or Not Advanced
Fairbanks Children's Museum	Healthy Beginnings at the Fairbanks Children's Museum	AK	The Fairbanks Children's Museum serves families and children in a community with extremely limited early childhood education opportunities. Resources and support for new moms are limited, and isolation is ever-increasing, negatively impacting maternal health.	The Fairbanks Children's Museum came to be in order to address the absence of early childhood education opportunities and resources in Fairbanks. Additionally, the Museum began a Baby Mingle program offering free admission and breakfast to moms and their infants twice per month to allow them time to enjoy the museum in a quiet and calm environment, connect with other moms, and connect with maternal health resources. Additionally, FCM hosts Baby Cafe, a program put on by the Breastfeeding Coalition. They use the museum completely free of charge every Monday of the year to do check-ins with mothers and their newborns. They are able to do weigh-ins, get lactation support, and benefit from the knowledge of public health nurses in a safe, calm, inviting environment without the stress of visiting a doctor's office. Recently, FCM was awarded a long-term 40-year lease to relocate to vacant space inside City Hall. This move will allow us to expand our offerings, including maternal health support and access to early childhood education. In order to make this move, we need to design a capital campaign and complete design work for our updated facilities. In the meantime, as we continue to operate at our current location, we seek to significantly improve the space where the Breastfeeding Coalition is able to serve new moms and infants without burdening the Coalition itself with any additional expenses, because it provides all of its services for free. We would like to provide better seating options that lend themselves to breastfeeding, lactation consulting, and general postpartum comfort, as well as invest in supplies such as a device the Coalition can use to measure for breast pumps and additional scales so that new moms can be served effectively and efficiently.	\$50,000-\$250,000	Maternal health	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced

Fairbanks Children's Museum	Healthy Beginnings through the Golden Heart Early Learning Center	AK	There is a significant childcare shortage in Fairbanks, like there is across the entire state. This shortage significantly impacts our workforce development. Specifically, our learning center will prioritize care for city employees, including the Fairbanks Police Department and Fire Department. The childcare that is available in Fairbanks is consistently outpricing families in the community, so we are also seeking to provide affordable, high-quality care, in particular. FCM was recently awarded a long-term 40-year lease to relocate to space inside City Hall. The City has already spent \$750,000 renovating classroom space for our Early Learning Center to be established. The addition of an Early Learning Center in downtown Fairbanks will provide play-based educational childcare for 40 children, allowing folks to return to the workforce, and ensuring their children have every opportunity to get their healthy beginning. Play-based learning and access to robust early childhood education have long-term benefits that Fairbanks will see for decades to come, including increased high school graduation rates, decreased mental health crises into adulthood, and reduced reliance on public assistance resources. Additionally, FCM has created a model through the Golden Heart Early Learning Center that will ensure affordable tuition is maintained for all participating families. Childcare costs are ever-increasing as providers seek to pay staff a living wage. We will offset the costs associated with maintaining high-quality staff with Museum revenue and savings we will realize with the significantly reduced rent we will enjoy at City Hall.	\$50,000-\$250,000	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced

Fairbanks Integrated Community Services, INC	Fairbanks Street Medicine Program	AK	The Fairbanks North-Star Borough (FNSB) serves as a central hub of access for most of the Interior and Northern regions' healthcare and economic foundation. In line with this, the City of Fairbanks serves approximately 250 unique individuals experiencing chronic homelessness, with another 150 to 250 at any point across the year are experiencing some form of temporary homelessness status. Across the FNSB, there are hundreds of identified properties within the FNSB Code Enforcement Department that have individuals living in unfit for human habitation living situations. The critical side effect for individuals in critically housed or unhoused living conditions and the geographical diversity of Interior and Northern Alaska, is an inaccessible healthcare landscape often dependent on the emergency system. This project serves to address the unhoused and critically housed populations healthcare needs while reducing dependence on the emergency system.	The Assertive Community Treatment (ACT) model is an evidence-based practice model with a strong international evidence basis for providing care to individuals experiencing: serious mental illness, chronic substance abuse, and/or homelessness. This proposal intends to create an opportunity to bring the medical capacity of an ACT team to Fairbanks in supplementation of our existing clinical and case management functions. This proposal seeks to fund a full-time physician, one full-time APRN or PA, and two or three full-time nursing staff. The establishment of a full medical team that is capable of responding in the community would establish the first fully-functioning ACT team in the Interior Alaska region and would be capable of directly providing and supplementing healthcare across the FNSB and surrounding communities. This team would supplement the existing 8 full-time clinical and case management staff present at our organization (expanding up to 10 within the next 3 months) and would allow the full fidelity of the ACT model of care.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Yukon-Koyukuk Census Area	Advance to Implementation Application

Fairbanks Native Association	FNA Rural Behavioral Health & Workforce Access Initiative	AK	Rural Alaskans face distance, workforce shortages, and low awareness of how to access behavioral health care. These barriers delay help-seeking and complicate navigation into crisis lines and tele-health. FNA will aim to remove these barriers by deploying technology-driven messaging that tells consumers/ clients what services exist, how to access them, and how to pursue expanded workforce pathways in the Behavioral Health workforce development arena.	FNA will partner with Stream Alaska to produce and distribute four behavioral-health campaigns statewide via CTV (e.g., YouTube TV, Amazon Prime TV, Netflix (ad-tier), Hulu, Disney+) and targeted social media (Facebook, Instagram, social mirroring). Themes: (1) service awareness, (2) crisis access steps, (3) tele-health navigation, (4) rural workforce pathways. The 12-month plan: Month 1 mobilization/baselines, Months 2–3 creative + rural pre-tests, Months 4–11 deployment with monthly KPI dashboards and quarterly learning cycles, and Month 12 summative evaluation and scale plan. Targeting emphasizes rural ZIP codes; optimization uses A/B variants and channel mix. I will coordinate content fidelity with Clinical Leads and FNA Communications and use a formal change-control process to remain CMS-compliant.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kuskokwim Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Fairbanks North Star Borough School District	Growing Our Own: Building Alaska’s Future Health Workforce in Fairbanks with pathways & internships	AK	The Fairbanks North Star Borough School District FNSBSD is currently facing a critical gap in the regional healthcare clinician pipeline, specifically within specialized diagnostic and mental health roles. While student interest in medical careers is high, our current infrastructure lacks the accredited pathways and formal clinical agreements necessary to transition students from general education into professional certification in fields such as phlebotomy, medical laboratory science, and school psychology. By formalizing these technical tracks, the district can provide students with the credentials needed to enter the workforce immediately or pursue advanced postsecondary degrees with a solid foundation.	This five-year investment in student, intern, and employee health care pathways will improve the Fairbanks North Star Borough School District's capacity to facilitate student and community health improvement outcomes. Our approach blends rigorous technical training with meaningful community partnerships to build a clear and sustainable pathway into the healthcare and behavioral health workforce. Building on the district’s history of successful Career and Technical Education (CTE) programs, students will have access to specialized training that provides hands-on experience and prepares them to meet national certification standards. A dedicated coordinator will oversee student internships, ensuring all clinical hour requirements are completed through established partnerships with regional healthcare providers.	\$1M-\$5M	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced
Fairbanks North Star Borough School District	Healthy Schools, Healthy Futures: A Districtwide Wellness and Prevention Initiative in Fairbanks	AK	Schools play an important role in shaping lifelong behaviors for children. However, many of the Fairbanks North Star Borough School District's K-12 schools lack the coordinated resources needed to fully implement prevention-focused wellness initiatives. Wellness efforts currently exist in pockets. Some schools have implemented strong programs, while others lack equipment, supplies, or training to support similar efforts. This creates an opportunity to implement a districtwide wellness initiative that aligns equipment, professional development, technology, and prevention supports across all 28 schools. A coordinated approach will ensure over 11,000 students and nearly 1,500 staff members throughout the district benefit from healthier learning environments and consistent wellness practices.	The Fairbanks North Star Borough School District will implement a coordinated wellness initiative that integrates staffing, equipment, technology, training, and prevention resources across 28 schools. Schools will receive updated physical fitness equipment and classroom wellness materials that promote physical activity and healthy lifestyle habits. School health offices will receive nursing supplies that support student health needs and preventative care. Technology tools will support Multi-Tiered Systems of Support (MTSS) data tracking, allowing staff to monitor wellness indicators and evaluate prevention strategies using data. Professional development will prepare educators and staff to integrate wellness practices into classroom instruction and school culture. A staff wellness platform will support employee health and retention while helping educators model healthy behaviors for students.	Over \$5M	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced

Fairbanks Rescue Mission	Fairbanks Integrated Behavioral Health and Housing Stabilization Initiative	AK	The Fairbanks Rescue Mission serves between 600 and 1,000 men, women, and children each year through our emergency shelter, housing programs, and veteran services. Many of the individuals we serve struggle with mental health and behavioral health challenges and require case management, counseling, and crisis intervention in order to achieve stability. While many of our clients are Medicaid eligible, we are not currently a Medicaid billing agency and therefore cannot bill for behavioral health services. As the need for mental health support continues to grow, the cost of providing these services without reimbursement places increasing strain on our organization. To address this challenge, we are entering into a partnership with a statewide addiction and mental health recovery center to expand and formalize counseling services for our clients. This partnership will allow us to integrate licensed counseling into our shelter, housing, and case management programs, creating a more coordinated, one-stop approach to care. The primary challenge will be covering the cost of additional personnel and modest capital expenses during the initial period before Medicaid reimbursement begins. This project will help bridge that gap while building a sustainable behavioral health service model.	Fairbanks serves as a major hub for rural Alaska, and approximately 40 percent of the individuals we serve are Tribal members who travel from communities across the state seeking temporary shelter and support. Many arrive facing significant challenges, including mental health concerns, substance use disorders, trauma, and other behavioral health needs. Mental health issues, suicide, substance abuse, and alcoholism remain significant concerns in many rural communities, and individuals often come to Fairbanks seeking services that are not available in their home communities. The Fairbanks Rescue Mission is uniquely positioned to help address these needs because many of these individuals are already coming to our facility for shelter and support. One of the greatest challenges in behavioral health services is engaging individuals in treatment. Barriers such as transportation, unfamiliar environments, fear of seeking help, and social discomfort often prevent people from accessing care. By integrating counseling services where individuals are already staying, these barriers are greatly reduced. Through a partnership with True North Recovery, we will incorporate Medicaid-approved counseling services into the programs we already operate. While we do not intend to operate a full in-house treatment program, licensed counselors will work alongside our existing case management and support services to provide accessible behavioral health care to our guests. Our facility operates as a high-barrier shelter, requiring guests to remain drug and alcohol free. This environment supports individuals who are actively working toward sobriety and stability. Counseling and case management will be integrated into our existing programs, including our “30-60-90” program. While guests are typically guaranteed 30 days of shelter, individuals who are actively participating in programs or demonstrating progress toward independence are often able to stay longer. With the addition of Medicaid billing capability through this partnership, we will be able to expand counseling and case management services that support recovery, stability, and long-term independence for the individuals we serve.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Fairweather	Alaska Mobile Integrated Health & Community Care Network	AK	Many rural and frontier communities across Alaska face significant barriers to accessing healthcare due to geographic isolation, limited local healthcare infrastructure, workforce shortages, and long travel distances to regional medical facilities. Preventive care, chronic disease management, and routine health services are often delayed because patients must travel long distances or wait for periodic provider visits. These challenges can result in worsening health conditions, avoidable emergency evacuations, and higher healthcare costs. At the same time, many communities have dedicated local healthcare providers, such as community health aides and EMS personnel, who would benefit from additional clinical support and training opportunities to strengthen local capacity. This project presents an opportunity to expand healthcare access through a mobile integrated health model that delivers care directly to rural communities. By deploying mobile healthcare teams and supporting local providers, the project will improve access to preventive services, strengthen chronic disease management, and enhance the capacity of rural healthcare systems across Alaska.	The Alaska Mobile Integrated Health and Community Care Network will deploy mobile healthcare teams to deliver preventive and primary healthcare services directly to rural and frontier communities across Alaska. Using a mobile integrated health model, Fairweather will send trained healthcare professionals to communities where access to care is limited, providing services where people live and work rather than requiring patients to travel long distances to regional medical facilities. Mobile teams will provide preventive health screenings, chronic disease monitoring and management, vaccinations, occupational health services, and health education. These services will support earlier identification of medical conditions, improve management of chronic diseases such as hypertension and diabetes, and help reduce preventable emergency evacuations and hospitalizations. Fairweather has already demonstrated the effectiveness of mobile healthcare delivery through its work with the State of Alaska to deploy vaccination teams to rural communities and remote locations across the state. Through this partnership, Fairweather delivered vaccines and healthcare services to communities that would otherwise have limited access to care. This experience provides an operational foundation for expanding mobile healthcare services statewide. A key component of the project will be collaboration with local healthcare providers. Mobile healthcare teams will work alongside community health aides and other local providers to deliver care while providing hands-on clinical support that strengthens local healthcare capacity. This collaborative approach ensures services complement existing healthcare systems and supports continuity of care within rural communities. By combining mobile care delivery, preventive health services, and collaboration with Tribal health organizations and regional healthcare providers, this initiative will expand healthcare access, improve preventive care, and strengthen healthcare capacity in rural and frontier communities across Alaska.	\$1M-\$5M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Fairweather	Alaska Rural Emergency Response & Stabilization Network	AK	Many rural, remote, and frontier communities across Alaska face significant gaps in emergency response capacity. In some locations, communities lack dedicated emergency responders, organized EMS systems, or the vehicles and equipment needed to respond effectively to medical emergencies, accidents, or fires. When emergencies occur, local healthcare providers, community health aides, or community members may be required to manage critical situations while waiting for outside assistance to arrive. Alaska’s geography, extreme weather, and limited road infrastructure make traditional emergency response models difficult to implement in rural communities. These conditions create an opportunity to develop response systems specifically designed for remote environments that can support local providers and strengthen community-level emergency response capability. Fairweather has developed the Emergency Response Vehicle (ERV) concept after years of providing remote medical services across Alaska and recognizing the need for mobile response capability in communities that may lack both personnel and equipment. ERVs are designed to support trained responders by providing mobile medical stabilization capability and initial fire suppression support in environments where traditional emergency vehicles may not exist. Expanding this model presents an opportunity to strengthen emergency response capacity and improve healthcare resilience in rural Alaska.	This project will strengthen emergency response capacity in rural, remote, and frontier communities across Alaska by supporting local responders and healthcare providers with additional response capability, training, and mobile stabilization resources. Many communities face gaps in both personnel and equipment, limiting their ability to respond effectively to medical emergencies, accidents, and fires. The initiative is designed to support communities where dedicated responders, vehicles, or organized EMS systems may not currently exist. Mobile medical response teams will assist communities and local healthcare providers during critical incidents. These teams will coordinate with local clinics, community health aides, Tribal health organizations, and regional healthcare providers to improve stabilization and coordination of care. Earlier intervention can reduce risks associated with delayed treatment while patients await evacuation or transport to higher levels of care. Fairweather developed the Emergency Response Vehicle (ERV) concept after years of providing remote medical services across Alaska and recognizing the limitations of traditional emergency response systems in remote environments. Some Rural Communities lack the resources needed to reach patients or respond effectively to emergencies. ERVs are designed to operate in off-road environments and extreme weather while providing mobile medical stabilization capability. They can also support initial fire suppression in communities that may not have dedicated fire response infrastructure, helping protect critical assets such as clinics, housing, schools, and utilities. While ERVs are not required for the program to operate, they would enhance response capability in communities that currently lack emergency vehicles or organized response systems. Clinical protocols and responder training will be guided by Fairweather’s Medical Director, Dr. Michael Levy, who has served in the role for more than 15 years and provides EMS medical oversight for both the State of Alaska and the Anchorage Fire Department. His experience ensures that response practices and stabilization protocols align with current prehospital care standards. Through trained responders, coordination with local healthcare providers, and optional deployment of specialized response vehicles, this initiative provides a flexible model for strengthening emergency response capability and improving healthcare access in rural Alaska.	\$1M-\$5M	Home- and communit y-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Fairweather	Alaska Rural Health Workforce Training Network	AK	Rural and remote communities across Alaska face significant healthcare workforce shortages and limited access to training opportunities for providers who serve these regions. Healthcare professionals practicing in frontier environments must manage complex medical emergencies and chronic health conditions with limited resources, long transport times, and minimal access to specialty care. Despite these challenges, many rural providers must leave Alaska to obtain advanced clinical training or maintain required procedural competencies. This lack of accessible training infrastructure contributes to workforce shortages, limits providers’ ability to practice at the top of their license, and creates barriers to recruiting and retaining healthcare professionals in rural communities. The Alaska Rural Health Workforce Training Network will address this gap by establishing regional training hubs and mobile training programs designed specifically for rural healthcare delivery. By expanding in-state training opportunities and supporting the development of critical clinical skills, this project will strengthen Alaska’s rural healthcare workforce and improve access to high-quality care for communities across the state.	The Alaska Rural Health Workforce Training Network will establish a hub-and-spoke training model designed to expand clinical training opportunities for healthcare professionals serving rural and frontier communities across Alaska. Fairweather will lead development of regional training hubs in Anchorage, Prudhoe Bay, and Fairbanks, leveraging existing facilities and operational infrastructure to provide simulation-based clinical training, certification programs, and continuing education for healthcare professionals practicing in remote environments. Training programs will focus on skills required for rural healthcare delivery, including emergency stabilization, trauma care, critical care procedures, and management of complex medical conditions in settings where evacuation or specialty care may be delayed. Programs will support the training and continuing education of Emergency Medical Technicians, paramedics, nurses, nurse practitioners, physician assistants, and other healthcare professionals serving rural communities. The project will incorporate high-fidelity simulation training, hands-on procedural education, and certification programs designed to help providers maintain critical competencies required for rural practice. In addition to fixed training sites, mobile training teams will travel to rural communities to deliver training locally, reducing barriers for providers who cannot leave their communities for extended training. Partnerships with Tribal health organizations, EMS agencies, healthcare systems, and educational institutions will help align training programs with regional workforce needs and expand participation across the state. These collaborations will support coordinated workforce development efforts and strengthen healthcare systems serving rural Alaska. By creating in-state training infrastructure specifically designed for rural healthcare delivery, the project will expand access to professional development opportunities, strengthen workforce retention, and improve provider readiness to deliver high-quality care in Alaska’s most remote communities.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Family Centered Services of Alaska, Inc.	FCSA Partial Hospitalization Program	AK	One in seven Alaskans aged 12-17 had serious thoughts of suicide and 1 in 5 had at least one major depressive episode in 2021-2023 (SAMHSA, 2025). Partial Hospitalization Programs (PHPs) offer an appropriate level of care for children and youth with serious mental health concerns, but access in rural Alaska is extremely limited. Statewide, we know that youth often are stuck in a cycle that alternates between lower levels of care (outpatient therapy) and the highest levels of care (hospitalization or residential treatment), leading to unnecessary crises and/or losses of the gains from therapy, in addition to academic disruptions and challenges reintegrating back into their home communities. FCSA is licensed to provide intermediate level PHP services and has completed a feasibility study to do this; however, financial support is needed to operationalize our services. With the addition of PHP services, FCSA has an opportunity to transform the way services are delivered to rural Interior youth with serious mental health needs, filling a gap in transitional behavioral health services by providing a bridge between residential treatment and outpatient care. PHP services will build in educational programming via school district partnerships, improve access to the full spectrum of behavioral health services, allow youth to remain connected to family and their community systems, strengthen transitions between levels of treatment, and reduce system costs overall.	Our model aligns with all standards and licensing requirements and is structured to meet regulatory and staffing guidelines. A feasibility study is complete and RHT funds will support operationalization of the program. In Phase 1 we will develop a detailed implementation workplan with steps to formalize partnerships with school districts, referral sources, and community partners to assist rural families with housing and transportation needs. We will increase our staffing capacity to ensure continuity of care and effective transitions after discharge. Our telehealth expansion project will further support delivery of specialized pediatric services to rural youth within their home communities to ensure stability and successful transitions. In Phase 2 we will launch PHP services and begin referral coordination, working with partners to refer and enroll a limited number of youth. We are licensed to provide services to children aged 5-18; however, services will initially be offered only to youth aged 12-18. In Phase 3 we will scale up the program (by number of youth served and/or age of youth served), monitoring youth outcomes and program operations to ensure goals for the program and rural Alaskans are met. Our PHP will provide a structured, therapeutic environment for children and youth centered around a standardized daily schedule and designed with staffing ratios to support clinical intensity and safety. Each youth and their treatment team will participate in developing individualized Treatment Plans that include diagnosis, treatment team members, measurable goals, timelines, and discharge plans. All youth will receive a Behavioral Health Assessment from a qualified clinician with psychiatric or psychological assessment as indicated. Treatment services will include intensive individual, group, and family therapy and medication management services. The program includes an integrated educational component so youth may stay academically engaged during treatment. We already contract with Fairbanks North Star Borough School District for the Midnight Sun Academy, which lives within our residential treatment program and will also serve the PHP. Clinical and educational staff will collaborate to support individual learning needs and inform reintegration planning with a youth’s home school district. For families from rural communities, FCSA will work with our referral sources and community partners to coordinate transportation and lodging.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Family Centered Services of Alaska, Inc.	Leveraging Technology to Increase Access to Behavioral Health Services for Rural Youth	AK	There is a lack of specialized pediatric behavioral health services in Alaska’s rural communities. Often youth reach a point of crisis or hospitalization that could have been avoided. Added to challenges recruiting qualified clinicians, clinician capacity is also limited by administrative burden and documentation requirements; our clinicians currently spend over 20% of their time completing required documentation. This project presents a transformational opportunity to modernize the technological backbone of Family Centered Services of Alaska (FCSA) in a way that will directly expand access to behavioral health services for rural youth in Interior Alaska. By leveraging telehealth infrastructure and emerging AI-assisted clinical technology, we will significantly improve access to behavioral health services for our rural youth as well as the sustainability of our clinical workforce. These investments will support continuity of care for rural youth across the full continuum of behavioral health services. Services delivered within our residential treatment environment or other structured programs often result in strong therapeutic gains; however, maintaining those gains when reintegrating into home communities can be challenging when follow-up care is limited. This project will allow us to extend the reach of our clinical teams beyond our physical facilities to support behavioral health prevention, treatment, and stabilization services to rural youth throughout the region.	We will roll out the project in 4 phases: 1) infrastructure upgrades including workstation refresh and network capacity improvement; 2) deployment of AI clinical documentation tools and training; 3) telehealth expansion and community partnership development; and 4) monitoring and outcomes evaluation. In Phase 1 we will work with our IT department to ensure our systems have capacity to handle the increased technological load, completing any indicated upgrades to ensure seamless delivery of services and that telehealth delivery does not become tethered to a single location, truly enabling mobile healthcare and expanding the reach of services throughout Interior Alaska. In Phase 2 we will deploy AI clinical documentation software that will reduce the administrative burden for our clinical staff. This software will work like a “silent partner” that helps clinicians document sessions, assessments, treatment plans, screenings, and discharge summaries while ensuring necessary components such as risk assessment, treatment recommendations, goals, and interventions are addressed to meet all regulatory compliance standards. FCSA is currently in the process of evaluating AI clinical documentation platforms that are HIPAA compliant, specifically designed for behavioral health environments, able to integrate with our EHR platform, and proven to reduce documentation burden. The software is expected to significantly increase our clinicians’ capacity, and as administrative burden is reduced will set the stage for Phase 3, telehealth expansion and partnership development. In Phase 3 we will travel to communities to foster and strengthen partnerships necessary to support smooth implementation of expanded telehealth services, including with local schools to ensure connectivity and secure space are available for students to participate in telehealth visits without having to leave the building and miss school. We will also make any identified upgrades to our telehealth platform to ensure it has the proper capacity to handle the projected increase in demand. Once launched, while services will be delivered primarily via telehealth, quarterly trips to communities for face-to-face services will ensure stability of the clients being served, as well as stability of the community partnerships that support our telehealth program. Finally, we will undertake rigorous program evaluation (Phase 4). During this phase we will closely monitor program processes as well as client outcomes.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Family Outreach Center for Understanding Special-Needs, Inc.	FOCUS Electronic Health and Medical Records Software Project (FOCUS EHR/EMR Software Project)	AK	Alaska’s Part C Early Intervention program operates without a unified electronic health and medical record system (EHR/EMR), resulting in fragmented documentation, inconsistent data tracking, and administrative inefficiencies across rural providers. Many agencies rely on manual processes or disconnected systems that limit real-time care coordination, standardized outcome reporting, and accurate Medicaid billing. In a geographically vast state, this lack of centralized infrastructure delays services, increases staff burden, contributes to reimbursement challenges, and restricts statewide quality monitoring. This project presents an opportunity to modernize rural early childhood health infrastructure through a comprehensive, cloud-based care coordination and billing platform. A unified EHR will streamline documentation, strengthen Medicaid sustainability, support telehealth delivery, improve data transparency, and enhance equitable access to services for Alaska’s youngest children.	To address the lack of a unified system for Alaska’s Part C Early Intervention program, we propose implementing a comprehensive, cloud-based EHR/EMR platform supported by updated mobile technology for field-based providers. This project will include the purchase and deployment of a centralized EHR system with integrated IFSP documentation, care coordination, outcome tracking, and Medicaid and private insurance billing functionality. The EHR/EMR will standardize documentation across providers, centralize Individualized Family Service Plans (IFSPs), enable real-time service tracking, and improve interdisciplinary communication. Integrated billing tools will strengthen billing compliance, reduce claim denials, and stabilize revenue streams essential for rural program sustainability. Built-in reporting capabilities will allow for consistent data collection, quality monitoring, and equitable service tracking across communities. Implementation will include system configuration, data migration, staff training, and phased rollout to ensure minimal service disruption. Ongoing technical support and workflow refinement will promote long-term sustainability. By implementing an EHR/EMR, this approach strengthens rural health access, improves operational efficiency, enhances workforce capacity, and builds a sustainable foundation for high-quality early intervention services across Alaska.	Under \$50,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area	Deferred or Not Advanced
Family Outreach Center for Understanding Special-Needs, Inc.	FOCUS Technology Project	AK	Our current desktop computers, software systems, and mobile plans are outdated and inefficient. Providers are challenged to provide Part C services aligned with state and federal requirements, such as obtaining 'wet' parent signatures and timely documentation. This project provides an opportunity to modernize our technology to match the demands of the job, streamline the coordination of care for families, and reduce billing errors. Access to in-home hearing screening will lead to early detection and intervention of hearing loss and lead to better outcomes for children.	To ensure successful adoption, providers will be equipped with touchscreen laptops and mobile technology to support mobile documentation during home visits and telehealth sessions. These devices with e-signature software will allow real-time data entry in remote communities, reduce paperwork duplication, and increase time available for direct services. The technology upgrade will also support secure data transmission and compliance with IDEA Part C and state reporting requirements. Implementation will include staff training on the OAE hearing screener and streamline use of touch screen laptops. Ongoing technical support and workflow refinement will promote long-term sustainability.	Under \$50,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area	Deferred or Not Advanced

Family Outreach Center for Understanding Special-Needs, Inc.	FOCUS Workforce Development Project	AK	In Alaska, it is extremely difficult to recruit and retain highly qualified early interventionists including developmental specialists, occupational therapists, physical therapists, and speech-language pathologists. Our university systems have limited or no capacity to graduate professionals in these specialty areas, so we must recruit personnel from out-of-state and compete with private employers for these hard to fill positions. This project will invigorate and expand our recruitment and retention strategies, tools, and resources.	The project includes the following components to strengthen recruitment and retention of highly qualified early intervention providers: Develop on-going relationships with university systems located outside of Alaska as 'pipelines' for recruitment, which would include travel and participation in university sponsored career fairs and outreach activities; development of retention incentives, such as loan forgiveness options and scholarship opportunities; funding for advanced professional development opportunities aligned with the professional discipline, which would include reimbursement for travel expenses and fees, and targeted training to build provider capacity and reduce reliance on outsourced specialty services.	Under \$50,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area	Deferred or Not Advanced
Far North EMS Solutions	Alaska Rural Emergency Care Network	AK	Communities across rural and remote Alaska face persistent challenges accessing timely healthcare within a geographically dispersed healthcare delivery system. Patients often rely on emergency response systems and costly medevac transports when medical conditions worsen due to limited access to routine monitoring and follow-up care. Emergency responders—including EMTs and Emergency Trauma Technicians (ETTs)—are often among the most consistently available healthcare resources in rural communities. However, their role is typically limited to emergency response rather than ongoing patient monitoring or coordination with healthcare providers. There is an opportunity to strengthen Alaska’s rural healthcare system by expanding the integration of EMS responders into a coordinated network that supports early intervention and care coordination. By leveraging the existing EMS workforce and connecting responders with healthcare providers through telehealth-supported collaboration, communities can improve continuity of care while reducing avoidable emergency transports and medevac flights.	This project proposes the development of the Alaska Rural Emergency Care Network, a pilot initiative designed to strengthen healthcare access and coordination in rural communities through EMS integration, telehealth-supported collaboration, and workforce development. Community-Based Emergency Care Coordination Trained EMTs and ETTs will conduct scheduled outreach visits focused on monitoring and supporting individuals who may benefit from additional care coordination. These visits may include post-hospital discharge follow-up, monitoring of chronic conditions, medication adherence support, wellness checks, and connection to telehealth consultations with healthcare providers. Responders participating in the program will operate within their existing scope of practice and under protocols developed in collaboration with healthcare partners. Their role will focus on monitoring and connection to care rather than diagnosis or independent clinical treatment. Telehealth-Supported Collaboration When appropriate, responders will connect patients to healthcare providers through telehealth consultation during visits. This allows providers to assess patient conditions earlier and determine whether additional intervention or referral is necessary, helping prevent conditions from escalating to emergencies requiring transport. Workforce Development The project will provide additional training for EMTs and ETTs participating in the program to support care coordination, communication with healthcare providers, and patient monitoring. The program will begin as a pilot in select hub communities and will	\$250K-\$1M		Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway	Advance to Implementation Application

Far North Urgent Care	North Pole Far North Urgent Care	AK	Residents of North Pole, Alaska and nearby communities currently have no local urgent care facility to address immediate, non-life-threatening medical needs. As a result, individuals experiencing minor injuries, acute illnesses, or other urgent medical concerns must travel to Fairbanks to seek care through primary care clinics with limited same-day availability or hospital emergency departments. This creates significant barriers for patients, including travel time, transportation challenges, longer wait times, and higher healthcare costs. These barriers can lead to delays in treatment, increased use of emergency departments for conditions that could be treated in a lower acuity setting, and limited access to timely care for families living in this growing community. The absence of local urgent care services also places additional strain on regional healthcare facilities that already serve a broad rural and frontier population across Interior Alaska. This project presents an opportunity to establish North Pole Urgent Care, a dedicated urgent care clinic that will provide timely treatment for common acute medical conditions and minor injuries within the community. By creating a local access point for urgent medical care, the project will improve healthcare access, reduce unnecessary emergency department utilization, and strengthen the healthcare infrastructure serving North Pole and surrounding rural areas.	To address the lack of immediate healthcare services in the North Pole community, this project will establish North Pole Urgent Care, a new urgent care clinic designed to provide timely treatment for non-life threatening medical conditions and minor injuries. The clinic will serve residents of North Pole and nearby rural communities who currently must travel to Fairbanks for urgent medical care. North Pole Urgent Care will provide walk in access to care for a range of common urgent medical needs, including acute illnesses, minor injuries, infections, simple fractures, lacerations, and other conditions that require prompt medical attention but do not require emergency department services. The clinic will also offer basic diagnostic capabilities such as point of care laboratory testing and imaging to support accurate and timely diagnosis and treatment. The facility will be staffed by qualified medical providers and clinical support personnel trained to deliver efficient, high quality urgent care services. Extended hours and walk-in availability will help ensure that patients can receive care when they need it, reducing delays in treatment and minimizing the need for unnecessary emergency department visits. By locating urgent care services directly within the North Pole community, this project will improve access to timely medical care, reduce travel barriers for patients, and strengthen the local healthcare system. The clinic will also coordinate with regional healthcare providers and hospitals to ensure appropriate referral and continuity of care when higher levels of treatment are required.	\$1M-\$5M	Clinic	Statewide	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

FasPsych, LLC	FasPsych Telehealth and Utilization Initiative	AZ	Rural communities continue to experience a persistent and worsening shortage of psychiatric and behavioral health providers, resulting in delayed care, preventable crises, and excessive reliance on emergency departments. Rural healthcare facilities lack reliable access to psychiatric evaluations, medication management, and crisis intervention services. As a result, patients frequently experience long wait times to see a mental health professional, fragmented care pathways, and increased risk of hospitalization or emergency department utilization for conditions that could be managed earlier and more effectively. FasPsych’s mission is to expand sustainable access to high-quality psychiatric and behavioral health services in underserved rural communities through innovative telehealth staffing models. The purpose of this pilot program is to alleviate provider shortages, reduce system inefficiencies, and enable rural healthcare facilities to deliver timely, coordinated mental health care without incurring unsustainable staffing costs.	The project will implement a centralized telepsychiatry staffing model supported by fee-for-service workflows, enabling efficient provider utilization across multiple rural facilities. Strategies include targeted facility onboarding, rapid provider deployment, and continuous performance monitoring.	\$250K-\$1M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Ketchikan Gateway Borough	Deferred or Not Advanced

Fathoms Alaska	Canoe Camp	AK	According to the 2020 Alaska Native Injury Atlas, suicide attempt and suicide were the second leading causes of hospitalization and death respectively for Alaska Native and Indigenous populations in Southeast Alaska. This trend is consistent with patterns for Indigenous youth statewide. Across Alaska, the leading cause of hospitalization and/or death for Native youth ages 10-19 was suicide, at a rate approximately five times higher than that of their non-Native peers (Alaska Native Injury Atlas). Over half of these were confirmed or suspected to be alcohol-related. Our program will aim to support students struggling with mental illness and/or substance abuse. Canoe Camp’s goals are to directly improve the physical, psychological, and social wellbeing of youth and young adults in Southeast Alaska while also creating multiple protective factors, increasing access and relationship to local environments and cultural traditions. A growing body of work has shown youths’ exposure to nature improved mental health, cognitive function, heart health, and sleep. Recent research after the Covid-19 pandemic showed outdoor activities improve adolescents’ mental health and wellbeing by increasing their resilience to stressors. Canoe Camp consistently provides the opportunity for participants to immerse in the magnificent nature of their local ecosystems, and to improve their physical fitness, increase their self-awareness, and develop self-confidence by overcoming challenges.	Canoe Camp’s approach to increasing access to long term health-supporting experiences, protective factors, physiological wellbeing and community resiliency is to provide free, locally available programming that encourages physical activity, connection to place, and supportive peer and mentorship relationships. During Canoe Camp, participants spend multiple days on the water learning how to paddle, exploring coastal ecosystems, and practicing skills that require communication, trust, and shared responsibility. Canoeing is a collaborative activity, requiring effective communication, active listening, and teamwork. Participants will develop leadership and followership skills, fostering confidence, self-awareness, and self-actualization. While immersed in this natural-classroom, guides integrate age appropriate curriculum that includes; social and emotional learning opportunities, education around healthy habits and lifestyles, nervous system regulating and resiliency skills, and lessons that help to support and encourage self-awareness and confidence in their identity and belonging to people and place. These experiences support multiple dimensions of health. Regular physical movement and time outdoors promote physical wellbeing and resilience. Team-based canoe travel strengthens social skills and reduces isolation by building supportive peer networks. Structured play, teamwork, and mentorship create a safe environment that helps regulate stress and strengthen emotional wellbeing. In communities where access to mental health services can be limited, these experiences function as preventative care that builds protective factors for youth. Fathoms’ founders bring a combined 24 seasons of experience working with Alaskan youth in wilderness environments and have seen firsthand how connection to the natural world can support healing. Our team’s experience with at-risk youth, as well as in therapeutic and educational fields, allows us to provide a safe, supportive environment for emotional and mental expression. In the next five years, Fathoms will strengthen the sustainability of Canoe Camp by inviting Yakutat community members to participate in and facilitate the program. A locally guided model will increase community capacity to support youth wellbeing while ensuring the program can continue long-term.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area; Prince of Wales-Hyder Census Area; Yakutat (City and Borough)	Deferred or Not Advanced

Finity	Whole Person Health Smart Solution for Alaska RHT: Innovative Technologies + Trained CHWs	OR	Rural Alaska faces extreme geographic isolation, workforce shortages, transportation barriers, seasonal access disruption, and high rates of maternal risk, behavioral health need, diabetes, and cardiovascular disease. Fragmented care, coverage instability, and preventable disenrollment further disrupt continuity. These challenges create a clear opportunity for Finity’s Whole Person Health (WPH) Smart Solution to unify engagement, coverage stabilization, and chronic condition support into one coordinated framework. Our model addresses rural fragmentation by: • Delivering structured Whole Person Health engagement • Stabilizing coverage and preventing avoidable disenrollment • Activating primary care and preventive screenings • Providing targeted Smart Chronic Condition Support • Producing measurable engagement, utilization, and outcome reporting In frontier environments where clinical resources are limited, a disciplined engagement infrastructure becomes the backbone of access and continuity. By combining technology-enabled outreach and programs with specialty trained CHW-delivered support, Finity strengthens Healthy Beginnings, Health Care Access, Healthy Communities, Workforce, Fiscal Sustainability, and Technology Innovation—turning rural constraints into a scalable, coordinated system of whole-person support.	Finity will deploy a structured Whole Person Health (WPH) Smart Solution integrating technology, engagement, benefit stabilization, smart condition support, and community partnerships to address Alaska’s rural health challenges. Key components include: 1. Engagement & Whole Person Health Navigation Engagement begins with coordinated, partner-branded outreach: • Targeted outbound calls and SMS reminders • Claims-driven identification of high-risk individuals • Outreach to individuals at risk for disenrollment • Proactive contact with recently disenrolled individuals Each engaged member completes a CHW-led WPH Assessment session including: • Comprehensive WPH Assessment and Profile • HEDIS-aligned SDOH screening • Depression screening when indicated • Primary care utilization review and scheduling support • Identification of unmet medical or behavioral needs • Education on benefits continuity This structure stabilizes coverage, strengthens primary care activation, and improves preventive compliance. 2. Finity Smart Programs Following WPH Assessment, clinically appropriate individuals enroll in: a. BabySmart – Maternal & Infant Health Provides prenatal and postpartum support delivered by doula-trained IHS b. DiabetesSmart – Diabetes Management Delivers DSMES-aligned education, medication adherence reinforcement, and glucose routine guidance c. LoseSmart – Prediabetes & Early Intervention An NDPP-aligned lifestyle program focused on reducing diabetes risk through structured nutrition, movement, sleep, and stress routines d. HeartSmart – Hypertension & Cardiovascular Health An AHA-aligned program supporting blood pressure monitoring, medication adherence, and heart-healthy routines e. MindSmart – Behavioral Health Provides emotional support, light CBT- and mindfulness-based routines, stress-management, and check-ins that reinforce stability Each Smart Program includes: • Structured IHS visits based on need • HEDIS-aligned screening • CBT-informed goal tracking • Primary care follow-up • Personalized LifeTracks • SDOH coordination • Education modules • Optional device/DME integration • Incentive-based engagement • Matched cohort outcome reporting	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

3. Technology Infrastructure
Finity’s SmartSaaS platform includes mobile apps for engagement and tracking, CHW workflow portals, analytic dashboards, device integration, and secure communication tools.

Fireweed Montessori	Facility Floor repairs and replacement of indoor and outdoor materials	AK	The childcare facility serving our rural community is experiencing deterioration of critical building surfaces and materials due to years of heavy daily use. Existing flooring has become worn and damaged, creating potential tripping hazards and making proper sanitation more difficult. Interior walls require repair and repainting due to scuffs, damage, and general wear that can impact cleanliness and the overall learning environment. In addition, several indoor and outdoor materials used by children for learning and play have become worn and need replacement to ensure they remain safe and developmentally appropriate. Because childcare resources in rural and remote communities are limited, maintaining safe, high-quality facilities is essential to ensuring families continue to have reliable care options. Without these repairs and replacements, the facility risks declining safety conditions, increased maintenance costs, and reduced quality of the environment for children. This project will address these issues by replacing damaged flooring, repairing and repainting interior walls, and updating indoor and outdoor materials. These improvements will create a safer, healthier, and more sustainable environment for children and families while helping ensure the continued availability of essential childcare services in the community.	Assessment and Planning We begin with a comprehensive inspection of all indoor and outdoor flooring areas to assess current conditions, identify safety hazards, and determine the extent of damage or wear. This includes evaluating subfloor integrity, drainage, surface coating, and material compatibility. Based on the findings, we develop a detailed plan outlining scope, priorities, timelines, and cost estimates. 2. Material Selection Flooring materials will be selected to meet the facility’s functional, safety, and aesthetic requirements. Indoor areas: Durable, low-maintenance materials such as epoxy, vinyl composition tile (VCT), ceramic tile, or polished concrete depending on usage. Outdoor areas: Weather-resistant, non-slip surfaces like sealed concrete, pavers, or asphalt with proper grading and drainage considerations. All materials will adhere to relevant industry standards and environmental/sustainability goals when applicable. 3. Phased Execution To minimize disruption to operations: Work will be scheduled in phases, prioritizing high-traffic or safety-critical zones first. Clear signage, temporary barriers, and alternate routes will ensure continued access and safety. Demolition, surface preparation, installation, and curing will be carefully sequenced for efficiency and quality. 4. Quality Control and Safety Each phase includes inspection checkpoints to verify surface leveling, adhesion, finish quality, and compliance with specifications. Our team follows strict safety protocols, including PPE use, dust control, and hazard signage, ensuring both worker and occupant safety throughout the process. 5. Final Inspection and Handover Upon completion, a joint inspection will confirm workmanship quality and performance. As-built documentation, material warranties, and maintenance recommendations will be provided to ensure long-term durability and ease of care.	Under \$50,000	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

First Choice OB/GYN	The Fourth Trimester	AK	The postpartum period, often called the "fourth trimester," is a critical yet historically neglected phase of maternal care in Alaska. Traditional care models rely heavily on a single six-week follow-up, leaving significant gaps in addressing postpartum depression, anxiety, and nutritional recovery. In the Mat-Su Valley and Anchorage, many new mothers face barriers to accessing specialized support during this vulnerable window, leading to poor long-term outcomes for both mother and child.	"The Fourth Trimester" redesigns the standard of care by making mental health and nutritional assessments mandatory components of the postpartum journey. Initiated by First Choice OB/GYN, the program adds structured virtual touchpoints between birth and the traditional 6-week visit. • Integrated Staffing: We will hire a Physician Assistant (PA), a Licensed Mental Health Therapist, a Registered Dietitian and administrative supportive staff as needed to facilitate various roles to form a dedicated postpartum care team. This team is expected to grow as the platform grows. • Virtual First Model: Utilizing our existing AthenaOne Electronic Medical Record (EMR) infrastructure, appointments will be conducted via telemedicine to eliminate travel barriers for new mothers. • Mandatory Touchpoints: To bridge the critical gap in early postpartum care, our program implements a high-touch telemedicine protocol ensuring all patients are scheduled and receive a clinical screening within the first seven days of delivery. This rapid-response intervention is designed to preemptively identify and manage perinatal mood and anxiety disorders (PMADs). Simultaneously, we address nutritional equity by delivering counseling specifically adapted for the Alaskan landscape. Our curriculum will navigate the complexities of food insecurity in remote regions by integrating traditional subsistence patterns—accounting for hunted, gathered, and home-grown foods, provide culturally resonant, evidence-based education resulting in nutritionally dense support for breastfeeding mothers, therefore benefiting both mom and baby.	\$250K-\$1M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Denali Borough; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area	Deferred or Not Advanced

Flagstar Staffing	Flagstar Staffing Letter of Interest	NY	Rural and frontier communities across Alaska face significant barriers to accessing consistent behavioral health support. Geographic isolation, workforce shortages, and limited availability of behavioral health professionals often leave communities without the outreach, care coordination, and early intervention services needed to support individuals experiencing mental health and substance use challenges. These gaps can lead to delayed treatment, increased crisis situations, and strain the already limited healthcare resources. Community Health Workers (CHWs) present a strong opportunity to help address this challenge. As trusted members of the communities they serve, CHWs are uniquely positioned to provide outreach, education, care navigation, and ongoing support for individuals who may otherwise have difficulty accessing behavioral health services. However, many rural programs struggle to recruit, retain, and deploy qualified CHWs due to limited local workforce pools and administrative capacity. This project will strengthen the behavioral health support network in rural Alaska by expanding the recruitment, retention, and deployment of CHWs who can provide culturally responsive, community-based support. By building a sustainable pipeline of CHWs and deploying them to rural and frontier communities, the project will help improve access to behavioral health resources, strengthen early intervention efforts, and support more stable community-based care systems.	Flagstar Staffing’s proposed approach focuses on strengthening Alaska’s rural behavioral health workforce by recruiting, retaining, and strategically deploying Community Health Workers (CHWs) while advancing the Triple Aim: improving population health, enhancing the patient experience, and reducing the per-capita cost of care. CHWs serve as trusted community-based professionals who can extend the reach of limited behavioral health providers in rural and frontier communities. To improve population health, Flagstar will build a targeted recruitment pipeline for CHWs with experience in behavioral health outreach, care navigation, and community education. Recruitment efforts will prioritize individuals with strong ties to rural and tribal communities, cultural competency, and the ability to engage individuals who may be hesitant to seek traditional behavioral health treatment. By expanding the availability of CHWs in rural areas, communities will gain greater access to early intervention, prevention programs, and behavioral health education that help reduce crisis events and improve long-term health outcomes. To enhance the patient and community experience, Flagstar will support CHWs through structured onboarding, ongoing engagement, and coordination with local behavioral health programs, tribal health organizations, and rural healthcare providers. CHWs will serve as consistent points of contact who help residents navigate behavioral health services, connect to social resources, and maintain engagement with treatment and recovery programs. This community-centered model improves trust, increases participation in behavioral health services, and ensures that care remains culturally responsive and accessible. To support cost-effective and sustainable care, the project will deploy CHWs to help reduce unnecessary emergency department visits, hospitalizations, and gaps in care by strengthening outreach, prevention, and care coordination efforts. By addressing behavioral health needs earlier and supporting individuals before crises occur, CHWs help healthcare systems operate more efficiently while improving outcomes for rural populations. Through targeted recruitment, workforce support, and coordinated deployment of CHWs, Flagstar’s approach strengthens the behavioral health workforce in rural Alaska while advancing the Triple Aim—improving health outcomes, enhancing community trust and patient experience, and supporting more sustainable healthcare delivery systems.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Fond of You Inc d/b/a Somethings	Virtual Low-Bandwidth Certified Peer Support for Youth and Young Adults in Rural Alaska	NY	Alaska’s youth are experiencing a severe and growing mental health crisis. Recent data show that 43% of Alaska high school students report persistent sadness or hopelessness, among the highest rates nationally, while two-thirds of teens with major depression receive no treatment. Youth suicide remains a critical concern, particularly in rural communities where limited access to behavioral health services leaves many young people without support. Geographic isolation, workforce shortages, and stigma continue to prevent youth from receiving early care. As a result, many reach crisis levels of care; in Alaska, suicidal ideation accounts for roughly 1 in 4 child and adolescent behavioral health emergency department discharge diagnoses. Mental health challenges also affect education. Nearly 45% of Alaska students are chronically absent, with depression, anxiety, and substance use among the leading contributors. Without early support, youth are more likely to miss school and fall behind academically. Many ultimately enter high-cost crisis systems, including emergency departments and out-of-state residential treatment, where approximately 130 Alaska youth are placed each month, more than 1,500 placements annually, leaving their school and community. This project addresses the opportunity to intervene earlier by connecting youth to timely mental health support before concerns escalate into crisis, helping youth stay connected to school and engaged in their communities.	Our approach expands access to mental health support by providing virtual peer mentoring for youth ages 13–26. Through our HIPAA-compliant app, young people can connect with certified peer mentors who share similar lived experiences and understand the realities of growing up in rural and remote communities. Youth are matched with mentors who are just a few years older and have relevant lived experience navigating mental health challenges. To strengthen trust and cultural understanding, mentors are recruited from Alaska communities across the state. Youth are matched with mentors from a different but similar community so they can connect with someone who understands their experiences while still maintaining privacy in small communities where confidentiality can be difficult. All mentors complete structured certification and training in youth mental health, crisis recognition, and trauma-informed support. Mentors are supervised by Alaska-licensed providers who oversee safety protocols, review cases, and support escalation when higher levels of care are needed. This clinical oversight ensures youth receive safe, high-quality support while allowing mentors to build authentic, supportive relationships. The program is designed specifically for Alaska’s geographic realities, functioning in low-bandwidth environments and can be accessed on basic smartphones, allowing youth in rural and remote areas to connect even with limited internet connectivity. All services are delivered through secure in-app chat or video, eliminating the need for travel and allowing youth to access support privately from their homes or communities. Mentors provide prevention and early intervention support, helping youth talk through stress, anxiety, or depression before challenges escalate. They support youth experiencing acute stress or emotional distress by helping them process what they are experiencing, develop immediate coping strategies, and provide ongoing support. When additional support is needed, mentors follow protocols and work with supervising licensed clinicians to escalate care or connect youth to appropriate resources. This approach prioritizes helping youth remain safely connected to care within their own communities whenever possible. By offering after-hours, confidential, and culturally responsive support, this approach creates a new model that strengthens Alaska’s behavioral health system while ensuring young people can receive help when and where they need it.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Food Bank of Alaska	Food Is Medicine - Increasing Produce Prescription Opportunity Across Alaska	AK	Across Alaska, hunger and nutrition insecurity are driving preventable health challenges and straining rural healthcare systems. Statewide, 1 in 7 Alaskans experience hunger, and rates are even higher in remote communities where food costs, transportation barriers, and limited retail options make accessing healthy foods extremely difficult. The most food insecure areas - Kusilvak, Bethel, Yukon Koyukuk, Nome, Northwest Arctic, and Prince of Wales Hyder - are all off the road system, demonstrating that the burden of food insecurity is concentrated in places where day to day life is already costly and complex.(Feeding America, 2023) Lack of access to nutritious foods contributes directly to higher rates of chronic disease, including diabetes, hypertension, and heart disease, and leads to increased emergency care utilization. Many healthcare providers in rural Alaska serve patients whose diet related conditions are worsened by limited availability of affordable, fresh produce, an essential component of chronic disease prevention and management. This project addresses the opportunity to integrate nutrition access into clinical care. By enabling healthcare providers to connect patients with reliable, low or no cost sources of fresh produce, we can intervene earlier, reduce the impact of preventable conditions, and support healthier outcomes in communities.	This project will build on 47-years of community-based work, leveraging a strong foundation of statewide coordination, strategic planning, and program piloting to expand prescription produce access across rural and remote Alaska. In 2025, we entered a 10-year partnership with the Alaska Department of Health to serve as the Resource and Coordinating Agency for Produce Incentive and Food Is Medicine Programs. This role positions us to strengthen collaboration among healthcare providers, community partners, and food access organizations to address nutrition insecurity as a key driver of health. However, RHTP funding is needed to accelerate impact, better integrate with the healthcare sector, and expand our scope. Specifically, we will: (1) Leverage existing infrastructure by integrating fresh produce into the Commodity Supplemental Food Program (CSFP), which currently serves approximately 2,500 nutrition-insecure seniors statewide. Adding produce to this monthly food distribution will immediately increase access among a high risk population. (2) Collaborate with healthcare experts to co-create standardized food insecurity and nutrition risk screening criteria usable across the continuum of care - from emergency departments and primary care to long term care settings - ensuring efficient identification of patients who would most benefit from produce prescriptions. (3) Identify priority populations for future project scaling, using statewide data, community insights, and healthcare partner referrals to ensure produce prescription programs reach those at greatest risk of diet related disease. (4) Implement the statewide Food Is Medicine strategic plan by launching produce prescription programs in additional rural communities and supporting local partners with training, logistics, and evaluation tools.	\$50,000-\$250,000	Statewide	Anchorage (Municipality); Bethel Census Area; Kenai Peninsula Borough; Matanuska-Susitna Borough; Yukon-Koyukuk Census Area	Advance to Implementation Application

Forget Me Not Grief Center of Alaska	Grief Center Alaska Outreach	AK	Rural and frontier communities in Alaska face gaps in grief support for children, teens, and adults. Losses from suicide, sudden death, substance-related causes, accidents, or chronic illness are common, yet few communities have structured programs. Geographic isolation, provider shortages, transportation barriers, and stigma limit access. This project provides peer-to-peer grief support that is culturally sensitive and responsive to Alaska’s diverse communities. Programs create safe spaces for participants to share experiences, normalize grief, strengthen coping skills, and build protective factors. Children and teens receive support that can reduce behavioral and academic challenges, while adults gain tools to navigate loss and support family stability. By expanding accessible, community-based, and culturally responsive grief support, this project addresses a critical service gap and strengthens behavioral health resilience across rural Alaska.	FMNGCA will implement a structured, peer-to-peer grief support program for children, teens, and adults, delivered in rural schools, community settings, and via hybrid formats when appropriate. Programming will be culturally responsive, honoring Alaska’s diverse communities, traditions, and values. Our approach includes: Program development and oversight – trained staff will design age-appropriate, trauma-informed curricula, supervise volunteers, and ensure consistent delivery. Peer support groups – facilitated sessions where participants share experiences, normalize grief, and develop coping skills in a safe, supportive environment. Outreach and community engagement – targeted marketing and education to connect families with services, build local partnerships, and increase grief literacy among caregivers, educators, and providers. Evaluation and quality improvement – collect participant feedback, monitor program fidelity, and refine approaches to meet community needs. By embedding grief support within trusted community institutions and building local capacity, this approach increases access, strengthens quality, and enhances sustainability of behavioral health services for Alaska’s rural, remote, and frontier communities.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough	Deferred or Not Advanced

Forgetmenot USA	AIR Care will offer Aging Inhome Resources by linking seniors to technology.	AK	One of the biggest barriers in our society is presented by technology. The goal of AIR Care is to train our elderly population in technology and various devices so they can access the resources they need.	Project Title: The Silver Link Initiative (AIR Care) The Project Concept The Silver Link Initiative moves beyond simple technical support to create a sustainable "human-centered ecosystem." Our approach utilizes an intergenerational mentorship model, pairing local youth with seniors for one-on-one coaching. Unlike standardized programs, this initiative is specifically engineered for the Alaskan context by prioritizing "offline-first" functionality for low-bandwidth regions, ruggedized hardware for harsh environments, and specialized training for critical state resources like the PFD and heating assistance portals. Societal Impact This initiative is designed to create a "Triple Win" for Alaskan society: Economic Efficiency: Empowering seniors to independently manage telehealth and resource applications reduces the strain on high-cost emergency services and rural transport. Health & Dignity: Digital literacy provides a proven defense against isolation, connecting elders to family and healthcare, thereby reducing rates of depression and cognitive decline. Community Safety: By educating our seniors on scam detection, we protect the financial security of Alaskan households and keep local resources within our economy.	\$50,000-\$250,000	Statewide	Bethel Census Area; Chugach Census Area; Denali Borough; Dillingham Census Area; Juneau (City and Borough); Kodiak Island Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced
Forgetmenot USA	Data Link - hub for anyone (serves anyone who needs to connect to resources)	AK	The inability to connect directly to healthcare or other services.	Provide a connection to services through an online application designed for Alaskans. The online application would include healthcare facilities and resources geotargeted to serve the individual better. Potential clients or patients would be connected to resources and services based on location services, urgency, and proximity. Artificial Intelligence would be utilized.	\$50,000-\$250,000	Statewide	Copper River Census Area; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Foundation for End of Life Care, Inc.	Enhancing Hospice, Home Care Support and Utilization in Southeast Alaska	AK	After termination of support for Hospice & Home Health Care (HHC) in Juneau in 2022 by a non-profit provider, the City & Borough of Juneau (CBJ) restored these services under the auspices of the city-owned Bartlett Regional Hospital (BRH) a year later. Since then, BRH has been actively working to expand the supporting infrastructure. A collaborative effort led by the CBJ, BRH, The Juneau Community Foundation, and the Foundation for End of Life Care, Inc. coalesced to support start-up costs of Home Health & Hospice through the first five years (now in Y3). A major goal is sustainability for Juneau and outlying communities. Our region has the highest population over age 60 in the state, yet hospice care remains underutilized in Juneau (~60 patients a year) and it is often unavailable outside Juneau. Currently in its third year, rising costs, high turnover of hospice staff, and low patient utilization challenge HHC sustainability. More effective education aimed at physicians, patients and families on the value of HHC and a better understanding of the benefits of early referrals to HHC during the end-of-life process will have a positive impact on the program's revenue streams and long-term sustainability. The resulting program stability will allow BRH to more effectively partner with the Southeast Alaska Regional Health Consortium and volunteer organizations to extend and expand HHC services to outlying communities in southeastern Alaska.	The Foundation for End of Life Care (FELC) is committed to launching a comprehensive, multi-channel campaign aimed at raising awareness about hospice and home health care services. This campaign will leverage community events and educational initiatives, paired with ongoing education and training opportunities for healthcare staff and providers. The objective is to ensure information about critical hospice services reaches a broad audience while simultaneously strengthening the skills and knowledge of those delivering care. Development of Training Materials: As part of this initiative, FELC will develop specialized training materials for onboarding hospice providers, staff, and healthcare workers not only in Juneau but also in surrounding communities. These resources are designed to equip caregivers with the necessary knowledge, skills, and emotional resilience required to effectively support individuals and families through the hospice experience. Awareness Resources for Caregivers and Professionals The campaign will also feature a variety of customized, culturally informed resources such as educational videos, handouts, and podcasts or radio scripts. These materials will be tailored to increase awareness of available resources among family caregivers, volunteers, hospice administrators, physicians, nurses, social workers, and chaplains. By addressing the unique needs of each group, these resources will help ensure that everyone involved in hospice care is informed and supported. Regional Training Opportunities: All of these educational materials will be integrated into a robust training program specifically designed for rural medical responders. FELC will facilitate these programs, making them accessible to healthcare professionals and volunteers across the region. This approach will foster a community of well-trained individuals, ready to provide compassionate and competent care to those in need. Experience in Public Awareness and Professional Training FELC has a proven track record of successfully hosting public awareness events that are paired with training opportunities for healthcare professionals. These events have consistently focused on maintaining sustainable hospice programs and education, as well as bereavement counseling and training.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Foundations Physical Therapy LLC	Women’s Health Access Project; Strong Roots - Alaska Women’s Health Initiative	AK	Pelvic floor dysfunction, including bladder leakage, pelvic pain, low back pain, and core instability, affects many women during pregnancy and the postpartum period. Despite how common these conditions are, many women receive little education about pelvic health and have limited access to early screening or guidance on when to seek care. As a result, symptoms often go unaddressed for months or years, leading to preventable complications and reduced quality of life. In Juneau and many Alaska communities, access to pelvic health education and specialized providers is limited. Many women report they were never informed about pelvic floor changes during pregnancy, postpartum recovery, or the connection between pelvic health, bladder function, and core stability. This lack of early education frequently leads to delayed care and worsening symptoms. This project addresses this gap through two connected efforts: Strong Roots, a prenatal and postpartum pelvic health screening and movement program, and a broader Women’s Health Initiative that delivers monthly workshops, virtual learning opportunities and resource connections. Together, these programs increase awareness, support early symptom identification, and expand access to preventative women’s health education. By piloting this model in Juneau, the project will create a framework that can be adapted for other Alaska communities, improving access to women’s health education and preventative care in rural and frontier settings.	The long-term vision of this project is to establish the Alaska Women’s Health Initiative, a community-based effort designed to expand access to women’s health education, early screening, and coordinated care across Alaska. While the initial focus is pelvic health during pregnancy and postpartum recovery, the initiative will address women’s health needs across the lifespan, including reproductive health, contraception education, menopause, and healthy aging. The initiative will begin with a pilot program in Juneau through the Strong Roots Prenatal & Postpartum Pelvic Health Program. Strong Roots is a structured small-group wellness program providing early education, preventative support, and guided movement for women during pregnancy and postpartum recovery. During the first year, the project will develop and implement a pelvic health and pregnancy screening tool that can be integrated into primary care settings to help identify early signs of pelvic floor dysfunction and connect women with appropriate care when needed. Participants will receive small-group movement classes focused on core strength, pelvic floor function, birth preparation, and postpartum recovery, along with education on pelvic health, labor preparation, and postpartum healing. The program will also support early identification of symptoms with referral to appropriate medical care when needed and provide opportunities to build peer support during pregnancy and postpartum recovery. Grant funding will support key start-up infrastructure, including rehabilitative ultrasound equipment and pessary fitting supplies, expanding the ability to provide pelvic health screening, education, and conservative management of pelvic floor conditions. Additional support will fund part-time program coordination, technology for virtual workshop delivery, and operational costs necessary to launch and sustain the program. In the first year, the program aims to serve 40–60 women through Strong Roots and deliver 8–10 educational workshops. As the program develops, education will expand to additional Southeast Alaska communities through virtual workshops and partnerships with regional organizations such as SEARHC, allowing women in rural communities to access trusted health information without traveling long distances. Over time, the project will grow into The Alaska Women’s Health Initiative, a statewide education and collaboration network connecting healthcare providers, educators, and community organizations.	\$50,000-\$250,000	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Kodiak Island Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Four Valleys Community School Inc	FVCS Rural Preventive Wellness Infrastructure Initiative	AK	Residents of Girdwood, Indian, Bird, and Portage face significant barriers to accessing preventive health and wellness services due to geographic isolation, limited local infrastructure, and seasonal travel challenges. Although within the Municipality of Anchorage, these communities function as rural areas where accessing recreation, health education, and structured physical activity often requires 30–60 minutes of travel, which is frequently disrupted by winter conditions. The valley lacks a dedicated community recreation or wellness center, leaving residents to rely on costly private memberships, personal equipment, or travel outside the community. These barriers disproportionately affect families with limited income, older adults, and individuals at elevated risk for chronic disease. Limited year-round access to indoor recreation and preventive education contributes to reduced physical activity, social isolation, and lower exposure to practical nutrition and stress-management strategies, key drivers of obesity, cardiovascular disease, diabetes, and behavioral health challenges. This project addresses these gaps by expanding local preventive wellness infrastructure and creating reliable, affordable opportunities for residents to engage in health-promoting behaviors close to home, strengthening rural prevention capacity, and reducing long-term health system burden.	Four Valleys Community School has operated out of Girdwood School for over 45 years, serving the communities of Girdwood, Indian, Bird, and Portage. We maintain a Memorandum of Understanding with the Anchorage School District and currently hold a building-use permit to operate programs beyond normal school hours (2:00–8:00 p.m., Monday–Friday). FVCS currently offers a variety of recreational and educational programs, including adult basketball and pickleball, youth football, and open gym times. In addition to recreational opportunities, we utilize school classrooms for cooking classes, yoga sessions, guest speakers, and community education events. At present, FVCS maintains office staff Monday through Thursday. While we occasionally offer Friday programming, we do not have sufficient staffing capacity to do so consistently. To address this limitation, FVCS proposes hiring an additional part-time staff member to expand regular programming to include Fridays and potentially Saturday mornings. These expanded hours would become part of our standard operating schedule, providing predictable and reliable access for the community. An additional component of this project is expanding the breadth and quality of our wellness programming. FVCS currently relies primarily on volunteers, limiting consistent delivery of specialized preventive programming. While this model fosters strong local engagement, it limits our ability to offer specialized wellness programming consistently. Project funding would allow FVCS to: 1. Recruit credentialed fitness and preventive health instructors 2. Offer competitive stipends and mileage reimbursement to recruit instructors from Anchorage 3. Partner with local nonprofit organizations such as Turnagain Arm Health Center to provide expert-led classes in nutrition, stress management, and preventative health 4. Purchase essential recreation and fitness equipment Equipment purchases would include: Yoga props (bolsters, foam rollers, blocks) Light hand weights for fitness classes Basketballs, youth volleyballs, soccer balls, and other recreation equipment By strengthening staffing capacity, expanding instructor expertise, and improving access to equipment, FVCS will create sustainable, year-round wellness programming that is affordable, geographically accessible, and responsive to community needs.	Under \$50,000		Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Four Valleys Community School Inc	Turnagain Arm Youth Active Lifestyles Initiative	AK	Four Valleys Community School (FVCS) has provided weekly summer camps for more than 30 years, serving youth from Girdwood, Indian, Bird, and Portage. As the only organization offering full-summer programming in the valley, FVCS engages about 75 youth annually in environmental education, hiking, biking, and field sports, providing structured physical activity in a community with limited recreation infrastructure. During the school year, programs such as running club, Nordic ski club, indoor soccer, volleyball, and basketball rely largely on volunteers. Community feedback consistently identifies the need for expanded, year-round youth physical activity led by trained instructors. Geographic isolation limits access to youth recreation. Travel to Anchorage requires 30–60 minutes each way, with winter conditions often restricting safe participation and disproportionately affecting families with limited time or financial resources. Limited access to consistent physical activity contributes to sedentary behavior and missed opportunities to build healthy habits early in life. This project expands structured, instructor-led summer camps and secures indoor space for restroom access, sheltered meals, and programming during inclement weather. By expanding youth activity opportunities in a rural setting, this project supports Healthy Beginnings and Healthy Lifestyles goals and helps reduce long-term chronic disease risk.	Four Valleys Community School will expand structured, youth-centered physical activity programming through enhanced summer camps and strengthened year-round recreation opportunities in Girdwood. Active Summer Youth Programming Funding will support additional trained staff to lead full-day, instructor-guided outdoor adventures, including hiking, biking, field sports, and skill-building activities. These programs are designed to increase daily moderate-to-vigorous physical activity while developing confidence, teamwork, and outdoor safety skills. To reduce transportation and equipment barriers, funds will support bike rentals or the purchase of shared-use bicycles, ensuring that all youth can participate regardless of their access to personal gear. Funding will also increase shared transportation capacity to transport youth safely to local trailheads, expanding access beyond neighborhood trails. FVCS is currently pursuing a U.S. Forest Service trail permit to further broaden supervised access to regional trail systems beginning in 2027. Expert Instruction & Facility Access Girdwood Parks and Recreation provides access to tennis courts, pickleball courts, soccer fields, and other existing facilities. Funding will allow FVCS to recruit qualified instructors to provide structured skill development in these settings, increasing program quality and safety while fostering long-term engagement in physical activity. Healthy Beginnings: Safe and Supportive Infrastructure FVCS currently lacks a reliable indoor space for youth during summer programming. Funding will support rental of indoor facilities to provide safe restroom access, sheltered lunch areas, and structured indoor activity space during inclement weather. This ensures continuity of supervision, safety, and developmentally appropriate rest and creative time, particularly for younger children. By expanding access to structured, instructor-led physical activity and reducing barriers related to transportation, equipment, and weather, this project builds foundational healthy habits during childhood and promotes lifelong engagement in active lifestyles.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Frontier Community Services	Alaska Community Care for Medical Complexity Pilot	AK	Although Alaska has group homes and residential providers, many do not accept individuals with high medical needs because current Medicaid reimbursement does not reflect the level of care required. As a result, individuals with complex medical conditions often cannot secure community placements and may remain in hospitals or face institutionalization. Long-standing nonprofit providers like Frontier Community Services increasingly become the last option before institutional care, supporting individuals declined by other programs. Residential habilitation for individuals with IDD is funded at about \$333 per day, while individuals served through the Alaskans Living Independently (ALI) waiver receive residential support equivalent to roughly \$220–\$280 per day, even when they have similar medical needs. These rates are tied to waiver category rather than medical acuity. In contrast, hospital swing-bed care averages about \$961 per day and hospital long-term care can exceed \$1,200 per day. This project will pilot a model supporting individuals with high medical needs in community homes with appropriate staffing and medical oversight, demonstrating that community-based care is both more humane and significantly less costly than institutional placement.	This project proposes piloting a model that supports individuals with significant medical needs in community-based homes while demonstrating that reimbursement should be tied to the level of care required rather than waiver category or residential setting. Currently, Alaska’s Medicaid waiver system sets residential reimbursement largely based on waiver type and service category, rather than the actual medical complexity of the individual receiving care. For example, individuals served under the Intellectual and Developmental Disabilities (IDD) waiver may receive residential habilitation funding of approximately \$333 per day, while individuals served under the Alaskans Living Independently (ALI) waiver may receive residential support equivalent to roughly \$220–\$280 per day, even when they have similarly complex medical needs. These rates are significantly lower than institutional alternatives, where hospital swing-bed care averages approximately \$961 per day and hospital long-term care can exceed \$1,200 per day This structure unintentionally creates a system where providers are disincentivized from accepting individuals with higher medical acuity, as reimbursement does not reflect the level of care required. As a result, providers often prioritize individuals with lower support needs while those with complex medical conditions struggle to find community placements and face a greater risk of institutionalization. Our proposed approach is to incentivize providers to support individuals with high medical needs in home settings, rather than creating a system that inadvertently favors institutional placement due to reimbursement limitations. The pilot will utilize existing wheelchair-accessible homes already developed by our organization, along with accessible transportation vehicles assigned to those homes. Enhanced staffing will include higher wages for Direct Support Professionals to recruit individuals with CNA credentials and the employment of a Registered Nurse to provide clinical oversight, staff training, and coordination of medical care. During the five-year pilot, we will evaluate the true cost of providing 24-hour care for individuals with complex medical needs, including environmental accessibility, transportation supports, specialized staff training such as safe transfer techniques, medication administration protocols, and nursing oversight	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Frontier Community Services	Connected Independence: Advancing Rural Aging in Place	AK	Alaska is experiencing one of the fastest rates of population aging in the United States. Since 2010, the population age 65 and older has more than doubled, and by 2030 older adults will represent nearly 20% of the state. This rapid growth is occurring amid significant healthcare workforce shortages and geographic access barriers, particularly in rural communities. Most elders in regions such as the Kenai Peninsula wish to age in place. Frontier Community Services provides grant-funded in-home supports including transportation for groceries and prescriptions, light housekeeping, appointment coordination, and basic wellness assistance. While minimal, these services are essential to preventing malnutrition, medication non-adherence, and avoidable hospitalizations. Workforce instability threatens consistent delivery. Rural staff travel long distances in harsh weather, and turnover or illness often leads to canceled visits. Even short disruptions increase risk for elders living alone, where emergency response times may already be extended. An additional equity gap exists: access to medical alert and safety technology is often limited to low-income individuals. Many elders slightly above poverty guidelines cannot afford private monitoring services yet do not qualify for subsidies. This creates instability in home-based care, increasing preventable emergencies, hospital use, and long-term costs.	Frontier Community Services will implement a hybrid service delivery model that integrates structured in-person supports with purpose-built technology embedded directly into elders’ homes. Building on our existing senior and home care platforms, we will partner with ProCern to deploy the Live WellNest system and establish the community infrastructure needed to support its use across rural service areas. The proposed approach does not replace in-person care; rather, it strengthens and stabilizes it. Through Live WellNest, elders will receive a simplified tablet and optional wearable safety device designed specifically for seniors and adults with disabilities. The technology will provide daily check-ins, secure video communication with approved contacts, wellness content, appointment coordination, and centralized monitoring through a program dashboard. Wearable devices will offer fall detection, emergency SOS capability, and geo-tracking where appropriate. ProCern will support implementation by assisting with device deployment, connectivity configuration, training, and technical integration. Frontier Community Services will embed the platform within existing workflows, including service coordination, documentation processes, and staff oversight protocols. Staff will be trained to utilize the centralized portal to coordinate essential services such as medical appointments, grocery access, prescriptions, and personal wellness supports. The dashboard will allow real-time visibility into participant engagement, missed check-ins, safety alerts, and follow-up needs. This model creates a structured daily touchpoint with elders, even when in-person visits are limited by staffing shortages or weather conditions. Automated alerts and monitoring reduce reliance on manual tracking while enabling faster response to emerging concerns. Families may opt into communication features to strengthen transparency and connection. Data collected through the platform will support performance tracking, quality improvement, and reporting aligned with Rural Health Transformation Program goals. Metrics such as appointment attendance, check-in compliance, safety alert response time, and preventive engagement will inform continuous improvement. By embedding technology within established community-based services, this approach expands access, improves consistency, and strengthens workforce sustainability without requiring proportional increases in staffing.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Frontier Community Services	Bringing Alaska’s Children Home: Community-Based Therapeutic Care and Family Supports	AK	Children with developmental delays, disabilities, and complex behavioral health needs in rural and frontier communities often face significant barriers to accessing appropriate care and supportive services. Many families struggle to find childcare providers, after-school programs, or therapeutic environments capable of supporting children with higher levels of developmental, behavioral, or trauma-related needs. In many rural communities, these services simply do not exist, leaving families without reliable options when children are not in school. This gap is particularly challenging for children receiving services through the Individual Support Waiver, as families often need structured support during after-school hours. Individualized in-home supports during these times can be difficult to staff, and without structured programs available, children miss opportunities for therapeutic engagement, social interaction, and skill development. At the same time, more than 50 Alaska children are currently placed in institutional care outside of the state because appropriate residential and therapeutic supports are not available locally. There is also a growing workforce challenge, as Direct Support Professionals working extended shifts often lack access to reliable childcare. This project addresses these gaps by expanding therapeutic childcare, after-school programs, foster care options, and residential supports so children can receive care within their home communities.	Frontier Community Services (FCS) proposes developing a coordinated system of therapeutic supports for children with developmental delays, disabilities, and complex behavioral health needs in rural communities. FCS has served the disability community in the Central Kenai Peninsula since 1981, providing a continuum of services that support individuals and families across the lifespan. The project will establish a therapeutic daycare and after-school program that provides structured developmental, behavioral, and social supports for children whose needs cannot be met in traditional childcare environments. These programs will focus on strengthening social-emotional, cognitive, and adaptive skills through therapeutic play, behavioral health-informed practices, and individualized learning strategies. To expand community-based care options, the project will also license therapeutic foster homes and specialized daycare providers trained to support children with developmental disabilities, behavioral health needs, and trauma-related challenges. These homes will provide safe, stable environments where children can receive consistent care while remaining connected to their families and communities. The project will also support the disability services workforce by offering childcare options for Direct Support Professionals and other frontline workers who often work extended or 12-hour shifts. Providing reliable childcare will help strengthen workforce recruitment and retention, which is essential for sustaining services in rural communities. FCS already has the infrastructure to implement these services. As a Medicaid provider, the organization has established systems for service delivery and billing and currently operates residential services for adults with disabilities, providing experience in staffing and program management. FCS also operates an Infant Learning Program, where developmental specialists and educators design therapeutic learning environments that will help guide program curriculum. Over time, FCS will also work toward developing residential supports for children currently placed outside of Alaska in institutional care, helping more Alaska children receive services within their home communities.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Planning

Frontier Community Services	Building a Unified Data Warehouse for Rural Care Delivery	AK	Frontier Community Services operates nine different programs, each with its own database and reporting requirements. As a result, critical information about services, staffing, finances, and outcomes is spread across multiple systems, making it difficult to establish a single source of truth for organizational decision-making. Staff often must enter the same information into multiple platforms and rely on spreadsheets or manual reconciliation to understand program performance, service utilization, and financial sustainability. The rapid expansion of required technology systems has created an environment where administrative tasks are increasing and data entry is often duplicative, taking time away from direct service delivery and increasing administrative costs. This project presents an opportunity to work directly with ProCern, a reputable information technology company, to develop a centralized data warehouse that integrates key systems used across the organization. By allowing financial, workforce, clinical, and billing systems to communicate with one another, the organization will gain access to real-time information that supports better decision-making. With accurate and timely data, leadership will be able to assess staffing needs, allocate resources more effectively, and ensure programs remain sustainable while continuing to provide high-quality services to individuals and families in our rural community.	Frontier Community Services proposes partnering with ProCern, an experienced information technology company, to design and implement a centralized data warehouse that integrates information across the organization’s multiple platforms. Currently, key operational data is stored in systems such as MIP for accounting, ADP for payroll and workforce management, AlayaCare for clinical documentation and care coordination, and Waystar for claims processing. These systems operate independently, requiring staff to manually reconcile information across platforms. Through this project, ProCern will work with Frontier Community Services to build a secure data warehouse that connects these systems and creates a single, reliable source of information. The data warehouse will automate the flow of financial, workforce, clinical, and billing data into one integrated environment. This will allow leadership and program managers to access real-time dashboards and reports that provide a clear picture of program performance, staffing capacity, service utilization, and financial sustainability. The project will also include the development of reporting tools and training for staff to ensure the system is used effectively across the organization. By reducing duplicative data entry and streamlining reporting requirements, staff will spend less time managing disconnected systems and more time focused on direct service delivery. Ultimately, this approach will create a sustainable data infrastructure that supports informed decision-making, strengthens operational efficiency, and ensures Frontier Community Services can continue delivering high-quality services to individuals and families in rural Alaska.	Under \$50,000	Home- and community-based services provider	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Frontier Community Services	Closing the Early Intervention Gap: Expanding Support for Alaska’s Youngest Children	AK	Alaska’s current eligibility requirement for the Part C Infant Learning Program requires a child to demonstrate a 50% developmental delay to qualify for services. This threshold leaves a significant gap for infants and toddlers experiencing moderate developmental delays (25–50%), many of whom are identified by health providers, early childhood programs, or the Office of Children’s Services but remain ineligible for early support. This gap is particularly impactful in rural communities where early intervention programs may be the only developmental support available before children enter school. Many of these children later qualify for special education under Part B at age three, meaning the system missed the opportunity to intervene during the most critical period of brain development. Frontier Community Services has operated the Part C Infant Learning Program on the central Kenai Peninsula since 1998 and has the infrastructure already in place to enroll additional children with minimal additional cost. When Medicaid is available, providers could also bill eligible services, helping offset targeted case management that connects families to health, behavioral health, and community supports. Expanding early intervention eligibility allows Alaska to act when it matters most—giving children the support they need early while reducing long-term education and service costs.	FCS proposes expanding access to early intervention by enrolling infants and toddlers experiencing 25–50% developmental delays through our existing Infant Learning Program (ILP) infrastructure. Since 1998, FCS has operated the Part C ILP on the central Kenai Peninsula, serving families through developmental screening, early intervention services, and family service coordination. Our program already has trained developmental specialists, established referral networks with health providers and child welfare partners, and strong community partnerships in place, allowing services to expand quickly and efficiently with minimal additional administrative cost. Children referred through health providers, early childhood programs, and the Office of Children’s Services would receive developmental screening and family service coordination designed to strengthen social-emotional, self-help, and cognitive development. FCS would also coordinate closely with the local Children’s Advocacy Center, complementing their robust clinic-based services by providing in-home supports that help families implement strategies within the child’s natural environment. In addition, FCS plans to expand its Fetal Alcohol Spectrum Disorder (FASD) clinic, bringing in additional specialists, including behavioral health therapists. While traditional early intervention services often focus on occupational therapy, physical therapy, or speech therapy, this model emphasizes parent coaching, play therapy, and behavioral health services that address developmental challenges related to trauma, environmental instability, or prenatal exposure. Services would support the entire family unit, whether children remain in foster care or reunify with biological families. FCS is also a certified behavioral health provider, allowing our team to deliver and bill for behavioral health services when clinically appropriate. When children are Medicaid eligible, the organization will pursue Medicaid reimbursement for covered services, helping offset the cost of targeted case management and family coordination. Because FCS already operates the regional ILP, implementation can begin immediately, with expanded screening, enrollment, and service coordination occurring within the first six months of funding.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Frontier Community Services	Dignity at Home: Expanding Hospice Care for Rural Elders	AK	Many elders living in rural and frontier communities wish to remain in their homes during the final stage of life, surrounded by familiar environments, family, and the communities they have spent decades building. However, in many areas hospice services are primarily tied to facility-based care, requiring individuals to leave their homes and move into assisted living or a hospice residence to receive end-of-life support. For elders who have lived independently for many years, this transition can be emotionally difficult and disrupt important family and community connections. This challenge is especially significant in rural communities where access to medical professionals is limited. Families often want to support loved ones at home but may lack access to medical guidance and coordinated care needed to safely manage end-of-life care. There is also an opportunity to strengthen home-based hospice care through the use of technology. Telehealth and remote access tools allow families and caregivers to connect with nurses, physicians, and hospice specialists at the touch of a button, providing consultation and guidance even when providers are not physically located in the community. By combining home-based hospice services with telehealth access to medical providers, we seek to create a model that supports dignity, comfort, and independence, allowing elders to remain in the place they call home while receiving compassionate professional support during the final stage of life.	Frontier Community Services (FCS) proposes developing a community-based hospice and palliative care program that allows elders in rural communities to remain in their homes during the final stage of life. FCS already provides Senior-In-Home grant-based services and adult day programming, which means the organization has the workforce, infrastructure, and experience necessary to deliver compassionate care in the home environment. This project will build on that existing foundation by expanding services to include hospice-level care designed specifically for rural and frontier communities. The program will begin by establishing hospice licensure and hiring a registered nurse to oversee end-of-life care. This nurse will coordinate services for individuals and families, provide clinical guidance to caregivers, and ensure that care plans focus on comfort, dignity, and respect for the individual’s wishes. FCS caregivers who already provide in-home supports will receive additional training in hospice and palliative care practices so they can assist individuals and families during this stage of life. To strengthen access to medical expertise in rural communities, the program will also incorporate living wellness technology and telehealth tools that can be installed in the elder’s home. These tools will allow caregivers and families to connect with medical professionals at the touch of a button, ensuring that questions about symptoms, medications, or comfort care can be addressed quickly even when physicians are not physically present in the community. Medical oversight will be provided through regular coordination with the individual’s primary care provider, ensuring continuity of care and physician involvement throughout the hospice process. FCS also currently has a physician on staff who can help initiate and guide the development of this program. As the program grows, physician oversight can be sustained through partnerships with additional providers or traveling medical professionals who serve rural areas. By combining existing home-based services, nursing leadership, telehealth technology, and physician collaboration, FCS will create a compassionate hospice model that allows elders to remain in the homes they have lived in for decades, surrounded by family and community. This approach honors the dignity of individuals at the end of life while improving access to hospice care in rural and frontier communities.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Frontier Community Services	Home-Based Care Workforce Initiative	AK	The Direct Support Professional (DSP) and Certified Nursing Assistant (CNA) workforce in rural Alaska faces increasing demands without a coordinated infrastructure to support competency, stability, and career growth. Providers must meet mandatory certifications such as MANDT, CPR, and medication administration by an Alaska-licensed RN, while also implementing best-practice trainings that are often costly and inconsistent across agencies. Many organizations develop internal trainers, leading to duplication of effort and variable standards. Workforce challenges extend beyond recruitment. DSPs and CNAs frequently face barriers such as housing instability, limited access to childcare, transportation challenges, and inadequate benefits. These pressures contribute to turnover, burnout, and service disruption. As care needs grow more complex for individuals with developmental disabilities and elders, expectations for skill and accountability increase, yet structured career pathways and regional training coordination remain limited. The issue is not simply a shortage of workers; it is the absence of a sustainable, competency-driven workforce model that supports professional development, removes practical barriers, and strengthens long-term retention in this essential field.	Frontier Community Services will establish a regional training and workforce development hub to strengthen healthcare access, quality, and sustainability in rural communities. The project will provide a training platform to train and license Certified Nursing Assistants (CNAs), help Direct Support Professionals (DSPs) move through the certification process aligned with national standards, and deliver required trainings such as MANDT, CPR, and medication administration by an Alaska-licensed RN. Training will be offered in both in-person and hybrid formats to expand rural access and reduce duplication across providers. This initiative builds upon our existing Good Life service model, which incorporates innovative scheduling structures that promote work-life balance, predictable time off, and reduced burnout. Frontier Community Services has already implemented this scheduling system internally and trained other providers to adopt this model, strengthening retention and improving service consistency. The goal of this approach is to create consistency and best-practice standards in workforce training while building a sustainable workforce pipeline beginning in middle and high school. By offering centralized, competency-based instruction through a regional hub, agencies will no longer need to independently hire and maintain in-house trainers. This model will generate cost savings while improving quality, uniformity, and long-term workforce development. Certifications earned through the training hub will be portable, allowing DSPs and CNAs to move between provider agencies — including the school district — without duplicative retraining. This portability reduces administrative costs, strengthens workforce mobility, and ensures providers invest in a credentialed workforce rather than repeatedly funding the same training across organizations. To support workforce stability, the project will integrate childcare assistance, housing supports, advocacy partnerships, and explore zero-interest or contract-based loan options to offset transportation and housing costs. Together, these strategies create a competency-driven, supported, and sustainable rural healthcare workforce.	Under \$50,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Frontier Community Services	Integrated Youth Employment and Behavioral Health Initiative (IPS-Y) for Rural Alaska	AK	Youth in rural Alaska face significant barriers when transitioning from adolescence to adulthood, particularly those involved in behavioral health systems, foster care, or the juvenile justice system. Many young people experiencing mental health challenges or substance use disorders struggle to access employment opportunities that provide stability and purpose. Traditional workforce programs often require youth to complete training or treatment before pursuing employment, which can delay engagement and contribute to disengagement from school, work, and community. In rural areas, these barriers are compounded by limited job availability, transportation challenges, and fragmented coordination between behavioral health services and employment supports. This project addresses the opportunity to integrate employment services into Frontier Community Services’ behavioral health programming through the evidence-based Individual Placement and Support for Youth (IPS-Y) model. IPS-Y has demonstrated strong outcomes nationally helping young people with mental health challenges obtain competitive employment and pursue educational goals while receiving behavioral health support. Through this initiative, Frontier Community Services will expand its behavioral health services to include IPS-Y employment supports, helping rural youth access meaningful employment earlier, strengthen recovery and independence, and build long-term economic participation in their communities.	Frontier Community Services will implement the IPS-Y model to support youth ages 16–24 experiencing behavioral health challenges in obtaining competitive employment and pursuing educational goals. Employment specialists will be integrated within Frontier Community Services’ behavioral health program to ensure employment services are coordinated with treatment and recovery planning. Using the IPS-Y model, youth will receive individualized employment services that focus on rapid job search, personalized job development, and ongoing job supports. Rather than requiring extended preparation or training before employment, youth will be supported in identifying their interests and pursuing competitive jobs quickly while receiving coaching and support as needed. The program will prioritize youth who face significant barriers to employment, including those aging out of foster care, involved in the juvenile justice system, or experiencing behavioral health and substance use challenges. Partnerships with local schools, community organizations, and workforce agencies will support referrals and coordination of services. Employment specialists will build relationships with local employers to identify opportunities that align with youth interests and community workforce needs. Additional supports may include transportation assistance, workplace accommodations, education coordination, and benefits counseling to help youth maintain employment while continuing their education or treatment. By expanding Frontier Community Services’ behavioral health services to include IPS-Y, this project will create a coordinated approach that supports youth independence, recovery, and long-term workforce participation.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Frontier Community Services	Kenai Community Access & Health Navigation Hub	AK	Rural communities on the Kenai Peninsula face persistent barriers to accessing social support services essential to maintaining health and independence. Individuals with developmental disabilities, aging adults, and people with behavioral health needs often must interact with multiple agencies to secure benefits such as Medicaid, Social Security, housing assistance, environmental modification grants, representative payee services, and employment supports. For vulnerable populations, these systems are complex and difficult to manage independently. Many individuals require assistance completing applications, understanding eligibility requirements, and maintaining program compliance. Documentation errors or missed deadlines can result in delayed services or loss of critical benefits such as Medicaid or SSI—benefits directly tied to accessing healthcare, medications, and long-term supports. Without coordinated assistance, individuals often experience disruptions in care, delayed treatment, or avoidable health crises. Access challenges are particularly evident on the Kenai Peninsula, individuals may only access Social Security through limited virtual appointments hosted at the Kenai Senior Center a few times each month. Capacity is limited, and individuals often arrive early to secure a slot for a virtual meeting. These barriers highlight a broader structural gap: essential services exist, but navigating them requires coordination many rural residents cannot manage alone.	The project proposes developing a comprehensive community navigation hub to help rural residents access and maintain critical health, disability, and social supports. The hub would provide a centralized location where individuals receive hands-on assistance navigating complex benefit systems while accessing the tools needed to complete applications and maintain eligibility. Trained navigators would work alongside individuals to understand program requirements, complete applications, gather documentation, and maintain compliance with ongoing reporting. Rather than expecting vulnerable individuals to navigate multiple agencies independently, navigators would provide step-by-step support through systems such as Medicaid, Social Security, housing programs, environmental modification grants, and employment supports. To strengthen financial stability and benefit compliance, Frontier Community Services would also serve as a Representative Payee agency. Representative payee services ensure essential expenses such as housing, utilities, medications, and healthcare needs are prioritized, helping prevent housing instability, service disruptions, and avoidable health crises. The hub would also include a technology resource library where individuals can access computers, secure internet, and digital tools needed to complete online applications, attend virtual appointments, and manage documentation. Staff would provide technical assistance to reduce barriers related to digital literacy and limited technology access. Transportation coordination would also be integrated into the hub model, helping individuals access medical appointments, benefits interviews, and community services. In rural areas where transportation barriers often prevent individuals from maintaining services, this coordination improves continuity of care. Frontier Community Services is a Medicaid provider agency, and this infrastructure positions the organization to expand into person-directed Medicaid waiver service support if available in Alaska. Frontier would assist individuals in understanding program requirements, managing service budgets, hiring support staff, and maintaining compliance while preserving choice and control. By combining navigation, technology access, financial stabilization, and transportation coordination in one location, the hub reduces system fragmentation, improves healthcare access, and supports sustainable community-based care in rural Alaska.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Frontier Community Services	Neighborhood Network: A New Model for Independent Living	AK	The Kenai–Soldotna area is experiencing a shortage of affordable housing, creating barriers for both individuals with intellectual and developmental disabilities (I/DD) and the Direct Support Professionals (DSPs) who provide essential services. Many individuals with disabilities rely on fixed incomes through Social Security or Medicaid benefits and cannot access market-rate housing. At the same time, DSPs often struggle to find affordable housing themselves, making recruitment and retention in rural communities difficult. Because of these housing limitations, many individuals who could live in more independent settings are instead placed in group homes that provide 24-hour care. In many cases, this level of care is not clinically necessary but becomes the only option due to housing and transportation barriers. This results in individuals living in more restrictive environments than needed and increases long-term service costs for the State of Alaska. The Neighborhood Network Project addresses this gap by creating safe, semi-independent housing where individuals can live with a compatible roommate and access support only when needed. Technology-enabled safety supports and nearby on-call staff allow individuals to live more independently while maintaining safety. The project also creates affordable housing opportunities for DSPs within the same neighborhood, strengthening workforce stability.	To address these housing and workforce challenges, the Neighborhood Network Project proposes developing a small, neighborhood-style housing community on subdivided land in or near Soldotna. This model would include multiple small homes designed to support independent living for adults with intellectual and developmental disabilities (I/DD), including studio-style homes for individuals and larger units for compatible roommates. The community would also include affordable housing for Direct Support Professionals (DSPs), helping recruit and retain the workforce needed to sustain community-based services in rural Alaska. This model would also provide long-term housing stability for individuals with disabilities who often face uncertainty in the private rental market. Rapid inflation and limited housing availability in the Kenai–Soldotna area have made it increasingly difficult for individuals living on fixed incomes to secure and maintain stable housing. Many individuals fear entering rental agreements due to unpredictable rent increases or the risk of losing their housing. By developing housing specifically designed for this population, the project would provide stable, predictable rental rates aligned with benefit allowances, ensuring individuals can remain in their homes long-term. In addition to resident and workforce housing, the development would include short-term housing for visiting specialists such as physical therapists, occupational therapists, speech therapists, and nurses who travel to the Kenai Peninsula to provide services. Currently, agencies rely heavily on short-term rentals such as Airbnb accommodations for these providers, which increases costs and limits service availability. Dedicated housing for visiting professionals would expand access to specialized care while strengthening the local service system. This neighborhood model allows individuals who do not require 24-hour group home care to live in safe, supportive housing while receiving technology-assisted and on-call supports when needed, reducing reliance on more restrictive residential settings.	\$1M-\$5M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

FRONTIER PSYCHIATRY, INC.	Behavioral Health for Rural Alaska: Telehealth, Training, and Early Intervention	MT	Alaska has among the highest suicide rates in the country and has for decades. Behavioral health workforce shortages affect virtually every community in the state, with rural, remote, and frontier areas hit hardest. Many Alaskans have no realistic path to seeing a psychiatrist. For those in crisis, the emergency department is often the only option, leading to costly and avoidable hospitalizations that strain an already fragile system. The workforce gap cannot be closed by recruitment alone. There are simply not enough psychiatrists, and the ones who are available are concentrated in urban centers. The opportunity is to pair immediate access to psychiatric and addiction treatment services via telehealth with investments that strengthen the capacity of local communities. Through Single Session Interventions, we can train thousands of Alaska's existing professionals, both licensed and unlicensed, to deliver evidence-based mental health support, while making free digital tools available directly to Alaskans. Through predictive risk stratification using health information exchange data, we can help local providers identify patients heading toward crisis and intervene earlier. Each of these strategies has been developed and tested in Montana, a state with the same structural challenges. The opportunity is to deploy them together in Alaska, in partnership with local providers and communities.	Our approach rests on a simple conviction: someone living in rural Alaska deserves the same quality of psychiatric care as someone living in Seattle or Salt Lake City. Geography should not determine the quality of care a person receives. Everything we propose is designed to close that gap. The first strategy is direct clinical care via telehealth. Frontier Psychiatry will deliver psychiatric and addiction treatment services to rural, remote, and frontier communities across Alaska. Our clinical team includes board-certified psychiatrists across child, adolescent, adult, addiction, geriatric, and perinatal subspecialties, along with advanced practice providers, a full-time pharmacist, case managers, and therapists. We do not simply prescribe medication. Every patient is connected to local primary care and community resources through integrated case management. Our pharmacist works directly with patients and providers to ensure medication adherence, avoid harmful drug interactions, and reduce polypharmacy. When local therapists are available, we partner with them. When they are not, our team fills the gap. The second strategy is statewide deployment of Single Session Interventions. SSIs are evidence-based, structured therapeutic encounters that produce meaningful clinical improvement in a single session. They can be delivered in person by trained professionals or digitally through free online platforms. We have direct experience with this model through our partnership with the State of Montana and Northwestern University's Lab for Scalable Mental Health, through which we made digital SSIs freely available to Montana youth statewide. In Alaska, we will train thousands of licensed and unlicensed professionals to deliver SSIs in person, while simultaneously deploying digital SSIs for youth and adults across the state. The third strategy is predictive risk stratification. We recently developed a tool using Montana health information exchange data that identifies which patients are at highest risk for an emergency department visit within 30 days. This allows our clinical team and local providers to intervene proactively rather than reactively. We intend to build the same capability in Alaska using Alaska's HIE infrastructure, giving providers across the state a shared tool for identifying and reaching patients before they reach a crisis point.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Frontline Mission	On site Clinical Care & Referral Services.	AK	Frontline Mission serves a vulnerable population in the Mat-Su Valley. The patrons who are benefiting from the services Frontline offers often suffer from physical, emotional, and mental health challenges. Through our connection with patrons, we often hear at Frontline that there is a fear that many individuals have towards medical personnel or medical buildings. Frontline has often worked in collaboration with medical doctors and clinics in the valley who have offered support to the individuals in need of health exams and appointments. Many patrons put off the opportunity to seek medical help until it's a dire medical emergency. This creates a problem in the individual's health, which often could have been avoided if they had sought medical assistance before it became a major issue. This fear exists for several different reasons; sometimes it comes from past trauma or a loss, sometimes it's a form of malpractice or a broken trust in the healthcare system. While fear is the main foundation for many individuals, others feel overwhelmed by the process of scheduling appointments, not knowing if they will have the means for transportation, especially to multiple locations, or simply overwhelmed by navigating a system that is unfamiliar. As a result, many individuals delay seeking medical attention until a situation becomes an emergency.	Frontline Mission’s approach would be to bridge the gap between vulnerable individuals and the healthcare system by building on the relationship and trust already established with the community. Because of the trust between Frontline and the community, we believe Frontline Mission will be able to successfully evaluate, treat, and refer patrons with their medical needs. This setting reduces many of the barriers that often prevent individuals from seeking care, including the fear that spreads to many areas in the medical field, transportation challenges, and the complexity of navigating healthcare systems. The focus of addressing the problem described above is to assess the need of each individual who needs medical assistance. In addition to basic medical treatment, Frontline Mission would refer patrons to medical providers we have partnered with in the past. Once the individual is assessed, basic medical treatment can take place on site. In addition to this, the medical care established at Frontline would connect patrons to established medical providers and facilities in the Mat-Su Valley to receive more advanced care. This support would include helping them through the referral process. This support may include helping individuals schedule appointments, understand their care options, and possibly offer support/ access to transportation if needed. Without the go-between organization in place, like Frontline, it is our concern that many individuals will not seek medical help or treatment until a very late stage in a medical crisis. This would allow Frontline Mission to complement existing healthcare services in the borough while ensuring that individuals who are most at risk are not left without access to healthcare assistance.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Galena City School District	Grow Our Own: High School CNA Certification Pathway for Rural Alaska	AK	The communities we serve are facing a real and growing healthcare workforce crisis. In the Yukon-Koyukuk Census Area and across rural Alaska, certified nursing assistants are among the most in-demand and hardest-to-fill roles in the healthcare system. For our students and their families, this is not an abstract policy problem. It means elders without adequate care, villages without trained health staff, and young people with no clear pathway into a healthcare career without leaving home. We operate two schools, uniquely positioned to change that. Sidney C. Huntington School serves our local Galena community, while our Galena Interior Learning Academy enrolls residential students from rural and remote communities across Alaska, many of which have no local healthcare training infrastructure. Both schools share campuses and CTE pathways, including Emergency Medical Services and Biomedical Science, so we know our students are interested in healthcare careers. A CNA certification pathway gives our students something they can use the moment they graduate, a portable, stackable credential that lets them return home and fill critical workforce gaps without the financial burden of out-of-community post-secondary training. That is the opportunity we are pursuing, and with RHTP support, we are ready to launch it in the 2026-2027 school year.	Rural Alaska does not have a healthcare workforce pipeline problem that needs years of study. We know what the problem is, we know who it affects, and we are ready to help fix it. We will launch our CNA certification pathway in the 2026-2027 school year, enrolling our first cohort of ~5-10 juniors and seniors at SHS and GILA who have already completed foundational coursework through our existing EMS and Biomedical Science CTE programs. These are students who have demonstrated interest in healthcare careers. Our pathway is built around the University of Alaska Fairbanks Community and Technical College Nurse Aide Occupational Endorsement, a focused, nine-credit program designed specifically to prepare students for the Alaska State Nurse Aide certification exam. The UAF CTC partnership gives our students something powerful: college-level credit and a state-recognized certification earned before they ever leave high school. That is a stackable credential they can carry into LPN, RN, or allied health programs if they choose to go further, or put to work immediately in their home communities the day they graduate. The program model is straightforward and can be implemented within Year One. Students complete preparatory coursework integrated into our existing CTE sequence here in Galena. We then bring the cohort to Fairbanks for approximately two weeks to complete classroom instruction and fulfill the required 48-hour clinical practicum at an approved long-term care or hospital setting. GILA's residential school model makes this feasible; our students already live and learn away from home. A structured two-week block in Fairbanks is not a barrier for them. By October 2027, our first cohort will have completed the requirements, sat for the Alaska State Nurse Aide certification exam, and be certified CNAs ready to return to villages across Alaska.	\$50,000-\$250,000	Single Community	Yukon-Koyukuk Census Area	Advance to Implementation Application

Galena City School District	A Pathway to Healthy Beginnings: IDEA PreK Family Support Program	AK	Our rural PreK population faces a compounding set of disadvantages including geographic isolation from early childhood services, limited local health and developmental support infrastructure, and caregivers who are navigating their children's critical developmental years without professional guidance or community resources. For families enrolled in IDEA's homeschool correspondence program, parents serve as the primary educator with most receiving no structured support specific to the health and developmental needs of children in the preschool range of 3 to 5 year old. Early childhood represents the highest-return window for intervention in developmental delays, behavioral health concerns, and chronic disease prevention. Research consistently demonstrates that unaddressed developmental delays in the PreK years compound through elementary school and beyond, and that rural Alaska Native children face disproportionate rates of adverse childhood experiences (ACEs) and chronic disease risk factors that are preventable with early, consistent support. Yet IDEA currently has no dedicated capacity to provide health referrals, developmental screening guidance, or family health education to this age group. IDEA's regional infrastructure already reaches these families. The gap is not access, it is specialized capacity. This project fills that gap by funding a dedicated statewide PreK Family Support Navigator embedded within IDEA's existing hub-and-spoke system.	GCSD will hire a full-time PreK Family Support Navigator housed within IDEA's program structure and operating across our nine regional hubs as a dedicated support resource for enrolled PreK families, with priority focus on rural and remote families lacking access to local early childhood health and developmental services. The Navigator’s core functions will include: (1) developing and delivering a weekly, structured club/workshop framework at all nine regional sites grounded in Alaska’s Early Learning Guidelines across all five domains (physical well-being and motor development; social and emotional development; approaches to learning; general knowledge and cognition; and communication, language and literacy); (2) administering the Ages and Stages Questionnaire (ASQ-3), a validated developmental screening tool for children ages 3-5, to proactively identify developmental delays and connect families to health, behavioral health, and early intervention referrals through tribal health organizations, IHS clinics, community health aides, and other local providers; (3) implementing the Teaching Strategies GOLD Observational Assessment Tool, using family observations to inform checkpoint ratings and provide a feedback loop for instruction; (4) developing a “Modeled Moments” video resource library of short, accessible, culturally reflective home activities that strengthen early learning and support assessment goals; (5) providing monthly one-on-one family contacts and supporting ECE leads through bi-weekly agenda meetings; and (6) building and maintaining a regional health referral network across all nine service areas. The hub-and-spoke delivery model is foundational to this approach. Each of IDEA's nine regional offices, located in Anchorage, Eagle River, Palmer, Wasilla, Fairbanks, North Pole, Soldotna, Anchor Point, and Juneau, serves as a hub from which the Navigator reaches spoke communities across a vast geographic footprint. Virtual and phone-based outreach removes the need for families to travel, while rural families who visit hub communities receive in-person support that deepens relationships and broadens service delivery. The Navigator will coordinate with IDEA's regional contact teachers, who maintain ongoing relationships with enrolled families, to ensure warm handoffs and integrated support. Tribal health organizations and regional health entities will be formalized partners with clear referral pathways to avoid duplication of existing services.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Galileo, Inc.	Expanding Primary Care Access & Sustainable Infrastructure: Delivering High-Value Care Close to Home	CA	There are systemic and structural access gaps that prevent the delivery of a full continuum of care close to home: 1. Gaps in the Continuum of Care: Many rural, remote & frontier communities lack consistent primary care infrastructure, creating primary care shortage areas. This isolation leaves underserved populations without a medical home, leading to delays in long-term disease management & acuity exacerbation. 2. Workforce Stretched to its Limit: Local clinicians face geographic & operational challenges that lead to severe provider burnout and recruitment challenges. Without a clinical wraparound, the lack of 24/7 urgent, primary & specialty care causes significant out-migration. Patients bypass local systems for expensive, out-of-region treatment, destabilizing the local health ecosystem. The Opportunity: 24/7 tech-enabled primary care infrastructure & safety net that: > Maximizes access close to home (#2) by enabling 24/7 urgent, primary, behavioral, & specialty care > Strengthens healthy communities (#3) by targeting the root causes of disease with a prevention-focused approach, utilizing locally tailored preventive care & long-term disease management > Strengthens workforce (#5) by acting as a clinical wraparound to reduce burnout & enable clinicians to practice at the top of their license > Sparks innovation (#6) by deploying a Mobile App and consumer-facing digital tools to improve population health management.	This project establishes a 24/7 Primary Care Infrastructure & Safety Net that supports patients and local providers at all times, not just after hours. By providing a "one-stop" digital medical home, we can resolve 90%+ of cases—ranging from simple to complex—without requiring patients to leave their community. > Wraparound Provider Supports: Enhancing availability, patient panel management, and expanding patient reach / practice catchment. Enabling care coordination, navigation and connectivity across Galileo, local providers, and community-based support. > Persistent Access & Reliability: Provides a 24/7/365 on-demand medical care that spans primary, urgent, behavioral, and specialty care, creating new access points and wrapping around existing local providers and care infrastructure to flexibly address acute to complex cases based on provider partnership preferences and community need. > Multispecialty Workforce Multiplier: Delivers direct access to over 20 clinical specialties through a primary care "front door," allowing complex cases to be managed in-place rather than referred out in concert with a patient's existing providers and local infrastructure. > Proactive Chronic Management: Addresses the root causes of disease through evidence-based interventions for diabetes and hypertension, having already demonstrated a 5.4 point average A1c reduction in engaged members. > Low-Bandwidth Resilience: Specifically engineered for rural, remote, and frontier Alaska, Galileo enables multi-modal communication – utilizing text and phone calls to remain functional in areas where video-based telehealth may be a challenge. > Clinical Continuity: Facilitates "virtual-to-physical" transitions through dedicated navigation teams and data sharing, ensuring seamless hand-offs and integration with local providers when hands-on care is necessary. > A Modern, Digital Patient Experience: Galileo deploys a Mobile App and consumer-facing digital tools that support a broad spectrum of care, including chronic disease self-management. By leveraging secure, data-driven tools, warm handoff protocols, and statewide data exchange, we enable efficient care, population health, and interoperability in remote areas.	\$1M-\$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Generational Vision Overseer	Lakefront Wellness & Prevention Access Project	AK	Many rural communities have limited access to safe, structured environments that support preventative health, physical activity, and mental wellness programming. While natural outdoor spaces exist, they are often underutilized due to safety concerns, limited infrastructure, or lack of facilities that allow organizations to provide structured programming. This project addresses that opportunity by upgrading an existing lakefront area to create a safe, accessible environment for community wellness activities. Improvements to walking paths, fences and shoreline safety, the dock, pavilion, parking area, and renovation of an existing cabin will allow youth organizations, community groups, and wellness programs to use the space for physical activity, health education, mentorship, and behavioral health support. By transforming an existing natural resource into a functional prevention-focused community space, the project expands opportunities for healthy recreation, strengthens community connection, and supports preventative health programming for youth and families.	The proposed approach focuses on renovating an existing homestead cabin to serve as the primary hub for preventative health programming, education, and community wellness activities. The renovated cabin will provide year-round indoor space where youth organizations, community groups, and wellness programs can host health education, mentorship programs, behavioral health support groups, and nutrition classes. The cabin will include bathrooms, a kitchen for cooking demonstrations and nutrition education, and flexible meeting space designed to support group facilitation and wellness programming. To complement the cabin and expand opportunities for outdoor activity, the surrounding lakefront area will also be improved to create a safe and functional environment for physical recreation and nature-based wellness activities. Planned improvements include a gear hub, upgrades to walking paths, shoreline safety enhancements, improvements to the existing floating dock, pavilion improvements for sheltered outdoor gatherings, and expansion of the parking area to accommodate vans and small buses transporting participants. Together, the renovated cabin and improved lakefront will create a combined indoor and outdoor wellness space that supports preventative health, physical activity, and social connection. This approach allows organizations serving at-risk youth and community members to offer consistent, structured programming in a safe and supportive environment throughout the year. In the second phase, the project plans to add a bathhouse and small bunkhouses to support extended youth programs, wellness retreats, and mentorship activities. These additions will expand the site's capacity for multi-day programming and allow organizations to host structured wellness and leadership programs that further support healthy lifestyles and community resilience.	\$250K-\$1M	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Genetic Support Foundation	Telegenetic Counseling for Rural Alaska: Expanding Preventive Genetic Health Access	WA	Genetic testing now plays an important role in preventive health care, including hereditary cancer and cardiovascular screening, prenatal and preconception care, pediatric genetic evaluation, and management of inherited conditions. However, access to genetics specialists remains extremely limited in rural and frontier areas such as Alaska. Many rural clinicians lack access to genetic counseling expertise, and patients often must travel long distances to receive specialty care. These barriers can delay diagnosis, limit preventive screening and care, and reduce patient understanding of genetic testing results. At the same time, clinicians increasingly encounter genetic testing in routine care but may not have ready access to genetics consultation when complex questions arise. The Genetic Support Foundation proposes expanding telegenetic counseling and genetics education services to rural Alaska communities. By leveraging telehealth technology and partnerships with Alaska health and community organizations, the project will improve access to preventive genetic health services and support clinicians in integrating genetics into routine care. This approach aligns with Alaska’s goals to expand specialty care access, strengthen the rural health workforce, and use innovative technology to improve health equity across geographically dispersed communities.	The proposed project will expand access to preventive genetic health services for rural Alaska through a telegenetic counseling and education model designed to integrate with existing rural health systems. The project includes three primary components. 1. Telehealth Genetic Counseling for Patients Board-certified genetic counselors will provide virtual consultations for patients referred by rural clinicians. Services may include hereditary cardiovascular and neurological disease risk assessment, prenatal and preconception counseling, pediatric and rare disease consultation, interpretation of genetic testing results, and guidance on preventive screening or care planning. Telehealth visits may occur through rural clinics or from patients’ homes depending on local infrastructure. 2. Clinical Support for Rural Providers The project will strengthen the rural health workforce by providing genetics expertise to clinicians who may not have ready access to specialists. Services will include case consultation, guidance on appropriate genetic testing, resource development, and continuing education on genetics in preventive care. 3. Patient and Community Education The project will also expand outreach and educational resources to help families understand genetic testing and inherited conditions. Current outreach efforts include engagement with Alaska health and community organizations such as Alaska Primary Care Association, Stone Soup Group, and the Alaska Down Syndrome Network to ensure resources reach families and providers across the state. GSF would also provide accessible educational resources about genetics and health, including materials from the Lettercase National Center for Prenatal and Postnatal Resources. These materials help patients and families understand genetic conditions and health decisions in clear, unbiased language. Together, these activities create a scalable telehealth model that improves access to specialty expertise while supporting local clinicians and strengthening preventive care services.	\$250K-\$1M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Geri-Gadgets, Inc.	Integrated Rural Fall Prevention & Behavioral Health Model	CA	Rural Alaska communities face a compounding challenge of fall risk, chronic disease burden, cognitive decline, and behavioral health stressors, intensified by geographic isolation, limited specialty access, workforce shortages, and transportation barriers. Falls remain a leading cause of injury-related hospitalization among older adults, while unmanaged agitation and cognitive impairment contribute to caregiver burnout, emergency utilization, and premature institutionalization. Many rural and frontier sites lack structured, non-pharmacological programming to address both physical and behavioral contributors to decline. Access to physical therapy, dementia-informed engagement, and preventive movement programs is limited, particularly in small, multi-use community settings. Broadband variability and staffing constraints further reduce the feasibility of technology-dependent interventions. The opportunity is to implement an integrated, infrastructure-light prevention model that strengthens local capacity to reduce preventable falls, stabilize behavioral symptoms, and support aging in place through durable, scalable systems designed for rural environments. Rural regions experience higher rates of fall-related injury and emergency utilization yet often lack sustainable prevention infrastructure. Without accessible, community-based intervention models, small sites remain reactive rather than preventive in addressing mobility decline and behavioral escalation.	The proposed approach implements an integrated, dual-pillar prevention model across multiple rural census areas through site-based deployment and workforce capacity building. Phase 1 focuses on cognitive and behavioral stabilization through deployment of Geri-Gadgets®, a patented manipulation system for the stimulation of cognitive abilities delivered through durable, washable sensory engagement kits. Participating adult day programs, senior centers, and community health hubs will receive kits and structured implementation guidance. Initial training will be delivered to site staff, followed by a train-the-trainer model supported by instructional videos and printable materials for low-bandwidth environments. This pillar addresses agitation-driven standing behaviors, supports structured engagement, and reduces caregiver strain in low-staff settings. Phase 2 introduces Exer-Square, a patented multi-function exercise platform supporting full-body strength, balance, coordination, and cognitive dual-task training through seated, standing, and floor-based progression. Manufacturing will occur through an established production partner, with deployment anticipated within approximately 90 days. Site staff will receive movement curriculum training and progression protocols to support safe, adaptable implementation. The model emphasizes practical integration into existing programming rather than creation of parallel services. Sites will incorporate movement sessions and sensory engagement blocks into current schedules, allowing sustainable continuation without additional staffing. Evaluation will include participant reach, session frequency, site participation rates, staff-reported behavioral stabilization, and aggregate site-level fall incident tracking where available. This low-burden reporting structure ensures feasibility for rural providers. By equipping local sites with durable, reusable systems and structured curriculum, the approach strengthens community-level prevention capacity, reduces reliance on external specialists, and creates scalable infrastructure for rural health stabilization. The model is adaptable for Tribal health organizations and culturally diverse communities due to its language-neutral, tactile design. By addressing mobility decline, chronic disease engagement, and behavioral stabilization in tandem, the approach shifts rural sites from reactive crisis response toward proactive, community-based prevention infrastructure.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Dillingham Census Area; Northwest Arctic Borough; Prince of Wales-Hyder Census Area; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

GigXR INC	EpiBrain: Holographic Patient Education and Engagement Platform for Addiction and Behavioral Health	CA	This is an opportunity to save lives, save money, and help Alaskans devastated by the fentanyl and drug epidemic return to their families and jobs. Drug overdose deaths in Alaska cost an estimated \$3.83 billion in 2023 - or \$11.45 million per death (CDC WISQARS). The total cost of deploying EpiBrain to every clinic in Alaska is less than the economic cost of a single overdose death. Approximately 90% of Alaska's overdose deaths involve opioids. FDA-approved medications for opioid use disorder cut fatal overdose risk by 60% or more, but only when patients stay in treatment. CDC SUDORS data indicate that Alaska's high death rate may be driven largely by treatment dropout, not lack of initial access. Early patient engagement delivered can increase retention up to 21 times. EpiBrain helps providers deliver that engagement at the point of care, during the critical early window when dropout risk is highest. Alaska's geography makes conventional approaches unworkable. Over 200 communities lack reliable broadband and are accessible only by small aircraft. EpiBrain operates offline-first giving a Community Health Aide in a remote community the same evidence-based tools as a clinician in Anchorage. The platform's modular design allows expansion to depression, trauma, and other co-occurring conditions without new hardware, maximizing the return on federal investment and building durable behavioral health infrastructure across rural Alaska.	In 2024, Alaska ranked #2 for opioid overdose deaths in the US and #1 for methamphetamine deaths. We will address the root causes of these substance use deaths and behavioral health morbidity and mortality through three integrated strategies: (1) deploying proven technology and media to give patients, families, and communities more accessible understanding of medical conditions and treatment options: we offer, partners implement, technology informs, and patients decide; (2) retaining patients in care through evidence-based technology and engagement modalities; and (3) scaling successful approaches to other behavioral health and chronic conditions using our partner's data and analytic capacities and the same technology and networks. Proven Technology: Our tools are already deployed, delivering results, and the tech has been proven. In a survey at an Anchorage-based substance use treatment clinic, three out of four patients preferred AR-based engagement using active medical models over written, verbal, or video explanations, and no patients preferred the standard verbal intake conversation (Isgro, Collins, & Kolachala, 2025). A full 92% reported improved understanding of their addiction, and 82% said they wanted to use the device again. Research further shows that early patient engagement consistent with HEDIS measures for substance use disorders can increase treatment retention up to 21 times (Williams et al., 2023). Partners: Through our partnerships with Alaska tribal health organizations, we have compiled complete provider lists for all substance use and behavioral health facilities in Alaska, tribal and private sector. In year one, we are positioned to contact, inform, and deploy to up to 300 facilities. Through the TAGGS database, we have also prepared current lists of all relevant behavioral health federal grant recipients in Alaska as potential partners. Effectiveness will be demonstrated through a performance monitoring and reporting program developed collaboratively with our partners. Data: Our approach relies heavily on the data and analytic capacity of partner organizations to scale efforts and prioritize reversing Alaska's critically low treatment uptake. Alaska mortality data reveals that from 2020 through 2024, approximately 98% of Alaska Native and American Indian opioid overdose decedents were not in treatment at the time of death (CDC SUDORS), a rate higher and worse than the Alaska overall rate (95.3%) and the national rate (93.2%).	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Girdwood Fire & Rescue Inc	Alaska Rescue Extrication Road Show	AK	The Girdwood Fire Department has a uniquely trained cadre of extrication instructors from previous grant awards and extensive hands on training under national lower 48 instructor trainers. We would like to share this knowledge and provide specific hands on skill training opportunities for departments with varying degrees of complexity specifically building up each department’s capabilities. Alaska Extrication Road Show would provide 4-5 instructors, basic equipment and coordinating damaged vehicles for hands on training traveling south on the Seward and Sterling Highways, reaching the smaller community emergency service response agencies. In April of 2023 The Girdwood Fire Department organized a \$300,000+ extrication grant purchase that benefited 11 different emergency service agencies on the Kenai Peninsula with extrication equipment. We would like to continue this momentum with additional education and techniques of operations. As vehicles continue to change with enhanced safety features they are only becoming more difficult and hazardous for the responder to access the entrapped patients. This training opportunity will be developed and delivered with each agencies current goals and objectives ranging from a basic one day extrication awareness course to a three day operations level intensive, all depending on each departments availability, personnel and needs.	The Alaska Extrication Road Show would be a coordinated training event that allows our team of instructors to travel between emergency services areas, spending one –three days per location working on knowledge and techniques too safely and efficiently remove patients from harm, hazard and transport to a definitive medical treatment facility. We plan on engaging each department prior to the training, coordinating and designing the training around their current equipment and operational capability to empower and enhance their immediate extrication capability. Our team of instructors would travel between the emergency service agencies with all the equipment and material to safely engage, educate and enhance the training opportunity. Providing multiple vehicles for each location in coordination with local tow and junk yard services along with environmental protection considerations is one of the logistical capabilities we can provide. With multiple tow capability vehicles and transport trailers we can provide the hands on training that is typically the largest burden for the emergency service agencies to attain for this type of operational training. Our current training outlines provides 2-4 vehicles per day of hands on operations depending on the number of participants. This would allow each participant to receive beneficial hands on experience that is not occurring in time of emergency but under supervised training and safety operations in a controlled environment. Over the years we have responded to many mutual aid incidents that the responders only have a basic understanding of the tool operations and while only limited use experience.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough; Kodiak Island Borough	Deferred or Not Advanced

Girdwood Fire & Rescue Inc	Alaska Rural Wilderness Medicine Conference	AK	Alaska has limited training opportunities for emergency service agencies to learn enhanced skills for supporting patients in austere situations. From Aviation, ATV/UTV, boating, hunting, hiking, climbing, skiing, biking or any of the other plethora of outdoor activities that end in accidents and unexpended injuries; Alaskan emergency services in underprepared in either limited personnel, equipment or knowledge while provide this expected and needed emergency response service. This conference opportunity would jumpstart the capabilities and build the relationships to support a multiagency approach in providing multi discipline teams to attack a rural emergency service response in difficult terrain, environments and hazardous conditions. The ability for agencies and personnel to train together and learn in an environment that promotes team work, collaboration and patient driven outcomes in a non-emergency setting only strengths our capability and response potential.	Hosting pre/post conference courses will provide bookend training to the core objective of better education our providers in the state of Alaska to provide the best possible care in the remote rural settings of the Alaska wilderness. Very few individuals get injured on the door step of their clinic and the time, distance and access to get an injured individual to definitive care can vary greatly. Providing a three day core conference highlight the key components to wilderness medical success, equipment and continuing training opportunities. While hosting intensive 3-5 day courses pre and post event creates the foundation for some or challenge other to new heights of patient care and success.	\$50,000-\$250,000	Statewide	Anchorage (Municipality)	Deferred or Not Advanced
Girdwood Fire & Rescue Inc	Expand Rural Patient Access Special Scenario Training: Water Rescue, REMS, Post Earthquake	AK	Problem: The skill level of rural Alaska ems agencies and providers to rescue and treat patients in water rescue situations, wilderness areas requiring rope systems and post earthquake scenarios varies widely across Alaska, as there is limited funding to train for special scenarios or complex patient management. Opportunity: Provide a series of special patient rescue trainings targeted at ems providers in communities with populations less than 10,000. This would expand the capacity and skill level (workforce development) of ems responders and rescuers in multiple rural communities translating directly into improved patient outcomes.	Girdwood Fire Rescue to host water rescue and REMS training annually for 2 years and on the third year provide a Train the Trainer course. The classes would be open to ems providers from communities less than 10,000 people (rural Alaska). The courses would bring instructors with national standards and certifications to Alaska. Girdwood previously hosted the first REMS class in Alaska in 2024. Scenarios students could take back to their own departments would be developed. Girdwood Fire Rescue would host a half day webinar on post earthquake injuries, treatment guidelines and presentations from providers who responded to large earthquake events.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Copper River Census Area; Denali Borough; Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Lake and Peninsula Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Girdwood Fire & Rescue Inc	Girdwood Ambulance Staffing	AK	Improve consistency to ambulance response between Girdwood and Hope. Currently the ability of Girdwood to continue to respond south of the municipal boundary is in jeopardy without a funding source to maintain a staffing level. Girdwood Fire (a nonprofit) has been responding to vehicle accidents, multi-casualty accidents, train medical events and recreational medical emergencies south of Girdwood for decades. While Girdwood has 2 ambulances, our department is provided by the MOA the equivalent of 50% funding for staffing one Anchorage ambulance. Often we have 2 ambulances transporting patients during vehicles accidents or simultaneous incidents. Since we provide the emergency response south of the Anchorage boundary to the Hope cut off, the MOA is not willing to increase our ems funding to support those responses. Similarly we have approached the Chugach National Forest requesting help with funding for ambulance staffing or rescue equipment without success. If we don't have staffing from paid on call personnel not on shift for the second ambulance, the next closest ambulance being dispatched is from Anchorage. In January 2026 we had to discontinue response to Turnagain Pass for a three week period due to lack of paid on call staffing to be able to maintain response to our service area and to areas beyond the municipal boundary. We are continuing to see the paid on call staffing model we rely on to provide ems care erode due to Girdwood housing and food costs.	Our project requests funding for the Girdwood ambulance 24/7 with an ALS provider and an EMT. We already have the ambulance and medical supplies. We require staffing funding to implement 24 hr staffed shifts. The paid on call staffing model is not working as more of our firefighters are moving into Anchorage due to high housing and food costs in Girdwood. It is making is hard to recall paid on call staffing for the second ambulance for a motor vehicle accident or a second response when the first ambulance is already transporting. By having staffing in the station, we can provide consistency in care and response to Seward Hwy vehicle accidents and medical and traumatic injury patients in Chugach National Forest. We have been trying to solve this problem on our own. Besides unsuccessful funding requests to the MOA and Chugach National Forest, we requested the Turnagain Health Clinic (Girdwood Clinic) switch to urgent care or expand hours to evenings and weekends to relieve a portion of the ambulance transports, since the clinic is only open during the week, but that was also unsuccessful. Having already been forced into discontinuing service in January for 3 weeks due to staffing, we need to find stability in access to emergency response for the thousands of Alaskans that travel the Seward Highway.	\$250K-\$1M	Other	Anchorage (Municipality); Kenai Peninsula Borough	Deferred or Not Advanced

Girdwood Fire & Rescue Inc	Girdwood Fire & Rescue sUAS program	AK	Girdwood Fire and Rescue responds to the remote rural areas of the Southern portion of the Municipality of Anchorage and the northern portion of the Kenai Peninsula Borough along the Seward Highway. Responding and assisting multiple agencies with advanced backcountry medical rescue operations in the highest utilized State Park and Nation Forest lands in southcentral Alaska. Hooligan fisheries, hunting/fishing operations, snow machine and skiing along with many other year round recreational activities happen every day in these areas and are only increasing. The backcountry skier with a broken femur in Turnagain pass, to the buried Snowmachiner in Main bowl off Seattle ridge, or the patient that was found unconscious from hitting a tree skiing and three hours out at a remote cabin, the hiker that fell and has an open lower leg fracture, the list continues and is only becoming more complex. Being able to locate the patient rapidly, determine safe and efficient access while guiding the responding providers to the scene is what must happen first before any patient care, stabilization and transport options can occur. This is greatly increased with the ability to scout ahead, using thermal and other advanced imaging capability from a Small Unmanned Aerial System (sUAS). Providing the equipment, training, certification and overarching technology to make this happen is the goal of this project.	Girdwood Fire and Rescue has identified individuals with long term response potential, department service continuation of greater than five years and interest in creating a team of trained responders to operate and provide enhanced optical imaging capability during times of emergency and mutual aid response requests. This requires each individual to train and test for their FAA Part 107 license, operating under the department standard operating procedures for Emergency Drone Operations, working under the appropriate FAA Certificate of Authorization for emergency operations applicable uses and continued training and recertification every two years. The response profile would be scalable on need for the incident and can be staged to be launched remotely from the Fire station or once on location due to the variables and needs of the incident. Pilot in Charge (PIC) are the responders that would be able to provide the information to the incident command in a visual display to allow the best tactical decisions and support of the patients in need of medical services. We have found and have been successful in including this information in the patients Electronic Health Record as backup to the mechanism of injury and visual display of the scene for the definitive care providers.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Girdwood Fire & Rescue Inc	Workforce Strengthening Girdwood EMS Providers	AK	Strengthen Workforce 1) Attracting and retaining a skilled workforce in Girdwood is difficult due to the high cost of living, and dangerous commute from Anchorage along the Seward Highway 2) Our fire department relies on a 50% paid on call workforce. The EMS providers as paid on call firefighters, are on shift 48hrs a month but only paid when they go on calls. Its is not cost effective for become a paid on call firefighter if you have to also pay for childcare to attend shifts or training 3) Girdwood needs locally based EMS providers that can respond from the community for incidents and in a disaster when the community is isolated by road conditions, rock slides or avalanches. 4) Girdwood has high housing, limited rental housing stock and high food costs compared to Anchorage, limiting the number of providers willing to live and work in Girdwood. 5) Girdwood ems call volume is often multisystem trauma from car accidents and recreation injuries. This provides a high stress load on ems providers who need professional ALS skills. It is easier to train a provider to a higher level of certification who likes working in Girdwood than to recruit into the community and workplace.	Strengthen Workforce 1) Offer structured retention bonus for Girdwood EMS providers that serve the Girdwood Community for 5 years or more 2) Provide monthly childcare support bonus for Girdwood EMS providers 3) Offer Girdwood housing bonus for all Girdwood responders that live in the Girdwood community 4) Offer Paramedic training funding for 1-2 members each year to train from AEMT/EMT2 to Paramedic	\$50,000-\$250,000	Single Community	Anchorage (Municipality); Kenai Peninsula Borough	Deferred or Not Advanced

Girdwood Health Clinic Inc	Fresh Start Clinical Integration: Connecting Prevention with Rural Chronic Disease Monitoring	AK	Chronic diseases such as hypertension and diabetes are leading causes of preventable illness, hospitalization, and rising health care costs in Alaska. Rural communities face particular challenges managing these conditions due to geographic barriers, limited workforce capacity, and delays in clinical follow-up. Residents of our service area often must travel long distances to access specialty medical services beyond primary care. These travel barriers, combined with limited clinical staffing, can delay adjustments to treatment when chronic disease indicators worsen. During these gaps in monitoring and follow-up care, uncontrolled blood pressure or blood glucose can lead to serious complications including stroke, cardiovascular disease, and kidney failure. The Alaska Department of Health’s Fresh Start program provides evidence-based prevention and behavior-change programs that support healthier lifestyles and chronic disease prevention. However, many participants require additional clinical monitoring and care coordination to manage established chronic conditions. TCH proposes the Fresh Start Clinical Integration Initiative to bridge this gap by integrating prevention programs with clinical chronic disease monitoring and care management. The project will expand nurse-led monitoring programs, strengthen referral pathways between Fresh Start and primary care, and develop a coordinated rural care model to improve chronic disease outcomes and reduce preventable complications.	Turnagain Community Health (TCH) proposes the Fresh Start Clinical Integration Initiative to strengthen coordination between public health prevention programs and primary care–based chronic disease management. The project builds on existing partnerships with the AK Department of Health’s Fresh Start program and TCH’s ongoing efforts to improve chronic disease outcomes through quality improvement initiatives and community outreach. The initiative will focus on four strategies. First, TCH will expand clinical chronic disease monitoring programs. This includes strengthening Self-Measured Blood Pressure Monitoring (SMBP) for patients with hypertension, expanding remote glucose monitoring for patients with diabetes, and increasing nurse-led care management to support medication adherence, treatment adjustments, and ongoing monitoring. These services will allow clinicians to identify worsening conditions earlier and intervene more quickly. Second, the initiative will establish coordinated referral pathways between Fresh Start prevention programs and TCH’s clinical teams. Participants in Fresh Start programs who are identified as having elevated chronic disease risk will be referred for clinical monitoring and care management. Likewise, patients receiving care at Turnagain Community Health may be referred to Fresh Start programs for lifestyle coaching, tobacco cessation, and prevention services. Third, the initiative will support development of a Remote Patient Monitoring (RPM) program that enables patients to track health indicators such as blood pressure and glucose levels between clinic visits. RPM tools will allow patients to monitor conditions from home while clinicians review data, identify concerning trends, and intervene earlier when treatment adjustments are needed. Fourth, the project will strengthen the role of CHWs in identifying high-risk patients and supporting engagement with both prevention programs and clinical care. CHWs will conduct outreach across dispersed communities, helping residents overcome barriers such as transportation, health literacy, access to services, and education on the use of RPM tools. Together, these strategies will create an integrated rural chronic disease care model that combines prevention programs, clinical monitoring, remote monitoring technology, and coordinated care. This approach will support earlier treatment escalation, improve chronic disease control, and reduce preventable complications.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough	Advance to Implementation Application

Girdwood Health Clinic Inc	Integrated Community Health Worker Navigation: Bridging Health Care & Community in Rural Alaska	AK	In rural Alaska many factors influencing health outcomes occur outside clinical settings. Transportation barriers, housing instability, food insecurity, and complex eligibility systems for health and social services often prevent patients from accessing care or managing chronic conditions effectively. These barriers frequently lead to delayed treatment, worsening health conditions, and avoidable ER visits or hospitalizations. At the same time, Turnagain Community Health (TCH) is experiencing demographic and economic trends within the communities we serve. We are caring for a growing number of older Alaskans on Medicare, as well as increasing numbers of uninsured and low-income patients who face significant barriers navigating health care systems and public benefit programs. CHWs help address these challenges by building trusted relationships with patients and helping them navigate health care and community resources. As integrated members of care teams, CHWs improve engagement with preventive and health care services, support chronic disease self-management, and assist individuals seeking treatment for substance use disorders. TCH currently employs three CHWs who serve as patient advocates and care navigators, helping patients address social drivers of health and connect with essential services. Demand for these services continues to grow. Expanding the CHW workforce will improve access, strengthen care coordination, and support healthier rural communities.	Turnagain Community Health (TCH) proposes to expand and strengthen its Integrated Community Health Worker Program as part of a coordinated effort to improve access to care and strengthen community-based health supports for rural residents in the Turnagain Arm region. Currently, TCH employs three Community Health Workers who are fully integrated members of the clinical care team. These CHWs primarily focus on addressing patients’ social drivers of health and helping individuals navigate complex systems that affect their ability to access care. Their work includes helping patients connect with food banks and other food assistance programs, assisting individuals experiencing housing instability or domestic violence in locating safe housing, coordinating transportation to medical appointments, and helping patients complete applications for Medicaid, Medicare, SNAP, Social Security, and other public assistance programs. Our CHWs also support patients experiencing substance use disorders by helping them identify treatment options, complete intake processes, secure admission to treatment facilities, and coordinate transportation and follow-up care. Through the Rural Health Transformation Program, TCH will expand its CHW workforce from three to five Community Health Workers in order to increase access to care navigation services for rural residents. In addition to expanding capacity, the initiative will evolve the CHW role to include structured health education and chronic disease management support. Working in partnership with medical and behavioral health providers, CHWs will assist patients managing conditions such as diabetes, hypertension, and obesity by helping them understand care plans, maintain engagement with treatment, and overcome barriers that interfere with treatment adherence. This initiative will also align closely with the emerging statewide Community Health Worker Network, in which Turnagain Community Health actively participates. Through this collaboration, CHWs will have access to standardized training, shared documentation tools, and coordinated referral systems that strengthen collaboration between clinical providers and community-based organizations. By expanding CHW capacity and strengthening care navigation services, this initiative will improve early intervention, enhance chronic disease management, support behavioral health and substance use disorder treatment engagement, and reduce avoidable emergency department utilization.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough	Advance to Implementation Application

Girdwood Health Clinic Inc	Rural Value-Based Care Transformation Initiative: Building A Sustainable Rural Health System	AK	Rural health systems face a structural mismatch between the care rural communities need and the way health care is traditionally reimbursed. Fee-for-service payment models primarily reimburse individual clinical services. These models provide limited financial support for many of the services that are most critical to improving rural health outcomes, including chronic disease management, care coordination, preventive care, behavioral health integration, and services addressing social determinants of health. For rural providers serving geographically dispersed populations, these limitations create significant barriers to improving health outcomes. Patients frequently face transportation challenges, delayed access to specialty care, and fragmented care across multiple providers. Without sustainable funding for proactive care management, providers are often forced to respond to advanced illness rather than prevent complications. Nationally, health systems are transitioning toward value-based payment models that reward improved outcomes and reduced total cost of care. However, participation in these models requires significant investments in data infrastructure, quality reporting systems, population health analytics, and care management workflows. Without support to develop these capabilities, rural health providers risk being excluded from emerging value-based care systems, potentially worsening existing financial and access disparities between rural and urban health systems.	The Rural Value-Based Care Transformation Initiative will prepare Girdwood Health Clinic d/b/a Turnagain Community Health (TCH) to successfully participate in value-based payment models while strengthening care coordination and population health management for rural patients. Key activities will include: • Joining Alaska Community Health Network LLC, a statewide clinically integrated network that supports collaborative quality improvement, data sharing, and value-based contracting among participating providers. • Participating in Resolute Health Alliance LLC, an Accountable Care Organization participating in the Medicare Shared Savings Program. • Developing internal population health management capabilities, including data analytics, quality performance tracking, and patient risk stratification. • Implementing care management workflows that support proactive outreach to patients with chronic conditions and complex care needs. • Training clinical and administrative staff in value-based care principles, quality improvement strategies, and data-driven population health management. These capabilities will enable TCH to identify high-risk patients earlier, coordinate care more effectively across providers, and align clinical strategies with payment models that reward improved outcomes. Importantly, this infrastructure will also support the success of our other RHTP initiatives focused on medication access, community health worker services, chronic disease management, and behavioral health integration.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough	Advance to Implementation Application

Girdwood Health Clinic Inc	Rural Pharmacy Innovation: Expanding Medication Access Through Innovative Technologies	AK	Many small rural Alaska communities struggle to sustain traditional pharmacies due to low patient volume, workforce shortages, and high operating costs. The Turnagain Arm region faces a critical risk to medication access. The area currently relies on a single privately owned pharmacy serving residents of Girdwood, Hope, Whittier, Bird Creek, Indian, and surrounding communities. The pharmacy is experiencing financial challenges common to rural markets and may not remain viable without structural changes. If it closes, residents would need to travel 40–90 miles to Anchorage for medications, creating barriers to timely treatment, medication adherence, and chronic disease management, particularly for elders, patients with complex conditions, and individuals receiving behavioral health services. Turnagain Community Health (TCH), an FQHC and the only provider of primary care and behavioral health services in the area, prescribes the majority of medications dispensed locally. The pharmacy owner has approached TCH about transitioning pharmacy services to the clinic. TCH proposes to develop a Rural Pharmacy Innovation model that integrates pharmacy services within the FQHC care model while leveraging telepharmacy, technology-enabled dispensing solutions, and participation in the 340B Program. This approach will sustain medication access, improve care coordination and health outcomes, and create a financially sustainable pharmacy model designed for small rural Alaska communities.	Turnagain Community Health (TCH) proposes to develop and implement a Rural Pharmacy Innovation model that sustains medication access while strengthening care coordination and improving health outcomes for residents of the Turnagain Arm service area. The project will transition the community’s existing pharmacy to an integrated model within the TCH FQHC, aligning pharmacy services with primary care and behavioral health to support a coordinated rural care delivery system. Financial sustainability will be achieved through participation in the federal 340B Drug Pricing Program, which will allow TCH to acquire medications at reduced cost and reinvest savings into pharmacy operations, medication affordability, and expanded services. This model addresses financial barriers that often prevent small rural pharmacies from remaining viable. To address rural workforce constraints, the project will implement a telepharmacy model in which licensed pharmacists provide remote prescription verification, medication counseling, and clinical consultation. On-site staff will support dispensing operations and patient education while maintaining pharmacist oversight and regulatory compliance. The project will also test technology-enabled dispensing solutions designed for rural communities. Potential innovations include secure automated medication dispensing kiosks or other remote dispensing technologies in accessible community settings. These tools will expand medication access across the service area while reducing travel barriers and operational costs. In addition to dispensing services, the project will integrate clinical pharmacy services into patient care, including medication therapy management, medication adherence support, and coordination with primary care and behavioral health providers. These services are expected to improve chronic disease management, support behavioral health treatment continuity, and reduce avoidable health complications. This project aligns with Alaska’s Rural Health Transformation Program priorities by expanding access to essential services, leveraging technology to overcome workforce and geographic barriers, and strengthening long-term financial sustainability of rural health care delivery. By combining telepharmacy, innovative dispensing technologies, and efficiencies created through the 340B program, the project will create a scalable model that may inform sustainable pharmacy solutions for other small rural Alaska communities.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough	Advance to Planning

Girdwood Health Clinic Inc	Rural Behavioral Health Access Expansion: Connecting Alaskans to Care	AK	Turnagain Community Health (TCH), an FQHC serving the Turnagain Arm region, has expanded behavioral health services in recent years through federal grant support. Mental health services increased by more than 35% following implementation of our Behavioral Health Service Expansion program, and new substance use disorder (SUD) and medication-assisted treatment (MOUD) services were integrated into primary care. Despite this progress, access to behavioral health care in our rural service area remains constrained by workforce shortages and geographic barriers. Recruiting and retaining behavioral health clinicians in small rural communities is difficult, leaving many patients without timely access to care. At the same time, mental health needs continue to increase, particularly among youth, seasonal workers, and individuals experiencing housing instability or substance use disorders. Local schools and community partners report a growing gap in mental health services for children and adolescents, with few local options for counseling or early intervention. This Initiative will address these challenges by strengthening workforce recruitment and training, expanding telebehavioral health services, and exploring school-based mental health service development. These strategies will improve access to care, strengthen rural workforce capacity, and support sustainable behavioral health service delivery in small rural Alaska communities.	Turnagain Community Health proposes a multi-strategy initiative to expand access to behavioral health services in rural Turnagain Arm communities by addressing workforce shortages, improving telebehavioral health infrastructure, and expanding community-based access points for care. First, the project will support behavioral health workforce development and recruitment. Despite successful program implementation, recruiting licensed behavioral health clinicians to rural Alaska remains a major barrier to sustained service delivery. RHTP support would allow TCH to develop innovative recruitment strategies, explore shared workforce models, expand clinical training partnerships, and provide professional development and support systems designed to attract and retain behavioral health professionals in rural communities. Second, the initiative will strengthen telebehavioral health capabilities. Telehealth has proven to be a critical tool for delivering care across the geographically dispersed Turnagain Arm region. Building on existing services, TCH will expand telebehavioral health capacity for therapy, psychiatric medication management, crisis consultation, and specialty behavioral health services. This includes strengthening technology infrastructure, developing telehealth workflows, and establishing partnerships with remote behavioral health providers to supplement local staffing capacity. Third, the project will explore development of school-based behavioral health services in partnership with local schools. Community leaders and school staff consistently report unmet mental health needs among children and adolescents. TCH will work with local school districts to evaluate the feasibility of establishing school-based mental health clinics or embedded behavioral health services, allowing students to access counseling and early intervention services within their schools. Finally, the project will continue strengthening integrated behavioral health care within the FQHC model. Behavioral health providers will continue to work alongside primary care teams, Community Health Workers, and care managers to deliver coordinated services addressing mental health, substance use disorders, and social determinants of health. Together, these strategies will create a more resilient and accessible behavioral health care system for rural residents of the Turnagain Arm service area.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough	Deferred or Not Advanced

Girdwood Health Clinic Inc	Rural Health Transformation Planning: Turning the Tide on Health Outcomes Across the Turnagain Arm	AK	Rural health systems must continually adapt to evolving community needs, workforce shortages, and changing health care delivery models. For small rural providers, limited administrative capacity often constrains the ability to pursue strategic planning, develop innovative service models, coordinate regional partnerships, and manage complex multi-year transformation initiatives. Turnagain Community Health is currently developing a coordinated portfolio of rural health transformation initiatives designed to enhance community-based outreach and care navigation, strengthen chronic disease management, expand behavioral health services, improve medication access and adherence, and support participation in emerging value-based payment models. While these initiatives offer significant potential to improve rural health outcomes, successful implementation requires dedicated planning and coordination capacity. In addition, rural communities in the Turnagain Arm region face broader system questions related to emergency medical services coordination, access to diagnostic services, expansion of preventive screening tools, and potential new service delivery models such as mobile integrated care teams and expanded urgent care capacity. The Rural Health Transformation Planning Initiative will address these needs by establishing dedicated capacity for grants management, rural health system planning, community partnership development, and coordination of multiple transformation initiatives.	Turnagain Community Health proposes to establish a Rural Health Transformation Planning Initiative that strengthens the organization’s ability to coordinate multi-year health system innovation efforts while supporting broader rural health planning activities across the communities we serve. The initiative will support a dedicated Rural Health Transformation Project Manager responsible for coordinating implementation of multiple RHTP initiatives while leading community health system planning efforts. Key activities will include three primary areas of work. First, the initiative will coordinate development and implementation of Turnagain Community Health’s rural health transformation portfolio. This includes projects focused on pharmacy access innovation, community health worker expansion, chronic disease monitoring integration with public health programs, behavioral health access expansion, and participation in value-based care networks. Coordinated project management will support implementation planning, grant management, evaluation design, and reporting across initiatives. Second, the project will support community health system planning in partnership with regional stakeholders. This includes collaboration with local emergency medical services providers to explore opportunities for improved care coordination, potential development of mobile integrated care teams, and strategies that allow primary care clinics to serve as alternative destinations for certain urgent care needs. These efforts may help reduce unnecessary emergency department utilization while improving timely access to care. Third, the initiative will support exploration of innovative service delivery models designed to address rural access challenges. Potential areas of evaluation include expanded diagnostic services such as laboratory and radiology capacity, adoption of new screening technologies, development of mobile clinic models or modular “clinic-in-a-box” care sites, and other strategies designed to improve access to preventive and urgent care services across geographically dispersed communities. Through coordinated planning, partnership development, and strategic evaluation of new service models, this initiative will help rural communities identify practical solutions that strengthen access to care and improve health system sustainability.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough	Deferred or Not Advanced

Girdwood Inc	Girdwood Workforce Housing Project	AK	There is not enough housing in Girdwood, as well as many small or remote communities of Alaska. Traditional onsite construction has proven to be uneconomical and unfeasible in many cases. Alaska needs to be a leader in new housing types. Modular housing has greatly improved in the past decade and we need to utilize the advancements in design, technology and cost efficiency to make Alaska a compelling place to live, work and play. Girdwood is a recreation hub and can be used as a driver to bring non-resident health care talent to Alaska. Modular housing can have a sigma associated with it, and we want to break that mindset, that not only can they be functional, but beautiful and fit a character of a community. We would like to design, engineer and plan a workforce neighborhood to benefit the Turnagain Arm Area. A Workforce Housing need is clearly identified in the recently updated Girdwood Area Plan. A site has been identified. A final report will be generated and published regarding how to export this concept to remote areas.	Girdwood Inc shall produce all the necessary documents required to be shovel ready for the workforce subdivision. A range of 30-50 workforce units are desired at the targeted location. Preference for units shall be given to employees of Turnagain Community Health, as well as emergency responders employed by Girdwood Volunteer Fire Department and Whittier Police. Additional units for teachers/staff at Girdwood School, as well as other essential workforce will be taken into consideration during the planning phase. The goal is to research the best modular housing type for arctic environments, with a preference on simple assembly, affordable shipping costs and long-term durability. Girdwood Inc will not only produce documents for the Girdwood workforce housing project implementation phase, but also create a template and checklist for creating a subdivision and necessary infrastructure for modular housing in rural Alaska, to maximize the knowledge and lessons learned during this planning stage. This grant would fund: surveying costs, land studies, permits, special inspections, planning, design, architect fees, consultant and grant administration. Girdwood Inc is months out from completing the Girdwood Workforce Childcare Project, where we fund-raised nearly 6 M to build a desperately needed childcare center. We were given a Community Innovation Grant from the State of Alaska that was used for planning, design and engineering. This model worked incredibly well and resulted in being well prepared to execute the construction portion over the last 10 months. The building is currently on budget and on time. Girdwood Inc has demonstrated it can take on multi-million dollar projects and is poised to take on this next pressing item in our community and state. Girdwood Inc intends to partner with Girdwood Community Land Trust, who has been working with municipal land holders and is already included in Heritage Land Bank's Annual and 5 year plan.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Glacier Bear Community Peak Performance	Glacier Bear Community Peak Performance: Enhancing Rural Health through Community Recreation	AK	Like many rural Southeast Alaska communities, like Haines, are confronted with distinct health challenges primarily due to geographic isolation, limited infrastructure, and barriers to preventive care. The lack of community recreation infrastructure hinders residents' ability to engage in regular physical activities, which are essential for maintaining health and well-being. This situation is exacerbated by the harsh weather conditions, long travel distances to healthcare facilities, and limited built environments, which collectively create significant obstacles to maintaining an active lifestyle. According to statewide health reports, a considerable portion of Alaskans face chronic health risks, such as obesity, high blood pressure, and insufficient levels of physical activity. These conditions are prevalent among populations in rural areas, where access to preventive healthcare services is restricted. Additionally, musculoskeletal injuries, which are common in both youth sports and the occupational activities prevalent in this region (e.g., fishing, forestry), contribute to disability and healthcare costs.	The Glacier Bear Community Peak Performance project presents a significant opportunity to tackle these challenges head-on by developing a Community Recreation, Sports Performance and Injury Prevention Program led by a certified athletic trainer. The goal for this program is to assess the need for a community recreation and injury prevention programming. Determining if the need to build a Community Recreation Center to support activities. This initiative aims to: Enhance Preventive Care: By focusing on injury prevention and sports performance, the program will reduce the incidence of common injuries, thereby lowering healthcare utilization and costs. Expand Access to Services: Establishing structured, inclusive programs will improve access to recreation, health education, and wellness services, especially for underserved populations such as low-income families, elders, Alaska Native members, and those with limited mobility. Promote Health Equity: By eliminating participation barriers through sliding scale fees, culturally responsive offerings, and outreach partnerships, the initiative will intentionally reduce inequities in access to preventive health services. Strengthen Community Ties: Recreation spaces and programs will serve as vital hubs for physical activity and social connection, thereby fostering community cohesion and mental well-being. Build Local Capacity: The project will create sustainable community capacity for preventive health through the expansion of the healthcare workforce, including the addition of a locally available athletic trainer role. By addressing these issues through a community-centered approach, the Glacier Bear Community Peak Performance project promises to improve the quality of life for residents, enhance physical and mental health outcomes, and create a foundation for sustainable, long-term health improvements in Haines.	\$250K-\$1M	Home- and community-based services provider	Single Community	Haines Borough	Deferred or Not Advanced

Glytec, LLC	Glytec Glycemic Management - Implementing eCQM metrics mandated by Joint Commission and CMS	MA	Many rural hospitals still rely on paper-based insulin protocols and manual calculations to determine insulin dosing. This process is time-consuming and increases the risk of human error, especially in busy clinical environments. Even a single glycemic event—whether severe hyperglycemia or hypoglycemia—can significantly impact patient outcomes, length of stay, and overall cost of care. In some cases, miscalculated doses can lead to serious adverse events, putting vulnerable patients at even greater risk. Without real-time visibility into glucose performance, clinicians and leadership often lack the ability to proactively manage or intervene early. In addition, insulin dosing decisions can vary depending on the provider or nurse on shift, leading to inconsistent glycemic management across the same unit or patient population. This variability makes it difficult to standardize care, track performance, and consistently achieve optimal outcomes for patients with diabetes or stress-induced hyperglycemia. Digital glycemic management solutions help address these challenges by standardizing insulin dosing, reducing calculation errors, and providing real-time insights that support safer, more consistent glucose management across the hospital. All while helping to boost the confidence of the clinical staff and maintain the retention of nurses.	Align: Identify the glycemic safety leadership team and schedule a focused demo for the identified stakeholders Define: Confirm workflows and perform a risk assessment. Evaluate expected Return on Investment Implement: Train teams and bring the program live This is NOT another system to manage but is imbedded in the EMR/EHR.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Grimm Investments LLC, DBA Alaska Medical Transport	Bariatric Transportation	AK	There are currently no ambulances specifically equipped to transport bariatric patients in Southcentral Alaska.	AMT proposes retrofitting two ambulances to be capable of carrying bariatric patients. This includes bariatric specific stretchers and bariatric ramp and winch systems, to safely load and unload bariatric patients.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced
Guardian Flight	EMS and Aviation Workforce Development	AK	Rural Alaska’s emergency care system is constrained by three connected challenges: (1) workforce instability (burnout, turnover, vacancies) among village-level providers and rural clinicians; (2) limited access to hands-on training, especially for rare but high-risk emergencies; and (3) specialty transport bottlenecks, including neonatal capability concentrated in a single hub that can be stressed by back-to-back missions, weather, and distance. These constraints compound each other. When providers can’t access realistic, scenario-based training, confidence and readiness erode. When staffing is thin, providers have fewer opportunities to leave for training, and turnover rises. When specialty transport resources are centralized, rural facilities can experience delays that increase clinical risk — especially for newborns requiring tightly controlled transport conditions. The opportunity is to invest in a single integrated solution that addresses root causes: build local workforce pathways, deliver training where care occurs, and expand proven neonatal transport readiness closer to Southeast Alaska communities — creating durable statewide capacity rather than episodic fixes.	This project delivers a coordinated, implementation-ready approach aligned to Alaska RHTP’s Strengthen Workforce initiative, while also improving Health Care Access and Healthy Beginnings through specialty transport readiness. - Build a rural EMS pipeline with earn-while-you-learn support and relief coverage. Year one focuses on the scope of 20 EMT scholarships and 20 paramedic scholarships, structured to reduce barriers (lodging/logistics as needed) and to support rural Alaskans from villages into training and back into rural roles. Training is designed to be held in Alaska where possible, with planned high-volume clinical/ride experiences in the Pacific Northwest when required for competency and exposure. - Create durable training infrastructure: simulation + mobile delivery. The project establishes high-fidelity simulation capability and a mobile training model that delivers BLS/ACLS/PALS/NRP, skills validation, and rural-relevant emergency scenarios directly to providers. Year one includes mobile training delivered to 10 rural locations, reducing travel barriers and enabling recurring competency maintenance. - Expand neonatal transport readiness in Southeast Alaska using a proven model. The project positions an isolette and trained neonatal transport capability in Southeast Alaska, leveraging existing protocols, training standards, and clinical oversight from the established program to ensure consistency and patient safety while reducing delays caused by equipment/crew repositioning. Across all components, the project is designed for measurable improvement in access and outcomes, and to demonstrate the kind of system-level transformation Alaska’s evaluation framework prioritizes: strong need-to-intervene logic, measurable outcomes, coordination, sustainability, and feasible implementation.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough);	Advance to Implementation Application

Guardian Flight	Advancing Emergency Care Access for Rural Alaskans (Health Care Access)	AK	Rural Alaska faces a persistent mismatch between patient needs and the structure of emergency response systems. Non–time-critical medical concerns frequently result in ambulance dispatch, air transport, or emergency department utilization because there are few alternatives available at the moment of need. This dynamic strains limited emergency resources, increases costs for patients and payers, and can reduce availability for higher-acuity events. Workforce shortages and geographic distance further exacerbate these challenges. The opportunity is to modernize how emergency access points function by embedding clinical decision support and care navigation into existing 911 infrastructure. By doing so, Alaska can better match patients to appropriate levels of care, strengthen system sustainability, and improve patient experience, with all of this achieved without compromising safety or public trust in emergency services. This project does not restrict access to emergency services; it protects and preserves emergency capacity by ensuring that limited EMS and transport resources remain available for the patients who truly need them. This project complements investments in air medical transport by ensuring that transport is used when clinically necessary and avoided when better care can be delivered where patients are. Without intervention, increasing call volume and workforce shortages will continue to erode reliable emergency access in rural communities.	911 REACT operates as a 24/7 clinician-led care navigation service integrated with emergency dispatch and field response. When non–time-critical calls are identified, callers or responders are connected to Alaska licensed clinicians operating under physician-approved protocols. Clinicians conduct real-time assessments, provide clinical guidance, and coordinate the safest and most appropriate care pathway. These pathways may include telehealth consultation, referral to local or regional providers, coordination with rural hospitals, or escalation to EMS and transport when conditions warrant. The approach emphasizes flexibility and scalability across Alaska’s diverse communities, recognizing differences in local resources, geography, and population needs. The model aligns with Alaska’s priorities for technology-enabled care, workforce support, and system integration by leveraging centralized clinical expertise, interoperable data exchange, and standardized protocols. Implementation is designed to occur in phases, allowing for stakeholder engagement, refinement, and adaptation while maintaining consistency and safety statewide. Importantly, the approach enhances—rather than replaces—existing emergency response systems, reinforcing 911’s role as a trusted front door to care.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Guardian Flight	Regional Medevac Infrastructure Improvement (Dutch Harbor) & Fleet-Wide Garmin G1000 Modernization	AK	1) Dutch Harbor Infrastructure Improvements: Alaska’s rural healthcare access, especially for unplanned or emergency care, is tightly coupled to aviation readiness. In the Aleutians, distance, severe weather, and minimal redundancy mean that a single infrastructure weakness can isolate communities from urgent care. Guardian Flight’s Hangar in Dutch Harbor is a strategic outpost, but roof and facility conditions require repair to continue to reliably protect aircraft and equipment from harsh maritime exposure. Without improvements, corrosion and weather damage will ultimately render this hangar unusable. 2) Statewide Fleet Modernization: Statewide, aging avionics and limited approach capability delay access to care. This investment will put modern avionics in the cockpit and allow for access to the approaches needed to more reliably land in remote Alaska locations. The FAA through state and federal funding has already created a number of approaches but without the modernization – these aircraft cannot take advantage of the capabilities. Dutch Harbor functions as a regional aviation and medical access node for multiple island communities, not just Unalaska, extending the benefit of this investment far beyond a single location.	The project has two coordinated workstreams designed to protect access in the Aleutians while improving statewide medevac reliability: 1) Dutch Harbor Infrastructure Improvements: Complete targeted roof and facility repairs to restore weather protection, functionality, and year-round operational readiness. Improvements will focus on preventing moisture intrusion, reducing corrosion exposure, and ensuring the hangar can withstand the continued impact of maritime weather. Work can begin as soon as summer 2026. 2) Statewide Fleet Modernization: Modern avionics allow aircraft to fully utilize existing instrument approaches already developed by the State, converting prior public infrastructure investments into real, usable access for remote communities. We will upgrade three (3) fixed-wing aircraft in year one, five in year two, and five in year three. Overall, the target will be to modernize a total of eight King Air 350s and five King Air 200s—with Garmin G1000 avionics. Each installation includes acquisition, installation, certification, and standardized training for pilots and maintenance personnel. Together, these investments increase approach reliability and situational awareness, reduce unplanned maintenance and weather-related delays, and add a critical safety layer through auto-landing in rare pilot-incapacitation scenarios. The approach prioritizes durability, readiness, and uninterrupted service—delivering immediate benefits as assets return to service while building long-term system resilience.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Guardian Flight	Rural Clinic Support to Stabilize Emergency Patients	AK	Rural Alaska’s emergency healthcare system is constrained by distance, frequent weather-related transport delays and structural aviation access limitations. In many communities, clinics are clinically prepared to initiate care but lack the staffing depth required to safely sustain prolonged patient management when transport is delayed. These challenges are compounded by aging or limited airport infrastructure and other aviation constraints that reduce the reliability of medical transport during common Alaska weather conditions. This readiness project will address two interdependent challenges that together define rural emergency access reliability. The first is an assessment of rural clinic staffing readiness and sustainability, including evaluation of current staffing models, surge capacity, skill mix, and the ability of clinics to safely manage extended patient holds during transport delays. The second is an assessment of aviation related infrastructure and access at rural locations, including airport proximity to clinics, availability of instrument approaches and departures, runway and lighting limitations, weather reporting reliability, and other aviation factors that directly influence the safety and consistency of medical transport operations. By jointly assessing clinical staffing capacity and aviation access limitations, this project will identify targeted, high impact readiness improvements that strengthen rural clinics’ ability to safely stabilize patients.	Year one will serve as a structured planning and readiness phase that integrates rural clinic stabilization planning, aviation access assessment, and workforce alignment into a single coordinated effort. Additionally, a gap analysis and needs assessment will be performed on identified pilot communities and rural health clinics. Specific & Measurable: Within the 12month readiness period, the project will identify and assess a defined set of pilot rural communities representing Southeast Alaska, Bristol Bay, and Tanana Chiefs Conference regions. For each site, the project will complete standardized evaluations of (1) clinic staffing models, surge capacity, skill mix, and prolonged-hold capability, and (2) aviation access factors including airport proximity, specialized instrument approach availability, runway and lighting limitations, weather reporting reliability, and operational constraints affecting medical transport. Achievable: Assessments will be completed through coordinated site visits, stakeholder interviews, and data review in partnership with Tribal Health Organizations, the Alaska Native Tribal Health Consortium (ANTHC), and clinic leadership. Existing clinical and aviation operational data will be leveraged to ensure feasibility within the readiness timeframe. The project will also evaluate the role of technology-enabled transport coordination platforms, such as Transport.net, to support real-time transport requests, ETA visibility, and decision support across multiple air and ground providers during weather-impacted events. Relevant: Findings will directly inform readiness gaps that limit safe patient stabilization and transport reliability during weather-related delays, ensuring alignment with RHTP priorities focused on equitable access, sustainability, and system resilience. Time Bound: By the end of the planning year, the project will deliver: • Site specific readiness profiles for each pilot community • A consolidated gap analysis identifying priority staffing and aviation access limitations • Defined coordination pathways and readiness benchmarks • An implementation roadmap to guide future funding and phased deployment This structured approach ensures year one outcomes produce actionable, high impact guidance for strengthening rural emergency care access—without committing to unsustainable staffing models or infrastructure investments.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Guidance Global Consulting Inc.	Advanced Care Coordination and Care Management Solution	MD	Alaska’s rural, remote, and frontier communities face persistent barriers to accessing continuous, high-quality health care. Geographic isolation, limited road access, provider shortages, and high transportation costs make routine chronic disease management extremely difficult for many residents. These challenges disproportionately affect Alaska Native and American Indian (AI/AN) populations, rural elders, and individuals with complex chronic conditions such as diabetes, cardiovascular disease, obesity, behavioral health disorders, and chronic pain. Alaska also faces escalating behavioral health and opioid-related challenges, with rural and AI/AN communities experiencing some of the highest rates of overdose mortality, suicide, and untreated mental health conditions in the nation. The state is projected to face a shortage of approximately 5,000 nurses by 2030, and many communities rely on small rural clinics, tribal health organizations, or critical access hospitals that are already operating at capacity. Nearly 75% of Alaska communities are not connected to the road system, making travel for routine care extremely costly and time-consuming. As a result, many patients with manageable chronic conditions go long periods without monitoring or care coordination. Medication adherence declines, early warning signs are missed, and preventable health crises result in emergency department visits or hospitalizations that could have been avoided with proactive monitoring and support.	GGC will lead program design, implementation, governance, and evaluation for a statewide pilot deploying Outcomeus’ virtual concierge chronic care platform to rural and tribal communities across Alaska. The program will initially enroll approximately 500 patients across a three-year demonstration, with priority outreach to Alaska Native and American Indian populations, rural elders, and individuals with complex chronic conditions. Outcomeus will provide the integrated technology platform that enables continuous remote monitoring and virtual care coordination. The platform combines several established care models reimbursable through Medicare and Medicaid, including Remote Patient Monitoring (RPM), Remote Therapeutic Monitoring (RTM), Chronic Care Management (CCM), Principal Care Management (PCM), and Advanced Primary Care Management (APCM). These reimbursement pathways allow the model to become financially sustainable beyond the RHTP grant period. Through Outcomeus’ operational infrastructure and telehealth operations partner BlueStar Telehealth, the program will provide: • Remote physiological monitoring for conditions such as hypertension, diabetes, heart failure, COPD, chronic kidney disease, and obesity • Daily biometric monitoring by registered nurses with escalation protocols for clinical concerns • Virtual care coordination and patient engagement between clinic visits • Medication adherence monitoring and support • Behavioral health and sleep monitoring capabilities • Patient-reported outcome tracking to measure improvements in quality of life The program will also pilot innovative non-pharmacological chronic pain management solutions, including prescription-based virtual reality cognitive behavioral therapy for chronic pain and secure medication adherence technologies designed to support safe management of controlled substances and medication-assisted treatment. GGC will coordinate partnerships with Tribal Health Organizations, Federally Qualified Health Centers (FQHCs), rural hospitals, and community health programs across Alaska. Tribal partners such as the Alaska Native Tribal Health Consortium, Southcentral Foundation, and regional tribal health systems will be prioritized because of their central role in delivering care to AI/AN populations. GGC will oversee program governance, stakeholder engagement, implementation planning, data reporting, and performance evaluation.	Over \$5M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Guidance Global Consulting Inc.	AI-Enabled Chronic Disease and Community Wellbeing Initiative for Rural Alaska	MD	Alaska’s Rural Health Transformation Program identifies Healthy Communities and Health Care Access as key initiatives focused on prevention, chronic disease management, consumer-facing digital tools, and population health infrastructure. Chronic disease management in rural Alaska presents unique challenges. Geographic isolation, transportation barriers, and limited access to providers make sustained engagement with prevention and self-management programs difficult. These barriers are particularly significant in rural and Tribal communities where access to in-person services may be limited. Effective chronic disease management requires more than clinical care. It requires sustained behavioral engagement, emotional resilience, and adherence to prevention and treatment plans. This project addresses the opportunity to deploy scalable, mobile-first digital tools that support chronic disease self-management and behavioral resilience. GGC will serve as the Prime Integrator, responsible for program governance, implementation coordination, Tribal engagement, evaluation metrics, reporting, and alignment with Alaska’s Rural Health Transformation Program priorities. AffirmedYou LLC will provide the Inner Journey App and REACH+ AI platform, which deliver neuroscience-based mental fitness tools, AI-enabled emotional support guidance, and personalized recommendations, and expand access to digital prevention and self-management tools.	This initiative deploys an AI-enabled digital platform designed to strengthen chronic disease self-management and behavioral resilience across rural Alaska. Guidance Global Consulting (GGC) will serve as the Prime Integrator responsible for program management, governance design, Tribal engagement coordination, implementation oversight, evaluation metrics, and reporting. GGC will coordinate with Tribal Health Organizations, regional health systems, and state partners to ensure alignment with Alaska’s Rural Health Transformation Program initiatives. AffirmedYou LLC will serve as the solutions partner, providing the Inner Journey App and REACH+ AI platform. The Inner Journey App delivers neuroscience-based mental fitness and behavioral support tools that help individuals manage stress, strengthen resilience, and sustain healthy habits that support chronic disease management. Participants enroll through mobile access and receive AI-enabled guidance, mental fitness exercises, and behavioral support tools designed to strengthen resilience, emotional regulation, and personal well-being. The platform also integrates biofeedback and resilience tracking. Where applicable, biometric indicators such as heart rate variability and stress indicators can be incorporated to provide deeper insight into individual well-being trends. The REACH+ AI enterprise layer integrates biometric analysis, psychometric readiness assessment, and AI-generated development pathways. These personalized recommendations support improvements in resilience, sleep, cognitive performance, and behavioral adherence. In addition to individual support tools, the platform generates aggregated community-level dashboards that provide insight into engagement patterns, resilience trends, and adoption levels across participating populations. These insights support population health management by helping organizations understand behavioral engagement trends and identify areas where additional support may improve chronic disease outcomes.	\$1M-\$5M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Guidance Global Consulting Inc.	Alaska AI Community Health Workforce Extender Initiative	MD	Alaska faces a major challenge in healthcare delivery, driven by constraints related to people, time, and geographic access. Approximately 39% of Alaska’s population resides in a federally designated Health Professional Shortage Area (HPSA), covering 96% of the state’s land area. Approximately 28% of Alaska residents live in designated mental health professional shortage areas, and many boroughs have extremely limited access to primary care physicians. At the same time, Alaska’s healthcare workforce faces substantial shortages. The state’s health care industry is projected to require more than 9,400 new healthcare workers annually due to high demand and workforce turnover. These challenges are particularly acute in rural and Tribal communities where access to behavioral health services, primary care, and social support services is limited by geography, workforce supply, and infrastructure. This project addresses the opportunity to expand healthcare access through an AI-enabled healthcare workforce extender model. GGC will serve as the prime integrator responsible for program governance, implementation coordination, Tribal engagement, evaluation metrics, reporting, and alignment with Alaska’s Rural Health Transformation Program priorities. HumAlnity.AI provides an artificial intelligence platform that functions as a healthcare workforce extender, allowing healthcare professionals to support thousands of individuals simultaneously via phone, video, text message, and chat.	This initiative introduces an AI-enabled healthcare workforce extender model designed to expand access to healthcare across Alaska’s rural and Tribal communities. GGC will serve as the Prime Integrator responsible for program management, governance design, Tribal engagement coordination, implementation oversight, evaluation metrics, and reporting. GGC will coordinate with Tribal Health Organizations, the Alaska Department of Health, and regional partners to ensure the project aligns with Alaska’s Rural Health Transformation Program initiatives. HumAlnity.AI will serve as the solutions partner, providing the AI healthcare extender platform. HumAlnity.AI is an artificial intelligence system designed to function as a healthcare workforce extender, similar to how Physician Assistants or Medical Assistants extend the work of physicians. The system enables healthcare professionals to support individuals at any time through phone, video conference, text message, and chat in the ten most common languages spoken in the world, covering approximately 97% of the languages spoken at home by residents in Alaska. HumAlnity.AI has been certified in California as a Community Healthcare Worker (CHW) and Community Mental Health Worker (CMHW). These roles serve as trusted intermediaries between communities and healthcare systems by providing culturally appropriate health education, care navigation, social support, and connections to services such as transportation, housing, and food assistance. Community Health Workers have demonstrated strong impact in reaching underserved populations, reducing disparities, and lowering emergency room visits. The HumAlnity AI extender model allows healthcare professionals to scale these services significantly by enabling a single workforce member to support thousands of individuals simultaneously. The platform also addresses behavioral health needs. Community Mental Health Workers provide support to individuals with mental health conditions by conducting assessments, supporting care planning, facilitating resources, and offering crisis support. According to the Alaska Behavioral Risk Factor Surveillance System, approximately 66% of Alaska adults experience at least one social determinant of health risk factor, while nearly 20% experience four or more. AI-enabled healthcare workforce extenders can improve access to care while supporting Alaska’s efforts to expand community health workers and strengthen rural healthcare delivery.	\$1M-\$5M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Guidance Global Consulting Inc.	Alaska AI Workforce Balance & Access Stabilization Initiative	MD	Alaska’s rural and frontier healthcare systems face persistent workforce instability driven by geographic isolation, limited staffing pools, weather disruptions, and administrative inefficiencies. These challenges are particularly acute in small rural and Tribal health facilities where even a single vacancy can disrupt entire service lines. Manual scheduling processes further compound workforce strain by creating coverage gaps, increasing overtime, administrative burden, and reliance on premium labor or temporary staffing. Workforce volatility directly affects access reliability in rural communities, particularly for emergency services, maternal health, behavioral health, and critical inpatient services, and stabilizes rural healthcare access through AI-enabled workforce scheduling optimization. GGC will serve as the Prime Integrator responsible for program governance, Tribal engagement coordination, evaluation metrics, reporting, and alignment with Alaska’s Rural Health Transformation Program priorities. Duality Systems provides the Balance Scheduler platform, an AI-enabled workforce optimization tool designed to automate complex scheduling processes, improve workforce stability, and reduce administrative burden in hard-to-staff environments. Together, this initiative strengthens workforce stability, improves service coverage reliability, and supports long-term fiscal sustainability across rural and Tribal health systems in Alaska.	This initiative deploys an AI-enabled workforce scheduling optimization platform integrated with GGC’s rural health transformation framework. GGC will serve as the Prime Integrator responsible for program management, governance design, Tribal engagement coordination, implementation oversight, evaluation metrics, and reporting. GGC will coordinate with rural hospitals, Tribal Health Organizations, and regional health partners to ensure alignment with Alaska’s Rural Health Transformation Program initiatives. Duality Systems will serve as the solutions partner, providing the Balance Scheduler workforce optimization platform. The initiative begins with a workforce baseline and transformation assessment led by GGC. This assessment evaluates staffing variability, vacancy risk patterns, overtime utilization, and coverage gaps across service lines. Baseline operational metrics will be established to support ongoing evaluation of workforce stabilization outcomes. Following the baseline assessment, Duality will configure and deploy the Balance Scheduler platform across participating facilities. The system automates schedule generation while ensuring credential and skill-mix compliance, workforce preference integration, and real-time disruption management. Automated scheduling dramatically reduces the administrative time required to build schedules, allowing leaders to focus on patient care coordination and operational management. The platform also generates workforce analytics and operational dashboards tracking key performance indicators including schedule build time, coverage reliability, disruption response time, fairness distribution across staff schedules, overtime utilization, and administrative time avoided. GGC will integrate these operational improvements into broader workforce stabilization and governance frameworks, ensuring that scheduling optimization translates into measurable improvements in access, workforce retention, and fiscal sustainability.	\$1M-\$5M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Guidance Global Consulting Inc.	Alaska RHTP Implementation, Quality Improvement, and Performance Management Support	MD	The Alaska RHTP represents a historic investment to improve access, quality, coordination, and sustainability of healthcare services across Alaska’s rural and frontier communities. Successfully translating this investment into measurable improvements in health outcomes requires strong program design, implementation support, evaluation infrastructure, and coordinated engagement with healthcare providers, Tribal Health Organizations, and community stakeholders. Rural and Tribal health systems operate within complex environments that include geographic isolation, workforce shortages, fragmented care coordination, and financial pressures on critical access providers. These challenges require transformation initiatives that are grounded in data, aligned with community priorities, and supported by strong governance and performance monitoring systems. Guidance Global Consulting (GGC) proposes to support the Alaska Community Foundation and the Alaska Department of Health as a strategic advisory and program management partner to strengthen the implementation of the Rural Health Transformation Program. Drawing on deep experience designing and leading large federal healthcare transformation programs, GGC will support program planning, stakeholder engagement, performance measurement, evaluation, and continuous improvement to ensure that RHTP investments translate into sustainable improvements in access, quality, and health outcomes for rural and Alaska Native communities.	GGC will serve as an independent program management, quality improvement, and strategic advisory partner supporting the Alaska Community Foundation and the Alaska Department of Health in implementing the Rural Health Transformation Program. GGC’s approach focuses on strengthening the infrastructure required to translate funding investments into measurable improvements in healthcare delivery and population health outcomes. The work will begin with program design and alignment activities that support implementation of the six RHTP initiative areas. This includes developing implementation frameworks, performance management structures, evaluation plans, and reporting mechanisms that align project investments with statewide health priorities. GGC will support the development of performance metrics and evaluation frameworks that track progress across key indicators, including access to care, workforce capacity, quality improvement outcomes, care coordination effectiveness, and financial sustainability for rural providers. A core component of the work will be stakeholder engagement and collaboration across Alaska’s healthcare ecosystem, including engagement with rural hospitals, Tribal Health Organizations, community providers, public health agencies, and community-based organizations. The GGC team has significant experience working with diverse provider types across the healthcare system, including hospitals, physician practices, behavioral health providers, community health centers, and long-term care providers. We will also support learning collaboratives and technical assistance to participating organizations, helping providers adopt best practices in care delivery, quality improvement, data reporting, and operational transformation. GGC’s team brings significant experience from the CMS, where senior leaders managed and implemented national healthcare programs impacting more than 65 million Medicare and Medicaid beneficiaries. This experience includes oversight of federal healthcare portfolios exceeding \$6 billion, including national quality improvement programs, rural health initiatives, and programs supporting American Indian and Alaska Native populations. Through this initiative, GGC will support Alaska’s RHTP by strengthening program governance, ensuring rigorous evaluation and reporting, facilitating stakeholder collaboration, and helping ensure that transformation investments achieve measurable and sustainable improvements in health outcomes.	\$1M-\$5M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Guidance Global Consulting Inc.	Alaska Rural Data Modernization and Program Integrity Acceleration Initiative	MD	Rural healthcare providers in Alaska face fragmented data systems, manual medical record retrieval, and increasing federal documentation requirements that strain limited administrative capacity. In a largely fee-for-service Medicaid environment, payment accuracy, audit defensibility, and efficient record processing are critical to the financial stability of rural facilities that cannot absorb improper payment recoupments or penalties. Critical Access Hospitals and Tribal Health Organizations often lack the workforce and digital infrastructure to manage high-volume documentation. Many providers rely on paper and fax-based record submission due to limited broadband and EHR capabilities. These challenges result in delayed reimbursements, increased risk of improper payments, reduced audit defensibility, and staff time diverted from patient care. Commence leverages AI-powered record ingestion, classification, and automated outreach to digitize and organize medical records at scale. These capabilities streamline workflows, improve claims review accuracy, reduce administrative burden, and enhance documentation defensibility. Applied in Alaska’s fee-for-service and cost-based environment, the platform strengthens payment accuracy, frees staff for patient care, and supports long-term fiscal sustainability without requiring immediate adoption of risk-based payment models.	This initiative deploys Commence’s AI-powered medical record platform to digitize, classify, and connect medical records and claims data across Alaska’s rural provider ecosystem—enabling structured, review-ready data exchange without requiring providers to upgrade existing infrastructure. Commence’s platform ingests records from every submission modality: fax, mail, secure portal, electronic fax, API, and Health Information Exchange connections. This multi-path design is essential in Alaska, where many rural and frontier providers rely on legacy channels. Records are automatically ingested, classified by type—discharge summaries, lab results, physician orders, operative notes—de-duplicated, and delivered as standardized digital records. File processing times have dropped from roughly one hour to 380 seconds, a 9.5-fold increase, and medical record retrieval timelines have been reduced by over 75 percent in federal deployments. More than 16,000 FTE hours per year have been reclaimed through automation. For fee-for-service Medicaid providers, the platform enhances improper payment analytics, documentation defensibility, and workflow efficiency. Structured data outputs align provider records with coverage policies, reducing billing errors and audit exposure. For Critical Access Hospitals under cost-based reimbursement, automation reduces administrative burden and modernizes medical records, reclaiming staff time for patient care. For Tribal Health Organizations under the All Inclusive Rate, the focus is on documentation accuracy, audit preparedness, and secure data modernization. Tribal governance is addressed through consent frameworks and data-use agreements developed with each Tribal entity. The platform enforces role-based access, HIPAA-compliant data handling, and deployment on AWS GovCloud, meeting the security and privacy needs of sovereign Tribal data environments. Guidance Global Consulting serves as an integrator, ensuring the deployment model aligns with Alaska’s reimbursement landscape: fee-for-service Medicaid—improper payment analytics and workflow efficiency; cost-based Critical Access Hospitals—administrative cost reduction and record modernization; Tribal Health Organizations—documentation accuracy, audit preparedness, and secure data modernization while respecting Tribal governance.	\$1M-\$5M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Guidance Global Consulting Inc.	Alaska Rural Revenue Cycle Stabilization and Fiscal Sustainability Initiative	MD	Rural providers in Alaska face persistent operational challenges, including delayed reimbursements, denied claims, documentation gaps, limited administrative staffing, and high overhead in geographically isolated communities. In fee-for-service and cost-based environments, even modest revenue leakage materially affects sustainability. Independent medical practices and small rural facilities often lack advanced analytics, structured denial tracking, and proactive revenue integrity processes. For Tribal Health Organizations operating under the All Inclusive Rate model, documentation accuracy and compliance remain essential for audit defensibility and federal reporting. Our Solutions make independent medical practices thrive, not just survive, and operate under a results-based pricing model in which the company is not paid unless its clients are paid [CiBR Solutions Mission and Vision]. This model aligns incentives with rural providers and ensures a focus on measurable improvements in collections.	The initiative begins with a comprehensive, complimentary assessment of participating providers to identify revenue leakage, denial trends, documentation gaps, coding issues, and workflow inefficiencies. Based on the findings, we will develop a tailored revenue cycle improvement plan that addresses billing optimization, denial reduction, coding accuracy, and collections enhancement. Our billing services operate on a percentage-of-collections basis, aligning payments with actual revenue performance and incentivizing the maximization of legitimate reimbursement. Pricing varies based on the volume of claims, the size of the practice, and the complexity of cases, ensuring right-sized engagement for rural facilities. We monitor industry-standard KPIs and provide monthly one-on-one consultations to review performance trends, denial rates, collections cycle times, and recommend corrective actions [CiBR Solutions Mission and Vision]. This structured oversight strengthens accountability and continuous improvement. GGC, as Integrator, ensures that revenue cycle improvements align with Alaska’s broader RHTP fiscal sustainability goals. For fee-for-service Medicaid providers, the emphasis is on improving clean-claim rates, reducing denials, and accelerating reimbursement timelines. For Critical Access Hospitals operating under cost-based reimbursement, the emphasis is on reducing administrative overhead and strengthening the integrity of cost reporting. For Tribal Health Organizations operating under the All Inclusive Rate model, emphasis is placed on documentation defensibility, compliance alignment, and audit preparedness. GGC will coordinate cross-provider learning collaboratives, ensure alignment with the principles of voluntary RHTP participation, and integrate revenue cycle performance metrics into broader RHTP reporting frameworks.	\$250K-\$1M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Guidance Global Consulting Inc.	Alaska Rural Workforce Optimization and Readiness Intelligence Initiative	MD	Alaska’s Rural Health Transformation Program identifies Strengthen Workforce, Spark Technology and Innovation, and Pay for Value Fiscal Sustainability as core initiatives required to stabilize rural health systems across the state. The RHTP framework recognizes workforce shortages, geographic isolation, and operational strain as central barriers to sustaining healthcare delivery in rural, remote, and frontier communities. Rural healthcare providers face persistent recruitment and retention challenges. Workforce instability contributes to service disruptions, increased costs, and reduced access to care. While many workforce strategies focus on recruitment pipelines and financial incentives, long-term stability also requires addressing burnout, stress, and operational strain affecting frontline healthcare staff. Traditional workforce wellness programs rely on periodic surveys that provide limited insight into real-time workforce conditions. This initiative addresses the opportunity to establish a workforce readiness and resilience intelligence infrastructure that allows healthcare organizations to monitor workforce wellbeing, prevent burnout, and improve workforce performance. Guidance Global Consulting (GGC) will serve as the prime integrator responsible for program governance, implementation coordination, Tribal engagement, evaluation metrics, reporting, and alignment with Alaska Rural Health Transformation Program priorities.	This initiative deploys an AI-enabled workforce readiness intelligence platform designed to strengthen healthcare workforce resilience and operational performance across rural and Tribal health systems. Guidance Global Consulting (GGC) will serve as the Prime Integrator responsible for program management, governance design, Tribal engagement coordination, implementation oversight, evaluation metrics, and reporting. GGC will coordinate with Tribal Health Organizations, regional health systems, and state stakeholders to ensure alignment with Alaska’s Rural Health Transformation Program initiatives. AffirmedYou LLC will serve as the solutions partner, providing the REACH+ AI human performance and workforce readiness platform. REACH+ AI is a ten-module enterprise platform that combines biometric analysis, psychometric readiness assessment, and AI-driven coaching to improve workforce resilience, performance, and well-being. The system generates continuous readiness intelligence using biometric signals, including voluntary wearable integration, along with psychometric indicators that measure stress, resilience, engagement, and performance readiness. Participating workforce members complete an onboarding process including a structured biofeedback assessment across multiple wellness and human performance dimensions. These assessments generate individualized readiness profiles. The system analyzes biofeedback indicators such as heart rate variability and stress regulation, and produces AI-generated development pathways designed to improve resilience, sleep quality, cognitive performance, and stress management. In addition to individual development tools, the platform generates aggregated organizational dashboards that provide leadership teams with anonymized readiness intelligence across workforce populations. These dashboards allow healthcare organizations to monitor workforce stress levels, burnout indicators, engagement trends, and resilience improvements over time. By combining individual development tools with organizational intelligence dashboards, the initiative allows healthcare organizations to identify emerging workforce risks earlier and implement targeted interventions that improve workforce stability.	\$1M-\$5M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Guidance Global Consulting Inc.	Alaska Tribal Health Workforce & Quality Transformation Initiative	MD	Alaska’s RHTP identifies six statewide initiatives designed to improve access, strengthen workforce capacity, modernize infrastructure, and advance fiscal sustainability across rural and Tribal health systems. Each initiative requires workforce readiness to successfully implement transformation priorities such as alternative payment models, population health infrastructure, telehealth and digital systems, chronic disease management programs, and maternal and behavioral health services. Tribal health systems are central to rural care delivery in Alaska. However, workforce shortages, geographic barriers, and increasing administrative and performance expectations create significant implementation challenges. GGC, serving as the prime integrator, will coordinate implementation, governance, evaluation metrics, reporting, and alignment with Alaska RHTP priorities. GGC will work directly with Tribal Health Organizations and Tribal leadership to ensure culturally appropriate implementation and alignment with Tribal governance structures. NAHQ will provide the workforce competency infrastructure and training solutions needed to strengthen healthcare quality, safety, and performance-improvement capabilities across Tribal health systems. Together, this initiative supports the workforce capacity necessary for Tribal health systems to successfully implement RHTP initiatives and translate transformation investments into sustainable improvements in access, quality, and fiscal stability.	This initiative establishes a structured Tribal workforce competency and quality infrastructure aligned with Alaska’s Rural Health Transformation Program. GGC will coordinate with the Alaska Department of Health, Tribal Health Organizations, and regional partners to advance the statewide transformation goals while respecting Tribal governance and operational models, and to support performance tracking across participating organizations. NAHQ will serve as the solutions partner, providing workforce competency frameworks, training programs, and tools for healthcare quality capability development. First, the project will deploy NAHQ’s Healthcare Quality Competency Framework™ to assess workforce capabilities across participating Tribal Health Organizations. This nationally validated framework defines the domains and skills required for high-functioning quality systems. Assessments will identify gaps in quality and safety capabilities, data and performance improvement readiness, leadership development needs, and readiness to participate in value-based care models. The proposed pilot will include approximately 100 participants representing key quality and safety leaders across regions, followed by broader expansion to clinical and leadership teams in Year 2. Second, the project will implement HQ Concepts, a one-hour online foundational course that provides baseline knowledge of healthcare quality and creates a shared vocabulary across teams. This course supports frontline clinical and non-clinical staff across Tribal clinic sites by strengthening their understanding of quality improvement and patient safety principles. Third, the project will deploy HQ Principles, a six-hour certificate program for quality and clinical leaders that introduces core quality and patient safety principles, performance improvement methodologies, and structured pre- and post-assessments. Fourth, the initiative will support value-based care and fiscal sustainability readiness through education, benchmarking literacy, and change management support. GGC and NAHQ will assist Tribal organizations in aligning workforce competencies with participation in alternative payment models and sustainable care delivery models. Finally, the initiative will embed quality governance across Tribal health organizations by integrating competency-based quality and safety roles across leadership, clinical, and operational teams, strengthening organizational capacity for system-wide improvement.	\$1M-\$5M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska- Susitna Borough	Deferred or Not Advanced

Guidance Global Consulting Inc.	Interior Alaska Rural Mobile Care Extension Hub (MIHCP + Primary Care + CAH Transitions)	MD	Rural and frontier communities in Alaska face persistent barriers to accessing coordinated health services, particularly for individuals with complex care needs, chronic disease, behavioral health conditions, and social risk factors. Some Health systems operate in silos, creating gaps in care coordination across emergency medical services, hospitals, primary care, behavioral health providers, and community-based services. These challenges contribute to avoidable hospitalizations, delays in care transitions, and limited follow-up care for high-risk individuals. Mobile Integrated Health and Community Paramedicine (MIHCP) models offer an opportunity to improve access to care and coordination by extending the reach of the healthcare workforce into homes and communities. However, MIHCP programs require reliable technology infrastructure to manage referrals, coordinate services, document encounters, and track outcomes across many organizations. It's an opportunity to establish a rural mobile care extension hub supported by interoperable care coordination technology. GGC will serve as the strategic integrator, enabling Tribal engagement coordination, evaluation metrics, reporting, and alignment with Alaska's RHTP priorities. Julota will provide the care coordination platform that enables community-based care teams, paramedics, and healthcare providers to coordinate services, manage workflows, document care activities, and generate reporting across participating organizations.	The project will establish a Rural Mobile Care Extension Hub designed to support care coordination across emergency services, primary care providers, hospitals, and community-based organizations in rural Alaska. Guidance Global Consulting (GGC) will serve as the program integrator responsible for program governance, implementation coordination, Tribal engagement, performance measurement, and reporting. GGC will also support alignment with Alaska Rural Health Transformation Program priorities and ensure integration across participating healthcare organizations and Tribal health partners. Julota will provide the cloud-based care coordination technology platform that supports workflow management, documentation, referrals, and reporting across participating providers and care teams. The Julota platform enables healthcare providers and community organizations to coordinate services through shared case management workflows. It supports referrals between providers, documentation of patient encounters, care plan tracking, and reporting on services delivered. Through the platform, care teams, including paramedics, community health workers, and other providers, can document interactions with patients in real time and share information across participating organizations. This improves communication across providers and reduces fragmentation in care delivery. The initiative will support Mobile Integrated Health and Community Paramedicine programs by providing a centralized system to track patient engagement, coordinate follow-up care, and document care transitions from hospitals and emergency services to community-based care. Guidance Global Consulting will also support program monitoring and evaluation by establishing performance metrics, reporting processes, and oversight structures for implementation. This includes tracking utilization, care coordination activity, and service delivery metrics. The initiative will also incorporate engagement with Tribal Health Organizations and input from the GGC Tribal Advisory Board to ensure the model aligns with the needs and governance structures of Tribal health systems.	\$1M-\$5M	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Guidepost Pediatric Therapies and Educational Services	Integrated Rural Rehab and Healthy Communities Hub: Expanding Access	AK	GuidePost Pediatrics has experienced these workforce challenges firsthand. Recruiting/retaining talented clinicians in Wasilla—a community technically considered "urban" under some federal definitions but in reality a frontier environment serving vast rural catchment areas has been successful in many ways and challenging in others. With the help of the RHG, and creative strategies, competitive compensation, robust professional development, and a supportive workplace culture, we will increase the workforce. GPTES seeks to address critical gaps in pediatric behavioral/ occupational therapy services in the Mat-Su Borough and surrounding rural regions of Alaska when children discharge from in-patient facilities. Without timely intervention and coordinated care, these children face increased risks of academic struggles, emotional distress, and long-term health disparities. These workforce shortages create delays in care that can significantly impact child development. GPTES seeks to address this workforce challenge through targeted workforce development strategies designed to increase the number of clinicians trained in pediatric occupational therapy and behavioral health services. These strategies include clinical training partnerships with universities, mentorship programs for early-career providers, continuing education opportunities, and telehealth-supported supervision models. Technology partnership that are already developing support app that extend care.	Pediatric health needs among children in the Mat-Su region and across the state have increased significantly in recent years. Schools, peds providers, and families report growing concerns related to anxiety, trauma exposure, emotional regulation challenges, attention difficulties, and behavioral disorders. Pediatric BH requires specialized training in child development, family systems, trauma-informed care, and behavioral intervention strategies. Without providers trained in these areas, families often struggle to find appropriate support for their children. Without appropriate intervention, these challenges can interfere with school success, peer relationships, and family functioning. GPTES addresses these needs through three prong approach: workforce development, technology support, and healthy and early intervention with integrated pediatric behavioral health services. We are seeking to expand these services through our already-designed, extensive workforce development plan and renovation. Providers collaborate with occupational therapists and other clinicians to address the complex interplay among emotional regulation, sensory processing, and developmental challenges. Telehealth services further expand access to BH support for families living in rural areas. By reducing travel barriers and increasing appointment availability, telehealth allows families to access behavioral health services more consistently. Expanding pediatric behavioral health capacity in the Mat-Su region when we launched four years ago already has improved early intervention, reduce school disruptions, and strengthen family resilience. With 207 referring providers, and multiple social work and tribal networks and with our large presence in multiple schools, we are meeting needs that would not have otherwise been met. Through sensory integration strategies, play-based therapy, and skill-building activities, occupational therapists help children build the neurological and motor foundations required for successful participation in daily life. GPTES seeks to expand occupational therapy access by increasing provider capacity, developing telehealth service models, and strengthening interdisciplinary collaboration between occupational therapists and BH providers. Our Integrated care model enables all therapists to collaborate to address complex challenges. We have already designed a renovation to an exsisting building that adds housing to our facility for new providers.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

H.O.P. E. (Helping Ourselves Prevent Emergencie s)	Exam Room for Survivors of Sexual Assault	AK	HOPE will solve the problem of survivors needing to leave their homes on Prince of Wales to travel to a different community to obtain a sexual assault forensic exam after they have already experienced a life-changing, traumatic violation, which contributes to suicidal ideations, substance abuse, and chronic diseases in those who have been victimized. Creating a new examination space on the Island that would always be available for use improves access to healthcare, encourages partnerships, and invests in rural community programs to ensure the availability of remote care services.	HOPE plans to renovate one of the rooms in the current office space to become a dedicated exam room. The room has cabinetry included, but they may need to be removed to allow enough space for an exam table and necessary exam equipment. HOPE will furnish the room with the most sterile flooring available and purchase equipment for the room, such as an exam table, a culposcope, sinks, stools, and supply organizers. The room is already in a private area, and the door can be locked for safety as well.	\$50,000- \$250,000	Multi- Community or Participating in Regional Hub-and- Spoke	Prince of Wales- Hyder Census Area	Deferred or Not Advanced
Haa Tóoch Lichéesh	Náakw wooch jeex_ tootee / We give each other medicine- Connecting Traditional Healers Across Alaska	AK	Across rural Alaska, many communities lack access to culturally relevant preventative and behavioral health supports that reflect Indigenous knowledge, community relationships, and traditional healing practices. Alaska Native people were 91% more likely to die by suicide than the U.S. population overall and behavioral health provider shortages affect over 75% of rural communities, leaving critical gaps in culturally relevant care. Geographic isolation, limited provider availability, and health systems that often fail to reflect Indigenous cultural knowledge leave communities without trusted pathways for healthcare and healing. For generations, colonization and assimilation policies—including government-run boarding schools—disrupted Alaska Native healing knowledge by suppressing cultural practices and separating communities from traditional healing systems. These disruptions continue to affect community health today, contributing to behavioral health challenges, substance use, and chronic disease. At the same time, traditional healers across Alaska continue to carry knowledge that supports cultural connection, resilience, and preventative approaches to wellness. However, many practitioners work in isolation with limited opportunities for mentorship, training, or coordination. Strengthening networks of traditional healers represents an important opportunity to expand culturally grounded prevention and behavioral health supports while strengthening the rural health workforce.	Haa Tóoch Lichéesh will establish a Southeast Alaska Regional Healers Cohort weaving together healing, development, mentorship, and community service into a regenerative, self-sustaining system. The cohort will launch with intergenerationally structured Southeast Alaska community teams connected through regular in-person training and healing gatherings, quarterly virtual gatherings, and an online message board. Skill development will focus on circle facilitation, peacemaking, traditional foods, and rites of passage, alongside certification opportunities including Somatic Experiencing International. Cohort members will receive priority access to all training opportunities, with limited additional scholarships available to other Alaska-based practitioners when space allows. Members will receive business planning and financial systems support through SpruceRoot, and website and storytelling development through Cedar Group. Community teams will access implementation funds supporting mentor stipends, youth apprenticeship wages, medicine harvesting materials, and community programming — advancing community sovereignty while providing preventative and restorative care. Teams will map local healing and behavioral health resources, strengthen referral pathways, and develop shared protocols for ethical practice. Sustainability models under exploration include a healer support call line, a plant medicine cooperative, shared physical spaces, and fee-for-service training offerings. Cohort structure, learnings, and resources will be compiled and shared with other Alaskan regions to support program replication. Complementing the cohort, key statewide partnerships will advance culturally grounded care across Alaska. Kaasei Indigenous Foodways will coordinate a statewide plant medicine learning network, and together with the Kayaani Sisters, will host annual statewide plant medicine symposiums and train-the-trainer intensives. This partnership will also advance Alaska-based plant medicine curriculum and educational resources, while exploring longer-term training pathways for practitioners seeking deeper study in traditional practices. Snow Creek Medicine will develop infrastructure supporting healer sustainability statewide, including healer gatherings, a cooperative, and a call line.	\$250K-\$1M	Multi- Community or Participating in Regional Hub-and- Spoke	Anchorage (Municipality); Bethel Census Area; Haines Borough; Hoonah- Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementati on Application

Haa Tóoch Lichéesh	Wooch yei tusnéxch / We heal each other- Elder-Led Boarding School Healing and Cultural Restoration	AK	The boarding school era disrupted language, culture, and family systems across Alaska Native communities. Today, every Alaska Native family continues to experience the intergenerational impacts of forced assimilation, cultural suppression, and separation from land and kin. Boarding school attendees had a 44% greater count of chronic physical health problems as adults compared with nonattendees. Many Elder boarding school survivors carry unresolved trauma with limited opportunity for culturally grounded healing. Rural health systems remain largely clinical in structure and are not designed to address the collective and intergenerational dimensions of this harm. Survivors often navigate healing in isolation, while community leaders working to return the remains of loved ones from boarding school sites carry complex emotional labor without coordinated support. Cultural knowledge and practices intentionally interrupted by boarding school policies are rarely integrated into prevention and behavioral health systems. Opportunities for Elders to share knowledge and for families to reconnect through cultural practice are limited by geographic isolation and resource inequities across rural communities. There is a critical opportunity to strengthen rural health transformation by building Elder-led, culturally grounded trauma healing infrastructure in Southeast Alaska—reducing isolation among survivors while restoring intergenerational pathways for cultural learning and community healing.	This project will establish a pilot Elder-Led Boarding School Survivor Healing Initiative in Southeast Alaska designed to build culturally grounded trauma-healing infrastructure that can expand across rural communities over time. 1. Survivor Healing Cohorts We will partner with 3–5 Southeast Alaska communities to establish locally led healing cohorts for boarding school survivors and directly impacted Elders. Each community will identify two compensated local leaders who will host structured gatherings grounded in cultural practice, storytelling, and collective grief tending. Haa Tóoch Lichéesh Coalition will provide coordination, facilitation support, and a shared framework while honoring each community’s cultural context. Quarterly virtual gatherings will connect the cohorts, strengthening regional connection and reducing isolation among Elders living in geographically dispersed communities. 2. Return-of-Remains Support and Coordination Circle Leaders engaged in efforts to return the remains of loved ones from boarding school sites and museum collections will participate in a quarterly virtual support circle. Lessons learned and emerging needs will inform longer-term coordination infrastructure for boarding school healing efforts across the region. 3. Cultural Restoration Mapping Through relationship-centered conversations with participating Elders, the initiative will document cultural gifts, interrupted learning, and areas of interest for skill restoration. This work will help identify opportunities for mentorship, knowledge sharing, and culturally grounded prevention strategies that strengthen protective factors for future generations. 4. Regional Elder Cultural Restoration Gathering In Year 2, the initiative will convene a regional gathering focused on reclaiming language, cultural practices, and knowledge that many survivors were prevented from learning during the boarding school era. 5. Elder Master-Apprenticeship & Knowledge Documentation As cultural knowledge and gifts are identified, participating Elders will have the ability to self-select into a compensated Master-Apprentice model of knowledge sharing with a local non-Elder community member. Apprentices would gain and document Elder traditional knowledge, following clan and tribe protocols for knowledge sharing. Together, these activities establish a scalable model for integrating culturally grounded trauma healing into rural behavioral health and prevention systems over a five-year arc.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Haida Canoe Revitalization Group	Transforming Community Wellbeing Through Cultural Competition	AK	The problem is that our community and neighboring communities across our region, and beyond, are struggling, and failing, to maintain anywhere near optimal mental and physical wellbeing. Drugs, alcohol, and behavioral health issues are rampant and chronic. Low self, as well as low community, esteem is prevalent and destructive across our region. There are many reasons for this. We are immersed in cultural trauma, identity uncertainty, career path confusion, alcohol & drug misuse, lack of purpose, economic uncertainty, underfunded schools, etcetera. The opportunity is that the RHTP grant timing is very good, we have the right people and organizations in the right places to make this project successful. With proper funding we can bring these people together to create a team which promotes healthy lifestyles using culturally appropriate community education, initiating a significant improvement in the lives of people in the Southeast region. In the foreseeable future we can also strengthen bonds with other regions. The people of the Southeast Region can really be empowered in a way that develops, physical, mental & emotional health, social connection, purpose & meaning. For the youth, a sense of identity can develop as an inner strength that will carry them through the most challenging of times for the rest of their lives.	The approach to this project is to bring potential affiliates together for discussions, identifying who is most suited to accomplish the various elements of work involved. We will hire several people, as well as incorporate students, to build traditional style canoes of combined natural and synthetic materials. There will be a focus on safety, quality, and beauty for an enhanced feeling/experience. These canoes will initially be distributed among 9 schools and 4 Federally Recognized Tribes on, or near, Prince of Wales island. An annual competitive multiday, traditional canoe inspired event will be hosted in Kasaan on Prince of Wales island. Schools, health organizations, tribes, individuals, and others will come together to compete, observe, play, network, relax, eat, bond, develop purpose, etcetera. Competitive events will be encompassing. They will include things such as single and team canoe racing, canoe tug of war, stunt canoeing, best looking canoe, etcetera. For participants less inclined to get involved in physical events, there will be competitive canoe academic sports such as canoe engineering/architectural design challenges, artistic design, etc. Challenges will include (but are not limited to) engineering, physics, hydrodynamics, etc. Throughout the event there will be health & wellbeing experts incorporating their knowledge and expertise, making the event an optimal pathway to wellbeing. The expertise range will be broad, it will encompass many areas of health and wellbeing, including but not limited to drug & alcohol prevention and recovery. There will be canoe making instruction and demonstration empowering more people get involved. Water safety courses prepare people for a variety of situations they may encounter during their lives in Southeast Alaska. In successive phases, canoes will be supplied to schools and tribes that are neighboring, yet distant from Prince of Wales island (a hub and spoke growth pattern). This will include teaching more people to make their own canoes. Each year the event will grow and reach further, it may even inspire replica events in other communities.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Haines Borough	Haines Wellness Initiative	AK	Mental health is an issue in Haines. We had 10 Title 47 involuntary commitments (emergency psychiatric holds) in 2025. One cell in the jail is stripped of furniture. Involuntary holds sleep on a mattress on the cement floor in a bare jail cell. We average 3 suicides every year, or 150 suicides per 100,000 people. This is 5.3 times higher than the Alaska rate of 28.2 per 100,000 and 11 times the national rate. Our suicides include people over 65. One-third of our community is over 65. The Haines Senior Center, designed for Seniors and Disabled gatherings, is used only a few hours each week. According to the National Council on Aging, adults over 65 have high suicide rates due to loneliness, sickness, and despair. With few opportunities for Seniors and Disabled to congregate, social isolation is prevalent in Haines. The Haines Pool is the number one public space for wellness activities during winter months, hosting over 300 people (15% of Haines) per week. It has large windows, bright lights, and tropical foliage, making it popular for light therapy during dark days. However, the ventilation system is 40 years old and doesn't meet today's standards for pools. In poorly ventilated natatoriums, chloramines become trapped in the air just above the water surface – exactly where swimmers breathe. Chloramine buildup causes severe respiratory, eye, and skin irritation. High humidity from poor pool ventilation causes poor air quality, mold, condensation and structural deterioration.	Haines Borough plans to launch The Haines Wellness Initiative as a cross-community effort to reduce suicides and mental health holds and improve happiness in Haines.. 1. Create a collaborative Haines Wellness Initiative group with healthcare providers, school staff, tribes, therapists, disability advocates, and first responders to outline health innovation projects, guide program choices, identify at-risk individuals, and advocate to destigmatize mental health issues within the community. 2. Develop 3 pilot projects that build and expand resources and track participants' mental health changes. Monitoring mental health changes will be done in collaboration with the local clinic and therapists. Pilot Project #1: Create a mental health hold room that looks less like confinement and more like a safe space. Mental health rooms are specialized, secure spaces designed for safety, comfort, and, in crisis situations, preventing self-harm. They feature anti-ligature fixtures, break-resistant materials, soft, calming colors, and 24-hour monitoring. To promote healing, these quiet rooms include ample natural light, art, and comfortable furniture for a non-institutional, calming atmosphere. We will provide staff training in crisis intervention, de-escalation, empathy building, mental health first aid, behavioral health, and mindfulness-based resilience. Pilot Project #2: Improve community-wide mental and physical health through expanding the use and capabilities of the pool and staff. First, improve air quality by replacing the HVAC and ventilation system, doubling air exchange to meet modern requirements, reducing chloramine and controlling humidity. Creating a healthy, safe, enjoyable indoor pool requires powerful air handling systems. Second, increase hours of operation and hire therapists to provide classes and aquatherapy for individuals with disabilities, collaborating with Southeast Alaska Independent Living (SAIL). Pilot Project #3: Develop the Senior Center into a community center that provides increased socialization opportunities for Senior and Disabled populations (1/3 of Haines) by providing daily meals, rides, and socially engaging activities like low impact yoga, tai chi, games, clubs, art and music therapy. Use mental health assessment tools to determine changes in mental health over 8-12 months.	\$1M-\$5M	Single Community	Haines Borough	Advance to Implementation Application

Haines Chamber of Commerce	Haines Community Potluck	AK	By providing a space for gathering and a meal made with whole foods, we are offering a health-giving service that benefits not only one's physical health but also one's mental health. The event is free and open to anyone who wishes to attend. Many individuals have been cited as saying they had not engaged in any social activity throughout the winter until this event was held. This can mean a great deal in relieving mental stress for these individuals, especially after stressful storms like the one we experienced last December. As soon as the roads were cleared, we hosted our first potluck with over 100 people in attendance. As a chef and restaurant owner, I served the main dish: homemade currywurst sausages with braised cabbage and homemade sourdough bread. We served everyone who attended. This model creates a space for those who have to share with those who don't. I always have food and the knowledge to create something with it. Creating a space where delicious whole foods can be shared for free helps community health, well-being, and commerce. Others who brought dishes to the event also felt they wanted to help, share, and to see our community gather together. This event has the opportunity to expand through the winter months. I'd like to see that it does, by reimbursing those who bring dishes, covering the cost of the space, the main dish, and providing adequate compensation for the time given to the organizers, ensuring the events longevity for years to come.	The project has been applied and tested, making the concept model successful and well-received. Hosting these potluck events not only upholds Alaska potlatch traditional values but also ensures that community members experience resilience and gratitude internally. Currently, funding has been raised through local business promotions. These businesses spend \$500 for a main dish and space rental. This amount of money feeds over 100 people for free. That is a cost of \$5 per person to have a large plate of diverse foods made locally by other community members. This sometimes means local products are incorporated into these foods, furthering the values of regional cuisines and the importance of healthy, locally produced foods. gaining access to healthy and affordable food can be a challenge for rural residents. Many rural areas lack food retailers and have limited supplies of fresh, affordable foods, even in areas where farming is important to the local economy. According to the Rural Health Information Hub website, in rural areas, access to food may be limited by financial constraints, transportation challenges, or a lack of grocery stores. Rural shoppers may be forced to rely on more expensive and less nutritious food, such as the types available at gas station convenience stores, or face a long drive to a town with a supermarket or grocery store that stocks fresh produce and other staples. Some rural residents and households are food insecure, meaning they cannot rely on access to sufficient, affordable, and nutritious food at all times, increasing the risk of poor health outcomes. According to the 2017 United States Department of Agriculture Economic Research Service (USDA-ERS) publication Food Insecurity, Chronic Disease, and Health Among Working-Age Adults, food insecurity is strongly associated with chronic disease and poor health, both of which disproportionately affect rural populations. Long-term food insecurity can affect physical and mental health, development, learning, productivity, and family well-being. If we were to provide 24 potlucks of the span of 6 months, we could provide over 2400 free meals to local residents.	\$50,000-\$250,000	Single Community	Haines Borough	Deferred or Not Advanced

Haines Huts and Trails	Haines Multi-Use Preventative Healthcare and Transportation Pathway System	AK	Haines is a remote community of approximately 2,500 residents facing significant barriers to physical activity and preventative health. Like many rural Alaskan communities, Haines experiences higher rates of chronic disease, limited access to healthcare services, and geographic isolation that compounds health disparities. With the development of a new hospital facility, Haines has a rare and time-sensitive opportunity to embed healthy living infrastructure directly into the fabric of the community. Currently, no safe, accessible, paved connection exists between the new hospital, downtown Haines, and the Southeast Alaska State Fairgrounds, leaving residents, particularly seniors and people with disabilities, without a reliable route to engage in daily physical activity or access essential services on foot or by non-motorized transit. This project will create an ADA-accessible trail and paved pathway linking these key destinations and integrating with existing trail networks. Research consistently demonstrates that accessible active transportation infrastructure reduces rates of obesity, cardiovascular disease, diabetes, and mental health challenges, directly reducing the burden on rural health systems. By connecting community anchors through a safe, inclusive corridor, Haines Huts and Trails will give every resident, regardless of age or ability, the opportunity to make physical activity a natural part of daily life, strengthening the long-term health of our entire community.	Haines Huts and Trails proposes to design and construct an ADA-accessible, multi-use pathway corridor connecting the new SEARHC hospital facility with downtown Haines, the Southeast Alaska State Fairgrounds, and the Haines High School pool and gym. The route will follow existing road corridors and public land where feasible, minimizing land acquisition challenges while maximizing community reach. There are currently sporadic trails and sidewalks throughout this area, however for them to become effective, reliable, and usable by the community, we need to turn this into a cohesive, well planned network. The pathway will serve a dual purpose: a safe, non-motorized transportation corridor for residents traveling to healthcare and recreation facilities, and a dedicated active-use trail that encourages daily walking and exercise. Paved and ADA-compliant surfaces will ensure year-round usability and equitable access for seniors, people with disabilities, and families with young children. The project will be developed in phases, prioritizing the segments with the highest daily-use potential and greatest connectivity gaps first. Each phase will include wayfinding signage, lighting where appropriate, and connections to Haines' existing trail network to extend the system's overall reach. Haines Huts and Trails will lead project coordination, working alongside local government, SEARHC, and community stakeholders to ensure the route reflects community needs. By embedding active transportation infrastructure into the built environment near a new healthcare facility, this project positions physical activity as an accessible, everyday choice, transforming how Haines residents engage with both their health and their community.	\$50,000-\$250,000	Single Community	Haines Borough	Deferred or Not Advanced

Haines Huts and Trails	Healthy Communities Trail Restoration: Investing in Preventative Health Infrastructure	AK	Haines Huts and Trails maintains an extensive network of non-motorized trails that serve as the primary outdoor recreation facility for residents of Haines, Alaska. These trails are used year-round by community members of all ages for hiking, running, skiing, and everyday active transportation, providing one of the most accessible and affordable forms of physical activity available in a remote community with limited fitness infrastructure. However, decades of minimal maintenance and capital investment have left this network in a significantly degraded state. Overgrown corridors, eroded tread, failing drainage structures, and deteriorating signage have made many trails difficult or unsafe to use, particularly for seniors, families with children, and people with limited mobility. As trail conditions worsen, fewer residents use them, directly undermining the community's most accessible preventative health resource. Haines is a rural community with elevated rates of chronic disease, limited healthcare access, and long winters that compound physical and mental health challenges. Restoring the trail network to a safe, welcoming condition is not a luxury, it is an investment in the daily health of the majority of our residents. This project represents an opportunity to reclaim and reinvigorate a community health asset that already exists, reaching residents where they are.	Haines Huts and Trails proposes to hire a dedicated four-person trail maintenance crew for three consecutive summer seasons to systematically address the maintenance backlog across our existing trail network. This crew-based model is the most efficient and proven approach to high-volume trail restoration, allowing coordinated, sequential work across the system rather than piecemeal repairs. During each summer season, the crew will prioritize work based on trail usage levels, safety concerns, and health equity, ensuring that trails most accessible to lower-income residents, seniors, and families are restored first. Core maintenance tasks will include tread restoration and erosion repair, drainage structure clearing and rebuilding, corridor brushing and blowdown removal, and signage replacement and wayfinding improvements. By the end of three full seasons, we anticipate completing the majority of the deferred maintenance backlog, returning the network to a condition that can be sustained through our organization's regular annual maintenance program. This three-summer investment is designed as a reset, bringing the system from a state of decline to one of stability and usability. Haines Huts and Trails will manage the crew directly, drawing on our organizational experience in trail stewardship and our deep familiarity with the network. Local hiring will be prioritized, creating seasonal employment in the community while building long-term local capacity for trail maintenance.	\$250K-\$1M	Single Community	Haines Borough	Deferred or Not Advanced

Haines Huts and Trails	Mosquito Lake Community Center Recreation Infrastructure Trail System	AK	The Mosquito Lake Community Center sits at the base of a 13-acre wooded parcel with moderate terrain rising into the Haines State Forest, terrain that is immediately suitable for hiking, biking, nordic skiing, and snowshoeing trails that support preventative healthcare measures. The vision for the Mosquito Lake Trail System is straightforward: a purpose-built, multi-use trail network radiating from the FWRC campus into the surrounding Haines State Forest, designed for Nordic skiing, downhill ski glades, mountain biking, hiking, and snowshoeing, and accessible to all residents regardless of income, fitness level, or prior outdoor experience. No such network currently exists in the upper Chilkat Valley. This project would utilize existing former logging roads that surround the community center, which are well-suited for developing a full trail network that community members can utilize year-round to increase their physical fitness and mental health. The planned trail system would serve four distinct use types across two seasons. In summer, multi-use trails would support hiking and mountain biking for all skill levels, with routes beginning directly at the FWRC campus and extending into the Haines State Forest. In winter, groomed Nordic ski loops and snowshoe trails would make the terrain accessible to families, elders, and youth who currently have no dedicated winter recreation infrastructure within reach.	Haines Huts and Trails will use this funding to conduct the terrain assessment, community engagement, state forest coordination, permitting groundwork, professional trail design, and detailed construction budgeting required to develop the Mosquito Lake Trail System. Phase 1: Terrain Assessment & Opportunity Mapping Conduct a terrain assessment of the FWRC parcel and adjacent Haines State Forest, evaluating grades, drainage, soil conditions, snow characteristics, and optimal corridor alignments for Nordic ski loops, downhill ski glades, mountain biking, hiking, and snowshoe trails. Conduct LiDAR-informed terrain analysis using 2021–2022 DGGS survey data for the Chilkat Valley corridor to identify sustainable trail alignments, avalanche risk zones, and optimal glade terrain above the FWRC campus. Phase 2: State Forest Coordination, Community Engagement & Permitting Initiate formal coordination with the Alaska Division of Forestry to understand land use authorization requirements, identify permitting pathways for trails extending into the Haines State Forest, and map the full extent of land available for trail development. Begin the permit application process for all trails crossing state forest land, including any required environmental review, cultural resource consultation, and agency coordination, establishing a clear permitting timeline for future construction. Convene community design input sessions at the FWRC activities room, gathering priorities from upper valley residents, elders, youth, and the Chilkat Indian Village of Klukwan on trail uses, alignments, naming, and cultural stewardship of these lands. Engage Chilkat Indian Village / Klukwan in a formal consultation process regarding trail alignment, naming, and land stewardship to ensure the trail system reflects Tlingit cultural values and territorial knowledge. Phase 3: Trail Master Plan, Design & Construction Budgeting Produce a professionally developed Trail Master Plan documenting all planned trail corridors, use designations (Nordic skiing, downhill glades, mountain biking, hiking, multi-use), difficulty ratings, phasing strategy, and long-term maintenance requirements. Develop a detailed, itemized construction budget for each phase of trail development, including contractor labor, materials, equipment, drainage infrastructure, trailhead facilities, and Alaska-specific cost factors, creating a fundable document for capital grant applications.	\$50,000-\$250,000	Single Community	Haines Borough	Deferred or Not Advanced

Haines Volunteer Fire Department	Haines Borough Rural Community Paramedicine, Mobile Integrated Health Program	AK	The Haines Borough consists of multiple small rural/frontier communities spread out over 2300 square miles, some of these are communities of less than 90 people. The people in these communities have a variety of needs that range from a lack of transportation to an inability to travel. Many have chronic medical problems that require frequent treatment and follow-up care. Mental health care is also a need as the Haines Borough has a suicide rate higher than the state average. All our communities are also in need of substance abuse counseling, medical care, and treatment. Furthermore, our community has no reliable access to the department of public health resources and no public health nurse. The schools in the community have no school nurse leaving students without access to preventive health education or assistance, let alone routine screenings. Other community non-profit organizations such as SAIL, Cornerstone Home Health can't keep up with demand for assistive devices. Hospice of Haines volunteers are non-medical and cannot provide medications for palliative care, this leaves patients unable to remain in home for their last days. There is a need for greater support with organizing community health fairs to provide hearing and vision screenings, to perform baseline concussion screenings. Finally, the volunteer EMS responders have been responding to increasing call volumes with dwindling numbers of responders, well over 400 per year.	We intend to approach our communities' needs by meeting those in need where they live or in a place they are able to meet and consider to be appropriate and safe. We will provide, coordinate, and facilitate care as needed for the individual patient, whether that is transportation, virtual telemedicine appointments, wound-care, medication delivery and/or administration. We will also provide social resource information and connect people to the agency that can best help them and provide follow-up to ensure completion of care. We will assist with community education at schools and community health fairs. The overall vision is to find and fill healthcare gaps in our community, either directly or as a secondary mediator/coordinator to provide care to residents while alleviating some of the pressure on our existing programs.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough	Advance to Implementation Application

Hallelujah Foundation	Pinewood – The Safe Home Project	AK	Hallelujah Foundation proposes to build, staff and operate a home for Alaskans with special needs resulting from severe mental illness. This home will fill an existing gap in the housing continuum providing an alternative to the Alaska Psychiatric Institute or similar settings. These Alaskans have either resided long term or frequently at the Alaska Psychiatric Institute, been incarcerated, or both because of the lack of suitable discharge options. When community alternatives cannot safely accommodate the needs of these individuals, the consequences are incarceration, homelessness, return to acute psychiatric care or death. As a result, individuals with special needs including co-occurring substance use disorders become part of the homeless population particularly in Anchorage, Fairbanks and Juneau.	The Pinewood Project is proposed to be a multi-year project ultimately resulting in the building, licensing, staffing and operating of a home designed for Alaskans with special needs resulting from severe mental illness. This project will fill an existing gap in the housing continuum providing an alternative to the Alaska Psychiatric Institute or similar settings. Intermediate steps include overall scoping of the project as well as finalizing architectural and engineering design. Hallelujah Foundation will provide the building site. Key areas of this project are currently estimated to be: 1) work with the SOA to establish a funding mechanism (preliminary research has happened already through technical assistance from the Mental Health Trust Authority supporting Agnew: Beck) 2) establish a care coordination model with partners to ensure that the people who need this type of placement of care receive it 3) work with the SOA to ensure that licensing and regulations needed for this placement facility align with the funding mechanism and 4) research and determine potential capacity considering span of life implications and resulting needs.	\$50,000-\$250,000	Home- and community-based services provider	Statewide	Anchorage (Municipality)	Deferred or Not Advanced

Hamilton Health Box	Rural Microclinic Network: Tech-Enabled Primary, Behavioral & Chronic Care	TX	Rural and frontier Alaska communities face persistent barriers to primary care access. Many are not road-connected, requiring air or seasonal transport to reach regional health centers. Residents often delay care or rely on emergency departments for manageable conditions. Chronic disease burden is high, with nearly 75% of adults living with or at risk for chronic conditions. Without consistent monitoring, these conditions worsen, driving avoidable hospitalizations and costly medical transport. All Alaska communities carry Health Professional Shortage Area designations, and recruiting providers to remote areas remains difficult. Alaska has strong regional hospitals and Tribal health organizations serving as care hubs. The gap exists at the community level, where residents need reliable local access to routine services and early treatment as well as specialists and maternal care. Alaska's RHTP identifies expanding primary care through right-sized infrastructure and technology-enabled models as a priority. This creates an opportunity for scalable care infrastructure that expands community-level access while strengthening the broader regional health system. Deployment will align with community-led regional health care delivery plans developed under the RHTP framework.	Hamilton Health Box will establish five mobile-capable Microclinics in rural Interior Alaska communities selected in collaboration with regional health systems, Tribal health organizations, and local stakeholders. Site selection will be informed by community-led regional health care delivery plans prioritized under RHTP implementation, ensuring deployments address validated gaps rather than duplicating services. Each Microclinic provides preventive care, physical exams, chronic disease management, medication management, pediatric and geriatric care, behavioral health support, access to maternal care and specialists, and treatment of minor illnesses and injuries. The care model combines local clinical staff with telehealth-supported physician oversight. Local clinicians perform exam components, collect vital signs and specimens, and facilitate diagnostic testing, enabling comprehensive evaluations when specialists connect virtually. Through partnerships with regional hospitals and specialist groups, clinics also provide specialty consultations and maternal health services. Each clinic is equipped with diagnostic tools, EHR systems integrated with healthEconnect Alaska, and telehealth infrastructure supporting real-time care coordination, advancing Initiative #6 (Spark Technology and Innovation) data-sharing objectives. Given the central role of Tribal health providers across rural Alaska, Hamilton Health Box will engage THOs early in planning to ensure Microclinics complement existing services, respect cultural priorities, and establish clear referral pathways. Mobile-capable units require lower capital investment than traditional facilities and deploy without new construction. Centralized physician oversight increases workforce efficiency. Hamilton Health Box will prioritize local recruitment and training to build community-based workforce capacity, supporting Initiative #5 (Strengthen Workforce) goals.	\$1M-\$5M	Clinic	Statewide	Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

HCBS Strategies, Inc.	ADRC/DDRC Mental Health & Substance Use Disorder Options Counseling Infrastructure Development	MD	Alaska faces a profound and interconnected crisis of homelessness, mental health disorders, and substance use disorders. On a single night in January 2024, over 2,600 individuals experienced homelessness statewide, while roughly 132,000 adults live with mental illness and approximately 50,000 individuals grapple with substance use disorders. This population often has complex care needs that span public and private resources and require frequent and coordinated support. However, while Alaska has built a network of ADRCs and DDRCs to provide options counseling and support in connecting to long-term service and support for older adults and most populations with disabilities, no agency, including the ADRCs and DDRCs, have built the systems and expertise to provide this support to people whose primary issue is a mental health and/or substance use disorder (MH/SUD). Alaska’s ADRCs and DDRCs are the primary front door for individuals looking to access publicly, privately, and community-funded supports. With their current reach, they are a logical front door for individuals with MH/SUD. To achieve this, HCBS Strategies will coordinate with at least three ADRC/DDRC sites to implement tracking systems, document available supports, and build relationships with State and provider agencies overseeing and providing these services. This effort will allow ADRCs/DDRCs to participate in a cross-agency effort to develop this infrastructure so that they can support these vulnerable individuals	This effort strives to improve outcomes for complex care MH/SUD populations by increasing ADRC/DDRC staff understanding and expertise on resources for this population; coordinating training, support, and other initiatives between ADRC/DDRC staff and State and local partners, including SDS, DPA, DBH, and Crisis Now; and, through at least three ADRC/DDRC project sites, providing direct support to individuals with MH/SUD. HCBS Strategies will function as the project manager and evaluator, contracting with and coordinating across at least three ADRC/DDRC project sites. ADRC/DDRC project sites will designate at least one primary staff to lead this project. These staff will be trained by partners on MH/SUD resources and statewide access process workflows. They will work directly with individuals with MH/SUD to provide options counseling that allows project participants to better understand resources available to them and access the most appropriate resources. Project staff will also work closely with DPA to streamline the Medicaid application process for project participants to enroll as many eligible individuals as possible and connect them with Medicaid resources. Following this, a key component of the project is to provide at least monthly follow-up with project participants for at least three months to ensure individuals are able to access and receive the identified services and supports. This follow-up will be especially critical for the vulnerable MH/SUD population, who may struggle if left alone to access supports. The goal of this project is to develop sustainable statewide infrastructure within the ADRCs/DDRCs and their partners so that this support can be embedded within ADRC/DDRC model ongoing. Much of the ongoing work performed by the ADRCs/DDRCs will be eligible for Medicaid Administrative Claiming (MAC), a sustainable source of funding already federally approved for ADRCs and DDRCs through SDS. Key components of the infrastructure include resource directories that outline local and statewide resources for individuals with MH/SUD that can be used by ADRC and DDRC staff to help people understand and access the options that best meet their needs; customized training provided by SDS, DPA, DBH, and Crisis Now on services, supports, and strategies for supporting the MH/SUD population; and direct support and coordination between the ADRC/DDRC project sites and the State and local partners to streamline access to services and supports.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

HEALING HOMES CONSULTING LLC	HEALING HOMES OF THE DENE - A Culturally Grounded Wellness Framework for Indigenous Communities	AK	Alaska's rural and Indigenous communities — particularly rural communities/villages across the Interior — face profound gaps in culturally responsive wellness support. Clinical systems are geographically inaccessible, and existing behavioral health services often fail to account for the cultural, relational, and land-based dimensions of healing that communities themselves identify as essential. The result is a persistent disconnect between what healing systems offer and what communities actually need. Healing Homes addresses this gap by building a wellness framework from Athabascan values rather than adapting Western clinical models. Before any program is designed or delivered, we must first understand each community on its own terms — its strengths, its needs, its existing resources, and its vision for healing. That foundational understanding is the work of Phase 1.	Phase 1 of Healing Homes will conduct a structured Community Landscape Analysis in partnership with six Tribal communities in Alaska's interior region. This is not a data extraction exercise — it is a relationship-building process grounded in community authority, cultural humility, and genuine co-design. The Landscape Analysis will map four interconnected dimensions in each partner community: • Healthcare infrastructure: Hub-and-spoke relationships between regional Tribal hospitals and village clinics; gaps in behavioral health, telehealth capacity, and emergency specialty care; and the current roles of Community Health Aides/Practitioners (CHA/Ps) and where expanded training or new workforce pipelines are needed. • Cultural and community assets: Traditional healing practices (including healing circles and elder-led guidance), Tribal Health Organization structures, and existing community-led programs that already support wellness and could be strengthened within the rural health transformation program framework. • Wellness gaps and disparity data: Community-identified priorities including behavioral health, suicide prevention, chronic disease, reentry and recovery needs, and outcomes disparities for Alaska Native populations. • Structural and environmental barriers: Geographic isolation, transportation access, permafrost and erosion threats to clinic infrastructure, and other structural factors that shape care access in each community. The analysis will be conducted through listening sessions with elders and cultural practitioners, conversations with community members and families, engagement with Tribal leadership and program staff, and review of existing data and community assessments. All findings will be reviewed and validated by each community before use. Phase 1 will produce: a Landscape Analysis report for each partner community; a cross-community synthesis identifying shared themes and opportunities; formal MOUs with each Tribal partner; a refined, community-informed version of the Healing Homes framework and its core tool (the Dene Assessment); and a co-developed Phase 2 implementation roadmap.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area; Fairbanks North Star Borough; Southeast Fairbanks Census Area	Advance to Implementation Application

Healing Lights Sanctuaries	Healing Hammocks Transformational Therapy Program	AK	In today's chaotic world, it can be almost impossible to find a space to be calm. Economic injustice, homelessness, chronic pain, government violence, grief, fear of the future, substance use impacts... We all face this list. And all of us, especially vulnerable members of our community and people in the workforce who support and care for them live daily with the results. These issues can cause debilitating behavioral and other health issues. Financial and logistics barriers often prevent access to resources that might help. Research shows significant value in employing holistic, spiritually responsive modalities (such as healing energy therapies) for help with relaxation, pain relief, and alleviating stress and anxiety. Impact on patients and caregivers is recognized and these therapies have been welcomed in hospitals for decades. Prioritizing access to culturally sensitive healing support for vulnerable people — and for those who care for them — is a critical need in Alaskan communities. "Hammock Healing" is a holistic project led by an Indigenous healer who has used Reiki and complementary energy healing modalities for decades to bring relief for neighbors experiencing homelessness, families living in shelters, at-risk youth, care providers, and hospice, behavioral health, and HIV-positive patients. The project will bring healing for several pilot locations and provide opportunity for people who are drawn to this work to train to become healers in their communities.	This project proposes to pilot the swaying peace of "Hammock Healing" with vulnerable youth and Emergency Medical Services personnel in Whittier, multi-cultural Community Health Workers, unsheltered neighbors in Fairbanks, participants accessing Indigenous-centered trauma healing circles in Anchorage, and pregnant and parenting people impacted by substance use in Sitka. The approach, using hammocks, rocking chairs, emotional support animals, healing music, and energy balancing therapies, helps participants shift their own energy to create a healing path for themselves. It grounds people and supports their reconnection with the real world by helping them step away from the soul-sucking artificial reality of social media and electronic devices. It helps people remember the power and value of connecting with our family, friends, and neighbors. To be more present and focus on what is around us. To be present with the power and healing of genuine human connections. We will support each group as a whole while mentoring participants who show interest in growing their healing skills through hands-on training and certifications that will help them build their ability to earn a sustainable income through this work. Logistics We'll implement our approach through building capacity, pilot projects, curriculum, and supporting healthy resilience in staff. Build Capacity Establish administrative and evaluation infrastructure capacity. Initiate staff training and support. Lease a space in Anchorage for local healing activities. Acquire and equip a vehicle to bring itinerant services to communities on the road system. Build relationships w/partner orgs. Share Hammock Healings with communities as we are invited. Pilot Projects Run 3-5 pilot projects, collect data, and identify trainees. Provide hands-on training for youth and adults with interest in sharing this healing modality in their communities (create a statewide network). Provide sound therapies, educational materials, and artistic activities to support local community. Develop culturally sensitive care protocol that can be adapted for use in rural, remote, and frontier communities. Curriculum Develop, test, and refine holistic flexible Hammock Healing healer training curriculum for youth (ages 14-24) and adults. Support Healer Resilience Provide training and holistic supports for healthy resilience of staff (including community-based healers) to sustain organic growth. Mutual support networking/gatherings.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough; Sitka (City and Borough)	Deferred or Not Advanced

Health Alliance Global, Inc.	Closing the Rural Care Gap: Mobile Diagnostic Technology for Alaska's Underserved Communities	FL	Alaska's rural and frontier health landscape is defined by stark geographic and systemic barriers. Over 200 communities lack road access to hospitals, and with only six urgent care locations statewide, the vast majority of rural Alaskans have no viable option for non-emergent care short of costly air transport. Clinical workforce shortages compound the problem — communities that do have facilities often cannot staff them consistently, leaving residents to delay or forgo care entirely. The human and financial cost is severe. Air medical transport for conditions that could be managed at an urgent care level consumes resources, disrupts families, and strains a system already operating at its limits. RHTP funding presents a rare opportunity to address this at scale. Dr Triage's MDU is purpose-built for exactly this environment — a deployable, telemedicine-enabled platform that integrates diagnostics, care coordination, and virtual provider access without requiring permanent facility construction or a full-time on-site clinical team. Beyond Alaska, this project represents a national proof point. CMS and state Medicaid programs lack reimbursement frameworks that adequately support rural urgent care and telehealth-first delivery models. A data-rich Alaska deployment creates the evidence base needed to drive payment reform — producing a replicable care model that can be adapted for frontier and underserved communities across the country.	Heal All proposes the phased deployment of approximately 70 MDUs into Alaska's highest-need rural and frontier communities — establishing a statewide network of accessible, technology-enabled urgent care access points where none currently exist. Deployment Model Each MDU operates as a 9am–9pm urgent-care-style access point, designed to manage the full range of non-emergent and lower-acuity presentations that today require air transport or go entirely unaddressed. This is not an ER replacement — it is a purpose-built intervention for the gap between those two extremes. By anchoring deployments within existing community infrastructure, MDUs minimize capital requirements and accelerate community integration. Staffing On-site teams will be composed of locally sourced medical technicians, nurses, and CHWs, supported remotely by Advanced Practice Clinicians and physicians operating within Alaska's regulatory framework. Prioritizing local hiring strengthens community trust, reduces workforce attrition, and ensures that economic benefit from the program remains in the communities it serves. Recruitment partnerships with PPO/PEO networks and Alaska-focused clinician placement firms will support consistent staffing across the network. Technology and Care Integration The MDU platform integrates EMR, remote diagnostics, real-time data capture, and population health analytics in a single deployable unit. This technology backbone enables care continuity across encounters, supports chronic disease management, and generates the structured outcome data essential for reimbursement advocacy. CHWs embedded in each site drive patient engagement, medication adherence, and navigation — functions that are critical in communities where trust in outside health systems has historically been low. Partnerships Effective deployment requires deep local alignment. Heal All will partner with Tribal and Alaska Native health organizations, community-based clinics, and public health officials to ensure each MDU is sited, staffed, and governed in a manner that reflects community priorities. These partnerships are not transactional — they are foundational to the program's clinical integrity, cultural competency, and long-term viability. Together, these elements constitute a scalable, replicable model: urgent-care access delivered through a lean, tech-enabled, community-rooted infrastructure designed to perform under Alaska's conditions and endure beyond the initial grant period.	Over \$5M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Health Lync LLC	Wellyfy Rural Alaska Telehealth & Workforce: IMG Pathways + Synchronous Diagnostics	TX	Alaska's rural, remote, and frontier communities face severe healthcare challenges due to vast geographic barriers, extreme weather, limited transportation (e.g., reliance on small planes, ferries, or snow machines), workforce shortages, high care delivery costs, and infrastructure gaps like inadequate water/sanitation in many villages. These result in delayed or reduced access to essential services, worse health outcomes (e.g., higher chronic disease burden, maternal/infant risks), provider burnout, and reliance on costly medevac or long-distance travel for basic care. The opportunity lies in leveraging innovative, low-burden solutions to strengthen the rural workforce and modernize delivery: accelerating entry of qualified International Medical Graduates (IMGs) into Alaska practices to address shortages, and equipping independent/telehealth-forward physicians with EMR platforms plus synchronous diagnostic tools (StethoCAPE for remote auscultation, OtoCAPE for otoscopy, and AI-enabled cardiac/hemodynamic triaging) to enable high-quality virtual exams. This reduces travel/wait times, eases administrative burdens, expands timely care close to home, and builds sustainable capacity—directly aligning with RHTP's goals for workforce strengthening, technology innovation, and improved access in frontier settings.	Wellyfy proposes a scalable, trust-based outbound acquisition and activation system tailored for rural, remote, and frontier Alaska. This low-burden approach empowers physicians to expand access without adding administrative weight, allowing them to focus on healing. We execute via two parallel, distinct tracks using our ready playbook (segmentation, LinkedIn/email sequences, call scripts, objection handling, KPIs): Track 1 – Workforce Strengthening: Identify and engage a deep pipeline of ECFMG-certified IMGs (USMLE Steps 1–3 passed) interested in Alaska practice. Provide expert administrative FastTrack Licensing support (Silver/Gold/Platinum tiers) to efficiently complete documentation, meet board requirements, and accelerate licensure—enabling motivated physicians to enter rural/frontier roles (e.g., family medicine, telehealth) sooner. Track 2 – Technology & Innovation: Target independent/telehealth-forward physicians serving or willing to serve Alaska. Offer subscription-based Wellyfy EMR platform subscriptions with optional cross-sell of patented synchronous diagnostic tools: StethoCAPE (remote heart/lung auscultation), OtoCAPE (remote otoscopy), and AI-enabled cardiac/hemodynamic triaging (submitted to DIU innovation challenge). These enable high-fidelity virtual physical exams, reducing travel, wait times, and medevac reliance while supporting timely, coordinated care in isolated areas. Implementation starts with targeted outreach (warm, empathetic, physician-centric tone—no hype, full transparency on timelines/processes). We build trust through clear explanations, respect for time, and light cadences (3–4 follow-ups max per channel, easy opt-outs). Conversions drive paid sign-ups (licensing tiers or EMR plans), with measurable outcomes tracked via dashboards. We seek early partnerships with Alaska rural clinics, Tribal health organizations, workforce programs, or telehealth networks to refine targeting, ensure cultural/local relevance, and co-deliver value. Readiness: Playbook is execution-ready for immediate Alaska adaptation (Phase 1 launch in weeks post-approval); scale via data-driven iteration (A/B testing, high-response segments). This approach directly advances RHTP priorities: strengthening rural workforce pipelines (IMG entry/retention) and sparking technology innovation (EMR upgrades, remote diagnostics, telehealth expansion) for sustainable, high-quality care close to home.	\$1M-\$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Health Management Systems, Inc. (HMS), a Gainwell Technologies Company	Expanding Gainwell Go™ for Care Management Mobile Connectivity	TX	Alaska Medicaid operates on a fee-for-service basis with no managed care organizations, meaning care coordination resources are limited and any tool that improves communication between members and their care teams has outsized value. The HMS/GW Team propose to address this care coordination and communication gap by expanding Gainwell Go™, a secure, member-facing mobile platform already positioned for deployment. HMS/GW brings two unique assets: operation of Gainwell Go™ and long standing, direct relationships with Medicaid members through fiscal agent and TPL services. Together, these assets create a strong foundation to shift from phone only communication to a richer mobile channel that can support care instructions, reminders, secure messaging, and eventually, remote monitoring. The opportunity is to partner with key stakeholders (e.g., AMCCI and the Department of Health (DOH)) to identify where mobile engagement can most meaningfully improve outcomes for care managed members. Early hypotheses focus on two high need areas: earlier engagement of pregnant members to improve prenatal care connections, and remote blood pressure monitoring for members with hypertension who have infrequent in person follow up. The HMS/GW Team will lead the assessment, pilot execution, and sustainability modeling to ensure that the State can scale what works.	HMS/GW Team will work directly with stakeholders (e.g., AMCCI, DOH) at each phase. The HMS/GW Team will provide structured assessment methodology and financial sustainability design delivering the analytical and technical lift that enables the HMS/GW Team and the State to move from concept to evidence-based action. Phase 1: Care Management Mobile Opportunity Assessment: An analysis based on qualitative and quantitative data will be assessed to identify where mobile solutions could best support the healthcare community for those in care management, convening stakeholders as well for input. Additionally, HMS/GW has been closely monitoring the customer feedback line and has identified real pain points for members in care management. From this work, we will build an initial assessment that will produce a prioritized roadmap, owned and endorsed by the State, with defined pilot parameters, member eligibility criteria, integration requirements, and measurable success metrics. Phase 2: Pilot Design and Concept Test: Based on the assessment roadmap, HMS/GW will direct the expansion of Gainwell Go™ for quick win use cases that can be deployed within year one. Our hypotheses will be validated through assessment; however, our initial focus areas include: • Maternal Health Engagement Pilot: The HMS/GW Team will work with stakeholders to identify care management-enrolled women of childbearing age where earlier pregnancy identification and prenatal care connection is a documented gap. The goal is to shrink the time between pregnancy identification and first prenatal contact for members particularly in communities where in-person access is limited and prenatal care in the first trimester is missed by over a third of women (e.g., Alaska IBIS data, Kusilvak and North Slope census areas). Phase 3: Pilot Design, Concept, and Scale: Example hypothesis to be validated through the assessment: • Hypertension (HTN) Remote Patient Monitoring (RPM) Pilot: HMS/GW Team will work with stakeholders to identify care management members with documented HTN in communities where routine in-person monitoring is infrequent.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Health Management Systems, Inc. (HMS), a Gainwell Technologies Company	Transforming Alaska's Rural Health Through Unified Data, Interoperability & Insight	TX	The opportunity: extend AK's CMS compliant framework to support broader use cases and pair it with an analytics platform that turns integrated data into insight, reducing fragmentation, improving coordination, and strengthening care. AK's fragmented data systems slow care because key information sits across state agencies, 229 Tribal health organizations, community partners, and rural clinics. With over 80% of communities off the road system and vast distances between hubs, these gaps hinder the RHT Program's need for secure, governed data sharing. AK has strong CMS aligned interoperability foundations and a clinically focused HIE through healthEconnect, but lacks a mechanism to integrate clinical data with Medicaid administrative, programmatic, transportation, and community-based information essential for operations. Without broader exchange capabilities, teams rely on manual processes, duplicate entry, and limited cross setting visibility, reducing efficiency and increasing burdens on rural residents who already travel long distances for care. AK also needs a flexible analytic environment integrated with its interoperability layer to enable enriched data, timely analysis, and actionable insights for the Rural Health Office, state agencies, Tribal partners, and local organizations. A unified dataset ensures consistent information for coordination, detecting fraud, waste, and abuse, improving program integrity, and supporting informed clinical decision making.	HMS/GW's approach is to enhance rather than replace current systems, minimizing implementation complexity, accelerating deployment, and supporting sustainability for resource limited providers. To accomplish this, HMS/GW will bring together and collaborate with healthEconnect and other state partners so that existing investments are leveraged to the greatest extent possible and that healthEconnect's clinical data exchange role is preserved and data governance and ownership remain intact. HMS/GW will extend this ecosystem by leveraging its CMS 9115 and 0057 Interoperability platform (Gainwell Connect™, which is currently being implemented in AK) to provide API-driven data exchange that complements existing HIE data exchange. Our interoperability platform allows for ingestion and exchange of data sources beyond those addressed through healthEconnect, including multi-payer claims, eligibility, patient-to-provider attribution, and non-clinical data from rural partners and community organizations. HMS/GW will harmonize and enrich these data sources in its Gainwell Genius™ analytics platform, applying normalization, risk stratification, quality logic, and cost-of-care methodologies to generate enriched, analysis-ready data. Through these solutions, stakeholders gain access to dashboards, standardized reporting, and ad hoc analytics that support population health management, quality improvement, utilization monitoring, and program oversight. In collaboration with rural health partners such as healthEconnect, we will leverage shared or interoperable technology platforms where possible to enable secure, efficient, and standards-based data exchange across participating organizations. We will seek to align on a common technical architecture to reduce integration complexity, accelerate onboarding, and implement consistent data governance and access controls. We will further work with AK and its partners to standardize analytic foundations across data and technology partners, which could include, for example, alignment on patient identity management and matching methodologies to support accurate longitudinal member records across care settings and data domains. By harmonizing infrastructure, governance, and analytics capabilities, AK will maximize existing investments while building a scalable, secure, and future-ready data ecosystem that advances interoperability, cross-sector integration, and measurable outcomes for Rural Health Transformation.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Health Management Systems, Inc. (HMS), a Gainwell Technologies Company	Value-Based Care Design, APM Development & Provider TA with VBC Analytics for Rural AK	TX	AK’s rural health providers operate under fee-for-service reimbursement that is financially unsustainable in low-volume, high-cost frontier settings. Without transitioning to payment models rewarding outcomes and providing stability regardless of volume, AK faces continued pressure on providers, leading to potential closures, access reductions, high costs of living, limited competition, and reliance of traditional fee-for-service model. AK’s RHTP application identifies voluntary VBC participation as a priority under Initiative #4, with careful attention focusing on the AHEAD Model as the goal and identifying Dual Eligibles as target population. Designing and implementing APMs for AK requires two capabilities no single organization provides alone: 1. Specialized actuarial, payment design, and provider transformation expertise to build models that work in AK’s extreme geography; and 2. An analytics platform connected to AK’s Medicaid data and operations that can measure VBC performance, identify care gaps, and monitor outcomes in real time PwC brings direct experience supporting Medicaid VBC programs with providers and payers in designing alternative payment methodologies, shared savings programs, and provider transformation roadmaps. The Genius™ analytics platform transforms Medicaid data into actionable insights for risk stratification, population health management, and VBC performance monitoring.	We propose an integrated approach combining PwC’s payment reform expertise with HMS/Gainwell’s embedded Alaska Medicaid operations and Genius™ analytics platform. The work is organized into four workstreams. Workstream 1 – Provider Readiness Assessment Assess financial stability, data maturity, clinical workflows, and organizational capacity for value-based care participation across Alaska’s regions. HMS/Gainwell will leverage access to Medicaid claims, utilization, and cost trends to support rapid data ingestion and readiness scoring. Assessment dimensions include financial (revenue cycle, cost structure), clinical (quality reporting capability, EHR maturity), operational (care coordination capacity, attribution readiness), and governance (leadership and board risk tolerance). The outcome is provider specific readiness scorecards identifying those prepared for early VBC adoption and those needing additional support. Workstream 2 – Alaska Specific APM Design Develop tailored alternative payment models, such as one-sided shared savings, prospective capitation with risk corridors, and episode-based payments for high volume rural conditions. Conduct financial modeling and actuarial analysis to test scenarios and inform program design. Evaluate alignment with CMS’s AHEAD model and other federal innovation approaches. Models will be adaptable for tribal health organizations, critical access hospitals, FQHCs, and community health centers. Workstream 3 – VBC Analytics Platform Configure Genius™ as the performance engine to measure quality outcomes, medication adherence, care gap closure, utilization, and cost trends for providers in APM arrangements. Develop real time dashboards for the Department of Health, Advisory Council, and providers to track implementation and results. Incorporate risk stratification and predictive analytics to identify high risk patients for proactive outreach. Population health management capabilities will support 360-degree member views integrating clinical, social, and behavioral data, delivered directly to providers or through their existing workflow systems. Workstream 4 – Provider Technical Assistance & Implementation Deliver hands on support for workflow redesign, care coordination models, quality measurement, and data infrastructure needs. Create provider facing materials and peer learning networks. Support DOH with phased VBC launches, continuous improvement, and long term sustainability planning.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

HealthFront Ventures	Workforce Development Initiatives: Structured Data System Measurement	TX	Alaska’s Rural Boroughs & Census Areas, Frontier, and Tribal Communities depend on a limited and geographically dispersed healthcare workforce serving patients across vast distances and challenging geographic conditions. Retaining, recruiting, and supporting your HCP Workforce across rural boroughs and census areas remains one of the most significant barriers to expanding access to care for Alaskans living in these rural communities. While Alaska has developed innovative care delivery models, including hub-and-spoke networks connecting regional medical centers with rural communities, many workforce initiatives operate with limited visibility into where HCPs are actively delivering care, where workforce capacity gaps exist, and how workforce programs are performed over time. Rural workforce reports consistently identify the “digital divide” and partial data as a key finding. Very few show which HCPs are actively delivering care in rural communities, and even fewer show what care those clinicians are delivering. Strengthening Alaska’s rural healthcare workforce therefore requires not only retention and recruitment initiatives, but also the ability to identify which clinicians are delivering care and what care is being delivered across rural communities. Programs alone do not transform systems. Learning systems transform programs.	HealthFront Ventures proposes deploying the Rural Workforce Intelligence Platform (RWIP™) to support Alaska’s Rural Health Transformation workforce initiatives. RWIP is a cloud-based LIVE workforce intelligence and engagement platform designed to identify, engage, and measure MD/DO, NP, and PA HCPs actively delivering care across Alaska’s rural boroughs and census areas. RWIP integrates medical and pharmacy claims data with National Provider Identifier (NPI) activity signals to provide near real-time visibility into the active rural healthcare workforce. By analyzing claims-verified HCP activity rather than static licensure records, RWIP enables Alaska partners to understand which clinicians are actively serving rural populations and where Rural HCP Workforce capacity gaps exist. Using AI-assisted pattern recognition with human oversight, the platform analyzes large-scale healthcare claims datasets to detect HCP activity patterns, Rural HCP Workforce participation trends, and emerging rural care delivery gaps. RWIP also enables states to measure what care is being delivered using standardized healthcare coding systems including CPT/HCPCS procedure codes, J-codes, ICD-10 diagnosis codes, and NDC medication identifiers, allowing workforce initiatives to generate quantitative performance metrics aligned with CMS program requirements. At the core of RWIP is HFV’s Structured Data Standard for Rural HCP Workforce Development, providing consistent data definitions, quantitative measurement methodologies, and reporting architecture aligned with federal policy and CMS program oversight. RWIP can be operational within approximately sixty days, allowing DOH and ACF partners to establish a statewide HCP Rural Workforce baseline and launch initiatives quickly while ensuring programs can be measured, evaluated, and strengthened throughout the RHT program lifecycle. Measurement readiness compounds. Hesitation compounds risk.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

HealthJay Inc.	Transforming Tribal Emergency Response: EMS–Behavioral Health–Community Care Collaborative	CA	Rural and frontier Alaska face severe care barriers due to fragmented services, provider shortages, and a lack of interoperable data sharing between EMS, clinicians, behavioral health, and community organizations. This disconnection leads to delayed care, high EMS recidivism, and unnecessary ER visits. The Opportunity: This project bridges these gaps via a simple, interoperable digital infrastructure. HealthJay introduces an "Apple-simple" technology approach specifically for underserved communities. By connecting EMS responders, clinicians, and CBOs through a shared coordination platform, we enable instant telehealth access to out-of-region specialists, expanding care without requiring arduous travel. Whole-Person Engagement: The platform goes beyond clinical care, allowing residents to book services, attend virtual health programs, join job interviews, and connect with local community groups. Remote patient monitoring and active app engagement generate real-time data, helping communities identify emerging health and social trends. System Sustainability: By leveraging FHIR-ready interoperable infrastructure, this model strengthens cross-sector collaboration and reduces administrative burdens. It transforms emergency response into a coordinated entry point for care, ensuring that rural Alaskan communities can maximize limited local resources while accessing a broader network of support.	This project proposes a coordinated care infrastructure to transform how rural communities respond to behavioral health needs, chronic conditions, and social determinants of health. HealthJay uses three mechanisms to expand care access, strengthen intervention, and enable collaboration among EMS, clinicians, behavioral health providers, and community organizations. Residents interact through the HealthJay app, a digital front door for telehealth, resource booking, reminders, and neighborhood support. 1. No-barrier telehealth to expand care access and enable care navigation. HealthJay deploys technology designed to remove participation barriers in rural settings. Auto-join sessions require no downloads, complex logins, or scheduling, allowing residents to connect quickly with clinicians or behavioral health providers. Responders, organizations, or residents can initiate tele-screening and care navigation. Out-of-area providers can easily participate, expanding access to expertise and enabling follow-up care without travel. 2. Behavioral health engagement through self-care and community support. A key innovation is shifting behavioral health intervention upstream before crises occur. Through the HealthJay app, residents receive automated reminders, AI-assisted outreach, and tools supporting medication adherence, appointment follow-up, and wellness. Neighborhood care watch networks allow trusted family or community supporters to receive alerts and check on individuals when risks arise. Residents can book services—counseling, recovery, peer support, job opportunities, housing, and community classes—to address underlying needs. 3. Shared data infrastructure enabling cross-sector collaboration. HealthJay connects EMS, clinicians, behavioral health providers, and community organizations through interoperable data infrastructure. Telehealth encounters, referrals, resource bookings, and community engagement are documented electronically and shared across partners. Multilingual surveys and standardized screening tools support community needs assessments and SDoH data collection, while FHIR-ready APIs enable integration with health information exchanges and provider systems. Together, these mechanisms create a closed-loop collaborative network where providers and organizations work from shared data to deliver coordinated care. This model expands access, strengthens early intervention, and helps communities move residents toward long-term stability.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Deferred or Not Advanced

HealthPulse Advisors LLC	Alaska Frontier Solvency & Reimbursement Architecture Initiative	OH	The primary opportunity is the mitigation of "Contract Lag." Alaska’s rural health systems are currently suffering from an estimated 8–15% net revenue leakage. This is driven by legacy commercial payer contracts (Anthem, United, etc.) with "stop-loss" and "rate-parity" triggers that haven't been updated to reflect 2026 labor and supply chain disruptions. In frontier settings, the cost of specialized labor and high-acuity drug delivery has outpaced reimbursement anchors. This gap effectively forces rural hospitals to provide interest-free loans to national payers. Correcting this financial friction is the highest-leverage opportunity to ensure the success of all other RHTP clinical initiatives.	We will deploy the Frontier Solvency Framework, utilizing our proprietary HealthPulse Reimbursement Intelligence (HRI) logic. This is a three-phased "Strike Team" approach: Phase 1: Rate Parity Diagnostics: We execute 7-day audits for participating rural sites to identify specific leakage points in current commercial agreements compared to 2026 benchmarks. Phase 2: Contract Re-anchoring: We lead the technical negotiation to move legacy agreements to defensible, cost-plus Medicare-linked logic. This ensures that every high-acuity case is reimbursed at a rate that covers the true "Frontier Cost of Care." Phase 3: Capacity Building: We provide Alaska’s rural CFOs and Administrators with Fortune 500-level negotiation data and automated diagnostic tools (M365-integrated) to maintain market parity independently. This approach bypasses traditional, slow-moving consulting models in favor of rapid, EBITDA-focused implementation that delivers results within the first 90 days of engagement.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

HealthPulse Advisors LLC	Rural Alaska Provider Reimbursement Optimization & Value-Based Care Readiness Program	OH	Rural Alaska health care providers — including Critical Access Hospitals (CAHs), Tribal health organizations, and Federally Qualified Health Centers — face a hidden financial crisis rooted in inadequate managed care contracts. Most rural providers lack access to specialized reimbursement advisory expertise, resulting in payer rates that are 15–30% below comparable market benchmarks, high rates of preventable claim denials, and millions of dollars in recoverable revenue that goes uncaptured annually. This fiscal gap directly limits the services rural Alaskans can access. Providers unable to cover operational costs cut hours, reduce specialty access, or close entirely. The problem is compounded by the complexity of Alaska's payer landscape — a mix of Medicaid managed care organizations, Medicare Advantage plans, Tribal health programs, and commercial payers — each with different contract structures that require specialized expertise to navigate effectively. Simultaneously, new CMS value-based care models (including the CMMI LEAD ACO Model, launching March 2026) represent significant financial opportunity for rural providers — but most lack the advisory support to understand, evaluate, or participate in these arrangements.	HealthPulse Advisors will deliver a statewide Reimbursement Optimization and Value-Based Care Readiness program for rural Alaska health care providers through three integrated service components: COMPONENT 1 — REIMBURSEMENT ASSESSMENT & BENCHMARKING (Months 1–6): HealthPulse will conduct individualized reimbursement gap analyses for up to 25 rural Alaska provider organizations. Each assessment benchmarks current payer contract rates against state and national standards, identifies underpayment patterns, quantifies recoverable revenue by payer, and maps denial rate trends. Priority focus on Medicaid managed care contracts, Medicare Advantage, Critical Access Hospital cost-based reimbursement, and 340B drug program optimization where applicable. Deliverable: a written Reimbursement Intelligence Report for each participating provider, with a prioritized revenue recovery roadmap. COMPONENT 2 — MANAGED CARE CONTRACT NEGOTIATION SUPPORT (Months 3–18): HealthPulse advisors work directly alongside rural provider managed care contracting teams (or, where no internal team exists, with provider leadership) to prepare and execute payer contract renegotiations. This includes: payer-specific rate benchmarking packages, counter-proposal drafting, negotiation strategy development, and ongoing support through the contract cycle. We bring expertise from both sides of the payer-provider table — directly applicable to Alaska's dominant managed care payers. COMPONENT 3 — VALUE-BASED CARE READINESS TRAINING (Months 6–24): HealthPulse will develop and deliver a virtual training curriculum for rural provider leadership on navigating CMS payment model transitions. Topics include: CMMI LEAD ACO model participation readiness, bundled payment opportunities, outcomes-based contracting frameworks, and Medicaid value-based purchasing strategies. Training is fully virtual, live-facilitated, and recorded for asynchronous access — designed for providers in remote communities with limited bandwidth for in-person travel. All services are delivered remotely with no geographic access barriers. HealthPulse will partner with an Alaska-based organization for community coordination and provider outreach.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Healthy Futures	Healthy Futures Challenge and Health Equity Program Expansion	AK	Health equity is a major problem in AK. Over 1 in 5 youth are below the poverty line. Our commitment to increase revenue to serve this need is a priority. Youth should have access to physical related activities. Too many kids face barriers with the cost of equipment, fees, travel, or even basic needs such as adequate footwear. The needs have increased due to decreased state/local resources, layoffs, increased cost of living, and events like typhoon Halong. We’re receiving increased requests for grants to participate in physical activities and simply ensuring children have boots/sneakers to recreate safely. We’ve seen a need in both rural and urban settings but those in communities off the road system have fewer resources available. About 1 out of 3 AK Native children are overweight/obese - a prime indicator of long-term health issues. Chronic conditions often develop early and Type 2 diabetes is being diagnosed increasingly in youth. We address this issue through a Healthy Futures Challenge (HFC) each spring and fall, which rewards children and schools that reach physical activity goals. The HFC requires an individual at schools to administer the program, usually a PE teacher in schools that have one. In schools with no PE teacher, this is a classroom teacher or administrator. High teacher turnover rates present another hurdle. Finding a person to fill the responsibilities of the coordinator role is a big challenge, especially in rural schools for reasons to be explained.	Our staff face numerous challenges recruiting school coordinators for the Healthy Futures Challenge, especially in remote areas. Currently, our coordinators are teachers who often play multiple roles in their schools so have limited time or resources available to administer the HFC. Since most Healthy Futures staff are based in Anchorage, they also have few opportunities to offer in-person support around HFC implementation. Our project concept approach is to offer \$500 stipends to the individual who signs up to administer the HFC for a school. These stipends would be contingent on the school meeting a student participation level criterion. The project would include a “Community Coordinator” campaign, aimed at recruiting an individual in the community who is not necessarily a school staff member, but could be a parent, family member, healthcare worker, or anyone interested in supporting the mission of our organization who is approved by the school. This person would reduce the workload of a school staff person, while ensuring that the HFC is operating in a manner that supports and enhances school curriculum. Our targeted recruitment plan for outreach to Community Coordinators includes working with groups such as: • Parent groups and aftercare/enrichment programs (e.g. parent-teacher associations, Campfire, 4-H, Boys & Girls Clubs, 21st Century Community Learning Centers, Alaska Afterschool Network). • Tribal organizations (e.g. tribal councils, tribal health organizations, regional corporations). • Paraprofessionals working within the school. Efforts may include, but are not limited to: • Announce the program through mechanisms such as the State of Alaska’s listserv, The Play Every Day campaign contacts, DEED (Department. of Education and Early Development) Information Exchange, Anchorage School District announcements, Alaska Native Tribal Health Consortium rural outreach network, newsletters, and social media. • Telephone calls and personalized emails to identified contacts. • Presentations at statewide or local events (e.g. AFN, SHAPE Conference, NYO, PTA meetings, superintendent and school board conferences, community events). Additional responsibilities of Community Coordinators will include help with promoting the Game Changer Fund/Kicks for Kids program to children from undeserved families. Having “boots on the ground” in a remote communities will help us identify youth/families in need of assistance and facilitate delivery of our services.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Healthy Interactions, LLC	Alaska Rural Health Transformation Access, Education, and Workforce Economic Self-Sustaining Program	WY	Cardiometabolic conditions (diabetes, heart disease, chronic kidney disease, and obesity) pose some of the most pressing health challenges in the U.S., with rural communities following a similar trend. Limited access to care, geographic isolation, overwhelming chronic disease demands on healthcare delivery systems, and persistent workforce shortages make effective disease management difficult. HI has decades of experience improving both healthcare capacity and effectiveness. This proposal focuses on improving access, capacity and effectiveness. In Alaska, an estimated 48,800 adults (8.3%) have been diagnosed with diabetes, and approximately 258,000 adults (36%) live with obesity, costing approximately \$1.2 billion annually. Obesity rates are expected to rise to 51% by 2030 (ADA, 2024). These figures emphasize the urgent need for scalable solutions to address this growing burden. To accomplish the goals set for Alaska’s RHTP, behavior change and education is needed for both providers and patients. HI has a proven model that utilizes Conversation Map® sessions to deliver effective education and behavior change planning in healthcare settings thereby strengthening prevention and chronic disease care. HI offers support provider programs and patient education initiatives, to extend care access, build trust, and support patients in managing lifestyle changes and treatment adherence for specific chronic disease conditions.	HI proposes this RHTP plan focused on prevention, chronic disease support, workforce expansion, and improved care delivery. The project includes four integrated aims that: a) strengthen access, b) expand clinical and community capacity, and c) improve rural health outcomes. Using a multi-component strategy, HI will enhance primary care delivery, build workforce capacity, and expand access to culturally relevant patient education. Aim 1. Improve patient self management and health literacy to expand education and support for chronic disease prevention and self-management. Aim 2. Grow the rural healthcare workforce through the Certified Primary Care Educators (CPCE) program in the first 20 practices, increasing access to patient education. Aim 3. Improve efficiencies in these 20 primary care practices to increase capacity for innovative care models and reduce provider burden. Aim 4. Strengthen primary care practices by introducing reimbursable education services that sustainably expand self management support. Initiatives A) Certified Cardiometabolic Primary Care Education Platform. A virtual, self-paced certification program for allied health professionals, equipping staff to deliver evidence-based cardiometabolic education and potentially qualify for reimbursement. (Workforce, Pay for Value, Healthy Communities). B) Practice Chronic Condition Education Program. Support for clinics to integrate evidence-based education workflows that reduce provider burden, expand access to chronic disease management, and improve team-based care. (Care Access, Healthy Communities). C) Patient Chronic Condition Education Program + Virtual Conversation Maps®. An evidence-based group education model using Conversation Map® tools to improve chronic disease understanding, engagement, and long-term self-management across rural communities. (Healthy Communities, Technology & Innovation, Care Access). D) Telehealth (AI enabled virtual support). A digital, AI enhanced tools health strategy that expands access to chronic disease support, enhances patient engagement, reduces load on rural providers, and strengthens coordinated care. (Technology & Innovation). HI is uniquely positioned to rapidly implement by leveraging our innovative engagement strategies and our full cardiometabolic Conversation Map® catalog. With these proven, ready-to-deploy resources rooted in evidence and real-world clinical insights, we can move quickly from planning to action and scale across Alaska.	\$1M-\$5M	Family or primary care	Statewide	Anchorage (Municipality); Bethel Census Area; Copper River Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Healthy Solutions with Angela LLC	The Alaska ROOTS Initiative —Rural Outreach, Optimization, and Transformation for Sustainable Health	AK	Rural Alaska faces some of the nation’s highest rates of preventable chronic disease. Geographic isolation, historic healthcare inequities, limited access to fresh and nutritious food, and the erosion of traditional subsistence knowledge have left rural, remote, and frontier communities with chronic disease rates among the highest in the United States, with Alaska Native and other underserved rural populations disproportionately affected. Several interconnected challenges drive this crisis. Type 2 diabetes affects Alaska Native adults at rates far above the national average, yet many rural residents lack access to structured, ongoing diabetes support, increasing the risk of complications and hospitalizations. Hypertension is also widespread and often undertreated because consistent monitoring and coaching are rarely available in rural communities. Nutrition access gaps persist across many regions where limited access to fresh foods and nutrition services makes long-term lifestyle change difficult. At the same time, Alaska’s preventive health workforce remains severely limited, leaving too few diabetes educators and dietitians to meet statewide demand. Alaska’s RHTP creates an opportunity to build a scalable chronic disease support ecosystem statewide. Healthy Solutions with Angela, LLC will combine Angela Manderfeld’s clinical expertise and rural health experience with CAPPA Health’s digital platform to deliver diabetes, hypertension, and nutrition programs statewide.	The Alaska ROOTS Initiative is a technology-enabled chronic disease management ecosystem built for rural Alaska's realities. Four integrated components address the most urgent chronic disease needs statewide: FLAGSHIP - Diabetes Support Program (DSP), Weekly Cohort Model: A new participant cohort launches every week, any referred individual begins structured diabetes support within 7 days, no waitlists. The DSP provides peer support, 1:1 lifestyle coaching from Angela (RD, CDCES, BC-ADM), biometric tracking, and AI coaching available 24/7 between sessions. Evidence: A1C reductions of 0.8–1.5 percentage points in participants attending 8+ sessions; reduced diabetes-related ED utilization. Healthy Lifestyle & Weight Management: Multi-week wellness program covering nutrition, physical activity, sleep, and tobacco reduction. Angela's 18 years as a certified group fitness instructor and personal trainer enables live virtual exercise classes alongside nutrition guidance, rare in rural health settings. Serves as a gateway to DSP for pre-diabetic participants. Hypertension Management with SMBP: Remote coaching with blood pressure device distribution, SMBP training, lifestyle modification, and medication adherence support. Average systolic BP reductions of 8–12 mmHg. Participant data transmits through the platform for real-time coach visibility. Digital Platform, Nutrition Access & Community Innovation: All programs delivered via HIPAA-compliant, FHIR-interoperable mHealth platform with bandwidth-adaptive technology for low-connectivity environments, contracted through Cappa Health. Nutrition components include farm referral partnerships (Pyrah's Farm Mat-Su Valley, Alaska Farmers Market Association, Delta Junction farms), medical nutrition therapy, cooking classes featuring traditional Alaska foods and food preservation, food resource navigation to WIC/SNAP/tribal programs, and health bucks incentives, all building skills and connections rather than food dependency.	\$1M-\$5M	Private practitioner	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

HealthyCon nect.AI	Healthy Connect for Every Alaska Resident	FL	HC offers HC Basic (an individual care plan, all you need is a cell phone, tablet, or PC with mobile web access) that incorporates a care plan, medication reminders, educational materials, and check-ins and that can be instantly shared with any other provider. This core base service adds value to the entire eco-system and in particular leads to instant telehealth access and then also easy expansion into CMS supported care management programs like ACCESS, CCM, RPM, and RTM. This increases core care for any patient and easy upgrade to care management programs with reimbursement or needed for value based care. This in effect turbocharges the whole HIE concept with a patient and provider shared infrastructure. Providers benefit from monthly economics, payers can see significant reduction in high cost care, and patients have simpler access via telehealth for routine and specialized needs. HC is leveraging data now available at the patient level, uses AI to summarize that for providers, and drives significant economic gains for any healthcare organization. It's a platform more than a service and should be considered patient and provider infrastructure. Here's an example: our provider have asked that we assess for patients with Medicaid redetermination requirements and notify them of required data submissions----they can open our app or mobile web, snap a picture of a class schedule or utility bill, and we upload to state.	HC believes that every Alaskan (age can be limited) should be enrolled in HC Basic (consent should be obtained) but it is free to very resident that does so. All we need is a roster and cell phone number or e-mail address, and our AI powered Care Assistant assembles patient data, creates a high level care plan, and does monthly check-ins, or reaches out if an event is detected. Its interactive, largely text or app messaging, and includes all important HIE data, Surescripts medication data, and the AI Care Assistant can answer questions or forward events to practitioners for action. This can be configured by patient, largely, based on needs and further configured by a linked provider. This is the core need for financial support during years 1 through 3. HC then identifies patients that can be enrolled in federal care management programs including ACCESS, CCM, RPM,, or RTM and can assist with pharmacy type programs as well. This creates both better care pathways for those that need it, all of the support services to deliver it (equipment, nurse coaches, program administration, claims management) etc. and creates a per patient subscription margin for providers or can be used to support value based care models, generating healthcare savings. This amount is substantial in many cases with 50,000 seniors in care management programs generating \$25MM in annualized income. HC Basic is proven for all patients to increase appointments, reduce no-shows, and should generate an additional visit per year with a provider, as importantly, for Medicaid patients, ensure coverage and reduce ER expenses. Keeping Medicaid patients eligible with redetermination requirements, this can be strongly positive too both for the State and for providers. The platform can also support other services from behavioral health (link to specialists, etc.) matching needs and available resources via telehealth, a concept well know by Alaska. The concept is quite simple: leverage an asset almost everyone has via satellite internet, mobile phone networks, or Internet in having a dynamic care plan populated with the most recently available data to improve care, reduce administrative costs, and access care management programs via Medicare and MA plans, and soon many Medicaid programs.	\$1M-\$5M	Family or primary care	Multi- Community or Participating in Regional Hub-and- Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Healy Lake Village Council	Healy Lake Clinic Restoration, Health Aide Housing Equipment & Emergency Transport	AK	Since a catastrophic septic failure in 2020, the Healy Lake clinic has been closed due to total building contamination. This has left our community with zero local healthcare infrastructure. Currently, residents must rely on a bush plane that only services the village twice a week. This lack of access has forced our elders to relocate to urban centers for routine care and leaves the remaining population at extreme risk during medical emergencies. We have a unique, time-sensitive opportunity to restore a sustainable healthcare ecosystem in Healy Lake. This project is shovel-ready and integrates three critical components: Infrastructure Restoration: Professional remediation of the existing clinic (\$343,750 including indirect/contingency) to provide a safe, sterile environment for care. Emergency Access: Acquisition of a dedicated medical transport boat (\$72,000) to provide immediate access to the road system, bypassing the limitations of the flight schedule. Workforce Synergy: The Tribe has already secured funding for Health Aide housing (completing Fall 2026). By fixing the clinic now, we ensure that when the housing is finished, the health aide has a functional, equipped workspace ready for immediate use. By funding this project, the RHTP will directly transition Healy Lake from a "healthcare desert" to a community that can provide high-quality, local care for its residents and elders.	Our approach is a coordinated, three-phase execution plan designed to restore clinical services in Healy Lake by the time our new Health Aide housing is completed in Fall 2026. Phase 1: Professional Remediation & Infrastructure Repair We will immediately contract the specialized firm that provided our \$275,000 estimate to begin site work. Decontamination: Full bio-remediation of the septic-contaminated zones to meet environmental safety standards. System Overhaul: Complete replacement of the failed septic components with a modern, high-capacity system designed for rural Alaska's sub-arctic conditions to prevent future failures. Interior Restoration: Reconstruction of clinical spaces, including sterile surfaces, pharmacy storage, and a telehealth-capable exam room. 2. Emergency Medical Transport Acquisition Parallel to the construction, the Village Council will execute the purchase of the \$72,000 medical boat package from Dewey’s Cook Inlet Marine. Customization: The vessel will be outfitted with a motor and trailer, then staged in Healy Lake to serve as a dedicated "water ambulance." Operational Training: We will establish a rota of trained tribal members capable of operating the vessel for medical transport to the road system, ensuring 24/7 emergency egress that is independent of flight schedules. 3. Workforce & Clinical Integration This project serves as the "anchor" for our broader healthcare strategy. Housing Synchronization: We are currently managing the construction of Health Aide housing (funded separately). By completing the clinic remediation now, we ensure the workplace is ready the moment the provider arrives. Administrative Oversight: Using the 15% indirect cost allocation, the Tribal Council will provide the project management and reporting necessary to ensure the grant is executed on time and within the 10% contingency budget. Expected Outcome By the end of this project, Healy Lake will have a fully certified, decontaminated clinic and a reliable emergency transport vessel. This	\$250K-\$1M	Single Community	Southeast Fairbanks Census Area	Deferred or Not Advanced

creates a sustainable "care ecosystem" that allows our residents—specifically our elders—to receive high-quality care at home rather than being forced to relocate for basic medical needs.

Heart of Eagle River Medical Clinic PC	Delivering Enhanced Patient Care to Rural Alaskans by Revitalizing Clinic Services & Systems	AK	We have two clinics, with the larger clinic in Eagle River subsidizing the smaller clinic in Willow. During COVID and again in 2024 we had two key medical providers retire from the larger clinic and have only been able to hire and retain one new part-time provider since that time. As a result, we are understaffed in Willow and were forced to close the Eagle River clinic on Saturdays. It has been difficult to find skilled office staff at an affordable hourly rate. Since 2020 our overall Medicare patient population has increased, but low reimbursement rates have not translated into more revenue to keep up with increased rents, taxes, and supply costs, as well as overtime wages for the additional coverage needed. Also, the largely Medicare/Medicaid patient population in Willow depends heavily on the Eagle River clinic's financial support while it too is struggling. Much needed IT and equipment upgrades in the clinics could not be realized so some patient services were discontinued, forcing our patients to travel long distances for diagnostic tests. Our loyal providers currently earn at the lower end of the wage scale (MD @ \$80/hr and ANP @ \$55/hr) and we want to give them much-deserved raises to retain them. We lack the funds for a website designer and have done very little advertising, resulting in limited introduction in our neighboring communities. Local involvement has historically been our primary method of outreach (i.e. the Willow community calendar & Jr. Iditarod).	We currently have two young people interested in training as x-ray tech assistants; one for the Willow clinic and the other for Eagle River. The boxes of retired patient files stored in both x-ray rooms (and commercial storage facilities) will be shredded so upgraded equipment can be installed. Patients will no longer need to travel to the emergency department for diagnostic images and this will help generate more income for clinic sustainability and eliminate storage facility fees. We are also exploring the possibility of bringing new staff onboard via SkillBridge, a federal program in which transitioning military personnel in their last 180 days of service gain training, apprenticeships, or internships in a civilian setting. The service member would continue to be paid by the Department of War while training and we, as the training partner, receive help in coverage and hopefully, a future employee. Ideally, we would do the full-time training in the Eagle River clinic but also integrate the trainee into the satellite clinic in Willow. Since there is no salary commitment on our part, we could conceivably use the proposed salary for the service member's temporary housing in Wasilla, conveniently situated almost exactly between the two clinics. New computers with electronic medical record and billing software will allow our providers and staff to more readily access and share patient information in a more timely manner and deliver more seamless patient care between our two clinics as well as with specialists, hospitals, insurance companies, and pharmacies. Outdated EKG, and PT-INR diagnostic equipment will be replaced with newer supported models for more comprehensive patient care. Currently the FAA now requires new private pilots to take a computerized color vision test and procuring this software will allow our Aviation Medical Examiner to administer this test and prevent our patients from traveling even further to fulfill this mandate. We anticipate the re-hiring of a part-time Advanced Nurse Practitioner starting in May, 2026 enabling the Willow clinic to expand its clinic hours of service and increase sustainability. A website will make our clinics more visible to potential patients, highlight patient services, and introduce our providers and staff to the communities we serve. Potential employees will also be researching our clinics and a website is one of the first tools they will use to inform them of location, community services, etc.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Denali Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Heart Of Gold Ministries International	Heart of Gold Ministries International	AK	According to the US Census Bureau's American Community Survey for 2019, Alaska had an estimated 11,000 disconnected youth, representing approximately 13.8% of the state's population aged 16 to 24. In an attempt to survive and escape the pressure attached to living and achieving a successful life youths and young adults often resort to violence, criminal activities, drug abuse among others and this is evident in the alarming increase in juvenile delinquency in Anchorage, Alaska. The neglect rate due to substance abuse in Anchorage according to The Office of Children's Services averaged 47.1% from Oct 2022 through Oct 2023. And over that same period an average of 595/Mo Out of home service reports were entered. According to the Anchorage Health Dept: Alcohol is the substance of highest use and misuse in the community, and the rates of alcohol addiction and alcohol-induced mortality are higher in Anchorage than they are nationally. Methamphetamine use is on the rise. Alaska had the highest rate in the nation of substance use disorder in 2016-2017 among 12-17-year-olds. The lack of behavioral and psychiatric health services exacerbates the substance misuse crisis. Alaska has a high rate of suicide mortality and suicide ideation, and Alaskans experience higher rates of serious mental illness than national average. The city lacks treatment providers, diverse treatment modalities, and treatment services that can treat co-occurring addiction and mental health issues.	Heart of Gold Ministries International (HGMI) aims to promote the well-being and prosperity of Alaska's people by facilitating their empowerment and capacity building through practical information and education. The organization offers a range of programs designed to enable Alaska's people to reach their full potential and become valuable members of society as well as functional family members. These programs include: Life Coaching Programs, Navigating Healthy Living Programs, and Substance Use Disorder Programs. The programs are equipped with a comprehensive set of services and resources to make a positive impact on the lives of families and empower them to achieve success in their personal lives, academic pursuits, and career development.	\$50,000-\$250,000	Single Community	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Heartland Intellicare	QualiNav Data Intelligence: Rural Patient Safety Network Hub Development	CA	Alaska's rural healthcare facilities face a persistent quality data crisis. Quality Directors, the professionals responsible for patient safety, regulatory compliance, and quality improvement - typically manage four to five additional job roles simultaneously, often without formal quality training or modern tools. The data they depend on to do their jobs is fragmented across spreadsheets, manual logs, and disconnected systems, making it nearly impossible to identify risks in real time or respond proactively. At the same time, Alaska's statewide rural patient safety network lacks a centralized digital home for its data reporting and analysis, meaning valuable comparative quality data is not easily accessible to the rural facilities that need it most. The RHTP presents a timely opportunity to address both of these gaps in Year 1: by building and validating automated, actionable quality data reports within the QualiNav platform through a focused group of approximately five rural healthcare facilities, and by establishing QualiNav as the statewide hub for rural patient safety network data. In turn, this lays the groundwork for full platform deployment in Year 2.	Heartland Intellicare, in partnership with the Alaska Hospital and Healthcare Association (AHHA), will conduct a structured Year 1 focus group build-out of the QualiNav platform with approximately five Alaska rural healthcare facilities. AHHA will identify and recruit willing facilities from its membership network. Heartland Intellicare will lead all technical development, implementation, and project execution. Year 1 work will concentrate on two core deliverables: - Automated, Actionable Quality Data Reports: Working directly with focus group Quality Directors, Heartland Intellicare will identify the highest-priority data reporting needs specific to Alaska facilities including quality metrics, regulatory compliance indicators, patient safety event tracking, and performance improvement data. The team will build, test, and refine automated report templates within the QualiNav platform that transform manual data entry processes into real-time, actionable dashboards. Focus group participants will provide ongoing feedback throughout the build to ensure reports reflect real-world workflows and decision-making needs. - Statewide Rural Patient Safety Network Data Hub: QualiNav will be configured to serve as the digital home for Alaska's rural patient safety network data reports, centralizing comparative quality data in a format that is accessible, interpretable, and actionable for Quality Directors across the state. This phased approach is an intentional, human-centered design approach. Year 1 generates the evidence, validated tools, and participant relationships needed to support a strong Year 2 application for full statewide deployment, including AI-driven workflow automation, the SCOUT chatbot for real-time compliance guidance, virtual mentorship, policy and procedure management, and the statewide peer learning network. This approach aligns directly with Alaska's RHTP Initiative #6 (Spark Technology and Innovation) - specifically the use of technology to improve care delivery and quality in rural hospitals; and Initiative #5 (Strengthen Workforce) through professional development and capacity building for quality leaders.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Dillingham Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Henning Inc	Henning Inc Surge Capacity	AK	Henning seeks to address the growing need for consistent, year-round shelter and coordinated support services for individuals experiencing homelessness. In Anchorage and surrounding communities, many individuals lack access to stable shelter options outside of seasonal or emergency capacity, leaving people exposed to harsh weather conditions and disconnected from the health and social services necessary to stabilize their lives. Without reliable year round shelter, individuals experiencing homelessness face significant barriers to accessing health care, behavioral health treatment, and case management services. When people are forced to focus on daily survival—finding a safe place to sleep, staying warm, and securing basic necessities—it becomes extremely difficult to address underlying health needs, connect with providers, or work toward long-term stability. This project will expand Henning’s ability to provide safe, consistent shelter year-round while strengthening connections to critical services including primary health care, behavioral health support, housing navigation, and other stabilization resources. By increasing the number of individuals who can access shelter on a consistent basis, the program creates a stable environment where service providers can engage individuals, address immediate health needs, and support pathways toward permanent housing and improved wellbeing.	Henning will address the need for consistent, year-round shelter and supportive services through a coordinated, multi-pronged approach that emphasizes stability, access, and individualized support. The program is designed to not only provide additional safe shelter but also create pathways to health care, behavioral health services, and permanent housing. We will increase available beds by 100 beds ensuring that individuals experiencing homelessness have consistent access to safe, warm, and supportive accommodations regardless of season. Upon entry, each client will receive a thorough assessment to identify immediate needs, including medical care, mental health or substance use support, and housing barriers. This allows us to tailor services to each individual and prioritize urgent interventions. Trained case managers will work directly with clients to connect them to primary health care, behavioral health services, employment resources, and housing programs. By coordinating these services, the program reduces barriers and helps individuals move toward long-term stability. The project will leverage partnerships with local health providers, behavioral health organizations, housing agencies, and community-based nonprofits to ensure clients have access to a broad spectrum of support services. These partnerships also enhance efficiency and reduce duplication of effort across service systems. The program will track client engagement, service utilization, and housing outcomes to evaluate effectiveness, identify gaps, and continuously refine the approach to ensure maximum impact.	\$250K-\$1M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Henning Inc	Rocket Fuel Feeding Kids Program	AK	Childhood food insecurity is a persistent challenge in Alaska, with approximately 1 in 6 children experiencing hunger. In Anchorage, many students rely on free and reduced-price school meals as their primary source of daily nutrition. When school is not in session—weekends, holidays, or breaks—these children often lack reliable access to nutritious food, leading to negative impacts on health, academic performance, and overall wellbeing. RocketFuel seeks to address this gap by providing take-home food bags for students attending Title I schools. By ensuring that children have access to consistent, nutritious meals even when school is closed, the program helps prevent childhood hunger, supports healthy development, and stabilizes families who are facing economic hardship.	RocketFuel will provide weekly take-home food bags to students attending Title I schools. Each bag contains a balanced combination of meals and snacks to sustain children through the weekend (approximately 2.5 days of food). Food bags are distributed discreetly through school partners, ensuring children can access support without stigma. The program is designed to scale efficiently: Identification: School staff identify students most at risk for weekend food insecurity. Distribution: Bags are packed weekly and distributed via school partners to students before weekends and holidays. Partnerships: The program partners with schools, community volunteers, and local food suppliers to ensure reliable delivery. Monitoring: Staff track participation and food bag distribution to ensure the program meets students’ needs and maintains quality. This approach ensures that children receive consistent nutrition while reducing the stress and instability families face when resources are scarce.	\$250K-\$1M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Hillcrest Children's Center	Childcare Cooperative Network (CCN)	AK	Rural healthcare employers cannot recruit workers with children when no licensed childcare exists nearby. The root cause is structural. Opening a licensed childcare program requires a credentialed administrator, technical assistance, and renovation of appropriate facilities. None of these conditions exist in rural Alaska without deliberate investment. Conventional models have not broken this cycle because they depend on conditions rural Alaska lacks — stable financing, adequate wages, and low turnover. The local worker-owned cooperative (WOC) model addresses these root causes directly. Worker-owners participate in governance, financial decision-making and profit-sharing, thereby producing the wages, job satisfaction, and retention in community that make programs sustainable where others have failed. The Cooperative Childcare Network (CCN) has demonstrated this model works in Alaska. The first Administrative Cohort trained 17 professionals — exceeding initial goals — and multiple Anchorage programs are actively transitioning to worker-owned operations. A registered apprenticeship program creates an ongoing pipeline of credentialed worker-owners, treating licensed childcare as the skilled profession it is. RHTP investment will extend this proven approach to rural Alaska: training administrators, developing childcare sites near healthcare workplaces, and building the shared infrastructure that allows community-rooted programs to open, operate, and endure.	The CCN project addresses the rural childcare-workforce cycle through five coordinated strategies proven in Anchorage and ready to scale statewide. 1. Advocacy and Awareness. Two documentaries about rural childcare challenges and a media campaign will advance worker-owned childcare as workforce development strategies. 2. Rural Administrative Cohorts. Building on the completed Anchorage pilot, the CCN will support childcare administrative training cohorts for rural early childhood educators, enabling participants to meet Alaska's state licensing educational requirements. Flexible, rurally-adapted delivery will be designed in partnership with communities to reduce barriers to participation. 3. Childcare Apprenticeship Pathway. Workers will be supported to complete the 480 hands-on hours required for the Child Development Associate credential through a structured apprenticeship at hub-community licensed facilities. Future RHTP funding could support travel, lodging, and wages — removing the geographic barrier that has historically excluded rural workers from this credential. 4. Rural Childcare Site Development. Working alongside rural communities and healthcare employers, the CCN will identify and develop home and center-based licensed childcare sites in proximity to healthcare workplaces, tailored to each community's size, culture, and need. Site development will draw on lessons learned through the Community Innovation Grant, applying what the CCN has tested in Anchorage about startup barriers, facility readiness, and community engagement to ensure rural programs are built on a foundation designed to last. 5. Shared Administrative Services. The CCN is actively developing a shared services model providing backbone administrative infrastructure — licensing support, compliance, HR, and enrollment systems — to licensed childcare programs (home and center based, multilingual) in Anchorage, reducing startup barriers and improving long-term viability. Statewide expansion of worker-owned and worker-managed childcare supported by shared services will provide rural programs the same critical administrative support that makes Anchorage programs viable, and that rural programs currently have no access to. Together, these strategies move beyond training individuals to building the system-level infrastructure rural Alaska needs to grow and sustain its own licensed childcare — and by extension, its healthcare workforce.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Holck Consulting	AI-Enhanced Public Health Data Accessibility: Reimagining BRFSS, PRAMS, and CUBS Interactive Portals	AK	Alaska State public health data dashboards are often cumbersome to navigate, particularly for non-technical users. Data is often structured within drop-down menus, organized by topics, with different types of User Interfaces between dashboards, making it confusing and frustrating to locate data a user is hunting for (if that data even exists!). Often Alaska's rural communities are at a disadvantage in having limited technical expertise useful to consume information from these dashboards. Without this knowledge, non-optimal, minimal, or incorrect data may be used by decision makers, who are more likely to resort to simple Google searches or general conversational AI engines (e.g. ChatGPT). Conversational AI can be misleading and even dangerous, providing unvalidated, incorrect numbers and interpretation that can lead to incorrect or suboptimal health policy decisions.	We have developed a prototype conversational AI to explore an alternate approach to accessing Alaska BRFSS data. This prototype solves a key challenge when integrating AI into a data stream, namely the potential for “hallucinations” that could result in incorrect or misleading data estimates. To address this very real concern, we use a tiered approach: we first use AI to identify the top three indicators available in the actual backend SQL database, based on the user question; we then use the machinery of the dashboard itself (rather than relying on an AI agent) to return the estimates, calculated by the dashboard’s statistical software. This approach ensures that although a user may still choose an incorrect indicator, the result returned for the selected indicator is correct and not based on an AI hallucination. Finally, we will implement an AI interpreter assistant (restrained to appropriate data sources) that allows the user to receive assistance with understanding the results and compare (if available) to national estimates. By re-envisioning data dashboards to include “safe”, conversational AI, users that are not familiar with or aware of the different point-and-click navigation can access and, furthermore, receive assistance in understanding available data more quickly and accurately. We propose to build-out our prototype, and to fully integrate it into the existing Alaska BRFSS application. Subsequently the developed tool can expand and adapt to be incorporated into other similar Alaska public health dashboards and applications.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Holck Consulting	Alaska Public Health Dashboards Unified AI Query System	AK	Alaska maintains numerous specialized public health data portals (BRFSS, PRAMS, CUBS, infectious disease surveillance, vital statistics, environmental health, injury prevention, and others), each valuable, but siloed. Health providers, public health officials, tribal health organizations, community planners, researchers, and grant applicants currently must first determine which of these systems holds the information they need, then learn each system's unique interface and terminology, then manually compile findings across platforms. This multi-step process can consume hours before a user even begins addressing the actual health challenge. The burden falls hardest on rural Alaska's health workforce, where limited staff wear multiple hats and lack dedicated data analysis capacity. A rural health director seeking information on prenatal care, substance use trends, and injury patterns may need to navigate three or four separate dashboards, a time investment that is often unsustainable. This fragmented data landscape undermines the data-driven, informed clinical decision-making that RHTP's Spark Technology and Innovation initiative envisions, limits the ability to identify high-risk populations and tailor interventions as called for under Healthy Communities, and weakens rural communities' capacity to address their most pressing health concerns	We propose to create Alaska's first unified public health data intelligence portal: a single, AI-powered interface that can identify, query, synthesize, and assist in interpretation of information from the state's many public health dashboards. Users will ask a single natural language question and receive a consolidated, evidence-based response drawn directly from the relevant Alaska Data Hub dashboard(s). The tool uses advanced browser automation technology to navigate dashboards exactly as a human user would. It crawls the dashboards linked from the Alaska Data Hub website, maps their interfaces and data structures, and learns to retrieve specific information on demand. The AI-powered tool returns results directly from these dashboards by navigating them. Incorrect hallucinations or fabricated data are not possible. The source of all data retrieved and the navigational steps used are returned to the user for full transparency. If requested, the tool will interpret results in plain language. We have a functioning alpha prototype that demonstrates technical feasibility and validates this approach. For rural Alaska's health workforce, where limited staff juggle multiple roles with minimal data analysis capacity, this tool transforms a multi-hour research process across three or four separate dashboard systems into a single question answered in minutes, reducing data search and compilation time by an estimated 80-90%. The project directly supports RHTP's Healthy Communities initiative by building infrastructure that aggregates behavioral and health-related information across existing data systems, enabling providers, tribal health organizations, and communities to identify high-risk populations, tailor interventions, and support proactive chronic disease management at the community level. The project advances RHTP's Spark Technology and Innovation initiative as an appropriate AI tool that supports informed clinical decision-making, integrates advanced analytics across public health data systems, and enables population-level analysis to guide care management and resource allocation in rural and frontier communities.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Holck Consulting	PRAMS Comparative Dashboard	AK	Alaska currently lacks a mechanism for cross-state and cross-regional PRAMS comparison, which limits the ability of planners and community leaders to evaluate the effectiveness of maternal health programs. Without a national benchmark, it is difficult to determine if a specific rural health indicator in Alaska represents a success or a systemic lacking that could benefit from intervention. This "benchmarking gap" puts Alaska and its rural communities at a disadvantage when competing for national grants, and complicates the process of setting realistic, data-driven goals for maternal health improvement. There is a significant opportunity to build on an existing proof of concept dashboard to create a National PRAMS Dashboard that allows Alaska to compare its rural and regional indicators against other states, providing the essential context needed for effective advocacy and enhancing or improving program design	Our approach focuses on technical integration and comparative logic to make national (at state and regional levels) MCH data indicators accessible and actionable for Alaska stakeholders. 1. Multi-State Data Integration: We will develop a dashboard (prototype version already exists) that pulls PRAMS data from multiple participating states, creating a unified SQL-based backend. The dashboard will allow for seamless cross-state benchmarking and comparisons with demographic stratifications and filters, geographical mapping, and indicator cross-tabulation presented with an intuitive interface. Secure authorization and login to the dashboard will be implemented. 2. Rural Subgroup Analysis: A useful feature will be the ability to filter data by rural vs. urban subgroups across states. This allows Alaska to compare its "off-road" outcomes not just to its own "on-road" populations, but to somewhat similar rural populations in peer states. 3.Regional Benchmarking: We will integrate Alaska’s existing regional and THO-level data into the national framework. This allows Alaska regions to assess how they perform on important MCH indicators relative to other state-level averages or—as the tool matures—to similar rural regions/counties in the Lower 48. 4. Integrated Interpretation: Following the model of other R shiny dashboards we have built for the State, we will include built-in statistical estimates and guidance to help non-technical users (such as community grant writers) interpret these comparisons correctly and use them to build strong arguments for funding. By leveraging an existing prototype, we can focus the project period on greatly expanding and refining the user interface and available backend data to increasing capabilities, as well as on establishing the governance structures needed for additional multi-state data sharing	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Holck Consulting	Small Area Health Estimation for Rural Alaska: Local Data for Community-Level Decision Making	AK	Alaska's primary public health surveillance systems generate reliable statewide and regional estimates, but small rural community populations produce sample sizes too small for valid local data. This is not a minor technical limitation, but also a structural challenge. Communities with the greatest health burdens cannot document their specific needs, track whether local programs are working, or compete effectively for funding. The State similarly lacks the community-level evidence needed to target assistance efficiently. Small area estimation directly resolves this by applying advanced statistical modeling to existing surveillance data to generate valid community-level health estimates where direct measurement has never been feasible.	Our approach builds directly on Alaska's existing public health surveillance infrastructure rather than creating parallel systems. We will apply the most appropriate small area estimation method, which may include hierarchical Bayesian models, multilevel regression with poststratification, or spatial smoothing techniques. Standard SAE methods borrow statistical strength from neighboring areas to generate estimates where local samples are insufficient. Alaska presents distinct methodological challenges: communities separated by vast distances, significant cultural differences, and limited administrative data linkage. Our team's 30 years of working directly with BRFSS, PRAMS, and YRBS and deep familiarity with Alaska's rural landscape positions us to extend and innovate on these methods (e.g., create ensemble models) rather than apply them off the shelf. Validated models will be integrated directly into existing dashboard infrastructure (where possible), generating community-level estimates accessible through the same platforms users already rely on. Estimates will include calibrated uncertainty measures and suppression rules for cases where reliability thresholds are not met, preventing misinterpretation. The approach is iterative: models will be validated against available direct estimates and reviewed with rural health stakeholders before broader deployment. This ensures that what reaches communities is methodologically sound, interpretable, and genuinely useful for local planning, program evaluation, and funding applications.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Holck Consulting	Statewide Technical Assistance for RHTP Projects Success	AK	A significant gap exists between the innovative ideas of rural health leaders and their capacity to meet the rigorous evaluation and data-reporting standards of the RHTP. Many promising projects lack the internal biostatistical expertise to translate a project concept into a measurable, statistically valid well-designed study or assessment, which can lead to inconclusive findings or effects, which diminish conclusions drawn about project efficacy and can threaten long-term sustainability. This "design and evaluation gap" limits the ability of rural communities or organizations seeking to assist them to demonstrate the benefits of their program or study, and handicaps their ability to compete for continued funding.	Our group has a 30-year track record of helping Alaska organizations bridge this gap. This project proposes to utilize that expertise into a resource of assistance and guidance offered to RHTP participants in their project’s up-front design, analysis, and evaluation capacity they need, and offer the methodological integrity/rigor required to sustain it. Our experience makes us well-suited to provide this capacity and assistance, while also fostering local skill-building in methods and analysis as desired. We will establish a multidisciplinary "Evidence Hub" that provides: 1. Consultation & Office Hours: Direct access to experts in study design, epidemiology, statistics, data management, evaluation, and meaningful reporting of successes, helping communities and researchers design projects that are logically sound, statistically valid, and likely to yield measurable results that can be evaluated. 2. Methodological Translation: We will help groups translate their "big ideas" into specific, measurable variables and data collection protocols that satisfy both local needs and rigorous funding requirements. 3. Rapid-Response Design Support: Providing templates and practical guidance for evaluation tasks that are often neglected until it is too late to collect baseline data. 4. Coordination with State Partners: We will proactively coordinate with existing State evaluation contractors to ensure our TA is supplemental where needed, and focused on the upfront logic of study design, meaningful data collection, and appropriate analysis and reporting. By applying 30 years of Alaskan common sense to complex data problems, we help ensure that the findings produced by rural projects are based on solid, interpretable methodology to help communities and researchers obtain evidence that effectively demonstrate a project’s benefits.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Holck Consulting	Urban–Rural Classification Framework for Alaska Health Equity	AK	The primary problem is that standardized federal urban-rural definitions are a “one size fits all” approach designed for lower 48 population distributions, and they therefore fail to allow discerning the differences that exist across Alaska’s rural communities. For example, a hub community such as Bethel with a regional hospital and scheduled air service differs fundamentally from a remote village accessible only by seasonal barge or small aircraft, yet they are often lumped together as the same type of community in health research. While on/off-road classification is a crude refinement to even broader MSA definitions, it is still lacking in distinguishing Bethel or Juneau from more distant villages. There is a significant opportunity to build on previous efforts (such as the Alaska Rural Primary Care Facility Needs Assessment Project from 2000 and its “Isolation Score”) to create a validated, multi-dimensional tool that accurately reflects remoteness and health delivery capacity. This will resolve misclassifications that currently distort rural health policy and resource distribution	Our approach combines methodological rigor with practical validation to ensure the new classification system is both scientifically sound and useful for decision-makers. Framework Development: We utilize community characteristics such as travel time to trauma centers, available mode of travel (road/boat/plane), presence and extent of community health clinic and staffing, availability/location of specialty care, and transportation infrastructure (e.g. airstrip capabilities, scheduled flight frequency, etc.) Validation: The underlying data informing this classification will be validated against actual infrastructure (transportation and clinic), population demographics, and health outcomes data. We will test the framework to see if it more accurately predicts disparities in care access and chronic disease burden than existing more crude classification models. Tool Creation: The final product will not just be a report, but a reusable definition and mapping tool that can be integrated into existing State of Alaska health dashboards and research workflows. By building a system that stakeholders accept as a standard based on a database of accurate relevant factors and a well-designed algorithm, we create a common standard for Alaska health research and policy resource allocation that much more accurately reflects the actual living situation of our rural population.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Holt Chiropractic Clinic	Coastal Chiropractic	AK	I want to address health of local and rural patients that rely on alternative health care. This project would provide upscale services that does not short change patients due to lack of state of the art equipment. We would use equipment and techniques with proven results enhancing the individual health of each and every Alaskan that chooses to be seen in our stationary clinic or marine facility.	I propose a rebuild of the existing brick and mortar clinic that would facilitate, state if the art equipment (new chiropractic and exam tables, X-rays, CT, US, decompression, hyperbaric decompression, shockwave, lasers and up to date EHR system. This would also include a Marine platform (boat) that would also be outfitted with very similar state if the art equipment that could handle rough seas and saltwater environments. This platform would be a mobile clinic on the water that would be able to get access into all the communities of Southeast Alaska.	\$1M-\$5M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Petersburg Borough; Sitka (City and Borough); Wrangell (City and Borough)	Deferred or Not Advanced
Homer Council on the Arts	Supporting Teen Wellness through Art	AK	The community of Homer has long sought to provide expanded access to youth programming out of school. Teens and students grades 7-12 have limited accessible programming outside of school. This program will provide a safe, supportive, and creative opportunities for teens.	HCOA will expand a current pilot project which provides a teen art space. Originally envisioned as a result-oriented teen created art project, we have learned that participating teens truly need a chance to be creative in a variety of art forms. By providing a space and access to supplies and materials, as well as a supportive facilitator, these teens are able to decompress, relax, commune with each other, explore their creativity, and develop their art. Additionally, we are piloting a teen art mentorship program. Targeted at at-risk or disadvantaged teens, this program will facilitate and provide mentorship pairings with local working artists.	Under \$50,000		Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Homer Cycling Club	Eastland Trails: Expanding Rural Access to Preventive Outdoor Health Infrastructure	AK	Rural Homer and the surrounding lower Kenai Peninsula face persistent barriers to preventive health access. Residents experience limited year-round employment, high living costs, long travel distances to services, and restricted access to structured wellness programming. While Kachemak Bay State Park is a major regional asset, nearly all trails are located across the bay and require costly water taxi or aircraft access, limiting regular use by families, seniors, youth, and lower-income residents. The north side of the bay, where most residents live, lacks free, accessible, road-connected infrastructure that supports daily physical activity and structured wellness engagement. As a result, opportunities for routine movement, outdoor stress reduction, and community-based preventive health programming are unevenly distributed. This gap presents a significant opportunity: to develop an existing, underutilized and road-connected State Park unit as a designated rural wellness location that integrates physical activity, mental health benefits, and preventive health education into a durable public setting. Rather than building a new facility, this project transforms an existing public asset into a community-scale wellness platform embedded in the natural environment.	This project will transform the Cottonwood Eastland unit of Kachemak Bay State Park into a designated rural wellness location through a phased infrastructure expansion totaling approximately 11.5 miles of professionally built, sustainable multiuse trails, supporting health-focused improvements. Phase 1 (2025–2026) established the foundation for the wellness site, including construction of a public trailhead, parking, maintenance area, and approximately 3.5 miles of highly accessible, low-grade trail. This phase created safe, road-connected access and the core infrastructure necessary to support year-round physical activity and community programming. Phase 2 (2026–2027) — The subject of this RHTP request, expands the wellness platform by adding approximately 4.5 miles of additional trail designed to increase movement opportunities and accommodate diverse user abilities. Phase 2 also includes installation of health-focused and wayfinding signage promoting physical activity, chronic disease prevention, mobility maintenance, and nature-based stress reduction. Targeted enhancements to existing park facilities will support structured wellness programming such as walking groups, youth engagement, adaptive recreation, and community health initiatives. This phase represents the critical shift from a passive recreation area to active, designated wellness location. Phase 3 (2027–2028) completes the system with a 3 mile outer loop that expands capacity and ensures long-term scalability of programming and sustained community use. Together, these three phases transform an underutilized State Park unit into a lasting preventive health asset, expanding an existing recreation area into an accessible outdoor wellness space that supports physical activity, mental health, and long-term rural well-being.	\$250K-\$1M	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Homer Hockey Association	Sustaining a Kenai Peninsula Rural Community Wellness Hub: Kevin Bell Arena Renovation	AK	Alaska's chronic disease burden is among the highest in the nation. Three in four Alaskans have or are at risk of chronic disease. Regular physical activity is one of the most effective tools for prevention and management, but access is limited in rural communities. Kevin Bell Arena is the only nonprofit ice rink in Alaska and the only dedicated indoor rink on the southern Kenai Peninsula. It serves over 15,000 residents a year, including Alaska Native villagers, Russian Orthodox communities, and rural families from Ninilchik through Homer and across Kachemak Bay. While the rink is well used and loved, the arena is over 20 years old, and critical building systems are failing. The boiler, fire suppression system, roof, parking lot lighting, and garage doors all require repair or replacement to keep the facility safe and operational. Homer Hockey Association (HHA) has operated the arena since 2005 and has maintained it responsibly, but the facility has reached a point where deferred investment is no longer an option. The refrigeration and mechanical infrastructure are also nearing the end of their useful lives. Without intervention, the arena risks closure, eliminating one of the only places for physical activity available to these rural communities. This LOI represents Phase 1 of a planned multi-year investment to address both immediate safety needs and long-term infrastructure.	Alaska's rural communities face a chronic disease crisis, and access to physical activity is one of the most effective tools to address it. Kevin Bell Arena operates September through April, providing indoor activity during Alaska's long winter months when outdoor options are severely limited. For Alaska Native villagers, Russian Orthodox communities, and rural families spread across the southern Kenai Peninsula, it is one of the only places where people of all ages can stay active close to home. During the summer months, the arena closes as Alaskans turn to the outdoors and the facility undergoes routine maintenance. For this project, HHA will complete arena repairs within the summer window, ensuring not a single day of community programming is disrupted. Phase 1 repairs will address the most urgent building system failures identified by HHA's maintenance and facilities team. Planned work includes replacement of the fire suppression system, boiler repair or replacement, roof repairs, installation of new parking lot lighting, and replacement of two garage doors. These repairs will bring the facility up to safe operating standards and reduce the risk of emergency failures that could force unplanned closures during the programming season. In parallel, HHA will commission a comprehensive assessment of the arena's refrigeration and mechanical infrastructure. This assessment will provide detailed cost estimates and inform a phased renovation plan for subsequent years of improvements, ensuring future investments are targeted, cost-effective, and properly sequenced. Shelly Laukitis, HHA's Finance Committee Chairperson and former board president, will serve as project manager. She will oversee contractors, manage timelines, and ensure all work is completed before the arena reopens in the fall. Her long tenure with HHA and deep familiarity with the facility make her well-suited to lead this work. Total estimated funding for Phase 1 is \$200,000. Upon reopening, a fully repaired Kevin Bell Arena will remain what it has always been for the southern Kenai Peninsula: one of the only places rural residents can stay active, healthy, and connected to their community through the long Alaska winter.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Homer OPUS	Homer OPUS: Advancing Rural Health Through Accessible String Education	AK	Homer OPUS proposes to use this opportunity to maintain and continue to expand the reach, breadth, and depth of our music education programs. Our goal is to ensure equitable access for students throughout the communities of Anchor Point, Homer and the smaller surrounding communities. This initiative will strengthen and extend OPUS’s established partnership with the Kenai Peninsula Borough School District (KPBSD), serving K–2 students at Paul Banks Elementary, Chapman School, and Fireweed Academy. This partnership is under an MOU which permits OPUS to provide violin instruction during the day. OPUS receives no funding from KPBSD. Additionally, this is an opportunity to maintain and expand our outreach to adults through mixed ensembles and performances. OPUS’s in-school programming provides free, high-quality, and inclusive music education at a foundational stage in a child’s academic journey. By integrating music into early elementary classrooms, the program fosters creativity, collaboration, and cognitive development while ensuring that access to arts education is not limited by geography or financial means. Through sustained expansion of these services, Homer OPUS seeks to contribute to the long-term vitality of the southern Kenai Peninsula by cultivating engaged learners, supporting educational music equity, and strengthening community connection through shared musical experiences across Homer, Anchor Point, and surrounding smaller communities.	Homer OPUS’s approach to this opportunity is to continue to provide access to high-quality string education to strengthen youth development, promote wellbeing, and support healthier rural communities across the Southern Kenai Peninsula. Our model integrates in-school instruction, afterschool ensembles, and community engagement to ensure consistent, equitable access to string music education for children and families. The project sustains in-school string instruction for K–2 students in partnership with the Kenai Peninsula Borough School District, Fireweed Academy, Paul Banks Elementary, and Chapman School. Delivering instruction during the school day removes common barriers such as cost and transportation, ensuring all students can participate regardless of background. Early exposure to music supports cognitive development, collaboration, and social-emotional learning during a critical stage of childhood growth. Afterschool programming deepens this impact through youth orchestras, ensemble learning, and performance opportunities. These programs provide safe, supportive environments where young people build confidence, teamwork skills, and meaningful peer relationships. Participation in music ensembles fosters belonging and engagement—protective factors that contribute to positive mental and emotional health. Cross-sector partnerships strengthen the Homer OPUS model. By collaborating with schools, behavioral health providers, youth-serving organizations, and community groups, the program expands access while aligning music education with broader efforts that support prevention, resilience, and connection. Partnerships with organizations such as Homer Youth Programs Everyday (HYPE) and South Peninsula Behavioral Services help extend outreach and increase participation among youth who benefit most from supportive programming. Homer OPUS also encourages multigenerational engagement through community performances, mentorship opportunities, and adult ensemble participation. These experiences build connections across age groups and strengthen community bonds. Ongoing evaluation will track participation and engagement, while feedback from students, families, educators, and partners guides continuous improvement.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Homer Senior Citizens Inc	Preserving Home: The HSC Senior Campus Renewal Project	AK	Homer Senior Citizens, Inc. operates the primary senior services campus serving older adults in our rural coastal Alaska community. Our campus includes an Assisted Living Facility, Adult Day Services, a senior center, and independent senior housing. In a frontier region with limited providers and significant geographic barriers, these services are essential to the local health care continuum. The core problem is instability caused by more than ten years of deferred maintenance combined with inadequate transportation capacity. Critical building systems and safety repairs now require comprehensive attention. In rural Alaska, contractor shortages, high material costs, and seasonal limits increase risk. If facilities fail or fall out of compliance, seniors may be forced to relocate hours away from family and providers, disrupting continuity of care. Transportation is also a major barrier. Many seniors no longer drive, public transit is minimal, and harsh weather restricts mobility. Missed appointments, delayed prescriptions, and higher emergency utilization result. HSC lacks sufficient transportation capacity to meet demand. A new micro-bus will provide reliable access to medical appointments, therapy, pharmacy services, and essential programs, while expanding service to community seniors. By stabilizing infrastructure and strengthening transportation, this project protects aging-in-place services, reduces strain on the health system, and ensures sustainable rural senior care.	Homer Senior Citizens, Inc. (HSC) proposes a phased five-year capital stabilization and transportation expansion strategy to address deferred maintenance and eliminate transportation barriers for rural seniors. Phase 1 (Year 1): Immediate Stabilization & Transportation Launch HSC will prioritize health and safety repairs identified through facility inspections, focusing on life-safety systems, critical mechanical components, exterior envelope stabilization, and compliance-related items in the Assisted Living Facility, senior center, and independent housing. During this phase, HSC will purchase a new ADA-accessible micro-bus to support Assisted Living and Adult Day Services transportation to medical appointments, therapy, pharmacy access, and essential shopping. Estimated Year 1 investment: \$750,000–\$900,000. Phase 2 (Years 2–3): Structural & Systems Rehabilitation HSC will complete major capital repairs including roofing, siding replacement, HVAC upgrades, parking and ADA improvements, and interior modernization to support infection control and aging-in-place standards. Transportation services will expand to include scheduled routes for community seniors. A formal preventative maintenance plan will be implemented to prevent future deferred maintenance. Estimated Years 2–3 investment: \$900,000–\$1,100,000. Phase 3 (Years 4–5): Sustainability & Expansion Remaining upgrades will focus on long-term durability and efficiency, including energy-efficient system replacements, accessibility enhancements, and establishment of a capital reserve fund. HSC will evaluate acquisition of a second light-duty vehicle if demand warrants. Estimated Years 4–5 investment: \$400,000–\$500,000. Five-Year Capital Plan (Total: \$2.1M–\$2.5M) Includes life-safety and compliance repairs; roof, siding, and envelope replacement; HVAC upgrades; accessibility improvements; interior modernization; ADA-accessible micro-bus (Year 1); potential secondary vehicle (Years 4–5); and capital reserve development. This phased approach protects essential rural health infrastructure, reduces emergency repair costs, stabilizes regulatory compliance, and builds a sustainable transportation program. Sequencing repairs and vehicle acquisition over five years ensures immediate impact and long-term operational resilience for seniors in our frontier community.	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Hoonah City Schools	Healthy Body Healthy Minds	AK	The problems are lack of mental health and stigma around mental health which would be improved by having access and education at the school. In addition, physical activity is limited outside high school sports so teaching ways to stay active and providing education about why is important. We also want to respond to student requests to have more nutrition information and to use that information to learn to gather foods and use local food options for meals.	We would like to add a School Counselor at the school and work to develop a continuum of care for mental health among school youth and their families. We would do education and outreach to parents and the community as well. We would also like to act on student requests to educate youth about healthy food choices through a native foods based culinary arts class as well as regular education to all grades and their families on healthy nutrition choices. We would partner with the clinic and the tribe to provide culturally relevant information and local food options. Our last piece of the puzzle is physical activity and we would like to have a full time PE/Health instructor to provide regular physical activity and lifetime choices for students in K-12 with information regularly provided to families with family engagement in physical activity events. Access to this information and activities at the school helps the entire community as the school is centrally located and is the hub for many events throughout the year. This would also be used to provide work based learning at the high school level to have students intern at the clinic thus growing the workforce at that location and improving long term care.	\$50,000-\$250,000	Single Community	Hoonah-Angoon Census Area	Deferred or Not Advanced

Hope Community Resources Inc	Complex Care Children’s Home	AK	Hope Community Resources, Inc. submits this Letter of Interest for Rural Health Transformation Project (RHTP) funding to support the development of a Complex Care Children’s Home in Alaska. This initiative directly advances RHTP Goals #1 and #2 by expanding access to high-quality, in-state care for children with complex medical needs while building a more sustainable and cost-effective health system for rural and frontier communities. Currently, many Alaskan children with complex medical needs and intellectual and developmental disabilities often face significant barriers to receiving appropriate care within their home state. Due to the lack of specialized residential care settings capable of managing complex conditions, many children are placed in hospitals for extended periods or are sent out of state for care. These placements separate children from their families, communities, and cultural supports, and result in significantly higher costs to the State of Alaska compared to providing care locally. In many cases, children remain hospitalized longer than clinically necessary or are placed far from their families simply because appropriate residential care does not exist within Alaska.	Hope proposes to establish a licensed and certified Complex Care Children’s Home in Anchorage that would provide specialized medical and supportive services within a nurturing home environment. While the initial home is based in Anchorage, Hope intends to expand this model into additional rural environments such as the Matanuska-Susitna Borough and Kenai Peninsula. This model will allow children to receive the level of care they need while remaining in their home state, closer to family, culture, and community. Care will be delivered by a multidisciplinary workforce including nurses, certified nursing assistants (CNAs), and direct support professionals (DSPs), coordinated with medical and behavioral health partners. Hope is prepared to develop and staff a Complex Care Children’s Home within 18 months. Hope has extensive experience operating licensed residential services and employing specialized healthcare and support staff. Required resources include sustainable funding at levels comparable to existing Home- and Community-Based Services (HCBS) waiver programs. The has already been purchased; it was remodeled in FY25 for \$111K; and nursing and medical staff have been secured. The home is licensed for three children with the potential to support a fourth through respite services. The estimated annual cost per home is \$1,062,000.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; North Slope Borough	Advance to Implementation Application

Hope Community Resources Inc	Direct Support Professional (DSP) Mentorship and Internship Program	AK	Within Hope, the average employee tenure is eight years—an extraordinary statistic in the Intellectual and Developmental Disabilities (IDD) field. However, this number masks a critical challenge: turnover during the first year of employment is 48%. Nearly half of new employees leave before completing their first year. This instability creates inconsistent staffing, disrupts relationships in the lives of people receiving services, increases recruitment and training costs, and strains remaining staff. The IDD field is extremely rewarding, but it can also be demanding and unfamiliar to individuals without prior exposure or experience. Without structured support and meaningful connection during the first year, many promising employees struggle to successfully transition into long-term careers in human services.	To address these challenges, Hope proposes a two-pronged workforce development strategy: 1. Direct Support Professional (DSP) Mentorship Program Hope’s work is guided by a core organizational principle: “We embrace the role of a teacher, coach, and mentor.” This philosophy recognizes that developing strong professionals requires intentional support, guidance, and opportunities for growth. Building on this concept, Hope will develop and implement an internal mentorship program designed specifically to support employees during their first year of employment, helping new staff successfully transition into the field while strengthening long-term workforce retention. This program will: • Pair new employees with experienced DSP mentors • Provide regular, structured check-ins, coaching, and guidance • Assist new employees in integrating into both the workplace and the broader community • Reinforce mission connection and organizational culture • Support professional development and skill-building Mentors will receive compensation for mentoring hours conducted outside regular shifts, recognizing the value of this investment in our workforce. Over time, reduced turnover costs are expected to sustain the program beyond initial implementation funding. 2. Formal Internship Program Hope will launch a structured, unpaid internship program serving 8–10 students annually across disciplines connected to nonprofit and human services work, including: • Human Services • Behavioral/Mental Health • Human Resources • Accounting/Finance • Property Management • Employee Education and Training • Information Technology • Marketing and Events The program will include structured learning objectives, supervision, and mentorship from field professionals. Distance learning and remote placements will be integrated to promote workforce development in rural and underserved communities across Alaska. Internships will serve as both a recruitment pipeline and an opportunity to cultivate long-term advocates for the human services field.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; North Slope Borough	Advance to Implementation Application

Hope Community Resources Inc	Travel Community Support Specialist (TCSS) Pilot Program	AK	Across Alaska, the field of intellectual and developmental disability (IDD) services continues to face longstanding and persistent workforce shortages. These shortages stem from multiple systemic challenges, including a limited number of trained direct support professionals (DSPs) and wage structures that struggle to compete with other industries. As a result, providers are unable to consistently staff programs at levels necessary to meet community needs. The impact is felt statewide. People with IDD experience inconsistent access to essential supports. Staffing gaps lead to interruptions in day habilitation services, reduced community engagement opportunities, and limited continuity of care. Families—particularly those in rural regions—remain underserved and often face uncertainty about the stability of services. Within Hope’s programs, workforce pressures are predictable and ongoing. Programs rely heavily on overtime to maintain minimum staffing levels, which leads to higher operational costs and burnout among staff. When vacancies occur, service delivery becomes reactive rather than proactive, requiring emergency travel and costly short-term coverage solutions. At the same time, seasoned employees have limited internal mobility options, contributing to turnover and loss of institutional knowledge. These conditions create a cycle in which workforce instability directly impacts service quality, staff retention, and financial sustainability.	The Travel Community Support Specialist (TCSS) role is designed as a strategic response and solution to Alaska’s persistent workforce shortages in IDD services. It is modeled after Hope’s previously implemented and extremely successful Travel Direct Support Professional Program (www.hopealaska.org/traveldsp), which has strengthened and stabilized our assisted living home environments across the state. Under this pilot model, Hope will establish four (4) full-time TCSS positions and one (1) Scheduling Coordinator position, offering competitive wages and full benefits. These team members will be deployed across all regions in which Hope operates to stabilize services in communities experiencing staffing shortages or service gaps. They would work a schedule of one month on/one month off to allow for focused, comprehensive service delivery during deployment periods and still supporting employee wellness and work-life balance. TCSS staff will be cross-trained to work in a variety of residential and community-based services—such as day habilitation, recreational activities, and community engagement—increasing workforce flexibility and internal mobility. During deployments, they will: • Provide direct supports in residential and community-based settings • Provide relief to existing teams • Ensure continuity of care during staffing fluctuations • Reduce Hope’s overall overtime utilization • Expand services to underserved waiver recipients in rural and high-need communities By combining structured travel rotations, cross-training, full-time employment stability, and a dedicated four-person TCSS team, the TCSS program offers workforce solution that strengthens service delivery and staff retention statewide. Importantly, the TCSS position is not intended to replace current employees or existing positions, but to complement and support them. These specialists will provide additional capacity to support existing teams, especially when staffing shortages occur, and their role will be to fill gaps and prevent disruptions to community-based supports.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; North Slope Borough	Advance to Implementation Application

Hope Community Resources Inc	Inclusive Communities for Alaska: A Statewide Housing Initiative	AK	Hope Community Resources, Inc. is seeking funding to support our statewide initiative to advance neuro-inclusive community housing models across Alaska. Through a series of forums in rural communities statewide, this project will educate communities, gather lived experience input, and build a replicable blueprint that Alaska communities can use to develop inclusive housing solutions. Across Alaska, communities are experiencing growing housing and care challenges affecting underserved populations such as people with intellectual and developmental disabilities (I/DD), aging Alaskans, people with behavioral or mental health needs, and families providing long-term caregiving. Too often, people face a very narrow set of options such as institutional settings, licensed facilities, traditional group homes, or costly medical and long-term care placements. In many rural areas—including even Anchorage—the lack of housing options can lead to out-of-state institutionalization, risk of homelessness, caregiver burnout, and increased demand on health care systems. Inclusive housing models are an alternative, person-centered approach. These models integrate accessible, community-based housing, shared spaces, assistive technology, and flexible support services in ways that promote independence, social connection, dignity, and long-term stability. They also reduce reliance on institutional care environments such as nursing homes, group homes, and other facility-based systems.	Hope played a huge role in transitioning Alaska out of institutional care and into community-based living for people who experience I/DD. As part of the deinstitutionalization movement, Hope helped demonstrate that people thrive when they live in their own home and community. Today, families and providers are facing a new transition based on aging caregivers, changing support needs, and a growing desire for independence, inclusion, and long-term housing stability. Inclusive housing can accomplish the next evolution by creating neighborhoods where people can live with more autonomy, build relationships, and access supports while remaining fully part of their communities, which in turn supports and elevates health. Hope has successfully developed and operates intentional communities in Kenai and Willow that support people who experience I/DD. However, this housing model is still unfamiliar to many communities across Alaska, so our goal is to introduce the concept statewide, gather community insight, and develop a framework that can be replicated and adapted to different regions and populations. Through this initiative, Hope will organize a series of both in-person and virtual housing forums for people and families with lived experience, aging adults, family caregivers, housing providers, tribal organizations, behavioral health providers, and community leaders. These discussions will introduce how intentional community models could support a range of Alaskan populations while also identifying housing preferences, cultural considerations, and support needs across the state. Hope is requesting \$115,000 in RHTP funding, with which Hope will hire a project consultant to coordinate the project, identify communities and partnerships, travel to and facilitate forums, and document and analyze findings. The findings will be compiled into a “blueprint” that outlines the model’s philosophy, design considerations, partnership strategies, and paths to developing intentional community housing. The blueprint will be shared with communities, housing agencies, and service providers as a practical resource to support development of inclusive housing solutions across the state. Budget: • Project Consultant: \$80,000 • Statewide Housing Forums: \$20,000 • Travel: \$15,000	\$50,000-\$250,000	Statewide	Anchorage (Municipality); Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Matanuska-Susitna Borough; North Slope Borough; Sitka (City and Borough)	Deferred or Not Advanced

Hope Holders Ketchikan	HHKTN HUB & Hope Holders Alaska Navigators: Southeast Alaska Rural Health Transformation Initiative	AK	Rural Southeast Alaska communities face significant gaps in access to and connection with community, medical, and behavioral health services due to workforce shortages, geographic isolation, transportation challenges, and fragmented service systems. Individuals experiencing substance use disorders, untreated mental health conditions, housing instability, and food insecurity often struggle to navigate access to care until they reach crisis points. The closure of Ketchikan’s low-barrier shelter in 2024 intensified these gaps. Many individuals now rely on emergency departments and crisis response systems rather than supportive, preventive, or recovery-oriented services. The HHKTN HUB initiative addresses these challenges by establishing a regional coordination and peer navigation infrastructure that connects individuals to community partners, essential basic needs, medical and behavioral health services, housing stabilization programs, recovery pathways, and community supports, while strengthening collaboration across providers and agencies.	The HHKTN HUB will serve as the central coordination point for outreach, basic needs support, peer navigation, workforce development, housing stabilization, and community service integration in Ketchikan and across Southeast Alaska. The project establishes the Hope Holders Alaska Navigators program, a regional workforce and registry of Certified Peer Support Specialists to help individuals navigate community systems and connect to support services, medical providers, behavioral health treatment, housing programs, and social services. Key components include rural behavioral health navigation, a centralized HUB coordination model, housing stabilization services through the AKHFC NGS partnership in Ketchikan, peer workforce development through a Certified 40-hour training curriculum aligned with Alaska standards, and development of a Southeast Alaska Peer Support Registry. HHKTN’s behavioral health program will gradually launch between 2027 and 2028, transitioning outreach and navigation services to Medicaid-reimbursable behavioral health services and private foundation support. This initiative is structured as a five-year rural health transformation project focused on building sustainable infrastructure for community support, essential basic needs, access to medical and behavioral health services, housing stabilization, and workforce expansion across Southeast Alaska.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Matanuska-Susitna Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough)	Deferred or Not Advanced

Hope Sunrise Emergency Services	Community Paramedicine/Mobile Integrated Health for East Peninsula	AK	East Peninsula emergency agencies have a deficit of medical providers and access to medical care. Unincorporated communities have very limited economies, with only seasonal and limited employment, most community tasks are performed through volunteerism, and most volunteers are informally/minimally trained. Additionally, access to health care is challenging and many residents of rural unincorporated villages in Alaska go long periods without medical care, increasing health problems until they are so acute that an emergency transport is required. Mobile Integrated Health would fill the gap for communities that are not able to access the CHAP program and are too far from more populous areas to make routine medical care easy access. One of the key components of this model is that the training and education is geared to reflect the needs of the community served. Research shows bridging healthcare to rural communities is one of the best ways to improve access and patient care/outcomes, decreasing the overall burden on the health care system. Maternal and child care, elder care, access to healthcare, pay for value and strengthen workforce would all be addressed with the proposed program. Utilization of modern technologies (telehealth, electronic health records, high speed internet) would be applied to support and execute a Mobile Integrated Health/Community Paramedicine program. Advanced EMS providers would strengthen the training & response capabilities of these rural departments.	In 2001 Nova Scotia implemented a program utilizing paramedicine to reach rural and vulnerable populations. Implemented in three phases, it began by opening access to paramedics on a 24/7 basis for non-emergency services. Second phase and third phases expanded EMS’s clinical role in the health care system. Eventually, this leads to a special certification for expanded scope allowing specially trained ambulance personnel to deal with tasks related to elder care at in-patient facilities, to address care issues, routine wellness and assessment screening, along with other mundane tasks such as bloodwork, simple sutures, home-healthcare, and care coordination. This showed a reduction in transport and took place during the routinely busy transport hours of 9:00 am to 9:00pm. Community paramedicine (CP) programs located in the United States have also shown to be successful. In 2013, Maine started a pilot program to train and certify paramedics and EMTs to monitor patients who are at high-risk for hospital readmission. The goals included helping to manage chronic disease, addressing medication issues, and assessing patient living conditions. These services were organized by the individual program sites, mostly Fire and EMS departments, and are tailored to specifically address the needs of the vulnerable in their service community. Affiliated with paired hospitals, built on a fee-for-service model, and home-healthcare framework; Maine’s CP program proved to be sustainable and reproducible. HS would implement a similar program, using an AEMT/paramedic and a mobile integrated health vehicle to perform house calls and operate "clinic hours" to serve patients in the service area. Affiliated with local clinics, hospitals and an overseeing physician, the program could eventually be expanded to the rest of the East Peninsula unincorporated villages (Cooper Landing, Moose Pass, Lowell Point), increasing the overall level of medical training and health care access in our area. Ultimately, the program could be expanded state-wide to serve similar rural towns, villages and populations. At present, it is virtually impossible to get hospice, skilled nursing or other medical care beyond emergency response in unincorporated towns on the East Peninsula. The proposed program would alleviate and address many of these deficits in health care access.	\$250K-\$1M	Home-and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Planning

Hope Sunrise Emergency Services	Hope Sunrise Emergency Services Ambulance Replacement	AK	HSES serves a year-round population of roughly 150 residents with 1,000+ daily visitors in the summer. HSES supports the Kenai Peninsula Borough's emergency services by providing emergency response to the Hope and Sunrise communities, the 15 miles of Hope Highway, and surrounding Forest Service/borough wildland/backcountry areas. Due to extremely limited resources, response scope covers typical medical and fire calls, wildland fire, search and rescue and many other unusual wilderness emergencies. Our small, fully-volunteer station does not have adequate ambulance transport services to allow for reliable emergency response, meaning that we must heavily rely on mutual aid partners for patient transport when the current ambulance is removed from service. This causes increased demand on neighboring emergency services (Moose Pass, Cooper Landing Emergency, Girdwood), impacting response times for emergencies within their service areas due to supporting HSES with emergency response and transportation. This creates a waterfall effect leaving surrounding agencies unable to provide the standard of care, personnel, or equipment necessary to maintain safety within the East Peninsula emergency corridor. Replacing the HSES ambulance will ensure reliable response for Hope and Sunrise, the Hope Hwy., and attract new volunteers, potentially increasing HSES's service area into the Seward Highway corridor, reducing the overall burden on the entire East Peninsula emergency services system.	Funding this project will allow HSES to purchase a new ambulance, reducing downtime due to critical maintenance and repairs and will fulfill the critical need for additional ALS equipment onboard. Given the extremely rural location of Hope and Sunrise (15 miles from the Seward Highway corridor and an additional 45+ miles to the next town - Girdwood, pop. 1,500, Moose Pass, pop. 228, or Cooper Landing, pop.334), our ambulance is a critical piece of equipment as residents are unable to access any type of health care services in Hope or Sunrise beyond emergency medical services provided by HSES. The nearest primary care service provider is located approximately 50 road miles away in Girdwood, with the nearest hospital/urgent care over 100 road miles away. Air ambulance services are available outside of severe weather conditions; however it takes upwards of 40+ minutes to arrive on scene, and requires transport via ground ambulance to a landing zone. Emergency Services (EMTs) provide the only health care for both emergent and non-emergent situations within a 50+ mile radius, with the nearest hospital over 100 miles away. Replacing HSES' ambulance will increase the overall response capabilities and medical interventions available to patients who must endure long transport times for access to higher levels of care while significantly decreasing overall maintenance costs for HESE's small and under-funded department, allowing funds to be redirected for ongoing training for volunteer personnel. HSES would be able to purchase a vehicle with Advanced Life Support capabilities, thereby increasing the ability to host and train local volunteers with higher levels of care.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Hope Sunrise Emergency Services	Sanitation and Training for First Responders	AK	HSES serves a year-round population of roughly 150 residents with 1,000+ daily visitors in the summer. HSES supports the Kenai Peninsula Borough's emergency services by providing emergency response to the Hope and Sunrise communities, the 15 miles of Hope Highway, and surrounding Forest Service/borough wildland/backcountry areas. Due to extremely limited resources, response scope covers typical medical and fire calls, wildland fire, search and rescue and many other unusual wilderness emergencies. At present, our small, fully-volunteer station does not have adequate sanitation (septic, toilet, shower, hot water sink, dryer and hookup of existing extractor machine), or overnight bunk accommodations. This makes it dangerous for our volunteers, as they are currently forced to go home with clothing and persons potentially contaminated with carcinogens and/or pathogens after calls, increasing spread of illness in the community and risk to responder's families. The lack of overnight accommodations makes hosting outside trainers or volunteers from other communities virtually impossible. Responders must travel more than 50 miles to other stations for certification courses, continuing medical education credits and other training. Sanitation and accommodation improvements HSES would be able to attract more qualified first responders, host training for HSES and other East Peninsula agencies and vastly improve the quality of care offered to residents and visitors, alike.	Funding this project will allow HSES to purchase and install a septic tank, finish existing plumbing, conduct a percolation test on the exiting well, and install a small bathroom/laundry in our existing facility, providing an immediate risk reduction for volunteer responders, their families and the community at large by allowing responders to decontaminate onsite immediately after an emergency call, reducing the potential exposure to carcinogens, pathogens and illness. Additionally, HSES will be able to create overnight accommodations by renovating a portion of the upstairs administrative loft area to be an enclosed room with a bunk, so visiting trainers, EMTs and firefighters would have a place to stay. The addition of overnight accommodations will allow for the facility to become a staffed station, which greatly improves emergency response times, station management and maintenance. HSES has already secured in-kind promise of assistance from laborers, plumbers and carpenters in addition to an informal estimate for the total cost and timeline for these projects. Funding for this project will ensure that these necessary improvements come to fruition and will significantly improve access to health care for our rural Alaskan community, visitors, and surrounding East Peninsula service area. As a small, volunteer operated organization with limited financial resources resulting in a reliance on volunteer labor, lack of funding for these facility improvements has been a long-standing hurdle to a sustainable and safe emergency services station with the ability to provide advanced life support and highly trained personnel. Sanitation is the first step in HSES's ability to grow and providing appropriate decontamination and a restroom will allow HSES to host training and staff the station. HSES has standing offers from EMTs, paramedics and neighboring agency firefighters to both volunteer and provide training in Hope which is virtually impossible with the current lack of complete facilities, directly impacting our service's ability to receive training and achieve a consistent higher level of emergency care. Our responders are currently taking on great personal risk by volunteering at a station that does not have adequate sanitation. By completing the septic and bathroom/laundry facilities, we will improve safety and health of our volunteers which will have a ripple effect to the community. Healthy first responders equal a healthy community.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Hospice of Anchorage	Expanding Access to Resources through Hospice of Anchorage's Community End-of-Life Resource Center	AK	Alaskans traveling from rural villages, remote and frontier communities, and the Anchorage Municipality for medical treatment face significant gaps in access to DME and essential end-of-life care supplies. Many temporarily relocate to Anchorage for specialty care without the adaptive supports needed to remain safely housed. Others require equipment to return home but encounter supply delays, high transportation costs, or limited availability. Without timely access to essential equipment, families experience unsafe caregiving environments, prolonged time away from home, preventable escalation of care needs, or unnecessary emergency services utilization. These gaps affect individuals in geographically isolated communities as well as Anchorage households facing cost, housing, or access barriers. HOA operates a Community EOL Resource Center and DME Closet that provides no-cost resources, equipment and supplies to individuals from any Alaska community. Rural families rely on this center while in Anchorage for treatment and often transport equipment back to their home community. Anchorage residents depend on this resource to maintain safe in their home environments. Demand continues to grow, while infrastructure, tracking systems, and redistribution workflows limit consistent response. This project will strengthen and formalize this infrastructure and improve efficiency to support safer transitions, improved continuity of care, and healthier communities statewide.	HOA will implement a comprehensive expansion and systems improvement of its Community EOL Resource Center and DME Closet to strengthen continuity of care and community health stability across rural villages, frontier communities, and the Anchorage Municipality. The project will greatly expand inventory of high-demand items such as incontinence supplies, walkers, wheelchairs, commodes, and shower and transition benches. Storage systems will be upgraded to improve organization, sanitation workflows, and equipment turnaround time. Structured refurbishment and maintenance protocols will extend equipment lifespan and ensure safety standards are consistently met. HOA will modernize inventory and data system integration to strengthen operational efficiency and long-term planning. A digital inventory tracking system will monitor equipment distribution, turnover, and return cycles. Geographic utilization data will capture where individuals originate and where equipment is ultimately used, allowing better understanding of rural and Anchorage access patterns. This information will guide future Healthy Communities investment by identifying high-demand categories, emerging regional needs, and opportunities to strengthen continuity of care across Alaska and will help HOA programming for future fiscal years--shaping our strategy directly to need. The project will also formalize rural access and redistribution pathways. Structured intake guidance, discharge-aligned distribution processes, and equipment transport recommendations will support individuals traveling to Anchorage for treatment and safely returning to their home community. When equipment is returned, streamlined cleaning and redistribution workflows will reduce availability gaps and improve circulation. Staff and volunteers will receive training in equipment safety, sanitation standards, logistics management, and documentation. Written operational protocols will ensure consistency, accountability, and long-term resilience. Through these integrated improvements, Hospice of Anchorage will transform an essential but capacity-limited service into a structured Healthy Communities infrastructure model that reduces avoidable hospitalization, supports safe home-based care, decreases caregiver strain, and strengthens the ability of Alaskans in both rural communities and Anchorage to remain safely in their home environments.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Humetrix	Operationalizing Alaska Medicaid & Medicare Data to Strengthen Rural Care	CA	Rural Alaskans face not only access challenges, but also significant care coordination barriers due to the long distances they must travel for primary and specialty care, compounded by Medicaid coverage disruptions and churning. The result: • Lack of continuity of care • Medication errors and duplication • Avoidable hospitalizations and medevacs • Poor chronic disease control • Limited telehealth effectiveness • Higher risk for dually-enrolled elders and pregnant women The CMS RHT initiative presents an opportunity to address these challenges through consumer-facing tools and population health dashboards that transform Medicaid and Medicare claims into actionable clinical intelligence at the point of care. This directly supports CMS RHT goals: prevention, consumer empowerment, IT modernization, measurable outcome improvement, and rural sustainability, without new infrastructure builds.	Our approach operationalizes Alaska Medicaid and Medicare claims data into patient-facing and population-level tools. Step 1: Deploy Consumer Mobile Applications Provide Alaska Medicaid beneficiaries and dually-enrolled with CMS-approved mobile apps (iBlueButton, WhatMeds) that: • Aggregate Medicaid and Medicare claims • Generate easily sharable health summaries with up to date medication lists • Provide AI medication safety alerts • Offer personalized chronic disease guidance • Enable secure QR code-based sharing at any point of care To enable care coordination and continuity of care at every point of care, including during telehealth and ER visits. Step 2: Enable Point-of-Care Data Sharing Patient-facing applications generate a dynamic QR code. Providers instantly access the patient’s up to date medical history and medication list No EHR integration required. Works in low-bandwidth settings. Step 3: Support High-Risk Populations Target: • Dually-enrolled (care coordination and polypharmacy risks) • Pregnant women (prenatal care continuity) • Rural chronic disease populations Step 4: Operationalize Medicaid Data for Chronic Disease and Epidemiological Surveillance Deploy a population health dashboard that: • Identifies high-risk individuals • Monitor Chronic Disease and adverse outcomes • Supports value-based payment alignment (not sure, but also mentioned in challenges) Proven track record: The Humetrix platform processed 100M Medicare claim lines weekly for 18 months, monitoring 20M beneficiaries during the pandemic to help the military efficiently deliver its pandemic support mission nationwide. Alaska can use the same infrastructure to both improve healthcare access and reduce adverse outcomes and strengthen frontier care delivery.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Huslia Village	Huslia Water & Wastewater Project	AK	The Koyukuk River bank in Huslia erodes every fall and the Huslia Tribal Council is funding a House Moving Project so the homes do not go over the bank. There were four (4) homes relocated last fall. The Water Plant in Huslia is outdated and is in critical need of renovation/upgrade. Huslia is currently undergoing a freeze up in water and sewer lines to a majority of the homes in the community. There are elders that have been without running water and sewer for over four (4) months. City Water Needs: relocate Lift Station next to the river bank before it caves over. Order pressure pump. Need an updated assessment on how many homes are frozen. Huslia has been in dire need of reliable water; especially during the freezing winter months. This year (2025-2026) there are a total of 13 homes that have no running water due to freeze up. The majority of these homes are owned by elders. Water was shut off in the entire loop that was hanging over the river bank last fall.	Water lines need to be installed in the Birch Grove Subdivision for all the new homes as well as the relocated homes over the past 5 years. We need a water line to the new subdivision because of fire hazards to homes. Right now we only have a 1200 gallon water truck to combat fires. The homeowners of the relocated homes are under duress because they do not want to move their home onto lots that do not on the current water system. The Elders of Huslia have had running water for years and now they have to haul water or hire people to haul water for them. Some homes have been without water for over 11 years since their homes were moved back from the river bank. The current water plant in Huslia is in need of upgrades. Last month Huslia residents went 7 days without water due to mechanical issues. Parts needed to be ordered to repair the water plant. This project will help maintain the water plant so that no health issues arise for our children and elders from lack of water and sanitation.City Water Needs: relocate Lift Station next to the river bank before it caves over. Order pressure pump. Need an updated assessment on how many homes are frozen: so far there are 13 homes that are frozen out of 35. Need to re-insulate the frozen waterlines. Arctic Pipe is needed. Need A & B Foam-mix & foam up exposed lines. Need excavators and operators to dig up the exposed lines. Need to engage jumper lines. Need heat exchangers and large space heaters. Tribal Council also requests that the State Energy Assistance Program help homes that are frozen with the electric bills from the constant heat trace that frozen homes have to leave on. All materials/supplies will need to be shipped on the Ruby Marine Barge or by air: Everts and/or Wrights Air.	\$250K-\$1M	Single Community	Yukon-Koyukuk Census Area	Deferred or Not Advanced

IBM	Multi-payer analytic platform for data-driven decision making and population health management	AK	Alaska’s RHTP identifies a critical statewide need for integrated, multi-payer analytics to support data-driven decision making, population health management, program integrity (PI), and care transformation across rural, remote, and frontier communities. Today, key data assets, including Medicaid claims, public health, HIE, Tribal partner datasets, behavioral health, social determinants of health, and operational metrics, are distributed across siloed systems with limited interoperability. This fragmentation limits the State’s ability to understand rural disparities, evaluate RHTP-funded initiatives, identify inequities in access, and track outcomes across maternal health, behavioral health, chronic disease, specialty access, and the health care workforce. Rural providers also face significant capacity constraints to build and maintain advanced analytic systems. Without a coordinated statewide approach, Alaska risks duplicative investments, variable data quality, and inconsistent methodologies that undermine rural health transformation. IBM’s project addresses these challenges by establishing a secure, scalable statewide analytics platform based on Microsoft Fabric, built on Azure. IBM and Microsoft leverage their existing infrastructure, technology assets, and jointly aligned capabilities to deliver the platform in support of DoH initiatives. The platform will enable the State to independently evaluate outcomes, support provider innovation, and meet CMS reporting needs.	IBM will partner with Alaska DOH to design and implement, using a phased approach, a statewide population health analytics platform built on Microsoft Fabric, Azure. The solution creates a single, secure environment for multi-payer data integration, advanced analytics, and insight generation aligned to RHTP priorities. We leverage our Maestro metadata-driven orchestration framework to accelerate development and ensure repeatable patterns across the solution. The project begins with alignment to your strategy, governance, and security controls. We also perform workspace configuration to reflect Alaska policies, Tribal partnership considerations, and CMS requirements. IBM’s relationship of more than 15 years with Alaska Medicaid helps us align with existing systems and lowers delivery risk. Next, we deploy core intellectual property, including Maestro, Fabric Continuous Integration/Continuous Delivery (CI/CD) standards, and metadata configuration. Modern AI tools like GitHub, Copilot, and IBM’s generative AI accelerators streamline key tasks, such as pipeline creation, documentation, and data mapping, reducing burden on State staff. Integration proceeds through a phased data ingestion plan that prioritizes Alaska’s highest impact RHTP areas. Phase 1 will focus on Medicaid claims, Tribal Health data, provider files, and key behavioral health and maternal health indicators. Later phases will expand to HIE feeds, social determinants of health, EMS, chronic disease, and facility datasets as agreements mature. Using Microsoft Fabric and Power BI, IBM will build curated analytic enhancements for maternal health, behavioral health, chronic disease, EMS, and dual eligible populations. These models support dashboards, predictive analytics, risk stratification, provider benchmarking, regional hub and spoke insights, and longitudinal patient journey analysis. Solution administration includes environment promotion, end-to-end testing, knowledge transfer, documentation, and hypercare. The platform supports multi-tenant access, so local providers, universities, health systems, and Tribal partners can view data relevant to their specific needs, while the State retains neutral governance and statewide visibility. This type of State-led, centrally governed analytics platform designed for multi-stakeholder participation has proven to be more effective at delivering consistent insights, protecting sensitive data, and aligning with evolving policy/regulatory requirements.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

ID.me	ID.me for Alaska RHTP: Authorized by CMS, Seamless Access for Every Alaskan's Care Journey	VA	Alaska's significant investment in rural health access faces a structural challenge: the state's realities—with ~82% of communities lacking road connections and unreliable connectivity—make digital adoption fragile at the first step of getting individuals online. When residents cannot reliably prove their identity, key digital services like telehealth, RPM, care navigation apps, and patient portals experience limited engagement, increased support burdens to non-digital channels, and lower continuity of care, particularly for rural Alaskans, Alaska Native communities, elders, and complex-care patients. The opportunity is to establish a statewide "digital front door" that is secure, trusted, portable,, and inclusive. This will be a high-assurance credential that Alaskans can verify once and reuse across all RHTP-funded tools and participating organizations. This approach is practical: 225,477 Alaskans (~30.5% of adults) already have an ID.me verified login. 155,326 are NIST IAL2 verified (~21.0% of adults). This user base has grown from ~8K to 155K since 1/2021 (+1,837.5%). Leveraging this existing credential reduces friction, accelerates program uptake, and lowers the administrative burden for rural partners. This model is also aligned with CMS modernization (live on Medicare.gov) and healthcare interoperability goals, providing high-assurance identity and strong authentication with consent-based access to reduce "login sprawl" and mitigate AI-driven fraud.	We will deploy a statewide, reusable “digital front door” by integrating high-assurance identity proofing and sign-in (NIST IAL2 with strong authentication) into priority consumer workflows: telehealth access, RPM enrollment, care navigation/scheduling, and patient portals. The approach is designed for Alaska’s rural/frontier realities (low bandwidth, high travel burden) and aligns with CMS modernization patterns (e.g., Medicare.gov) to establish trusted identity for both improved access and program integrity. The project will proceed in four phases: Phase 1 — Partner and Use-Case Selection (Months 1 - 3): Work with Alaska DOH and Alaska-based implementers to select 1–2 initial “high-impact” use cases (telehealth, RPM, navigation/portal). Define minimal verified attributes required and confirm success measures (completion rate, support burden, time-to-access). Phase 2 — Integration and Rural-Ready Design (Months 3 - 6): Implement standards-based SSO integrations (OIDC/SAML) into selected tools. Configure appropriate policy (e.g., NIST AAL2 / IAL2) and apply “minimum necessary” attribute exchange with auditable, user-consented sharing. Offer multiple pathways for residents to succeed: (1) Self-serve, (2) Video Chat, and (3) In-person Phase 3 — “No Alaskan Left Behind” Onboarding & Implementation (Months 6–12): Train Alaska DOH support teams with playbooks and escalation paths. Demo performance reports and self-service dashboards Establish collaborative communication channels between fraud programs Phase 4 — Measure Value and Scale (Year 2+): Launch pilot(s) Monitor success metrics weekly for optimization, and expand to additional RHTP-funded tools and partners. Review feedback and lessons learned. Apply to products and operations to drive continuous improvement. This leverages existing in-state adoption to accelerate uptake, reduce duplicative identity work, and lower administrative burden while strengthening trust and auditability statewide.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Ideal Option	Rural Telemedicine Nurse Care Team for Substance Use Disorder	WA	Rural, remote, and frontier Alaskans face major barriers to evidence-based substance use disorder (OUD) treatment, including long travel distances, limited local provider capacity, and gaps in between scheduled appointments. While telemedicine can reduce travel, telemedicine-only models can still be episodic and may not provide enough support to keep high-need patients engaged, stable, and safe. This project addresses the opportunity to expand access to MOUD statewide while improving continuity and outcomes by pairing telemedicine care with Ideal Option’s Nurse Care Team, proactive nursing outreach, care coordination, and 24/7 triage support. The goal is to reduce treatment drop-off, prevent relapse/overdose risk, and provide a sustainable, scalable model for rural OUD care in Alaska.	We will expand access to evidence-based SUD treatment for rural, remote, and frontier Alaskans by pairing telemedicine-based MOUD services with Ideal Option’s Nurse Care Team and dedicating one full-time Nurse Care Team member based in Alaska. Patients will receive virtual clinical visits for assessment, medication, and ongoing treatment support, while the Alaska-based nurse provides the day-to-day coordination needed to keep patients engaged and safe between provider visits. The Alaska Nurse Care Team member will deliver proactive outreach (appointment reminders, check-ins, adherence support, and patient education), coordinate required in-person services locally when needed (labs, urine drug screens, referrals) and connect patients to behavioral health and community resources. This role will also support timely triage and escalation to providers for urgent clinical needs, helping reduce gaps in care and avoidable emergency department use. RHTP funds will support this dedicated Alaska-based staffing capacity, workflow development, and reporting infrastructure to operationalize the model statewide. Core clinical services will be sustained through Medicaid and other payer reimbursement, and the Nurse Care Team model improves retention and outcomes by strengthening continuity of care for patients who face the greatest geographic barriers.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Igiugig Village	Igiugig Community Emergency Response & Mobility Initiative	AK	Our small Alaska Native village of approximately 70 residents located at the outlet of Lake Iliamna with no road system access. Residents rely on small aircraft, boats, and snowmachines for transportation depending on the season. Access to health care depends not only on the availability of clinic services but also on the ability of responders and patients to travel safely across challenging terrain and weather conditions. Currently, the community faces several transportation and mobility barriers that affect emergency response and access to routine health care. Winter conditions often require snowmachines to reach residents experiencing medical emergencies, yet the community has limited emergency transport equipment. Transportation barriers also affect residents who need to reach clinic services, particularly Elders and those without reliable vehicles. Missed appointments and delayed care can occur when transportation is unavailable. In addition, one community member with a disability faces significant mobility challenges due to the lack of terrain-capable mobility equipment. This project addresses these challenges by strengthening emergency response mobility, improving transportation access to the clinic, and enabling mobility for residents with disabilities—helping ensure that geography does not prevent Igiugig residents from accessing care and fully participating in community life.	The Igiugig Village Council proposes to strengthen local emergency response capacity and improve transportation access to health services by acquiring essential mobility equipment for the community. The project will purchase two snowmachines and two rescue sleds to support winter emergency response, allowing trained responders to reach residents more quickly and safely during medical emergencies and transport patients across snow and ice to stabilization points prior to medevac or clinic care. To improve access to routine health services, the project will also acquire a small community vehicle that can transport residents to the local clinic. This will reduce transportation barriers for Elders, individuals recovering from illness or injury, and residents without reliable vehicles, helping ensure consistent access to preventative and routine care. Finally, the project will improve mobility and independence for a resident with a disability through the acquisition of an off-road mobility device (RipChair 3.0) capable of navigating rural terrain and winter conditions. This will allow the individual to safely move throughout the community and participate in local employment, including providing services such as snow removal. Together, these investments will strengthen emergency preparedness, improve access to care, and support inclusive participation in community life.	\$50,000-\$250,000	Single Community	Lake and Peninsula Borough	Deferred or Not Advanced

Iḻḻgaat Munaqsriviat	Iḻḻgaat Munaqsriviat Child Care Center Furniture & New Staff Training	AK	Rural communities face a critical shortage of licensed childcare, creating a significant barrier for families and the local workforce. In our community, limited childcare availability prevents many parents—particularly those working in healthcare, education, and other essential services—from maintaining consistent employment. This shortage also limits opportunities for young children to access early learning environments that support healthy development and school readiness. To address this need, our nonprofit is launching a new licensed childcare center scheduled to open in fall 2026. This project will create reliable, high-quality childcare that supports working families and strengthens the local workforce. The current funding request supports key startup components needed to safely open and operate the center. Funding will provide classroom furniture and essential learning environment materials required to meet licensing standards and create developmentally appropriate spaces for young children. It will also support startup training for new childcare staff through hands-on learning at an established licensed in-home childcare program, helping build staff capacity before the center opens. These investments will help ensure the program launches with a well-prepared workforce and safe, functional classrooms, allowing the center to begin serving children and families as planned in fall 2026.	Our approach is to establish a new licensed, nonprofit community childcare center that expands access to reliable, high-quality early childhood care while strengthening workforce stability in our rural community. The center is scheduled to open in fall 2026 and will provide safe, developmentally appropriate care for young children while supporting families whose ability to work is currently limited by lack of childcare. This project focuses on the essential startup components required to successfully launch the center. Funding will support the purchase of classroom furniture and learning environment materials needed to meet state childcare licensing standards and create safe, functional, and developmentally appropriate classrooms for infants, toddlers, and preschool-aged children. Well-designed classroom environments are critical for supporting children’s social-emotional development, early learning, and consistent daily routines. The project also prioritizes building a strong early childhood workforce prior to opening. Funding will support startup training for newly hired childcare staff through hands-on learning at an established licensed in-home childcare program that is owned and run by the regional Early Learning and Family Program Occupational Therapist. This training model allows new staff to gain practical experience in daily operations, child supervision, developmentally appropriate practices, and licensing requirements before the center begins serving children. In addition to staff preparation and classroom setup, the program is being developed in coordination with local community partners and employers who have identified childcare access as a major workforce barrier. The center is designed as a sustainable, community-based nonprofit service that supports working families, local employers, and essential service providers. By combining prepared staff, fully equipped classrooms, and strong community partnerships, this approach ensures the childcare center opens with the capacity to provide safe, reliable, and high-quality care. This investment addresses a critical gap in local infrastructure and creates long-term support for children, families, and the rural workforce.	\$50,000-\$250,000	Single Community	Northwest Arctic Borough	Advance to Implementation Application

Iliuliuk Family and Health Services, Inc.	IFHS Pharmacy	AK	Unalaska has no retail pharmacy. Residents, seasonal workers, and visitors must rely entirely on mail-order pharmacies to obtain prescription medications in a remote island community accessible only by air. Severe weather, flight cancellations, and supply chain disruptions routinely delay medication delivery for days—or longer. These delays create dangerous gaps in treatment, prevent timely initiation of new prescriptions, and jeopardize management of chronic and acute conditions. Patients managing diabetes, heart disease, asthma, infections, and behavioral health conditions cannot afford interruptions in therapy. Even short delays can result in worsening symptoms, preventable emergency department visits, or costly medevac transfers. In a community more than 800 air miles from the nearest tertiary hospital, the consequences of medication inaccessibility are amplified. The absence of a local pharmacy creates a critical break in the continuum of care. Providers prescribe medications that patients cannot reliably obtain, undermining treatment plans and straining limited clinical resources. This is not a temporary inconvenience—it is a structural access gap that places rural residents at ongoing risk. Establishing a telepharmacy-enabled retail pharmacy is an urgent and necessary step to ensure timely medication access, prevent avoidable complications, and stabilize healthcare delivery in this frontier community.	IFHS is prepared to immediately implement a retail pharmacy within its clinic using a telepharmacy model specifically designed for rural and frontier communities. The foundational planning, partnership development, and implementation groundwork for this project have already been completed. The primary remaining barrier is capital funding to complete the required facility modifications and launch operations. A licensed contractor has been identified to complete the limited renovations necessary to convert existing clinic space into a compliant retail pharmacy, including secure medication storage, workflow adjustments, and appropriate physical safeguards. Renovation plans are aligned with regulatory requirements and can begin promptly upon award. IFHS has also established a relationship with an experienced telepharmacy organization that will provide remote pharmacist oversight, prescription verification, patient counseling, billing, and payment reconciliation services. This partner manages secure technology platforms and regulatory compliance, ensuring safe dispensing without the need for a full-time on-site pharmacist. The operational model has been defined and is ready for execution. The project includes creation of a new on-site pharmacy technician position to manage daily operations, inventory, and coordination with the remote pharmacist. Training plans for existing clinic staff have been developed to support pharmacy workflows and medication reconciliation processes. Workforce preparation can begin immediately upon funding. Because the physical footprint has been identified, the contractor is ready, and the telepharmacy partner is secured, IFHS can move directly into implementation. This approach minimizes startup delays and ensures that Rural Health Transformation funds can be fully deployed within the available timeframe. By leveraging existing infrastructure, established partnerships, and a ready-to-launch operational model, this project represents a low-risk, high-impact opportunity to rapidly close a critical medication access gap in Unalaska. With funding in place, IFHS can quickly transition from planning to dispensing and deliver immediate, measurable improvements in rural healthcare access and continuity of care.	\$250K-\$1M	Federally qualified health center	Single Community	Aleutians West Census Area	Advance to Implementation Application

Iliuliuk Family and Health Services, Inc.	Unalaska Healthcare Critical Need Infrastructure Project	AK	IFHS operates the only primary and emergency medical clinic serving the island community of Unalaska. The existing clinic was constructed in 1992, and many core mechanical systems—including HVAC, exhaust ventilation, hydronic piping, and domestic water infrastructure, etc.—are original and currently either malfunctioning or inoperable. A State of Alaska grant is funding expansion for emergency and diagnostic imaging services. However, the funding is insufficient to complete the critical infrastructure needs required to ensure long-term reliability of the existing clinic which houses other services such as primary care and laboratory, etc. Recent system failures highlight the urgency of these improvements. The clinic’s boilers, originally planned for replacement during the expansion project, failed unexpectedly in 2025 and required emergency replacement to maintain operations. These boilers are connected to fuel systems and piping that is actively failing and needs replacement. Other mechanical systems remain outdated and vulnerable to failure, creating ongoing risk to healthcare delivery. Without additional investment, the clinic will continue operating with failing infrastructure that threatens reliable healthcare services in this remote community.	This project will complete critical renovation and infrastructure upgrades to the 30-year-old existing Iliuliuk Family and Health Services (IFHS) clinic facility while expansion of the clinic is already underway through a State of Alaska grant. The expansion project addresses new emergency care space along with new diagnostic imaging space, but available funding is insufficient to complete all necessary replacement of the existing building’s aging and failing mechanical systems. RHTP funding will be used to replace essential infrastructure within the current clinic to ensure reliable and sustainable healthcare operations. Planned upgrades include replacement of the primary air handling systems, exhaust ventilation fans, cabinet and unit heaters, and upgrades to hydronic piping and heating distribution. Additional improvements will include upgrades to domestic water piping, mechanical controls, and fire protection systems, etc. necessary to support safe and compliant facility operations. This will address failing systems and reduce the consistent occurrence of system outages that disrupt healthcare delivery. Updated mechanical infrastructure will also improve facility efficiency, ventilation, and temperature control, which are critical to maintaining a safe clinical environment in a remote healthcare facility. These renovations will be coordinated with the ongoing expansion project to ensure efficient construction sequencing and minimize disruption to clinic operations. Completing these upgrades concurrently will maximize the impact of the State’s existing investment while ensuring the long-term reliability of healthcare infrastructure serving this remote community.	Over \$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area	Advance to Implementation Application

Iliuliuk Family and Health Services, Inc.	Unalaska Rural Emergency Access Stabilization Project	AK	Iliuliuk Family and Health Services (IFHS) is the sole provider of urgent and emergency medical care for the remote island community of Unalaska, Alaska. The community has approximately 4,500 permanent residents, but during peak fishing and seafood processing seasons the population expands to as many as 10,000 people. Due to geographic isolation—more than 800 air miles from Anchorage—and frequent weather-related travel disruptions, residents and workers rely on IFHS for emergency care at all hours. Although IFHS operates as a Federally Qualified Health Center (FQHC) and Frontier Extended Stay Clinic (FESC), after-hours emergency care is not recognized as a reimbursable service under those designations and therefore is not adequately reimbursed through existing payment structures. IFHS currently provides 24/7 emergency care which is unsustainable with current allowable reimbursement. In 2025, IFHS provided 388 after-hours encounters, demonstrating consistent need for emergency care outside standard clinic hours. 22 patients required overnight observation while awaiting medevac transport, requiring continuous ICU-level care and monitoring by clinical staff. Maintaining emergency and after-hours coverage requires overtime staffing, on-call wages, supplies, and equipment readiness that are not fully recoverable through current reimbursement models. Without additional funding, IFHS will be unable to sustain emergency after-hours services.	This project will stabilize after-hours and on-call emergency medical services at Iliuliuk Family and Health Services (IFHS) through one year of targeted operational support while longer-term reimbursement solutions are pursued. Funding will support the personnel and operational costs necessary to maintain continuous emergency coverage outside standard clinic hours. Specifically, funds will be used for overtime and on-call wages for clinical staff, additional medical supplies required for emergency care, and equipment maintenance necessary to ensure readiness of diagnostic and treatment systems during after-hours operations. Maintaining after-hours coverage allows IFHS to respond immediately to injuries, acute medical conditions, and emergencies that occur in the community’s maritime and industrial workforce. These services frequently involve trauma care, acute illness stabilization, and evaluation of conditions that may require medevac transport to Anchorage. This funding will ensure IFHS can continue to provide timely emergency care while avoiding dangerous delays in treatment for patients who cannot safely wait until regular clinic hours. Local stabilization also reduces unnecessary medical evacuations by allowing providers to evaluate and manage conditions that can be safely treated on-island. The requested funding will support approximately one year of after-hours services while IFHS collaborates with other Alaska Community Health Centers and state partners to pursue longer-term policy solutions. These efforts include exploring mechanisms that would allow Federally Qualified Health Centers to bill and receive reimbursement for emergency services that are currently unreimbursed under existing payment structures. By sustaining after-hours services during this transition period, this project protects emergency access for residents, seasonal workers, and visitors while enabling development of a long-term, sustainable model for rural emergency care delivery.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area	Advance to Implementation Application

Iliuliuk Family and Health Services, Inc.	Aleutian Islands Diagnostic Access Improvement Project	AK	Iliuliuk Family and Health Services (IFHS) is the only emergency and urgent care provider on Unalaska Island, serving a remote community more than 800 air miles from the nearest tertiary hospital. As the sole Level V Trauma-designated facility in the State of Alaska, IFHS is responsible for the evaluation and stabilization of traumatic injury and acute medical emergencies in a frontier setting where weather frequently delays transport. The clinic’s current CT and X-ray equipment are beyond their serviceable life and increasingly unreliable. Equipment failure or degraded imaging capability creates significant risk in a community without alternative diagnostic resources. Without dependable advanced imaging, providers cannot safely rule out life-threatening conditions such as intracranial hemorrhage, appendicitis, internal bleeding, fractures, or other traumatic injuries. When imaging capacity is limited or uncertain, patients must be transferred by costly medevac flights for evaluation that could otherwise be performed locally. This increases healthcare costs, strains emergency transport systems, and exposes patients to unnecessary travel risk. The opportunity is to replace end-of-life diagnostic infrastructure with modern, reliable imaging equipment that ensures uninterrupted emergency evaluation, improves diagnostic accuracy, and strengthens the resilience of healthcare delivery in this remote region.	IFHS will install a new CT scanner and digital X-ray system within its clinic expansion currently under construction and scheduled for completion by the end of 2026. This project will transition diagnostic imaging from aging, temporary infrastructure to a permanent diagnostic suite designed to meet modern clinical standards. The current CT scanner is housed in a mobile trailer outside the clinic facility. The unit was designed specifically for mobile deployment and cannot be relocated into the clinic building. It is also past its expected service life and has become increasingly unreliable. While the mobile unit has allowed IFHS to maintain limited imaging capability, the configuration creates operational challenges related to space, environmental exposure, workflow inefficiencies, and long-term reliability. As the only emergency care provider on Unalaska Island, failure of this aging equipment would leave the community, surrounding Aleutian region, and largest fishing fleet in the country without immediate diagnostic imaging capability. Moving CT services into the new expansion will improve safety, infection control, patient flow, and coordination with emergency services. Upon award, IFHS will procure equipment through established medical imaging vendors experienced in rural Alaska installations. Equipment selection will prioritize image quality, radiation dose optimization, durability, and compatibility with existing digital imaging storage and tele-radiology systems. Installation will be coordinated with the clinic expansion construction schedule to ensure integration into the new imaging suite. Because the expansion is already funded and on schedule, this project does not depend on speculative construction. Imaging room design, shielding requirements, and workflow layouts have already been incorporated into the expansion plans. The upgraded systems will integrate with tele-radiology services for rapid remote interpretation and support IFHS’s responsibilities as Alaska’s only Level V Trauma-designated facility. Reliable local imaging will also reduce unnecessary medical evacuations for conditions that can be safely ruled out locally—an important consideration in a region where medevac transport can cost more than \$100,000 per incident. Continuing education for imaging technicians will ensure proficiency with the new technology and adherence to evidence-based imaging and radiation safety standards.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians West Census Area	Deferred or Not Advanced

Iliuliuk Family and Health Services, Inc.	Unalaska Healthcare Workforce Mobility Project	AK	Residents of Unalaska depend on Iliuliuk Family and Health Services (IFHS) as the community’s primary provider of medical care. Due to the island’s remote location, IFHS relies heavily on locum and rotational staff to maintain adequate staffing and ensure continuous access to healthcare services. Unlike providers in most communities, locum staff traveling to Unalaska cannot bring personal vehicles. Shipping vehicles by barge is costly and impractical for temporary assignments. As a result, IFHS must maintain a small fleet of clinic vehicles to allow providers to travel between staff housing, the clinic, and community locations as needed. The existing IFHS vehicle fleet is aging and increasingly unreliable. Several vehicles require frequent repairs and are no longer considered safe for regular use. Maintaining unreliable vehicles creates operational challenges and risks interrupting transportation needed for clinical staff including emergency and on-call staff. This project will support the purchase and shipment of two new clinic vehicles to replace aging fleet vehicles. Reliable transportation will ensure locum providers can safely travel within the community and support the continued delivery of healthcare services in this remote island environment.	This project will support the purchase and transport of two reliable vehicles to replace aging fleet vehicles currently used by Iliuliuk Family and Health Services (IFHS) to support clinical workforce operations in Unalaska. Because Unalaska is an island community with no road connection to mainland Alaska, healthcare providers traveling to the community cannot reasonably bring personal vehicles. Shipping vehicles by barge is costly and impractical for short-term assignments. As a result, IFHS must maintain clinic-owned vehicles to allow locum and rotational staff to travel between staff housing, the clinic, and other locations within the community. The existing IFHS vehicle fleet has reached the end of its useful life. Several vehicles require frequent repairs and are increasingly unreliable, creating operational challenges for a clinic that depends on temporary providers to maintain staffing coverage. Often, the cost of repairs exceed the value of the vehicle. Project funds will be used to purchase two new vehicles suitable for year-round use in the local environment. Vehicles will be selected for durability, reliability, and safety in Alaska’s coastal climate. Funding will also support the cost of transporting the vehicles to Unalaska. Once delivered, the vehicles will be incorporated into the IFHS clinic fleet and used by locum and rotational staff to support daily clinic operations. Reliable transportation will allow providers to safely travel between clinic facilities, staff housing, and community locations as needed. By replacing aging fleet vehicles with safe and reliable transportation, IFHS will ensure that visiting providers have the mobility necessary to maintain clinical coverage and support continued access to healthcare services in this remote island community.	\$50,000-\$250,000	Federally qualified health center	Single Community	Aleutians West Census Area	Deferred or Not Advanced

Infinity Water, Inc.	Infinity Water: Expanding Healthy Beverage Access in Rural Alaska	AK	Sugar-sweetened beverage (SSB) consumption is strongly associated with obesity, type 2 diabetes, heart disease, and poor oral health. Reducing SSB intake is recognized as an important preventive health strategy that can lower risk for these chronic conditions. In the Yukon-Kuskokwim Delta, residents face disproportionately high rates of these health problems compared to statewide and national averages, placing a burden on local health systems. In rural AK, healthy alternatives to SSBs are limited by high cost and low availability. Confidence in public water systems is low, and stores do not carry affordable unsweetened beverage options. For example, a 12-pack of seltzer water in Bethel can cost \$18, while soda is often less than half that price. This pricing dynamic reinforces consumption of sugary drinks and undermines community efforts to improve diet quality. Children in the Yukon-Kuskokwim Delta experience approximately five times the national average rate of tooth decay, fillings, and missing teeth, a clear indicator of the impact of high SSB consumption on preventive oral health outcomes. Local health systems are challenged to address chronic disease and preventable illness in an environment where healthy beverage access is limited. This project addresses a rural health transformation opportunity by increasing access to affordable, appealing, unsweetened beverages that support healthier choices and chronic disease prevention in rural Alaska.	Infinity Water is a local nonprofit that has already demonstrated proof of concept by producing canned, flavored seltzer water in Bethel, providing an affordable, unsweetened alternative to sugar-sweetened beverages. The organization sources empty cans cost-effectively, uses volunteer labor, and has produced several thousand gallons of seltzer water. Products have been canned and sold through partnerships with local school sports teams as fundraisers. These pilot efforts show community interest, but current manual canning operations are slow and limited in scope. Without automation, Infinity Water’s capacity is constrained, preventing broad distribution to schools, concession stands, community events, and local stores. As a result, the project’s potential to improve access to healthy beverages and reduce SSB consumption across the community remains limited. This request would fund automated canning equipment to scale production capacity. Automation will increase output, improve consistency, and create a sustainable local operation that can reliably supply affordable seltzer water. Increased production supports multiple health-promoting goals: • Expanded distribution to school concession stands and community events, replacing sugary drinks with unsweetened alternatives. • A visible, community-led preventive health initiative that aligns with rural health transformation priorities for healthy communities and preventive care. • Continued partnership with sports programs and youth organizations to fundraise for healthy activities, reinforcing positive lifestyle choices. • The ability to produce and store canned water for emergency use when public water systems fail, enhancing community resilience. By moving from manual to automated operations, Infinity Water will transition from a small pilot into a scalable model that supports dietary health, preventive wellness, and community-based health promotion. Together, these impacts align with the Rural Health Transformation Program’s focus on prevention, innovation, community-driven solutions, and long-term sustainability. By scaling a proven pilot into an automated operation, this project transforms a small local effort into a meaningful rural health intervention that improves access to healthy choices and supports the long-term viability of health care in remote Alaska communities.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area	Deferred or Not Advanced

Inner Circle Mental Health	ResponderReady™ Alaska: Workforce Resilience for Rural EMS and Emergency Care	OK	Alaska’s rural and frontier communities depend on small EMS agencies, regional hospitals, and air transport networks to access emergency care. In many areas off the road system, there is little staffing redundancy. When EMS or emergency department positions remain vacant, when overtime becomes chronic, or when responders leave due to workforce strain, access to timely emergency care is reduced. Workforce instability therefore directly threatens the sustainability and continuity of rural health services. Alaska has invested significantly in health system transformation, including Medicaid expansion, telehealth growth, and strengthening of the Tribal health system. However, rural EMS agencies and emergency departments continue to face recruitment challenges, expanding clinical expectations, geographic isolation, and cumulative trauma exposure. These pressures contribute to burnout and turnover, undermining long-term system stability. The opportunity is to strengthen rural health sustainability by developing a structured, data-informed, and culturally adapted workforce resilience blueprint. ResponderReady™ Alaska will address this gap by building the foundation for coordinated retention infrastructure to support rural EMS and emergency departments and inform future RHTP implementation across frontier regions.	ResponderReady™ Alaska proposes a structured Planning and Infrastructure Build approach focused on workforce stabilization for rural EMS and emergency departments. Year 1 will establish the foundation for coordinated, retention-focused infrastructure aligned with RHTP workforce priorities. 1. Establish Alaska-Based Operations ICMH will secure an Anchorage operational base and hire Alaska-based staff, including a Partnerships & Training Director, Training Lead, Office Manager/Scheduler, and one licensed clinician. This ensures in-state presence, local hiring, and relationship-centered engagement before broader implementation. 2. Conduct Statewide Workforce Mapping ICMH will engage rural EMS agencies, emergency departments, and hospital leadership across geographically distributed regions. Structured interviews and site visits will assess turnover trends, vacancy duration, overtime burden, supervisory strain, and peer support readiness. Baseline workforce metrics (burnout, retention intent, workforce strain) will be collected in partnership with pilot systems. This assessment will result in an Alaska Responder Workforce Resilience Blueprint outlining region-specific retention strategies and implementation recommendations to guide future RHTP investment. 3. Co-Design Culturally Adapted Retention Infrastructure Rather than introducing pre-developed programming, ICMH will work with rural partners to collaboratively design peer support models, trauma-wise supervision practices, and referral pathways appropriate to each community’s operational and cultural realities. Cultural consultation and Tribal listening sessions will inform adaptation. 4. Expand Immediate Clinical Support One Alaska-based clinician will prioritize rural EMS and emergency department personnel, offering confidential sessions at no cost to reduce workforce strain and protect retention during the planning phase. Telehealth capacity will extend access to remote communities. 5. Build In-State Clinical Capacity Through the ResponderReady™ Clinician Certification program, Alaska-based clinicians will be trained in responder-competent care, strengthening long-term behavioral health capacity. This phased approach prioritizes relationship-building, measurable workforce assessment, and coordinated infrastructure planning in Year 1, positioning Alaska for sustainable implementation in RHTP Years 2–3 aligned with RHTP transformation goals.	\$1M-\$5M	Behavioral health/su bstance use disorder treatment	Multi- Community or Participating in Regional Hub-and- Spoke	Anchorage (Municipality); Bethel Census Area; Dillingham Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough; Kodiak Island Borough; Matanuska- Susitna Borough; Nome Census Area; Southeast Fairbanks Census Area; Yukon- Koyukuk Census Area	Deferred or Not Advanced

Innovaccer	Innovaccer Data and AI Orchestration Platform to Support Alaska Rural Health Transformation	CA	For states to deliver on the RHT promise, technology has to do more than collect data. States need to focus on connecting data, interpreting it, and turning it into action. That’s where Innovaccer plays a critical role. Through its Healthcare Intelligence Platform, Innovaccer helps states design and execute high-impact RHT strategies built on three core pillars: connected data, empowered teams, and measurable outcomes. By unifying rural data and systems, the platform integrates EHR, claims, behavioral, and social determinants of health (SDoH) data into a single longitudinal record. This gives providers, care managers, and policymakers a holistic and real-time view of the populations they serve. This unified foundation enables whole-person care, supports risk stratification for maternal and chronic populations, and helps identify avoidable utilization such as emergency department visits and readmissions. On the performance side, Innovaccer’s automation capabilities simplify one of the most complex aspects of RHT implementation: quality reporting and oversight. The platform supports 100% DQM automation, integrates eQMs, and provides real-time dashboards that help states monitor progress across counties while maintaining CMS compliance. And because rural transformation can’t succeed without sustainability, Innovaccer’s platform is built for rural realities. It works in low-bandwidth environments, supports offline workflows for mobile clinics, and scales seamlessly.	To transform care, states must first transform their data infrastructure. Rural providers often operate on disparate systems, making it difficult to see the full picture of patient needs or measure outcomes at the population level. Rural healthcare can’t be modernized through policy or intuition alone. It needs a real-time view of what’s happening across providers, patients, and communities. A connected data foundation that integrates EHR, claims, behavioral, and social determinants of health (SDoH) data into one cohesive picture of care is what allows states to move from reactive management to proactive population health. Unified data enables states and care teams to: Identify high-risk populations - These include expectant mothers, individuals with multiple chronic conditions, or those in need of long-term services and supports (LTSS). Reduce avoidable utilization - Track preventable emergency visits and readmissions, enabling early interventions before crises occur. Simplify quality reporting - Automate eQMs and DQMs submissions to reduce the administrative strain that often fuels burnout in rural providers. Monitor Countywide Performance in Real Time - Gain live insights into outcomes across regions to track progress and direct resources where they’re needed most. But data alone isn’t enough; it’s what you do with it that counts. When data becomes actionable intelligence, it can drive collaboration across every layer of the rural care ecosystem. A nurse in a critical access hospital, a community health worker visiting homes, and a state Medicaid analyst can all draw from the same source of truth. That shared insight transforms coordination from a manual task into a continuous, intelligent process.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Innovation Horizons	Alaska Clinician Continuing Education Initiative	DC	Alaska faces a compounding public health emergency rooted in a critical gap: clinicians expected to manage the state's most complex patients are among the least equipped — not due to lack of dedication, due to lack of access to meaningful, unbiased continuing education. Every community in Alaska carries at least one Health Professional Shortage Area designation for primary, dental, or behavioral healthcare. Clinicians serving these communities — physicians, nurses, NPs, PAs, CHWs, and pharmacists — are often the sole point of care for patients with severe chronic disease: diabetes and hypertension far exceeding national averages, drug overdose death rates among the nation's highest, behavioral health co-morbidities, and complex polypharmacy. Alaska Native peoples, rural elders, and veterans are most affected. These clinicians face two barriers to ongoing education. First, traditional CE requires travel to urban centers — prohibitive when 75% of communities lack road access and no absence can be absorbed. Second, much CE that does reach rural clinicians is industry-funded and biased toward pharmaceutical interests rather than evidence-based, patient-centered care. This initiative will deliver accredited continuing education for licensed health professionals and targeted training for community health workers, with content tailored to the chronic disease burdens and care contexts most prevalent among Alaskans — immediately upskilling the workforce already on the ground.	Innovation Horizons will adapt its proven continuing education model — currently delivering free, accredited, independent CE to approximately 70% of licensed clinicians in Washington, DC through the DC Department of Health's Center for Rational Prescribing — into a comprehensive, Alaska-specific clinician education initiative grounded in behavior change science and Alaska's distinct public health realities. Content Development. Working with an Alaska-based clinical advisory committee — including nurses, physicians, community health aides, tribal health representatives, and pharmacists — we will conduct a formal needs assessment before each development cycle and produce six accredited courses annually, building a growing, durable library tailored to the Alaskan care context. Priority topics include diabetes and hypertension management, opioid stewardship, polypharmacy safety, behavioral health integration, maternal health, emergency preparedness, and culturally appropriate care for Alaska Native patients. All content will be unbiased, evidence-based, free of pharmaceutical industry influence, and grounded in peer-reviewed literature and current clinical guidelines. Accreditation. CE modules will be accredited through ACCME (physicians), ANCC (nurses), and ACPE (pharmacists), ensuring licensure-qualifying credit. Community health worker training tracks will align with Alaska's CHW certification framework, ensuring the full care team — not just licensed providers — benefits from structured, credentialed education. Delivery. Three tracks address Alaska's realities: low-bandwidth asynchronous online modules accessible from any clinic device; quarterly live virtual sessions for case-based discussion, expert Q&A, and peer connection that directly combat the professional isolation of frontier practice; and an Annual Clinical Education Manual physically distributed to remote clinics, CHA programs, and tribal health organizations for low- or no-connectivity environments. Evaluation. Coursework will be grounded in the theory of planned behavior to maximize practice change. Pre/post assessments will measure knowledge gains and intent to change practice. Utilization data will track reach by discipline, credential type, and geography. An Alaska-based project manager will oversee continuous quality improvement and ensure content evolves alongside Alaska's shifting public health priorities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Innovia GA, LLC	CONNECT Alaska: Community Outreach, Navigation, and Networked Engagement for Care Transformation	GA	CONNECT Alaska explores a model designed to strengthen connection and continuity of behavioral health care through structured virtual support communities. These communities may help individuals stay connected while on wait lists, after discharge, or during periods when additional connection may be helpful. This approach helps strengthen connection to care before, between, and beyond formal care encounters. These support communities are not intended to replace clinical services. Instead, they support the care provided by behavioral health professionals across Alaska. The model may also benefit individuals not currently receiving clinical care who could benefit from supportive interaction while navigating life stressors, isolation, or periods of transition. Through collaboration between Innovia Life and Alaska-based iEXIST, LLC, CONNECT Alaska will engage stakeholders to explore how this model can complement existing behavioral health care and strengthen the continuum of care for rural residents across Alaska’s regional service areas and hub communities.	CONNECT Alaska is a collaborative learning initiative exploring how structured support groups can strengthen participation in behavioral health supports across Alaska. The Year One effort emphasizes stakeholder engagement, demonstrations, and a small pilot to better understand how this model could complement existing behavioral health services while contributing to broader system strengthening. The project will begin with listening sessions and stakeholder conversations involving behavioral health providers, Tribal health organizations, community organizations, universities, and other collaborators. These discussions will help identify use cases for support groups, such as supporting individuals on wait lists, between appointments, after discharge, or during periods when additional peer interaction or encouragement may be helpful. Innovia Life representatives will participate in several in-person engagements in Alaska to demonstrate how the platform functions and build relationships with stakeholders. The Innovia platform enables structured support groups that provide technology-enabled interaction between clinical visits and other points of care. These engagements will take place in Anchorage, the Matanuska-Susitna Borough, and the Bethel Census Area to reflect regional hub, road-system, and off-road community perspectives. Following these engagements, the project will offer a limited number of demonstration seats allowing participants to explore the model and provide feedback on group formats, participation preferences, and barriers to participation. Some participants may be navigating life stressors, isolation, or periods of stress and may not yet need or be ready for clinical services. Supportive interaction can help individuals remain connected with support networks and strengthen pathways to care. During the Year One period, CONNECT Alaska will work with providers, community organizations, and regional stakeholders to identify locally informed ways this model could complement existing systems of care across Alaska. Insights from participants and partners will inform implementation approaches reflecting the geographic, workforce, and transportation realities of rural Alaska’s health system. This learning process will also help identify opportunities to strengthen participation in behavioral health supports between formal care encounters in communities where workforce capacity and access remain limited.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

Integrative Learning Partners	Early Substance Use Intervention for Rural Alaska Youth	AK	Generally speaking, the problem/opportunity this grant seeks to address is the lack of early intervention opportunities for rural Alaskan youth displaying risk indicators for alcohol and substance abuse and addiction.	This project will develop and pilot a structured early intervention model for rural Alaska schools designed to respond to substance-related behavioral incidents involving middle and high school students. The goal is to provide a consistent and practical intervention that can be implemented immediately after a student is caught using or in possession of alcohol or drugs. Students involved in these incidents will complete a guided intervention experience designed to increase awareness of addiction risk, escalation patterns, and the long-term consequences of early substance use. The intervention will combine clear information about how substance use develops into addiction with culturally relevant narratives from Alaska individuals who have experienced substance misuse and recovery. The intervention will be delivered through a short digital learning module followed by a brief guided conversation with a trained school staff member. The conversation will use motivational interviewing principles to encourage reflection and help students consider how their current choices may affect their future health and goals. This approach adapts evidence-informed early intervention strategies commonly used in behavioral health, such as brief interventions and motivational interviewing, into a format that can be implemented within rural school systems. By embedding the intervention within existing school disciplinary processes and using a scalable digital platform, the model allows rural districts to provide early behavioral health intervention without requiring additional clinical staff. The project will pilot the model in two to three rural Alaska school districts and evaluate outcomes such as repeat substance-related incidents and student understanding of addiction risk.	\$250K-\$1M	Statewide	Fairbanks North Star Borough; Kenai Peninsula Borough; Kodiak Island Borough; North Slope Borough; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Integrity Solutions LLC	Healthcare Referral & Data Exchange Platform	AK	Integrity Solutions LLC Transforming Healthcare Infrastructure from Anchorage, Alaska to the Nation Integrity Solutions LLC is a healthcare technology and infrastructure company founded in Anchorage, Alaska, with a singular mission: to modernize how healthcare systems connect, communicate, and deliver care — especially in the most geographically complex and underserved environments in America. Born in one of the most logistically challenging healthcare landscapes in the United States, Integrity Solutions was not created in a major tech corridor or dense metropolitan market. It was forged in Alaska — a state defined by vast distances, rural isolation, tribal health complexity, extreme weather, and some of the highest per-capita healthcare delivery costs in the country. This foundation is not incidental; it is the company’s defining strength. Where most healthcare technology companies design solutions for urban hospital networks and retrofit them for rural use, Integrity Solutions built its model from the rural frontier inward. Anchorage is not simply the company’s headquarters — it is the proving ground that shaped its core philosophy: if a healthcare system can work in Alaska, it can work anywhere.	Integrity Solutions LLC proposes to develop and deploy a secure healthcare interoperability platform designed to streamline referral coordination, medical record exchange, and insurance verification between hospitals, clinics, and healthcare providers across Alaska. The project will focus on creating a centralized integration layer that enables providers to securely access and transmit patient information in real time, improving care coordination and reducing administrative delays. The proposed platform will utilize modern healthcare data standards, including FHIR-based APIs, to allow interoperability between existing electronic medical record (EMR) systems without requiring providers to replace their current software. Through a secure cloud-based infrastructure, the system will support real-time referral routing, access to relevant patient medical history and allergy information, and integrated insurance eligibility verification. This approach ensures that receiving providers have the necessary clinical and administrative information before a patient visit, improving efficiency and reducing redundant testing or delays in treatment. Implementation will occur in phases. The initial phase will focus on platform architecture, security compliance, and system design to ensure HIPAA-compliant data protection and scalable infrastructure. The second phase will involve development of the core platform and pilot deployment with one regional hospital and several clinics in the Anchorage and Mat-Su Valley region. During this pilot stage, the system will be tested to evaluate referral processing time, provider adoption, and administrative efficiency improvements. In the final phase, the platform will expand to additional healthcare facilities, including rural clinics and regional hospitals, supporting broader statewide interoperability. By focusing on integration rather than replacement of existing systems, this approach minimizes disruption for healthcare providers while delivering immediate improvements in referral management, data accessibility, and operational efficiency. The long-term goal is to establish a scalable healthcare interoperability infrastructure that strengthens care coordination, improves patient outcomes, and reduces administrative costs for healthcare providers throughout Alaska.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

IntellectAbility	Bridging the Gap: Advancing IDD Healthcare Workforce Capacity Across Rural Alaska	FL	People with intellectual and developmental disabilities (IDD), particularly those living in rural communities, face persistent barriers to timely, high-quality healthcare. In Alaska, where 82% of communities are not connected by road and many residents must travel long distances to reach hospitals, geographic isolation intensifies inequities. Workforce shortages, high provider turnover, limited specialty access, and few training opportunities further restrict access to clinicians prepared to address complex needs. As a result, the approximately 11,600 Alaskans with IDD experience significant disparities, including higher rates of preventable hospitalizations, non-urgent emergency department use, unnecessary diagnostic testing, and delays in diagnosis due to atypical symptoms and communication differences. Gaps in preventive care contribute to lower screening rates, higher rates of chronic disease, polypharmacy, longer hospital stays, and increased healthcare costs. A key driver of these disparities is the lack of structured training. Many clinicians report low confidence in managing IDD-related complexities and limited preparation in adapting care. Without targeted education and practical strategies to identify health risks, opportunities for early intervention are missed and inequities persist. This project addresses the shortage of IDD-specific training among Alaska’s rural healthcare workforce, strengthening capacity to deliver equitable, person-centered care statewide.	Our approach to delivering the Curriculum in IDD Healthcare eLearning course is designed to ensure accessibility, engagement, and measurable impact for healthcare providers across Alaska. The Curriculum in IDD Healthcare educates clinicians, including those delivering telemedicine, on important concepts to improve clinical and diagnostic skillsets. It includes the fatal five, which are the top preventable causes of illness and death in people with IDD, osteoporosis, common lab abnormalities, behavioral changes associated with underlying medical conditions, dental issues, mental health conditions, how to facilitate better communication in healthcare settings, and much more. The course is designed to enhance clinical skillsets and improve the capacity to deliver effective healthcare to people with IDD. The course will be hosted on our secure eLearning Platform (eLP), which provides a comprehensive learner experience. Each participant will have a secure account that tracks progress, allows bookmarking, and issues automated completion certificates. Built-in assessment and reporting tools capture participation and learning outcomes, while CME and nursing CEU tracking ensures professional development is accurately documented. To support statewide registration and engagement, we will develop a customized Alaska-focused landing page. This page will highlight the importance of IDD-informed care, clearly communicate available CME and CEU opportunities, provide a direct path for registration, and showcase testimonials and outcome data. Metrics from a prior study demonstrate that the course increased clinician confidence by 62% and medical student confidence by 108%, underscoring its effectiveness. The landing page will act as the central hub for licensed healthcare providers statewide, with enrollment analytics tracking reach and engagement. To maximize awareness and adoption, we will deploy a robust marketing strategy informed by successful statewide rollouts in other regions. This strategy will include targeted email campaigns to licensed healthcare providers, partnerships with professional associations, direct engagement with rural hospital systems and clinics, collaboration with the Division of Senior and Disability Services and other state agencies, as well as digital campaigns, including social media outreach. Together, these efforts are designed to create broad awareness, encouraging widespread adoption of the course among Alaska’s healthcare workforce.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

IntellectAbility	From Rural Risk to Rural Resilience: Improving Health Outcomes for Alaskans with I/DD	FL	People with intellectual and developmental disabilities (IDD), particularly those in rural and frontier communities, face significant barriers to timely, consistent healthcare. Geographic isolation, provider shortages, and limited local expertise delay identification of emerging health risks and reduce access to preventive care. Consequently, people with IDD experience profound disparities, including earlier mortality, higher rates of preventable death, later-stage cancer diagnoses, and lower rates of routine health screenings. They also have higher rates of chronic disease, mental health conditions, and dental disease, along with increased polypharmacy and inappropriate prescribing. People with IDD are more likely to experience abuse, unmet social determinants of health needs, longer hospital stays, avoidable emergency department use, and higher overall healthcare costs. These disparities are amplified in remote areas like Alaska, where 82% of communities lack road connections and many residents must travel hundreds of miles, often by plane, to reach hub hospitals. Without standardized tools to assess and monitor health risks, supporters and providers miss opportunities for early intervention. These systemic gaps perpetuate inequities in access, quality, and outcomes for some of Alaska’s most vulnerable residents.	Our approach addresses gaps in health care access, quality, and coordination for people with intellectual and developmental disabilities (IDD) in Alaska’s rural, remote, and frontier communities by leveraging the Health Risk Screening Tool (HRST) and its screening service. Recognizing geographic isolation, limited provider availability, and workforce constraints, this project introduces a structured, standardized process to assess health risks and support proactive care planning across dispersed communities. Potential timeline: Month 1: Stakeholder engagement and onboarding Months 2–6: Pilot cohort launch (500 participants) Months 6–12: Expansion to 80% waiver enrollment The project begins with outreach to state agencies (Division of Senior and Disability Services), provider associations (Alaska Association of Developmental Disabilities), Tribal Health Organizations and other community-based organizations to support adoption and integration of the HRST into existing systems. (This strategy has proven effective in multiple states leveraging the HRST statewide.) Screenings will be conducted remotely by trained IntellectAbility Raters, ensuring accuracy, consistency, and ease of implementation for providers. Individuals being screened are encouraged to actively participate in the process, supporting person-centered assessment and engagement. Each screening generates actionable insights to prioritize interventions, monitor risks, and develop individualized care plans. Training and technical support will further strengthen provider capacity and promote consistent, high-quality care. The HRST also generates de-identified, aggregated data to inform decision-making, identify trends, and highlight service gaps. This data-driven approach supports efficient resource allocation, preventive care initiatives, and quality improvement efforts for long-term sustainability. By combining standardized risk measurement through expert-led screenings, remote accessibility, training, and data-informed guidance, this model strengthens local capacity and promotes coordinated, equitable health outcomes for rural Alaskans with IDD.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

IntellectAbility	Strengthening Rural Care from the Front Lines: A Statewide Fatal Five Initiative	FL	Alaska’s ~11,600 individuals with intellectual and developmental disabilities (IDD), especially in rural and frontier communities, face persistent barriers to timely, high-quality healthcare. In remote Alaska, delay is not an inconvenience - it is a risk multiplier. When transport requires aircraft, prevention is the only scalable safety strategy. Geographic isolation combined with workforce shortages, high turnover, limited specialty access, and few IDD-focused training opportunities increase risks, resulting in higher rates of preventable hospitalizations, non-urgent emergency visits, unnecessary testing, delayed diagnoses, and higher healthcare costs. A key driver of these disparities is the lack of practical training for clinicians and frontline staff, who often report low confidence in managing IDD-related health complexities. Subtle but significant changes - especially the “Fatal Five” conditions (aspiration, dehydration, constipation, sepsis, and seizures) - can escalate quickly if not recognized. In rural Alaska, where emergency response and specialist care may be delayed, proactive intervention is critical. This project provides evidence-informed, practical training for Direct Support Professionals (DSPs), residential and day program staff, behavioral support specialists, community health aides, volunteers, and families. It strengthens workforce capacity, promotes person-centered care, and improves access, quality, and equity for rural Alaskans with I/DD.	The Fatal Five Fundamentals eLearning program provides practical, evidence-informed training to frontline supporters who provide direct care to people with IDD. It equips supporters with the skills to recognize early signs of health destabilization and take timely action to prevent avoidable crises. The course is comprised of seven self-paced modules, with knowledge checks built in to ensure learner engagement and retention. It is accredited by the National Alliance for Direct Support Professionals (NADSP), providing recognized professional development for participants. Total course completion time is roughly 4 hours. The course will be accessible to all provider agencies, tribal health partners, community-based organizations, and families across the state. We will develop a robust marketing strategy including direct email promotion, bulletins, and partnerships with the Senior and Disability Division, Alaska DD Association, and community providers to drive course adoption. Delivery is flexible: it can integrate into existing Learning Management Systems (LMS) used by the State, or it can be hosted through our secure electronic Learning Platform (eLP), which includes user management, tracking, reporting, and certification functionality. Disruptions in connectivity are accommodated through bookmarking of forward progress, ensuring learners can complete the course even in areas with intermittent internet access. SCORM-compliant integration ensures compatibility with most LMS environments, allowing seamless adoption. The content is practical and role-focused, emphasizing skills that non-clinical supporters can apply in daily care. Participants learn to identify early warning signs, recognize subtle changes in health status, document observations, and communicate concerns effectively to clinical partners. Training also covers proactive prevention strategies and guidance for escalating concerns when necessary. Completion tracking and reporting dashboards allow the State to monitor uptake, identify gaps, and evaluate impact, supporting RHT goals of measurable improvement in workforce capacity, care quality, and population health outcomes. By combining statewide access, flexible delivery, role-relevant skills, self-paced modules with engagement checks, accreditation, and robust reporting, the Fatal Five Fundamentals initiative builds sustainable, rural-ready capacity to prevent the Fatal Five and improve health outcomes for Alaskans with I/DD.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Interior AIDS Association	Hepatitis C Confirmation Test Machine	AK	Hepatitis C Confirmatory testing is not easy to access. IAA has done HCV screening tests for years, but we have had to rely on other healthcare providers to confirm reactive results of the Orasure fingerstick screening. People who screen positive may not follow through with confirmatory testing, or may delay it - during which time they can be transmitting the disease to others through sharing of drug use equipment. It is especially important for pregnant women to avoid HCV, or be treated as soon as possible. With this Hepatitis C Confirmatory testing machine, we can eliminate the waiting period for confirmation and reduce the number who are lost to care because they do not follow through with confirmation. With people in the room when they get a positive test, staff can immediately take steps to ensure linkage to care for HCV Treatment. If they have health coverage, they can receive case management assistance to make an appointment. If not, and they are not Alaska Native Beneficiaries with access to CAIHC, staff can assist them to access treatment through Pharmaceutical Assistance Programs, or other sources for the medication. IAA is insured for limited primary care - so our doctors could prescribe.	1. Purchase the Hepatitis C Confirmatory testing machine. "With Cepheid's Xpert® HCV, patients can undergo testing, receive a diagnosis, and seamlessly connect to treatment and care in a single visit. This efficient process has the potential to save time and can ensure more patients stay in care, leading to more people cured of hepatitis C." 2. Work with the State of Alaska, Section of Epidemiology to ensure proper use and training. Kira England, Syndemics Lead, informed us of this opportunity and they are willing to offer support to ensure success. 3. Add HCV Confirmatory Testing to our existing Prevention Program, wherein we already screen for HIV, HCV and Syphilis. 4. Ensure linkage to care for people who test positive for HCV.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Single Community	Fairbanks North Star Borough	Advance to Implementation Application

Interior AIDS Association	OTP Medical Services Renovation	AK	IAA's Medical Services are related to IMAT - a comprehensive Opioid Treatment Program. Medication is dispensed to patients every day of the year. The current medical area is made up of two rooms and the "kitchen" walkway between them. The sink is in the center area, while the medication dispensing area is in a separate room at one end with no water access. The bathroom that patients use to give urine specimens is off the center walkway. The Med room is a concrete box about 10 feet square. It does not meet DEA requirements by itself for Medication storage, so two safes are contained inside the room for methadone and buprenorphine storage. The doctor's exam room is at the other end of the center walkway - also with no sink. Ventilation inadequacy leaves the Medication Room so warm it has a permanently-running air conditioner in it. Reorganizing the existing space to increase the size of the Medication Dispensing room and add a sink for handwashing and adequate ventilation will improve the quality of the nurse's work environment. The Exam Room, which is about 8 feet square can be expanded into the unused "walkway" space to make a reasonably-sized room for the doctor and nurse to work in with patients. A handwashing sink and improved ventilation completes the exam room space. The walkway area will be smaller and more efficient with room for storage.	Our Medical Services area was not designed for its current purpose. It was sort of a staff break room. This renovation project will allow us to correct that problem. Our building was well-surveyed two years ago by Design Alaska engineers - the walls we want to move are movable. With this renovation, ventilation can be added to the expanded Medication Room - allowing us to remove the constantly-running portable air conditioner. The areas that must be accessed to add and/or move sinks is accessible from the rooms and from crawl space underneath when necessary - which is kept warm by the steam heat pipe coming into the building from the street. Design Alaska will create the renovation plans. Then we need to find a contractor to complete the renovations.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Single Community	Fairbanks North Star Borough	Advance to Implementation Application

Interior AIDS Association	Health Technology Modernization	AK	PROBLEM 1 is aging and outdated computer infrastructure. The OPPORTUNITY is this RHTP funding paired with the current identification of a new modern server, network improvements and new workstation computers that can keep up. We have a quote and a plan. PROBLEM 2 is an electronic health record that lacks the programming to support a fully digital health record and integrated billing capacity. The OPPORTUNITY is that a plan exists and is ready to implement to take the OTP’s electronic health record platform out of the paper age and into the modern digital age with confidence and security. PROBLEM 3 is a lack of opportunities for patients to interact with their health care experience digitally; we still depend on paper forms. This funding offers the OPPORTUNITY to hand a patient a tablet to complete a form or a survey instead of writing on paper, which must be scanned, and still does not interface with the EHR. The EHR has an APP that patients can use to enter information into their own records. While they could use their phones – if they have one – a tablet in the clinic is a better option. Five tablets would meet the need at peak traffic times.	New Server: The solution to the problem of an outdated server is to acknowledge that we have used the aging system to its limits, and to purchase and install a new server system based on current and emerging technology. In order to operate the upgraded EHR, the old server must be replaced. Our IT contractor has developed a description, explanation, and quote for costs associated with installing a new server. Workstations –With a server that operates on modern technology, 10 of our workstations must be replaced in order for the system to work effectively. Scanners are a necessity for maintaining a digital record, even if we have tablets to replace some paper. If this project is funded, the workstations and scanners will be ordered at the same time, creating an opportunity for discounts. Our IT Contractor is very familiar with our workflows, he will be installing the new server and will order the workstation configurations as needed for different functions. Workstations slated for replacement have been identified and the order will be placed within 24 hours of the notice of funding award. Otherwise, we have to order them individually or at least in smaller numbers when funding is identified. Electronic Health Record Upgrade: Plans have been developed with the EHR vendor, Netsmart. The system is Methasoft – which supports MOUD dispensing and record keeping. The plan includes installation/activation of the billing module and configuration of the system to enable direct billing. It also includes improved interfaces for clinical staff and patients: electronic signature pads, kiosk for efficient check-in and optional payment portal. With the added services come additional fees. For 10 years, the previous owner of Methasoft (Netalytics) charged IMAT for only 5 users (\$500/month). The new company and the new system is still quite reasonable, but is now \$1,049 per month plus the fee for billing. Our approach to this new problem is to request financial support for the fees for one year. It will take time and wages to scan and integrate our existing paper files. The efficiency gained in direct billing will be realized after the full transition is complete. We can sustain the fees after the first year because money is saved on data entry that we pay for now. Tablets for digital patient interface in the office can be purchased at any time upon recommendation of our IT Contractor in regard to security, capacity and durability.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced

Interior Alaska Center for Non Violent Living	Interior Alaska Rural Legal and SART Advocacy Initiative	AK	Survivors of domestic violence and sexual assault in rural Interior Alaska often lack consistent access to advocacy during medical, legal, and investigative processes. While coordinated response systems exist in Fairbanks, many rural survivors must travel long distances or navigate these systems without support. Traveling to Fairbanks may require survivors to leave their community, employment, childcare responsibilities, and cultural support systems. These barriers can prevent survivors from seeking care or participating in the legal process. This project addresses the opportunity to bring coordinated advocacy services directly to rural communities, ensuring survivors have access to trauma-informed legal and medical accompaniment without having to leave their home communities unless they choose to do so.	The Interior Alaska Center for Non-Violent Living (IAC) will establish two Legal and Sexual Assault Response Team (SART) Rural Advocate positions serving Interior Alaska’s 42 rural villages. The advocates will: Provide legal advocacy, including court accompaniment and meetings with law enforcement or prosecutors. Provide medical accompaniment during sexual assault forensic exams. Travel to rural communities when needed so survivors can access advocacy services without leaving their home community. Coordinate with rural health clinics, law enforcement agencies, and the Fairbanks District Attorney’s Office to ensure survivors receive coordinated support. Participate in the Interior Alaska SART Multidisciplinary Team to strengthen system collaboration. Work with tribal and regional partners to ensure services are culturally responsive and accessible. By staffing two advocates, the project increases the ability to respond to requests across a large geographic region and reduces response delays caused by travel distances between communities. By strengthening coordination between rural health providers, advocacy services, and the justice system, this project will help rural health systems deliver more effective trauma-informed care for survivors of violence while reducing the need for survivors to travel outside their communities for support.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Deferred or Not Advanced

Interior Alaska Hospital Foundation	Project “North Star”: Concept Formation for a New 24/7 Interior Alaska Hospital for 6,000+ Alaskans	AK	The residents of the 70,000-square-mile Delta Junction market face severe geographic isolation; they rely on small primary care clinics and endure a dangerous 2+ hour transport for emergency care. The primary opportunity of Project "North Star" is to solve this acute lack of access by establishing a financially viable, 24/7 hospital in Delta Junction. Second, this new hospital will serve as a physical hub to integrate other Alaska RHTP initiatives. Based on our discussions at the January 2026 DOH convening, the facility will incorporate a medical-based wellness program, advanced telehealth platforms for access to specialists, and innovative workforce development strategies. The specific opportunity for the FY2026 funding cycle is to execute the critical "Concept Formation" phase. Leveraging a small current grant and donations, this RHTP funding will allow the IAHF to verify market demand, determine specific service lines, develop conceptual designs and Total Project Budgets, and ultimately file a Certificate of Need (CON).	Project North Star directly advances the RHTP “Health Care Access” initiative by expanding essential services in a geographically isolated, severe-weather region. Our approach is a highly disciplined, multi-year initiative divided into four phases: Concept Formation, Implementation, Construction, and Operations Start-Up. Crucially, FY2026 RHTP funds will only be used for Concept Formation; they will not supplant existing funds or be used for actual construction. Our approach is not a dream, but is built on years of effort. In 2012, the IAHF secured funding for a feasibility study to determine what healthcare services could be sustainable in the region. The results 14 years ago were that a CAH and long-term care beds could be supported by the market. However, 14 years ago, HRSA told the IAHF to start with an FQHC, and the IAHF did, and now the opportunity is to fulfill the IAHF mission. The FY2026 approach is hands-on and data-driven. We will tackle unique logistical hurdles, collaborating with A&E firms to determine viable construction means, methods, and costs for extreme interior Alaska weather without port access. We will utilize empirical data to define the facility's scope and verify its financial sustainability. This approach builds in structural accountability, culminating in a strict “go/no-go” decision. If the data proves the hospital is viable, we will recruit an established operator (e.g., Providence, SEARCH). If deemed unviable, the IAHF will halt the project, and the DOH may reallocate unspent funds, ensuring zero risk of wasted state resources. The Concept Formation Phase focuses on viability, but in financial planning, we will also consider staffing, service alignment, and IT alignment for Value-Based Care success!	\$1M-\$5M		Multi-Community or Participating in Regional Hub-and-Spoke	Southeast Fairbanks Census Area	Deferred or Not Advanced
Interior Community Health Center	Improve blood pressure control in 50% of the 320 patients with hypertension by September 30, 2027.	AK	ICHC is addressing uncontrolled hypertension--a well-known chronic health condition that is a contributor to one of the greatest known causes of disability and premature death (i.e., heart disease and stroke). For this project, ICHC is focusing on uncontrolled hypertension in its adult population.	ICHC will contract with a remote patient monitoring (RPM) nursing service to provide daily monitoring of the patient's blood pressure via Bluetooth or cellular blood pressure monitors that link with the patient's Electronic Health Record. The RPM nursing team will alert ICHC's providers if patients' blood pressure readings are too high. ICHC's providers will then follow up with the patient.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough	Advance to Implementation Application

Interior Community Health Center	Increase access to medications for people living in poverty in the Interior of Alaska.	AK	The most recent community needs assessment, a partnership between Foundation Health Partners, the State of Alaska public health nursing and ICHC, reveals access to primary care as a top need. As ICHC is one of the few agencies in Fairbanks that provides a sliding fee discount, ICHC identifies many patients that have difficulty paying out of pocket for their medications. Inability to afford needed medications has been documented in various studies. When people cannot afford their medications and they go without, chronic conditions and other health related needs go unmet, resulting in the development of more serious and complicated conditions. This project will improve access to pharmaceuticals by discounting the patient’s medication cost. For example, an epi pen which ICHC can buy at cost through its 340B contract is \$29.65 a box, versus full cash pay without a discount card at Fred Meyer retails for \$762.99.	ICHC’s proposed approach to increasing access to medications for people living in poverty in the Interior of Alaska is to 1) utilize its existing 340B consultant list (including our auditor, Forvis Mazars, because they too have a division that provides contractual services for FQHCs who participate in the 340B program). ICHC would execute this contract by November 1, 2026 and select a consultant from this list to provide overall consultive services. 2) ICHC would contract directly with a pharmacy to provide a pharmacist by December 31, 2026. 3) ICHC would purchase a remote pharmacy dispensing machine (RPDM) and issue a design build renovation of its lobby by March 31, 2027. 4) ICHC would substantially complete its lobby renovation and installation of its RPDM by June 30, 2027, and 5) by September 30, 2027, patients will have access to discounted 340B pharmaceuticals in its lobby.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough	Advance to Implementation Application

Interior Region Emergency Medical Services Council	Alaska Interior Region Emergency Medical Services Cooperative - A Comprehensive Strategy for RHTP	AK	The Interior region faces a critical fragility gap in emergency medical services. Currently, EMS delivery is fragmented into localized, often uncooperative silos. This balkanization results in inconsistent medical oversight, disparate training standards, and inefficient resource allocation. While the spirit of Alaskan EMS is built on local independence, the administrative and logistical burdens of modern healthcare have outpaced the capacity of these small isolated agencies. In the roadless and remote communities of the Interior, the lack of a unified emergency medical services support structure leads to delayed care and a dangerous reliance on expensive, late-stage medevacs for conditions that could be treated in place. Furthermore, the traditional EMS model, designed for urban rapid response, fails to address the chronic and primary care needs of the frontier. The result is a system where the population is underserved by a binary transport or nothing model.	This concept applies a shared services approach to a vast, frontier landscape. By centralizing the business of EMS (education, medical direction, fiscal oversight, and supply chains) we allow local providers to focus on what matters most: the patient. This is an EMS Co-op designed to leverage economies of scale, ensuring every Alaskan community has access to high-level clinical and emergency care, regardless of geography. Pillar 1: The Regional EMS Cooperative Structure The goal is to eliminate systemic fragmentation by establishing IREMSC as the central support and coordination hub for regional operations. -Unified Medical Oversight -Regional Training Hubs (workforce development) -Centralized Logistics & Supply Chain -Administrative Support Services (unified executive functions) Pillar 2: EMS Operational Tiers (Hub and Spoke) This tiered model optimizes personnel deployment across both road-connected and off-road systems, reorganizing resources based on evaluated community needs. -Community based hybrid volunteer/paid BLS response and transport capability. -ALS Critical Care Intercept on Roadways. -Alaska Remote Duty Paramedic deployment rural and frontier communities. -Coordinated Surge Capacity for personnel & medical logistics. Pillar 3: Mobile Integrated Health & The Alaska Remote Duty Paramedic Initiative This is the system’s force multiplier. ARDPI transitions the paramedic from a transport provider to a remote clinical practitioner, a true physician extender delivering primary care to the most vulnerable Alaskans. •The Remote Duty Paramedic Model - New provider type •Remote Care Islands - primary care touch point with clinical competency •MIH - RDP coordinates resources and care •Specialty Engagement Teams: local asset (dental, OBGYN, behavioral health, public health initiatives) •Local Clinical Support - EMS training, clinical resource for CHA, ALS intervention and operational relief for rural providers. By transitioning to a regional cooperative model, IREMSC moves beyond the outdated transport-only paradigm in frontier communities and provides essential access to ALS resources on and off the road system. This initiative will prove that a unified clinical umbrella, coupled with the proven remote duty paramedic model, creates a more resilient workforce and a vastly more cost-effective healthcare delivery system. We are not just building a better EMS system; we are constructing a primary care safety net for the most remote Alaskans.	Over \$5M	Statewide	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Advance to Implementation Application

Internal Medicine Associates	Internal Medicine Associates expanded services and improved outcomes	AK	Rural Alaskans face limited access to specialty care, including endocrine and gastrointestinal care, resulting in delayed diagnosis and worsening chronic disease. Fairbanks has only intermittent in-person endocrine & gastrointestinal coverage, and surrounding Interior communities often have no specialty access at all. Patients with thyroid disease, adrenal disorders, GERD, IBS, Crohn’s disease, colitis, celiac disease, and gallstones frequently travel hundreds of miles for routine care, which leads to missed appointments, poor disease control, and preventable complications. The opportunity is to transform this fragmented system into a stable, accessible, and modernized statewide endocrine and gastrointestinal service. By strengthening the Anchorage hub, expanding Fairbanks coverage, and building tele-endocrinology pathways, we can dramatically reduce travel burdens, improve outcomes, and create a sustainable model for specialty care delivery in rural Alaska.	Our approach focuses on three coordinated strategies: workforce stabilization, telehealth expansion, and integrated chronic disease management. 1. Workforce Stabilization We will recruit 1–2 additional gastroenterology providers and 1 additional endocrinology provider or advanced practice clinicians to expand capacity and reduce burnout among the current team. Dedicated travel support will ensure consistent Anchorage-to-Fairbanks rotations. A rural care coordinator will manage referrals, follow-ups, and patient navigation across the Interior. 2. Tele-Gastroenterology & Endocrinology Expansion We will establish a telehealth hub in Anchorage with dedicated scheduling, remote monitoring tools, and EMR integration with Fairbanks and rural clinics. This will enable virtual follow-ups, insulin titration, medication adjustments, and chronic disease management for patients in Delta, Tok, Nenana, Healy, and surrounding communities. Telehealth will also support tribal health partners and reduce weather-related care disruptions. 3. Chronic Disease Management Program We will implement remote virtual education, medication management, and culturally appropriate materials for rural Alaskan patients. Standardized care pathways will improve thyroid, adrenal, GERD, IBS, Crohn’s disease, colitis, and celiac disease management. 4. Infrastructure & Technology Funding will support telehealth equipment, EMR integration, remote monitoring devices, and training for rural clinic partners. Together, these strategies create a reliable, scalable, and sustainable statewide gastrointestinal & endocrine services that aligns with RHTP goals for access, modernization, and improved outcomes.	\$250K-\$1M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Southeast Fairbanks Census Area	Advance to Implementation Application

International SOS Government Medical Services, Inc.	International SOS (Intl.SOS) Health on the Move - Bringing Care to Remote Communities	TX	The Mobile Rural Health Network expands the capacity of Alaska’s rural healthcare system by combining mobile clinical infrastructure with telehealth enabled care delivery. Three Mobile Medical Units will rotate among rural hub communities and surrounding villages, extending the reach of tribal clinics, community health aide programs, and regional hospitals while improving access to care in remote communities. Many rural communities in Alaska face barriers to accessing healthcare services due to geographic isolation, limited transportation infrastructure, and workforce shortages. Approximately 82 percent of Alaska communities are not connected to the road system and rely on air or marine travel to reach healthcare services. More than 90 percent of Alaska’s land area is designated as a Health Professional Shortage Area for primary care. Although Alaska’s healthcare system includes tribal health organizations, critical access hospitals, and federally qualified health centers, many communities still experience limited access to routine medical services. Travel distances for primary care can exceed 60 to 120 miles, contributing to delayed treatment and increased reliance on emergency departments for non urgent conditions. Three Mobile Medical Units supported by telehealth will deliver approximately 36,000 to 45,000 patient encounters annually while strengthening coordination with Alaska’s tribal clinics and rural hospitals.	Intl.SOS proposes a Mobile Rural Health Network that expands the capacity of Alaska’s rural healthcare system through mobile clinical services, telehealth technologies, and integrated health data systems. The program will deploy an initial pilot of three Mobile Medical Units that rotate among rural hub communities and surrounding villages on scheduled service routes. The Mobile Rural Health Network is designed to extend the reach of tribal clinics, community health aide programs, and rural hospitals by providing additional clinical access points in remote communities. This approach strengthens statewide healthcare infrastructure while preserving locally delivered care. Each Mobile Medical Unit functions as a fully equipped mobile clinic capable of delivering primary care, urgent care, preventive screenings, chronic disease management, women’s health services, and behavioral health services. Clinical care will be delivered by Advanced Practice Providers supported by nursing staff and connected through telehealth platforms to physicians and specialists when needed. Electronic health records will document patient encounters and support secure information sharing where appropriate to ensure continuity of care. Telehealth capabilities allow providers to monitor chronic conditions and provide follow up consultations between scheduled site visits. Each Mobile Medical Unit is expected to deliver approximately 12,000 to 15,000 patient encounters annually based on projected clinic operating capacity. The initial pilot of three Mobile Medical Units will deliver approximately 36,000 to 45,000 patient encounters annually across participating regions. The pilot establishes mobile healthcare infrastructure that can expand to additional rural regions, allowing the program to scale statewide while strengthening coordination with tribal health organizations and regional hospitals.	Over \$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Interstate Health Systems, Inc.	Interstate Health Rural Access Network – Alaska	TN	Rural and frontier Alaska faces some of the most severe healthcare access disparities in the US. Geographic accessibility issues mean that many residents often delay treatment until conditions become urgent, contributing to high rates of diabetes, cardiovascular disease, behavioral health conditions, substance use disorders, suicide, and preventable hospital utilization. These barriers worsen health outcomes while increasing the overall cost of care. Large areas of Alaska are designated Health Professional Shortage Areas and Medically Underserved Areas, reflecting persistent shortages of primary care, behavioral health, and specialty providers. Rural healthcare systems must also contend with high operating costs related to staffing, housing, transportation, and medical logistics. Many communities rely heavily on Medicaid, Medicare, Indian Health Service, and uninsured patients, creating financial sustainability challenges for local providers. Many residents must travel long distances or rely on emergency departments for conditions that could be managed through accessible community-based primary care. These gaps highlight the need for flexible, scalable care models. Expanding regional healthcare access hubs supported by telehealth, mobile outreach, and team-based care can bring essential services closer to rural residents while improving care coordination and reducing preventable emergency department use.	Interstate Health will establish a phased network of six rural and frontier clinics across Alaska, each approximately 1,200–2,000 square feet, designed to function together as a coordinated rural access network. Clinics will be located near population hubs, transportation corridors, and ports so they can function as regional healthcare access hubs serving surrounding rural and frontier communities supported by mobile outreach and telehealth connectivity. This scalable model allows Interstate Health to adapt to Alaska’s geographic terrain, transportation limitations, and logistical realities while expanding sustainable access to primary and urgent care services. Initial geographic targeting will prioritize rural and frontier regions with documented Health Professional Shortage Area and Medically Underserved Area designations and limited primary care provider availability, including the regions identified in this application and additional western Alaska regional service hubs that support surrounding rural communities. Clinics will be staffed by Nurse Practitioners and Physician Assistants with physician supervision. Care teams will include Community Health Coaches who function as patient navigators and community health workers, supporting patient education, chronic disease management, care coordination, and follow-up engagement. Telehealth-based physicians and behavioral health specialists will provide clinical consultation and specialty support. Workforce recruitment may include relocation assistance, telehealth-supported supervision, and flexible staffing models. Mobile outreach vehicles will conduct community visits, workplace health services, screenings, and follow-up care in remote communities. Core services will include primary and urgent care services, chronic disease management, preventive screenings, immunizations, diagnostic imaging, and behavioral health services delivered through telehealth and on-site. Clinics will provide occupational health services like DOT physicals, veterans’ medical disability examinations, and evaluation and management of sleep disorders through home-based, virtual, and clinic-supported sleep apnea testing when clinically appropriate. Telemedicine visits and remote patient monitoring will further support ongoing patient care. When patients require specialty or hospital-level services, care teams will coordinate with regional hospitals, tribal health systems, and specialty providers to ensure continuity of care.	Over \$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough; Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Intertribal Agriculture Council	Strengthening Tribal Food Systems to Improve Rural Health in Alaska	MT	Many Alaska Tribal communities have received federal investments in food system infrastructure such as cold storage, processing space, and transportation equipment. While these investments are important, infrastructure alone does not ensure reliable access to healthy food in remote communities. Across rural Alaska, long distances, limited road access, and seasonal transportation make healthy foods expensive and inconsistent. Many communities are located 250 to 1,200 air miles from Anchorage and rely on complex supply chains involving barges and small aircraft. Freight costs for food can exceed \$1.50 to \$2.50 per pound, increasing household food costs and contributing to spoilage and supply disruptions. The core challenge is an implementation gap. Prior investments supported infrastructure installation in 12 Alaska Tribal communities, but they did not fully fund the technical assistance, workforce training, operational planning, and market coordination needed to activate and sustain those assets. This project addresses that gap by supporting existing projects while expanding investments to at least three additional Tribal communities. By strengthening the ability to store, process, and distribute locally harvested foods, the project improves food access, reduces waste, and supports healthier rural communities.	Our approach is to close the gap between food infrastructure investment and actual community use. Building on the USDA National Intertribal Food Business Center work already underway in 12 Alaska Tribal communities, this project will provide the operational support needed to turn installed assets into functioning local food systems. This work builds on a successful collaboration between our team and the Alaska Food Policy Council (AFPC), which has helped strengthen coordination, shared learning, and statewide visibility for Tribal food system initiatives. Together, we will continue to support communities in activating existing infrastructure and expanding food access solutions that reflect local conditions across Alaska. Previous funding supported equipment such as cold storage, processing, packaging, and transport capacity, but it did not fully cover the implementation assistance needed to ensure these assets are used effectively. This project focuses on activating those investments while expanding support to additional communities facing similar challenges. The project includes five core components. First, we will confirm participating communities and launch the opportunity through coordinated outreach with Tribal partners and AFPC’s statewide network. Second, we will select three regional Tribal food system implementation awardees in underserved areas, with awards of up to \$100,000 each for the North Slope or Arctic region, Southeast Alaska Panhandle, and Yukon-Kuskokwim Delta. Third, we will support targeted procurement and installation of equipment where critical gaps remain. Investments may include cold storage, small-scale processing equipment, or supply chain delivery capacity that allows communities to safely store and distribute food. Fourth, we will provide on-site technical assistance and workforce development focused on food safety, operations, business planning, and local distribution systems. Fifth, we will work with AFPC and community partners to strengthen connections between producers, Tribal food programs, and buyers so locally harvested foods can move through sustainable local and regional systems. The work will be implemented over an 18-month period, beginning with community confirmation and award selection, followed by procurement and operational training, and concluding with market integration, site visits, evaluation interviews, and an Alaska Food Festival convening to strengthen statewide learning and collaboration.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Isaac Health	Reducing Medical Travel Through a Rural Neurocognitive Specialty Hub	NY	Alaska has an estimated 9,000–11,000 residents living with Alzheimer’s disease and related dementias, with many more experiencing early cognitive impairment that has not yet been formally diagnosed. Due to geographic isolation, workforce shortages, and limited access to neurologists, many Alaskans—particularly those in rural and frontier communities—face long delays in diagnosis and limited access to ongoing specialty care. Isaac Health’s telehealth-enabled neurologist model expands access to cognitive care without requiring patients to travel to urban centers. Within the first year, Isaac Health could serve 1,500–2,500 Alaskans, representing approximately 15–25% of the diagnosed dementia population. Patients receive comprehensive cognitive evaluation, diagnosis, individualized care plans, medication management, behavioral symptom support, and caregiver education. As referral networks grow and partnerships expand with primary care providers and health systems, the model could scale to serve 4,000–6,000 Alaskans annually within three years, reaching 40–60% of the state’s dementia population. By delivering specialist care directly to patients in their homes, Isaac Health reduces costly medical travel, supports local providers in managing complex cognitive conditions, and strengthens access to sustainable dementia care across Alaska’s rural and frontier communities.	Our model is dementia-forward given the epidemiologic reality that Alzheimer’s disease and related dementias (ADRD) are among the leading contributors to neurologic disability among U.S. adults over age 65 (Global Burden of Disease Study 2021). Within Medicare and Medicaid populations, dementia and vascular cognitive impairment account for a substantial share of functional decline, caregiver burden, and downstream health care utilization. These challenges are amplified in rural and frontier communities across Alaska where access to neurologists and geriatric specialists is extremely limited and patients often must travel long distances to urban centers such as Anchorage or Fairbanks for specialty care. Our model expands access to neurologist-led dementia care through a telehealth-enabled specialty approach designed for rural and remote communities. Using a proprietary supervised machine learning model trained on adjudicated claims and pharmacy data, we identify individuals at high risk for neurocognitive disorders with greater than 90 percent diagnostic accuracy. Identified members are proactively engaged and offered comprehensive neurocognitive evaluation by board-certified neurologists, geriatricians, or psychiatrists. Diagnostic evaluations follow evidence-based guidelines and include cognitive testing, functional staging (such as CDR or FAST), medication review, laboratory evaluation, imaging when clinically appropriate, and assessment of vascular risk factors. Diagnoses are coded precisely and aligned with CMS HCC/RAF requirements, enabling accurate identification and management of Alzheimer’s disease, vascular dementia, Lewy body disease, frontotemporal dementia, and mixed etiologies. The model also evaluates vascular cognitive impairment and post-stroke cognitive decline, integrating secondary stroke prevention, cardiometabolic risk optimization, and medication adherence strategies. These interventions support improved outcomes while reducing avoidable hospitalizations and costly medical travel. By combining advanced analytics, telehealth-enabled specialist care, and coordination with local providers and community health workers, the model strengthens the rural health workforce while expanding access to neurologic care. The result is a more sustainable care model that improves early diagnosis, supports caregivers, and allows older Alaskans to remain safely in their homes and communities longer.	\$1M-\$5M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

ISCCO (International Shared Care Community Organization)	Extended Discharge Support	HI	In many cases, individuals with chronic conditions, disabilities, or age-related health challenges rely heavily on family members or informal caregivers who may not have the training or support needed to safely manage complex health needs at home. our vision is for our program/organization to become a widely recognized and trusted resource for individuals who assume caregiving responsibilities for family members. Without adequate caregiver education and support, communities experience higher risks of medication errors, falls, preventable hospitalizations, and worsening health conditions. These challenges place additional pressure on rural hospitals, clinics, and emergency services. This project addresses the opportunity to strengthen community-based health support by equipping caregivers and community members with practical training, education, and resources that improve their ability to safely assist individuals with daily health management. By building caregiver knowledge and confidence, the project helps bridge gaps in healthcare access while improving patient safety and health outcomes. Supporting caregivers as an extension of the healthcare team creates a scalable and sustainable approach to improving health outcomes in rural and frontier communities while helping individuals remain safely in their homes and communities.	Our proposal addresses the challenges through a comprehensive caregiver education and support program designed to improve knowledge, confidence, and access to practical health management tools. The program will provide structured training, accessible resources, and community-based support to individuals who are caring for family members with health needs at home. The project will deliver caregiver education through multiple accessible formats, including in-person community workshops, telehealth-enabled learning sessions, and digital educational materials. These services will focus on practical topics such as chronic disease management, medication safety, fall prevention, nutrition support, mobility assistance, and recognizing early warning signs that require medical attention. By providing clear, practical guidance, caregivers will be better prepared to safely assist their loved ones between medical visits. A key component of the program is collaboration with local healthcare providers, hospitals, tribal health organizations, and community service agencies. These partnerships will help ensure that caregivers receive consistent information that aligns with medical care plans while strengthening coordination between caregivers and healthcare professionals. The program will also provide caregivers with tools such as care planning guides, educational materials, and access to support resources that help them organize and manage care more effectively. By increasing caregiver knowledge and confidence, the project helps reduce preventable health complications and supports individuals in remaining safely in their homes and communities. Through education, collaboration, and accessible support resources, this project strengthens caregiver capacity and creates a sustainable community-based approach to improving health outcomes in rural and remote communities.	\$1M-\$5M	Statewide	Anchorage (Municipality); Juneau (City and Borough); Ketchikan Gateway Borough; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough)	Deferred or Not Advanced

ISCCO (International Shared Care Community Organization)	Short-Time Care	HI	One of the greatest gaps in rural caregiving support is the lack of short-duration relief. Short time care is useful under many circumstances such as immediately after hospital discharge or post surgical assistance. Many persons in need could benefit from a brief period of help to attend medical appointments, run essential errands, or take time for rest. Longer hours are too costly, or require longer scheduling commitments. Without access to even short periods of relief, caregivers may experience burnout, stress, and fatigue, which can affect the quality and safety of care provided to their loved ones or themselves. The Short Time Care program addresses this gap by providing flexible caregiving support visits lasting 1 to 3 hours, allowing caregivers time to manage essential responsibilities while ensuring their loved ones remain safe and supported at home. By offering short, practical relief, the program strengthens caregiver capacity and supports safer home-based care in rural communities.	the Short Time Care program will address the need for short-duration support services in rural, remote, and frontier communities by providing flexible care visits lasting 1 to 3 hours. The program is designed to support individuals who need temporary assistance or supervision, while also providing relief for family caregivers when needed. In many rural communities, individuals may require short periods of assistance but do not need or cannot access traditional full-day care services. Short Time Care fills this gap by offering brief, scheduled visits that provide practical support in the home. These visits may include companionship, mobility assistance, medication reminders, meal preparation, safety supervision, and general support for individuals who may need help during a short period of time. The program will recruit and coordinate trained caregivers who can provide these short-duration services within their communities. Whenever possible, caregivers will be recruited locally to help reduce travel barriers and strengthen community-based support networks. Access to the program will be supported through partnerships with healthcare providers, community organizations, senior service agencies, and local social service programs. These partners will help identify individuals who may benefit from short-term support and assist with referrals and outreach efforts. A simple intake and scheduling system will allow individuals or families to request services for short periods of time, such as when attending medical appointments, running errands, managing personal responsibilities, or during times when temporary assistance is needed for safety and well-being. By providing accessible and flexible short-duration care, the Short Time Care program helps individuals remain safely in their homes and communities while strengthening local support systems. The program also helps reduce caregiver stress, improves continuity of care, and supports the overall resilience of rural families and communities.	\$1M-\$5M	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

J&M Global Solutions LLC	Alaska Rural Health Training Pipeline Mapping Design & Expansion Initiative	VA	Alaska is entering an unprecedented period of investment in rural health transformation through the federal Rural Health Transformation Program (RHTP). Workforce expansion is one of the state’s highest priorities, yet workforce shortages remain especially acute in rural, remote, and frontier communities. While Alaska has numerous training assets, including CHA programs, nursing schools, mobile training initiatives, and rural clinical sites, these assets are not consistently coordinated or strategically aligned across regions. The lack of a comprehensive, data-driven understanding of where training capacity exists, where gaps remain, and how pathways connect limits the state’s ability to scale workforce solutions efficiently. This project presents a strategic opportunity to map, integrate, and redesign Alaska’s statewide health workforce training pipeline. By grounding planning in geospatial analysis and stakeholder engagement, the initiative supports a coordinated, regionally responsive workforce strategy aligned with RHTP goals to grow and support resilient health care teams and strengthen partnerships across the care continuum.	The project will begin with a comprehensive statewide mapping of Alaska’s health workforce training assets using geospatial and programmatic data. This analysis will capture the full landscape of existing training capacity, including Community Health Aide training centers and their affiliated Tribal health organizations, university and community college nursing programs, mobile and satellite training hubs, and rural and frontier sites capable of supporting clinical rotations or residency expansion. By visualizing these assets together, the project will identify geographic gaps, areas of duplication, and opportunities for strategically targeted, regionally tailored investments that strengthen rural training capacity and improve workforce distribution. Building on this foundation, the project will design integrated and connected training pipelines that allow learners to progress smoothly through the workforce continuum while remaining linked to rural practice settings. These pathways will connect entry-level Community Health Aide roles to nursing prerequisites, nursing degree programs, and advanced practice opportunities, while also linking local training opportunities to clinical placements and rural residency sites. Mobile and hybrid training options will be incorporated to ensure that individuals in hard-to-reach communities can access education and advancement opportunities without unnecessary barriers or relocation. To further expand access to training, the project will support the development of mobile or pop-up training hubs that deliver simulation labs, hands-on skills training, and specialty certification courses directly to rural and remote communities. This approach modernizes workforce training delivery, reduces travel and cost burdens for rural providers, and expands access to continuing education critical for workforce retention and quality of care. Finally, the initiative will focus on expanding rural residency and clinical placement opportunities by identifying priority regions and assessing facility readiness. This work will support the expansion of rural primary care residency slots, increase behavioral health and specialty clinical placements, and outline infrastructure and incentive strategies designed to retain trainees in rural communities. Together, these efforts create a coordinated, data-driven approach to building a resilient, locally rooted health workforce aligned with Alaska’s rural health transformation goals.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	Chronic Disease Risk Mapping Initiative	VA	CDC research shows that American Indian and Alaska Native (AI/AN) populations experience significantly higher rates of smoking, physical inactivity, and obesity than non-Hispanic White populations — all major contributors to chronic disease. These conditions contribute significantly to avoidable hospitalizations, reduced quality of life, and longterm healthcare costs. However, health system leaders and community partners often lack precise, geographically targeted data that identifies where disease burdens are highest and where resources should be prioritized. Geographic Information Systems (GIS) offer a powerful, underutilized opportunity to visualize layered health, demographic, environmental, and service utilization data. By mapping chronic disease hotspots and associated social determinants of health, Alaska’s Rural Health Transformation Projects (RHTP) can better align interventions with the communities most in need. This proposal outlines an approach to implement a GIS-driven Chronic Disease Risk Mapping solution to directly support RHTP’s goal of promoting healthy communities and preventive care.	The proposed approach uses a GIS-driven, multiphase strategy to identify, analyze, and address chronic disease risks across Alaska’s rural and Tribal communities. It begins with data integration and preparation, compiling existing health information, such as hospital claims, screening rates, EMS data, and public health registries, alongside key social and environmental determinants, including transportation access, food availability, socioeconomic factors, and housing conditions. All data are deidentified and aggregated to ensure privacy while retaining analytic value. Next, the project develops interactive GIS maps and spatial models that visualize the prevalence of hypertension, diabetes, COPD, obesity, and behavioral health conditions. Additional layers include locations of critical access hospitals, Tribal and behavioral health facilities, community programs, and indicators of social vulnerability. Spatial analytics identify chronic disease hotspots, gaps in preventive care access, and communities facing overlapping risks, such as high disease burden combined with low primary care availability. The initiative then incorporates stakeholder engagement and validation, engaging Tribal health organizations, rural clinics, EMS leaders, public health nurses, and community partners. These collaborative sessions ensure that mapped insights align with on-the-ground experience and regional priorities, strengthening accuracy and community relevance. Finally, the project produces decision support tools, including user-friendly dashboards and a map library that enable health system leaders to translate GIS insights into actionable strategies. These tools support planning for preventive services, funding proposals, workforce deployment, and community-driven wellness initiatives.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	Community Resource Dashboards for Alaska	VA	Alaska’s communities—rural, urban, and Tribal—possess a rich network of local assets that support health, resilience, and wellness. These include schools, community centers, tribal health aides, food access sites, wellness hubs, behavioral health supports, and nonprofits delivering prevention services. However, these assets often operate in silos, and community members, agencies, and program planners lack a centralized way to see what resources exist and where service gaps remain. A Community Resource Dashboard presents an opportunity to create a statewide, easyto use mapping tool that visualizes local assets and connects them to prevention programs. This solution would help providers coordinate care, help residents find nearby supports, and give state and tribal decision-makers the data needed to target investments and interventions where they are needed most.	The project will develop a statewide Community Resource Dashboard by following a structured, collaborative, and data driven approach. First, the team will partner with Tribal health organizations, local governments, school districts, community coalitions, and state agencies to gather vetted datasets that represent Alaska’s diverse community assets. Priority resources include schools, youth serving organizations, community centers, cultural hubs, Tribal health aides, village based providers, food access points, wellness hubs, behavioral health services, and prevention programs. Next, the project will build an intuitive, web based dashboard that enables users to view resources by region, community, or service type; filter by target populations such as youth, families, or elders; and identify strengths and service gaps in real time. Integrated GIS mapping and optional heat-mapping will help visualize equity indicators such as food insecurity or behavioral health risks. Community engagement is central to the approach. The project will conduct workshops with Tribal councils, school administrators, and regional coalitions in a pilot region to validate data and ensure culturally grounded representation. Local partners will be able to request updates or submit new resources through a structured review process, strengthening accuracy and community ownership. To ensure longterm sustainability, the project will establish a cross agency steering group responsible for data governance, quality assurance, and maintenance. Training and user guides will help communities adopt and use the dashboard effectively over time.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	Emergency Response Optimization for Alaska’s Tribal and Rural Communities	VA	Alaska’s rural and tribal communities face some of the most challenging medical transport environments in the United States. Vast distances, limited road infrastructure, harsh weather, and inconsistent connectivity create delays in emergency response, particularly for medevac, EMS, and interfacility transport. These delays translate to increased morbidity and mortality for time sensitive conditions such as trauma, stroke, myocardial infarction, sepsis, and obstetric emergencies. Despite strong regional partnerships, transport pathways across agencies (tribal health organizations, regional hospitals, EMS, state assets, and contracted medevac providers) often remain fragmented. Dispatch protocols differ by region, duplication of effort across call centers is common, and many communities lack a consolidated view of available aircraft, capability (ALS/BLS), landing zones, and real-time route conditions.	The project uses a comprehensive, data driven, and collaborative strategy to strengthen Alaska’s emergency transport system and address delays caused by distance, weather, fragmented dispatch pathways, and inconsistent regional workflows. It begins with a statewide mapping of current medevac, EMS, and tribal transport processes, documenting the full chain of emergency movement, from local first response through dispatch, air and ground transport availability, handoff points, and receiving facilities. This mapping captures regional variation and identifies inefficiencies and gaps across diverse geographies. The team will then conduct data integration and workflow analysis, bringing together information from dispatch centers, air carriers, EMS agencies, and tribal health organizations. This includes analyzing historical response times, seasonal constraints, aircraft capabilities, and communication bottlenecks. Geospatial modeling will be used to identify underserved areas and optimize routing options under various environmental and resource conditions. A robust stakeholder engagement process ensures solutions are aligned with local needs. Tribal health organizations, medevac providers, EMS directors, hospital leaders, and community responders will participate in interviews and co-design workshops. These sessions validate pathway maps, highlight operational realities, and support culturally grounded system improvements. Findings will inform a detailed optimization blueprint that includes standardized dispatch protocols, cross agency coordination templates, and technology enhancements such as real-time routing recommendations and consolidated visibility into available aircraft and landing zones. The blueprint also includes redundancy strategies for weather or resource limitations, and offers actionable recommendations for staffing models, training, and system redesign.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	Facility Placement Algorithms to Expand Access to Essential Services in Alaska	VA	Alaska’s vast geography, extreme weather conditions, and dispersed rural populations create persistent barriers to accessing timely, essential health services. Communities often rely on limited local resources, long-distance travel, or intermittent visiting providers for care. Health systems and state partners need a more data driven way to determine where new service sites—such as telehealth pods, mobile clinics, community paramedicine hubs, or birthing centers—would have the greatest impact. Currently, placement decisions are often influenced by historical patterns, local advocacy, or limited data snapshots. This can result in investments that are difficult to scale or may not fully align with evolving demographic, workforce, and transportation realities. There is a significant opportunity to use advanced analytics to support more equitable, efficient, and proactive planning. Facility Placement Algorithms present a solution: a systematic, evidence driven approach to identifying optimal locations for new access points that bring care closer to home for rural and Indigenous communities.	The proposed approach uses a systematic, data driven framework to identify the most impactful locations for new health service sites across Alaska’s rural and Indigenous communities. First, the project integrates key datasets (population distribution, health outcomes, unmet service needs, travel barriers, broadband availability, existing facilities, and community infrastructure) to create a comprehensive geospatial model of current access gaps. This statewide map highlights service deserts and regions where residents face long travel times, limited local providers, or inconsistent access to essential care. Using this integrated dataset, the project applies proven facility placement and geospatial optimization algorithms (such as pmedian, location allocation, and coverage models) to test multiple scenarios for placing services like telehealth pods, mobile clinics, community paramedicine hubs, and birthing centers. These models quantify potential improvements in access and identify where new sites would deliver the greatest reduction in travel time and the largest boost in service availability. A critical component of the approach is a structured community and Tribal engagement layer. Local knowledge on cultural considerations, community readiness, workforce availability, and infrastructure capacity is incorporated to ensure recommended placements are feasible, culturally aligned, and supported by local partners. This step ensures the model’s outputs reflect real-world conditions rather than purely mathematical optimization. Finally, the project develops decision support tools (including interactive maps, dashboards, and scenario comparison tools) to make results easy for state and Tribal decision-makers to use. These tools enable leaders to weigh cost, access, and feasibility, and to update plans as populations shift, broadband expands, or new care models emerge.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	Geospatial Access Modeling to Expand Essential Services Closer to Home	VA	Alaska’s rural and frontier communities experience profound barriers to accessing essential health services due to long travel distances, limited to no road access, limited local providers, variable regional capacity, and reliance on weather-dependent transportation. The Alaska Department of Health emphasizes that the Rural Health Transformation Program (RHTP) is designed to ensure communities across the state can access “a full continuum of care as close to home as possible,” recognizing major geographic and operational challenges across regions. Additionally, federal RHTP investments aim explicitly to “bring care within reach,” reduce unnecessary travel, and strengthen rural clinics and regional care networks. This creates a unique opportunity to deploy geospatial modeling that accurately identifies service gaps, transportation barriers, and opportunities for bringing essential care delivery closer to rural residents.	The project uses a comprehensive geospatial modeling approach to identify and address barriers to essential health care across Alaska’s rural and frontier communities. The model integrates mapping of existing clinic and hospital service areas, multimodal transportation networks—including road, air, marine, seasonal overland, and weather-dependent routes—and travel times to priority health services to identify where geographic isolation and seasonal variability limit access. Using these integrated datasets, the project conducts scenario modeling to evaluate where expanding local services, such as primary care, maternal care, behavioral health, urgent care, diagnostics, or rotating and mobile clinics, would have the greatest impact. It also assesses the feasibility and expected benefits of telehealth expansion, mobile care models, and regional hub-and-spoke service designs, quantifying potential reductions in travel burden and improved continuity of care. The approach includes direct engagement with tribal health organizations, state partners, local clinics, regional hospitals, and community groups to validate model findings and ensure that recommendations reflect region-specific needs, consistent with RHTP’s emphasis on community-driven solutions. The modeling outputs will also directly inform workforce and infrastructure planning, identifying where provider shortages, facility limitations, and telehealth gaps are most constraining access. This supports strategic decisions about new satellite service points, workforce deployment, recruitment priorities, and technology modernization. Overall, the approach provides Alaska with a repeatable, data-driven analytic framework that drives targeted investments, supports value-based and sustainable care models, and accelerates the expansion of essential services closer to home for rural and frontier communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	Geospatial Support for TeleMFM Expansion	VA	Alaska’s vast geography and extreme rurality create profound challenges for delivering Maternal–Fetal Medicine (MFM) services. Many communities are not connected by road, weather can disrupt transportation, and high-risk pregnant patients often must travel long distances, or even relocate weeks before delivery, to access specialty care. This burden affects maternal and infant health outcomes and increases emotional, financial, and logistical strain on families. As the state expands its TeleMFM capabilities, there is a strategic opportunity to use geospatial analysis to optimize hub-and-spoke routing between MFM specialists and village clinics. By mapping transportation routes, population needs, risk factors, existing facility capabilities, and telehealth capacity, Alaska can better coordinate care, reduce avoidable travel, address provider shortages, and ensure more equitable access to specialty maternal care.	The proposed approach uses geospatial analysis to design an optimized TeleMFM hub-and-spoke system that improves access to high-risk pregnancy care across Alaska’s rural and frontier communities. The project begins with a targeted pilot to validate methods and workflows before expanding statewide. The pilot phase will integrate geospatial data on clinics, hospitals, transportation routes, village locations, MFM hubs, and telehealth capacity to create an initial mapping environment. Maternal health indicators, such as birth volumes, prevalence of highrisk conditions, and referral patterns, will be overlaid to identify priority regions and pinpoint gaps in access. This phase will model preliminary routing pathways between village clinics and MFM specialists, testing methods for minimizing travel burden, increasing reliability, and strengthening continuity of care. Routing optimization will evaluate air, land, and marine travel modes to determine which clinics are most suitable to serve as TeleMFM “nodes,” based on access, population need, and technical readiness. Pilot results will be validated with regional health systems, tribal organizations, and local clinicians to ensure that routing recommendations reflect local conditions, cultural considerations, and existing referral networks. Following the pilot, refined models will be scaled statewide. Full implementation will produce optimized routing configurations, clearer referral pathways, and operational guidance for incorporating geospatial insights into scheduling, triage, and telehealth workflows. This phased approach ensures the system is accurate, locally informed, and operationally feasible before expansion, ultimately enabling more consistent specialist support, reduced patient travel, and strengthened rural clinical capacity across Alaska.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	GIS Data Infrastructure for Health Interoperability in Alaska	VA	Alaska’s health ecosystem spans state agencies, tribal health organizations, telehealth networks, regional health systems, and emergency response entities. Despite strong individual systems, geographic isolation, bandwidth constraints, and fragmented data environments limit the ability to exchange real-time, place-based health information. Critical datasets, such as patient encounter locations, telehealth service availability, environmental hazards, emergency response zones, and tribal care networks, are often siloed in formats that cannot easily interoperate. There is a significant opportunity to build a modern Geographic Information System (GIS) data infrastructure that integrates spatial layers with Alaska’s Health Information Exchange (HIE), tribal Electronic Health Records (EHRs), and telehealth platforms. A unified spatial data backbone would improve clinical coordination, emergency response, public health analytics, broadband planning, and equitable access to care across rural and tribal communities.	The project will develop a federated, interoperable GIS data infrastructure that unifies spatial and health information across Alaska’s diverse health ecosystem. The first component focuses on building a statewide spatial data repository containing standardized, interoperable layers such as care facility locations, tribal jurisdiction boundaries, patient service areas, telehealth connectivity maps, transportation routes, and environmental risk data. These layers will follow national interoperability standards, including HL7 FHIR, USCDI+, and OGC spatial formats, to ensure seamless integration with Alaska’s Health Information Exchange (HIE), tribal EHRs, telehealth platforms, and emergency response systems. To support real-time information exchange, the project will create APIs enabling bidirectional data flow between GIS databases and clinical, telehealth, public health, and emergency operations systems. This infrastructure will allow providers, tribal organizations, and state agencies to access shared, place-based data essential for coordinating care across remote regions. A dedicated effort will focus on integrating tribal and rural health data through collaboration with Tribal Health Organizations, respecting data sovereignty, governance protocols, and role-based access models. This ensures equitable participation and secure sharing of community specific datasets. The project will also enhance telehealth and broadband mapping by unifying FCC availability data, provider networks, and community-level assessments to produce real-time layers that support digital health planning and broadband expansion efforts. Finally, the project will deploy interactive dashboards and predictive spatial modeling tools to support decision-making. These tools will help identify service gaps, optimize resource allocation, strengthen emergency preparedness, and inform planning for maternal health, chronic disease management, workforce distribution, and mobile or telehealth service deployment.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	GIS Enabled Maternal Health Access & Hotspot Mapping Initiative	VA	Alaska’s rural and frontier communities face profound maternal health access barriers. Families living off the road system encounter severe provider shortages, must travel long distances for labor and delivery, and often must relocate weeks before birth due to limited local maternal care capacity, causing significant emotional, financial, and logistical strain. These challenges are intensified by weather dependent travel, limited medevac availability, and reliance on air transport. A GIS-based hot spotting and access mapping solution provides a timely, evidence based opportunity to understand exactly where maternal risk, access gaps, and environmental/transportation vulnerabilities intersect.	The project will begin with a focused pilot implementation to validate the approach before scaling statewide. The pilot will integrate geospatial, transportation, environmental, and maternal health data to develop a GIS-based hot spotting and access mapping tool that identifies where high-risk pregnancies, service gaps, and environmental or transportation vulnerabilities intersect. This initial phase will test data ingestion, mapping workflows, and the accuracy of clustering analyses in a limited number of rural or offroad communities. It will also allow early collaboration with tribal health organizations, regional hospitals, and community health aides to ensure that the mapping outputs accurately reflect local realities, cultural context, and existing care pathways. Building on lessons from the pilot, the project will expand to statewide implementation. The full solution will integrate maternal and neonatal care facility locations, referral patterns, transportation routes, medevac landing sites, weather-related risks, social determinants of health, and telehealth availability. This data driven mapping approach will support RHTP’s emphasis on technology enabled decision-making and rural health transformation. Throughout the project, the team will conduct regional engagement sessions to validate local findings, incorporate community priorities, and refine mapping layers to ensure accuracy across Alaska’s diverse tribal and frontier regions. The statewide platform will provide actionable insights to support maternal care expansion, including opportunities for mobile maternity services, facility upgrades, telehealth hubs, and improved evacuation pathways. It will also supply workforce planners with precise geographic data to target recruitment, training, and deployment strategies in areas with limited maternal care capacity. Because the platform is cloud enabled and scalable, it can evolve as new RHTP-funded services come online and will remain useful throughout the 2026–2030 transformation window.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	Maternal Access Mapping	VA	Alaska’s pregnant and postpartum population faces persistent challenges related to geographic isolation, workforce shortages, fragmented care systems, and limited data visibility into where maternal health access gaps exist. These challenges are particularly acute in rural and remote communities. There is a critical opportunity to improve maternal health outcomes by developing a comprehensive, statewide understanding of service availability, access barriers, and care coordination gaps. Maternal Access Mapping seeks to address this opportunity by creating a structured, data-informed foundation that can guide policy, investment, and program development focused on maternal health equity.	The project will use a structured mapping and analysis approach to assess maternal health access across Alaska. This includes identifying existing maternal health services, referral pathways, workforce capacity, and geographic gaps. The project will integrate quantitative data and stakeholder input to produce a clear picture of where access challenges exist and where targeted interventions could have the greatest impact. Findings will be shared with partners to support coordinated planning, inform future investments, and align maternal health initiatives with statewide rural health transformation goals.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

J&M Global Solutions LLC	Recruitment Targeting Through Workforce Migration & Accessibility Analytics	VA	Alaska’s health care system continues to face persistent workforce shortages driven by geographic isolation, limited local training pipelines, high turnover, and strong competition for clinical and behavioral health professionals. Many rural and remote communities struggle to attract and retain workers due to housing constraints, long or seasonal commutes, and limited data on where potential candidates are most likely to relocate from. A data-driven understanding of workforce migration, commuting accessibility, and housing feasibility presents a significant opportunity. By identifying regions with high outbound migration of health care workers, analyzing commuting friction, and mapping housing availability near care sites, Alaska can more strategically target recruitment efforts and make informed siting and investment decisions. This project addresses not only where health care talent exists today, but where it is most likely to move in the future, supporting more efficient, evidence-based workforce planning and long-term system sustainability.	The project will integrate three core analytic components to inform recruitment targeting and workforce planning: Workforce Migration Analysis: J&M will examine historical and current migration flows into and within Alaska, segmented by health occupation, age, education, and household characteristics. This analysis will identify regions that consistently supply health care workers and reveal untapped recruitment opportunities. Commuting Barrier and Accessibility Assessment: Transportation networks, travel times, and commuting constraints, including seasonal variability, will be analyzed to identify areas where commute burden limits recruitment or retention. Scenario modeling will assess how incentives, housing support, telehealth-enabled hybrid roles, or transportation investments could expand the viable workforce catchment area. Housing Availability and Affordability Mapping: Housing stock near health care sites will be mapped and evaluated for availability, affordability, and suitability for relocating workers. The analysis will identify communities where housing constraints pose a barrier and where targeted investments could unlock sustainable staffing and recruitment pipelines. These analyses will be integrated into interactive dashboards and geographic visualizations that generate workforce siting insights and support decision-making for facility placement, training locations, and rotational workforce hubs.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

JAMHI Health & Wellness, Inc	Advancing Access: JAMHI's Capacity-Building Initiative for Sustainable Rural Care	AK	Although demand for integrated, high-quality care continues to grow, JAMHI faces key infrastructure gaps—such as outdated data systems, limited care-coordination processes, and insufficient workforce and quality-improvement capacity—that restrict its ability to expand services. These challenges directly affect patients in Southeast Alaska’s rural island communities, where limited local clinical resources, weather, and transportation barriers often delay timely care. To meet rising needs, JAMHI must redesign internal systems that coordinate care, integrate behavioral health, and support preventive services more effectively. Current limitations make it difficult to maintain service continuity, address growing behavioral health and chronic disease needs, and ensure reliable care navigation for rural patients. This project strengthens JAMHI’s capacity by building a well-trained workforce, improving workflows, and upgrading operational infrastructure. These improvements will support more timely, reliable, and fully integrated services aligned with the RHTP vision for a sustainable Alaska health system. The project will also improve access for Gustavus, Tenakee Springs, and Elfin Cove through a hub-supported, spoke-based model that enables patients to complete multiple services in a single Juneau visit and ensures coordinated follow-up when they return home.	JAMHI’s approach centers on a structured capacity-building effort to strengthen internal systems, improve care delivery, and expand access for rural residents of Juneau and SE Alaska. With RHT support, JAMHI will modernize its infrastructure, enhance workforce readiness, and build sustainable clinical and operational models that improve outcomes and reduce long-term disparities. JAMHI will launch a coordinated transformation initiative aligning operations, finance, compliance, and data systems around shared goals. Key priorities include strengthening budgeting, modernizing procurement and contract oversight, implementing clear time-and-effort policies, improving staff familiarity with standard operating procedures, reinforcing compliance structures, clarifying privacy and security roles, and improving policy management. JAMHI will engage an experienced FQHC/CCBHC consultant for workflow redesign, revenue-cycle improvements, value-based-care readiness, and data-system assessments, enabling selection of tools to better track quality outcomes, patient progress, and staff training. Operational improvements focus on rebuilding patient access and flow. Centralized scheduling, standardized EHR templates, walk-in flex capacity, and active no-show management will expand access to in-person and telehealth services. Workforce development is a core component. JAMHI will establish a tiered provider model, build a cross-trained staffing bench, and offer competency-based training with protected clinical time. Leadership development and structured change-management practices will standardize warm handoffs, referrals, supervision, and documentation, reducing burnout and strengthening interdisciplinary coordination. Data, reporting, and revenue-cycle functions will improve through unified data governance, standardized KPIs, and automated dashboards for access, quality, productivity, denials and A/R aging. End-to-end revenue-cycle redesign, self-audits, and denial-management loops will support financial stability and compliance. To ensure long-term sustainability, JAMHI will operationalize an on-site pharmacy integrated with care teams, scheduling, and prior-authorization workflows. Strong inventory and compliance controls will support timely medication access for rural patients. These investments will expand access and visit capacity, strengthen revenue integrity, improve staff retention, and create reliable, data-driven operations, meeting the needs of rural SE Alaska.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area; Juneau (City and Borough)	Advance to Implementation Application

JAMHI Health & Wellness, Inc	JAMHI’s Jordan Avenue Clinic Rural Health Hub: Integrated Facility Modernization Initiative	AK	JAMHI seeks to modernize its Jordan Avenue Clinic to meet rising regional demand for integrated primary care and behavioral health as an FQHC/CCBHC hub. Current access challenges, including limited staffing space, fragmented workflows, and an aging, undersized facility, restrict JAMHI’s ability to provide timely, high quality services to Juneau residents and patients from surrounding rural communities. The layout limits same day access, privacy, warm handoffs, chronic disease management, and telehealth, all essential to delivering care close to home with dignity, comfort, and cultural safety. JAMHI recently renovated the 1st floor to expand primary care, limited behavioral health services, and wellness programs. The 2nd floor and exterior remain outdated and inadequate for fully integrated team based care. This next phase will remodel the 2nd floor to create a comprehensive behavioral health clinic and needed administrative space; complete a first floor pharmacy in existing shell space; add an elevator for ADA compliant access; and implement major exterior upgrades, including new siding, repaired parking and walking surfaces, and rebuilt awning. Without investment, renovations would extend over a decade, delaying critical improvements in privacy, accessibility, trauma informed environments, and integrated service delivery. RHTP funding accelerates this transformation, creating a modern, dignified facility where patients feel safe, respected, and well supported	JAMHI will renovate and modernize the Jordan Avenue Clinic through a phased construction project that transforms the second floor into a comprehensive behavioral health clinic and essential administrative hub, completes a first floor pharmacy, improves vertical circulation with an elevator, and upgrades the building’s exterior to create a safe, dignified, and welcoming care environment. The redesigned second floor will support patient privacy and federal guidelines for confidential behavioral health care, providing 10 behavioral health offices, 11 administrative offices, a flexible conference/group therapy room, a staff break room with kitchen, four restrooms, and badge controlled access on all new and existing doors. On the first floor, JAMHI will build a fully functional pharmacy in existing shell space with secured access. A redesigned main entry stair and a new elevator will provide accessible movement between floors. Updated wayfinding and trauma informed interior design will strengthen culturally safe patient experiences and support integrated care workflows. FFE investments will enhance clinical capabilities: telehealth carts and room mounted screens, monitors in behavioral health offices, a multifuge to support expanded blood testing and faster pharmacy preparation, and consistent, durable furnishings across offices. Exterior upgrades will improve safety and community presence through a full roof replacement, refinished siding, repaired parking and walking surfaces, a rebuilt building awning, and refreshed landscaping. Mechanical, electrical, and plumbing improvements will support long term performance, including new electrical service for the elevator, an oil sensing sump pump, a new HRV with ductwork, new diffusers and grilles, additional heat pump capacity with new refrigerant piping and fan coil units, plumbing upgrades, added data drops, and a new fire alarm and sprinkler system. To maintain access during severe winter weather, JAMHI will purchase a skid steer equipped with a plow and bucket to ensure reliable snow clearing and protect appointment availability for patients traveling from remote communities. Together, these improvements will create a modern, accessible, integrated care hub that expands clinical capacity, strengthens coordination, improves rural access, and aligns JAMHI with RHTP’s statewide transformation goals.	Over \$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area; Juneau (City and Borough)	Advance to Implementation Application

JAMHI Health & Wellness, Inc	JAMHI's Salmon Creek Clinic Rural Health Hub: Integrated Facility Modernization Initiative	AK	JAMHI seeks to renovate and modernize its Salmon Creek Clinic to meet rising regional demand for integrated primary care and behavioral health as a designated FQHC/CCBHC hub. Current access challenges, including insufficient staffing space, fragmented workflows, and an undersized, outdated facility, limit JAMHI's ability to provide timely, high-quality care to local residents and patients traveling from Southeast communities. The existing clinical wing restricts same-day access, privacy, warm handoffs, chronic disease management, and telehealth, critical components for delivering care close to home with dignity, comfort, and cultural safety. Without investment, JAMHI estimates these renovations would take more than 10 years to complete, delaying essential improvements in privacy, accessibility, trauma-informed environments, and integrated care coordination. RHTP funding will accelerate these upgrades, enhancing patient experience and supporting a welcoming care environment where individuals feel seen, safe, and valued. The project involves a full renovation of the 9,525 sq ft clinical wing to create an integrated model of primary care, behavioral health, and wellness services. Modernized space will expand capacity, reduce delays, improve outcomes, and strengthen workforce retention. This project is mission-critical to meeting demand, serving more children and families, and advancing durable, community-anchored healthcare across rural Alaska.	Character Limit: 2500 JAMHI will use RHTP funding to modernize and renovate the Salmon Creek Clinic, transforming it into a high-performing hub for integrated primary care, behavioral health, and wellness services. Our approach advances the Health Care Access initiative by strengthening rural health infrastructure to improve safety, efficiency, clinical capacity, and the dignity and privacy essential to high-quality care in SE Alaska. Renovations will create 4 primary care exam rooms, 2 family health rooms, 8 behavioral health offices, 2 group rooms, shared provider offices, a lab, restrooms, a break room, a reception/waiting area, a teaching kitchen, and updated mechanical/IT spaces. Spaces are designed to enhance same-day access, warm handoffs, integrated workflows, and trauma-informed care that supports comfort, cultural safety, and dignity. FFE upgrades will further strengthen care delivery, including telehealth carts, consistent furnishings to support clinician well-being, and wellness/primary care equipment that reduces delays. Outdoor wellness areas and a second-floor deck will expand therapeutic and staff respite options, creating calming, dignified settings for patients and families. Renovation requires reconstruction of most non-load-bearing partitions with sound-isolating assemblies to ensure privacy and reduce stress. New fixtures, casework, badge-access doors, and acoustical improvements will modernize workflows and support workforce retention. Mechanical, electrical, and plumbing systems will be fully upgraded, including a new multi-zone air handler, improved filtration, updated coils, an air-water heat pump, and replacement of the oil boiler with an electric system. Electrical work will add LED lighting, CAT 6 cabling, advanced HVAC controls, a new fire alarm, sprinkler coverage, and comprehensive plumbing improvements. JAMHI will also acquire a skid steer to prevent weather-related closures that disrupt patient access. Without RHTP investment, these upgrades would take more than a decade to complete. Funding accelerates critical improvements, expanding access, reducing delays, supporting workforce stability, and delivering high-quality integrated care in an environment that reflects dignity, respect, and community-anchored health for Southeast Alaska.	Over \$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area; Juneau (City and Borough)	Advance to Implementation Application

JAMHI Health & Wellness, Inc	Developing a Regional Elder-Care Network for Rural Southeast Alaska	AK	Older adults in Juneau and Southeast Alaska face a crisis of unmet needs as chronic illness, dementia, and fall-related injuries rise. Significant barriers—including limited facility capacity and a lack of geriatric and rehabilitation specialists—result in fragmented care and avoidable emergencies. In rural areas, these challenges are magnified by a reliance on intermittent itinerant care and travel hindered by weather and unreliable ferry schedules. Compounding this, Alaska remains one of the few states without a Program of All-Inclusive Care for the Elderly (PACE), largely due to high operational costs and the lack of a state regulatory framework. As a catalyst for regional transformation, JAMHI is uniquely positioned to bridge these gaps by spearheading the state’s first PACE-inspired model. Leveraging 41 years of operational expertise, JAMHI is unifying a coalition of partners to overcome geographic and workforce hurdles. By identifying system gaps and mobilizing interdisciplinary resources, JAMHI aims to expand age-competent primary care, behavioral health, and falls prevention. Our goal is to execute a sustainable, coordinated care network that ensures Southeast Alaska’s aging adults can thrive in place.	With REACH and other Juneau-based social service agencies that serve the elderly, JAMHI will explore addressing critical gaps in elder health by assessing the ability to launch a PACE program to expand age friendly services, strengthening the geriatric workforce, and improving access to preventive, community based support to ensure that older adults in Juneau and surrounding ferry-dependent Southeast Alaska communities can age healthily and safely at home. A comprehensive Elder Care Services Needs Assessment will use mixed methods data analysis, inclusive of publicly available census data, mapping, surveys, and interviews with rural spoke communities to produce a gap analysis, service roadmap, budget scenarios and implementation plan guiding expansion of home based services, respite supports, adult day programs, and dementia friendly pathways. JAMHI will evaluate establishing a Community Wellness Center focused on elders and seniors that will have ADA compliant spaces for group exercise, mobility and balance classes, nutrition workshops, caregiver education, and preventive health programs, equipped with fall safe features, hybrid ready audiovisual systems, and private counseling rooms. To serve rural communities with virtual services, JAMHI will explore if equipping the Center with telehealth-enabled group sessions, CHW navigation, and itinerant elder programming will be viable options. Programming could also include primary care, behavioral health services, OT/PT led mobility sessions, chronic disease self management, culturally relevant meal planning, health promotion and peer led activities to increase participation, improve self reported health, and reduce risk factors. To further support aging in place, the project will explore establishing a PACE (Program of All Inclusive Care for the Elderly) site in Juneau, building on national recommendations that PACE offers a highly effective, integrated model for rural seniors with complex needs and supports aging at home. The HRSA National Advisory Committee highlights PACE’s strong outcomes and its potential to address long term care gaps in rural areas, noting the need for pilot programs, telehealth expansion, shared space partnerships, and workforce incentives to support rural implementation. Plans include multilingual programming, transportation assistance, and outreach to rural communities, with a Community Advisory Group of older adults and caregivers informing design and participation.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area; Juneau (City and Borough)	Deferred or Not Advanced

JAMHI Health & Wellness, Inc	Strengthening Screening & Care: JAMHI’s Regional Early Childhood Development Screening & Care Hub	AK	Juneau and nearby communities need a stronger, coordinated system to identify developmental needs early and connect young children and families to timely supports. JAMHI routinely see delayed referrals, limited early childhood mental health capacity, and inconsistent pathways for families seeking evaluation or follow-up—challenges intensified by the recent closure of the local child development center. Statewide assessments show that early developmental screening is essential for detecting strengths and potential delays, yet Juneau experiences inconsistent screening rates and uneven access to evaluation. Families face fragmented infant and early childhood mental health (IECMH) services, long waitlists, and a shortage of trained specialists, especially outside population centers, affecting children’s social-emotional development and caregiver well-being. These barriers are even greater in ferry-dependent Southeast communities. JAMHI plans to improve screening, referral, and access to IECMH-informed care through a hub-and-spoke model, expanded workforce pipelines, and better family navigation. The project will help close critical gaps in early identification, mental health supports, and system capacity so Juneau’s youngest children are assessed early, receive appropriate services sooner, and enter school healthier and ready to learn.	To address growing gaps in early childhood developmental (ECD) assessment and follow-up in Juneau and surrounding Southeast communities, JAMHI seeks planning funds to build on JAMHI’s existing child and family services to create a coordinated, clinically integrated early childhood system. The project will develop an ECD clinical service that expands access to autism, FASD, audiology, Early Intervention, and medically complex care, while strengthening referral pathways and reducing delays between screening and evaluation across JAMHI’s primary and behavioral health teams. A central component of the project’s plan is expanding youth behavioral health care through a school-based model. Embedded licensed clinicians in Juneau’s six elementary schools and one middle school removes transportation and scheduling barriers, allow for rapid response to behavioral health concerns, and support early identification and intervention. Collaborating with the Juneau School District improves IEP coordination, and establishes consistent communication between educational and clinical teams, ensuring smoother transitions from early childhood services into the K–12 system. To ensure timely, high-quality assessments, JAMHI train its clinicians in evidence-based protocols, paired with standardized workflows. These investments will support reflective supervision, training costs, and the adoption of consistent evaluation tools so rural families receive the same evidence-based care pathway available in Juneau. The project will also establish Community Health Workers (CHWs) as embedded care coordinators. CHWs will ensure that children ages 0–5 receive timely referrals, completed evaluations, and warm hand-offs to Early Intervention and school-based supports. One CHW will specialize in early childhood referrals, while another will coordinate care for medically complex children, reducing missed appointments and strengthening continuity of care. For rural families, CHWs will manage travel-sensitive scheduling, monitor referral progress, and maintain contact until evaluations and services are in place. Through these strategies, the project advances Healthy Beginnings, Health Care Access, and Strengthen Workforce by creating a reliable, equitable, and coordinated system. This approach increases early identification of developmental delays, expands access to specialty evaluations, and improves long-term outcomes for young children in Juneau and rural Southeast Alaska.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Skagway (Municipality); Yakutat (City and Borough)	Deferred or Not Advanced

Jasper Health	Jasper Health: Driving Access and Sparking Innovation for Cancer Patients in Alaska	ID	With a mission to ease the burden of cancer care, Jasper Health bridges the gap between clinical care and everyday life, improving outcomes and quality of life across the cancer journey. Jasper Health delivers the most comprehensive and scalable patient-centered oncology experience from the suspicion of cancer through survivorship or end-of-life care. Built for seamless partnership with stakeholders across the industry, Jasper takes administrative and clinical care management burden off care teams while improving outcomes and reducing total cancer spend through innovative payment models. The problems we are aiming to address with this project include: the affordability of cancer care, limited access to robust supportive cancer care, and improved outcomes for people with a cancer diagnosis.	Across oncology, providers struggle to connect with patients outside the four walls of the cancer center; this challenge is only exacerbated in vast, rural geographies, such as Alaska. Through our digital platform, we are able to provide tailored, expert support to patients no matter where they live to help them with their psychosocial, financial, transportation, and clinical needs. In addition, with years of experience in oncology value-based payment models, Jasper’s leadership team helps create sustainable, value-based contracts that incentivize providers on quality, evidence-based care, patient satisfaction, and cost efficiency. Jasper’s ability to flexibly participate in a wide range of payment models is essential to implementing or scaling any value-based program in oncology. Jasper’s team has participated and operationalized full sub-capitation contracts, clinical performance case rates, supportive care-only case rates, disease-specific case rates, and chemotherapy and immunotherapy gainsharing. Jasper would serve as a key thought partner and operational subject matter expert to establish alternative payment methodologies in oncology for health plans and the state of Alaska. To support the worsening shortage of oncology providers, including oncologists and certified nurses, Jasper can help providers practice at the top of their license by offloading time-intensive tasks that can be supported virtually, such as finding community resources and delivering emotional support. Jasper works closely with providers to help manage treatment-related symptoms at home or in the outpatient setting as appropriate. Through the use of Jasper’s consumer-facing digital platform, we are able to empower patients to track their symptoms and vitals, to better adhere to their treatment, and to become an active member of their care team. We strive to exceed our patients’ and our partners’ needs by continually improving and evolving our offerings. Jasper is an AI-native oncology platform, leveraging AI to take on manual work that allows our care team and our partners to spend more time delivering value directly to patients. Currently, Jasper uses AI agents to help transcribe patient calls and documentation, to identify evidence-based resources for individual patient needs, and to help standardize the triage and resolution of patient needs. Our AI-powered navigation model is led by a human-in-the-loop framework to ensure clinical safety, traceability, and confidence.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Jilkaat Kwaan Heritage Center	Food as Medicine Traditional & Modern Fusion Cookbook	AK	The proposed project “Food as Medicine” will be addressing concerns of obesity, diabetes, allergies, and nutrition deficiencies. Food security and food sovereignty have been priorities for our community for years. A traditional and modern fusion cookbook would support people with information on how to incorporate important information on how to prepare locally sourced foods. New ways to incorporate traditional ingredients and way to incorporate store bought produce intro a traditional way of cooking. This information would help empower our rural community residents to not rely on prepacked poor nutrient value snacks.	This project would focus on creating a Modern & Traditional fusion cookbook. This cookbook would support community members in incorporating locally sourced nutrient dense foods into their everyday meals. This cookbook would also include suggestions for grocery store sourced substitutes for traditional food ingredients if folks have moved away or the foods are out of season. This project would increase access by raising the baseline of general knowledge of nutritional values and processing information for our local foods.	\$50,000-\$250,000	Single Community	Hoonah-Angoon Census Area	Deferred or Not Advanced
Jilkaat Kwaan Heritage Center	Noise and Impact Study in Chilkat Indian Village (Klukwan)	AK	CIV proposes a baseline health assessment to better understand the impacts of loud and persistent noise on the wellbeing of our rural community. Community members have raised increasing concerns about exposure to noise from aircraft, watercraft, vehicles, and machinery occurring in and around the Village. These concerns include potential risks of hearing damage, tinnitus, hearing loss, mental distress, and related mental health impacts associated with sensory loss. Hearing health is closely tied to overall wellbeing. Hearing loss can contribute to social isolation, communication challenges, anxiety, and depression. In a rural environment like Klukwan, hearing also plays a critical role in personal safety. Reduced hearing ability can increase the risk of wildlife encounters and other environmental hazards where early auditory awareness is important. Village residents include many veterans who may experience heightened stress responses to sudden or persistent noise exposure. For some individuals, loud or unexpected sounds may trigger trauma responses or contribute to mental distress. Despite these concerns, no baseline data currently exists documenting the level, frequency, and duration of noise exposure experienced within the community. The purpose of this effort is to better understand community exposure and its potential implications for hearing health and mental wellbeing so that the Tribe can pursue preventative health strategies and long-term protections for residents.	This project will combine community knowledge with technical monitoring to establish a baseline understanding of noise exposure within Chilkat Indian Village (Klukwan). At key locations across Village lands, audio sensors and recording devices will be installed to measure decibel levels and capture information about the duration and frequency of loud or persistent noise events. These devices will help document how often these events occur, how long they last, and the intensity of sound levels experienced by residents. Monitoring locations will be selected based on community input and observations about where noise disturbances are most frequently experienced. This approach ensures the study reflects the lived experience of residents while producing measurable data. Once compiled, the data will be evaluated against known thresholds associated with hearing loss, sensory damage, and distress caused by prolonged or repeated noise exposure. This analysis will help the Tribe better understand whether the sound levels experienced within the community may pose risks to hearing health or mental wellbeing. Together, the monitoring data and community observations will provide the Tribe with a clearer understanding of noise exposure patterns within Klukwan and establish a baseline dataset that can inform future health planning and preventative care strategies.	\$50,000-\$250,000	Single Community	Hoonah-Angoon Census Area	Deferred or Not Advanced

Juanita Strong Forever Project	Juanita Strong Rural Youth Mentorship and Community Healing Initiative	AK	Youth in Alaska particularly in rural and underserved communities face increasing challenges related to behavioral health, social isolation, and limited access to mentorship and youth development programs. Many communities lack structured support systems that help young people build resilience, develop leadership skills, and maintain healthy lifestyles. Without consistent access to positive mentorship and community engagement opportunities, youth may struggle with emotional wellness, academic engagement, and long-term life planning. These challenges are often compounded in rural areas where access to behavioral health services and youth programming is limited. The Juanita Strong Forever Project seeks to address this gap by creating accessible mentorship networks and youth engagement programs that provide emotional support, leadership development, and healthy lifestyle opportunities. By focusing on prevention, peer support, and community involvement, the project aims to strengthen protective factors that help youth thrive and build stronger, healthier communities across Alaska.	The Juanita Strong Forever Project proposes a community-centered mentorship and wellness initiative designed to address the growing mental health, social isolation, and lack of structured support services for youth in Alaska’s rural and underserved communities. Our approach focuses first on peer-to-peer support, mentorship, and group healing opportunities where youth can safely discuss challenges, build confidence, and develop life skills. Through guided mentorship circles, leadership development workshops, and group discussions led by trained mentors and community leaders, participants will gain tools for emotional resilience, personal responsibility, and healthy decision-making. This initiative also creates safe spaces where youth can build positive relationships with mentors, law enforcement professionals, coaches, and community advocates who serve as trusted role models. As relationships and trust are established, youth will be introduced to structured development opportunities including leadership training, life-skills education, career exposure, and healthy lifestyle programming. Physical activity and team-based athletics such as football training, youth camps, and community sports events will serve as engagement tools that reinforce teamwork, discipline, and accountability while encouraging healthy habits and community pride. By integrating mentorship, emotional wellness support, leadership development, and structured youth engagement activities, the Juanita Strong Forever Project will create a sustainable support system that strengthens rural youth, families, and communities.	\$250K-\$1M	Statewide	Anchorage (Municipality); Bethel Census Area; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Juneau Economic Development Council	St. Ann’s Center for Integrated Care – Redevelopment Project	AK	Southeast Alaska faces a severe and growing shortage of senior-appropriate, accessible housing with coordinated supports. Many older adults—particularly those experiencing mental illness, chronic substance use disorders, developmental disabilities, dementia, or long-term homelessness—struggle to obtain stable housing and safe environments. These challenges often lead to repeated emergency department use, prolonged hospital stays, or unsafe living conditions. Meanwhile, the region’s aging housing stock, limited assisted-living spaces, and workforce shortages further restrict access to dependable long-term support. The St. Ann’s/Crimont Center, originally established in the late 19th century and expanded through multiple decades, now sits mostly vacant despite offering more than 30,774 sq. ft. of usable space across four floors. Longstanding vacancy, vandalism, weather damage, and outdated systems have left the building underutilized and in need of significant repair. Yet its size, location, and existing service-zoned layout make it an ideal candidate for redevelopment into a modern, community-serving senior housing campus. Renovation unlocks the potential for high-need seniors to remain in their home community, surrounded by culturally familiar supports.	The project will transform the existing St. Ann’s/Crimont Center building into a fully modernized, service-integrated independent senior housing facility. Renovation activities include structural stabilization; replacement of mechanical, electrical, and plumbing systems; full fire-suppression and alarm upgrades; ADA accessibility improvements; and modernization of the elevator and egress routes. Interior spaces will be reconfigured to create safe, private living units; accessible communal kitchens and dining rooms; flexible programming areas; and dedicated office and sleeping rooms for partner agencies providing wrap-around services. The renovation will also establish the infrastructure for an onsite geriatric clinic, offering primary care, chronic disease management, assessments, and care coordination for residents and the broader community. Partner agencies—JAMHI, REACH, Polaris House, and St. Vincent de Paul—will each be assigned administrative/clinical offices and staff rooms to enable 24/7 onsite coverage. The facility’s design integrates non-clinical and clinical supports, while this LOI focuses strictly on the building improvements and staffing necessary for opening. The approach includes phased construction and occupancy to allow portions of the facility to be brought online as they are completed.	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

Juneau Economic Development Council	Alaska Aging-in-Place Home Modification Infrastructure Initiative	AK	Alaska’s aging population and shortage of trained home-modification providers, especially in rural regions, have created a critical gap in safe, accessible housing for older adults and people with disabilities. Independent living and disability service organizations are preparing for the expansion of Medicaid Environmental Services, but the statewide infrastructure needed to deliver these services does not yet exist. This project addresses these gaps through a coordinated, multi-partner effort led by JEDC to build the statewide infrastructure required for home safety modifications, workforce training, and Medicaid Waiver Environmental Services readiness. SEABIA expands contractor capacity; Rosarium Health contributes workflow expertise; and SAIL and AADD support alignment with disability and Medicaid requirements. The result is a unified, statewide framework for safe aging-in-place and disability-inclusive home modifications.	JEDC will lead a three-year, phased infrastructure initiative to establish Alaska’s first coordinated system for aging-in-place and Medicaid Environmental Service home modifications. 1. Statewide Coordination & Medicaid Infrastructure (Led by JEDC) • Develop referral pathways, data standards, and regional coordination structures. • Establish readiness for a Medicaid Environmental Services pilot under the Medicaid Waiver. • Convene partners across health, disability, tribal, and construction sectors. • Manage fiscal oversight and sub-grant funding to SEABIA to deliver statewide training. 2. Workforce Development (SEABIA, via JEDC sub-grant) • Provide CAPS training, NAHB coursework, and contractor skill development statewide. • Build rural contractor capacity to complete aging-in-place and Medicaid-compliant home modifications. • Support an Educational Coordinator to manage training delivery and contractor support. 3. Clinical & Operational Integration (Rosarium Health, in-kind) • Provide best-practice guidance for assessments, documentation, and workflow design. • Support planning for scalable, coordinated home-modification pathways. 4. Disability & Independent Living Integration (SAIL & AADD) • Advise on accessibility needs and independent living approaches. • Coordinate with regional disability providers to meet Medicaid Environmental Modification criteria. • Support training and assessment processes to ensure modifications align with functional needs. This integrated approach ensures Year 1 builds foundational capacity, Year 2 launches regional pilot work, and Year 3 expands toward a sustainable statewide system.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Juneau Economic Development Council	Community Navigator Connection: Statewide Care Coordination & Resource Navigation Platform	AK	Across Alaska, care navigation is supported by inconsistent tools, ranging from paper files to spreadsheets to isolated referral systems. Navigators, case managers, PCA coordinators, and peer support specialists face daily challenges accessing accurate service information, communicating with partner organizations, and tracking complex care needs—especially in rural and frontier communities where broadband, staffing, and access barriers intensify system fragmentation. The lack of a unified statewide system contributes to delays in services, duplicated assessments, gaps in communication, and a heavy administrative burden. Alaskans often experience slow or incomplete referrals, limited follow-up, and unclear pathways between health, behavioral health, social services, housing, transportation, and employment supports. JEDC has already developed a working prototype, through their programming with the Southeast Regional Eldercare Coalition (SREC) beta navigation website (www.jedc.org/SREC/), which aggregates regional resources and demonstrates a functional foundation for broader statewide development. This project aims to expand that concept into a scalable, HIPAA-compliant platform that meets the needs of diverse providers and communities across Alaska.	The project will follow a deliberate, multi-phase approach to ensure statewide relevance and long-term sustainability. Phase 1: Partnership Formation & Planning JEDC will formalize partnerships with platform vendors such as FindHelp, Unite Us, or United Way of Southeast Alaska and other local IT partners such as Hansen and Gress. These partners bring established systems that can be adapted for Alaska. Collaboration will begin with technical scoping, security alignment, and the use of the JEDC SREC beta platform as a baseline prototype. Phase 2: Needs Assessment & Requirements Development JEDC will engage navigators, care coordinators, and social service providers across multiple regions to identify workflows, documentation needs, referral challenges, and training gaps. These findings will inform a unified set of technical requirements. Phase 3: Prototype Development Using the SREC beta structure, JEDC and technology partners will build an Alaska-specific prototype that includes referral pathways, case tracking, resource directories, billing support, secure messaging, and education libraries. The system will be optimized for rural bandwidth limitations. Phase 4: Training & Pilot Implementation Pilot regions will receive onboarding and training for hands-on testing. JEDC will collect user feedback on workflow improvements, usability, and system performance. Phase 5: Refinement & Sustainability Planning Pilot feedback will guide refinement and expanded directory development. JEDC will create a long-term funding model ensuring the platform remains free for nonprofits and small clinical providers while maintaining vendor-supported infrastructure.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Juneau Economic Development Council	SE Alaska Rural Healthcare Workforce Hubs: CNA, MA, HIM & PCA Pathways	AK	Rural Southeast Alaska faces persistent shortages of CNAs, MAs, HIM technicians, and personal care providers, driven by long travel distances, limited broadband, high training related housing costs, and too few clinical placements. These barriers—felt most by Alaska Native and rural learners—prevent completion of credentialed programs and weaken the healthcare pipeline. Current pathways are fragmented, and Home Maker–based DSDS certification does not create sustainable advancement into higher level health careers. Aligning training with the PCA portion of CNA instruction strengthens competencies and builds a viable entry point into health sciences. The proposed program advances this pipeline by using VR supported hybrid instruction to eliminate geographic and broadband limitations, while Community Support Hubs provide supervised skills practice, proctoring, and reliable technology access. Rising demand for home and community based services further intensifies the need for a trained workforce, yet agencies struggle due to inadequate training infrastructure and required nursing oversight. This project delivers an accessible, community anchored training model that expands local workforce capacity, ensures continuity of care, and supports long term rural health stability.	JEDC will lead the design and launch of Rural Healthcare Workforce Hubs across Southeast Alaska. A Health Workforce Hub Development Specialist will conduct needs assessments, coordinate partners, plan hub infrastructure, and align workforce pathways. Community Support Hubs will provide technology access, VR simulation, tutoring, supervised skills practice, proctored testing, and workforce navigation. The project supports accelerated hybrid training delivered in partnership with UAS for CNA, MA, HIM, and PCA/DSP roles. VR-enabled modules expand training access to remote learners and improve telehealth readiness. Partnerships with regional school boards, employers, SEARHC, tribal health organizations, and DSDS will modernize entry-level care pathways and integrate PCA-based training to replace the Home Maker model. Workforce partnerships will expand internship and experiential learning opportunities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Juneau Economic Developmen t Council	Thrive Together: Child Health & Provider Support Initiative	AK	Childcare programs across Southeast Alaska routinely serve young children during critical developmental windows yet lack consistent access to pediatric, behavioral-health, and developmental expertise. Providers often observe early warning signs but have no structured mechanism for consultation or referral. Rural and Tribal families face substantial travel barriers and long waits for Autism, FASD, and developmental assessments. Childcare workers themselves—many uninsured or underinsured—lack preventive care access, contributing to instability and turnover. This project addresses these gaps through a coordinated hub-and-spoke model that integrates child development consultants, telehealth diagnostics, clinic-delivered workforce health supports, and statewide navigation tools. These improvements simultaneously strengthen early identification, stabilize the childcare workforce, and enhance care access across rural communities.	The project uses a multi-layered approach integrating onsite childcare consultation, telehealth developmental diagnostics, clinic-led Provider Health Days, community education, and statewide digital access. Visiting specialists deliver developmental screening and case guidance in hub and regional childcare settings. Clinic-led Provider Health Days offer preventive screenings, behavioral-health tools, insurance navigation, and ergonomic support for childcare workers, building sustainable local capacity. A statewide website provides milestones, navigation tools, and specialist information, while the HIE-integrated virtual platform supports e-referrals, tele-assessments, secure communication, and coordinated care plans. Parent and grandparent education enhances community awareness of milestones and behavioral guidance. Together, these components create a cohesive, scalable system designed to improve access, quality, and coordination of early childhood and workforce health supports across rural and remote Alaska.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Juneau Economic Development Council	Thrive Together: Southeast Alaska Child Health & Provider Support Pilot	AK	Childcare programs across Southeast Alaska regularly observe developmental and behavioral concerns but lack reliable access to pediatric, developmental, and behavioral-health expertise and clear referral pathways. Rural and Tribal families often travel long distances and wait months for Autism, FASD, speech-language, or developmental evaluations, delaying intervention during critical windows of neurodevelopment. Childcare workers—many uninsured or underinsured—have limited access to preventive care, driving turnover and instability that reduces available slots for families. JEDC, led by Executive Director Brian Holst, brings decades of regional systems experience, 10 years of service on the Alaska Early Childhood Coordinating Council, 9 years on the Juneau School Board, and leadership in designing Juneau’s childcare subsidy program. This project addresses urgent access and coordination gaps with a Southeast Alaska pilot that embeds specialist consultation in childcare settings, delivers telehealth diagnostics through local clinics, and builds a statewide-ready website and navigation platform for coordinated referrals, family education, and data-informed quality improvement. Replace application Thrive Together: Southeast Alaska Child Health & Provider Support in leu of this proposal.	Year 1 launches a Southeast Alaska-only pilot that integrates clinic-led services, itinerant specialists, and telehealth-enabled diagnostics while building a statewide-ready digital platform. Core components: (1) On-site childcare consultation—screenings, classroom coaching, case conferencing, and referral support in Juneau, Sitka, Ketchikan, Prince of Wales, Wrangell, Petersburg, Yakutat, and Hoonah-Angoon; (2) Telehealth developmental diagnostics—Autism/FASD/developmental evaluations supported by regional clinics to reduce family travel and wait times; (3) Provider Health Days—clinic-delivered preventive screenings, behavioral-health tools, ergonomics, and coverage navigation for childcare workers; (4) Parent/caregiver/grandparent education—practical workshops and culturally responsive materials co-developed with partners; (5) Website + navigation platform—milestone checkers, family self-screener, specialist directory, referral guidance, and secure, HIE-integrated messaging optimized for low bandwidth. Implementation steps: co-design sessions with Tribal health and clinics; workflow mapping for referral and feedback loops; privacy/security training; deployment of tele-assessment kits; and continuous PDSA cycles to refine tools and care pathways. Equity and quality strategies include accessible content, multilingual supports, shared care plans, and closed-loop referrals tracked through the platform. The approach aligns with RHTP by strengthening early childhood health access (Healthy Beginnings), expanding specialty access via telehealth (Health Care Access), supporting workforce wellbeing (Strengthen Workforce), and deploying scalable, interoperable digital tools (Spark Technology & Innovation).	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Juneau Emergency Medical Associates	Emergency Medicine Physicians Access (EMPA) Hub: Telehealth Continuity for Rural Alaska	AK	Long-distance medevac transports in Alaska can exceed \$75,000–\$100,000 per event for patients requiring out-of-state specialty care — and they are happening because over 80% of Alaska’s communities are off the road system, with no access to emergency physician oversight during weather events or medical crises. Data from the Yukon-Kuskokwim Delta shows medevac costs consuming 3% of the entire regional Medicaid budget for a population of just 23,000, a per capita cost forty times the national average. Village clinics and EMS agencies are forced to make high-stakes clinical decisions without real-time specialist backup, driving both preventable patient harm and unsustainable system costs. The RHTP provides a catalytic opportunity to fix this. The EMPA Hub would centralize board-certified emergency medicine expertise statewide, bridging the gap between remote providers and regional trauma centers — so that location is never the reason a patient does not receive timely, appropriate care.	JEMA will establish the EMPA Hub — a 24/7 command center staffed by board-certified emergency physicians. Utilizing low-bandwidth, high-fidelity telehealth stations, the Hub provides synchronous “over-the-shoulder” support to rural health providers. JEMA will integrate its EMR with the healthEconnect Alaska (HIE) to ensure full data interoperability. The initial phase focuses on implementation and relationship-building with Tribal Health Organizations, with five pilot kits deployed to frontier sites. Phase 1: Infrastructure & Staffing Establish a centralized command center in Alaska staffed by a pre-identified cohort of board-certified emergency physicians. This Hub will serve as the specialist nerve center for rural providers across the state. Phase 2: Technical Interoperability Implement a cloud-based, low-bandwidth EMR fully integrated with healthEconnect Alaska (HIE), ensuring that real-time clinical data from village encounters is visible to regional trauma centers and meets federal ASTP/ONC and CMS interoperability standards. Phase 3: Deployment & Triage Deploy ruggedized, high-fidelity telehealth stations to five pilot sites — prioritizing communities off the road system and remote industrial sites in the oil, gas, and mining sectors. Clinical Strategy • Treat-in-Place Protocols: Physician-guided management of stable patients at the local level, avoiding unnecessary transport and preserving patient dignity and community trust. • Medevac Triage Optimization: Real-time specialist assessment to determine true medevac necessity, with a target of reducing preventable evacuations in pilot communities within the first 12–18 months, consistent with outcomes observed in comparable telehealth triage programs nationally.	\$1M-\$5M	Specialist	Statewide	Aleutians East Borough; Aleutians West Census Area; Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Juneau Women's Health	Juneau Women's Health: Point of Care Testing Services	AK	This project aims to reduce testing times and improve outcomes by implementing rapid testing for sexually transmitted infections and chronic conditions. Alaska has the third highest rate of Chlamydia at 697.7 infections per 100,000 and the highest rate of Gonorrhea at 310.9 infections per 100,000 in the US. If left untreated, these infections can lead to infertility and serious pregnancy complications. Chlamydia and gonorrhea are easily curable with antibiotics; the challenges lie in timely identification and treatment to reduce continued transmission. Long turnaround times for test results and high cost are the primary reasons patients decline STI screening. Juneau, Alaska experiences a significant influx of seasonal tourism workers during the summer, including cruise ship crew who may only visit the community briefly. These transient workers often lack the time or health insurance to access traditional lab-based STI screening. Likewise, many Alaskans suffer from chronic conditions can be debilitating if not identified or well-controlled. Patient outcomes can be well managed if closely monitored using routine lab tests, but currently labs must be drawn on-site then sent to LabCorp in Seattle for resulting, at which point we contact the patient and they return for follow-up. This send-out lab testing increases patient financial burden, wait times, and decreases follow-up adherence which ultimately hinders chronic disease management and can lead to poorer health outcomes.	To address these financial and health costs associated with delays in care due to send-out test results we propose the implementation of a small Point of Care (POC) testing lab. This lab would provide in-house screening for Chlamydia and Gonorrhea, lipid panels, and monitoring for blood glucose, hemoglobin A1c, and hemoglobin. Using the binx io chlamydia and gonorrhea assay we will be able to offer patients their test results within 30 minutes, allowing for counseling and treatment (if indicated) to occur during the clinical visit. Point of care analysis for lipid levels, hemoglobin, glucose, and hemoglobin A1c provide results in less than one minute. By providing these lab tests in-house patients would receive timely care and treatment, and lower-cost screening tests. Quick testing for Chlamydia and Gonorrhea specifically would reduce the time to diagnosis and help prevent further infections from asymptomatic patients. For tests requiring a blood sample, in-house labs would minimize patient discomfort and decrease the use of phlebotomy supplies by analyzing specimens obtained from a simple finger-stick, rather than venipuncture. In-house testing would minimize losses to follow-up and increase adherence to medical recommendations. This project would require the purchasing of CLIA-waived POC analysis tools, as well as testing supplies, test controls, staff training, and development and implementation of testing protocols. Cost for testing would be billed directly to the patient or their insurance for reimbursement. For patients who are uninsured this project will include a self-pay option, increasing access to testing. Send-out laboratory testing is billed directly by the lab performing the testing, presenting cost-uncertainty as a barrier for those without insurance. By offering POC testing, we can offer the patient an exact cost for the visit, eliminating the risk for large laboratory bills received by patients months after their testing has been completed.	\$50,000-\$250,000	Family or primary care	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

JVRX, LLC d/b/a Little Big Health Solutions	24/7/365 Nurse Advice Line (NAL)	PA	Many rural and frontier communities face significant barriers to timely healthcare due to geographic isolation, environmental risks, transportation barriers, limited access to healthcare, and healthcare provider shortages. Particularly in Alaska, residents of remote communities who require long travel distances to access medical care face delayed treatment, increased risk of chronic disease, increased morbidity and mortality rates, and increase reliance on emergency services. Our NAL project will address gaps by improving access to timely clinical guidance by providing a 24/7/365 telephonic nurse triage and advice service. By giving residents direct phone-based access to experienced registered nurses who use evidence-based clinical protocols, patients can receive education on managing symptoms, support in determining the appropriate level of care, and guidance on seeking in-person medical attention when necessary. Providing this type of remote support helps individuals make better informed healthcare decisions, reduces unnecessary long travel, decreases the burden on emergency services and departments, and ensures that limited healthcare resources are used more effectively. Our NAL model offers sustainability by eliminating technological barriers, offering an immediate solution that meets patients where they are at, by phone, in their language and with respect for their lived experience. This is especially important in rural communities where broadband access is limited.	Our NAL approach is aimed to immediately implement a scalable telephone-based 24/7/365 nurse triage and clinical guidance service, expanding high quality, timely healthcare access to residents of rural communities. Our service will quickly connect patients with experienced registered nurses who initiate the triage process through a combination of clinical expertise along with the Schmitt-Thompson gold standard evidence-based clinical decision-making support tool. This combined process allows our team of highly qualified registered nurses to evaluate symptoms, provide self-care guidance when appropriate, empower patients to make better-informed healthcare decisions through increased awareness, recommend seeking in-person care when necessary, connect patients to local resources, and pursue urgent or emergency services when appropriate, all in real-time. The service is designed to complement, strengthen and expand existing healthcare systems, not replace them. By instantly answering questions and addressing non-emergency health concerns, our telephonic nurse triage system reduces strain on local clinics, supports limited healthcare workforces, and allows providers to focus on patients who require in-person care. This approach also supports more efficient use of limited healthcare resources by reducing unnecessary travel and avoidable emergency department visits, reducing hospital admissions and readmissions, and limiting the use of emergency transport services to actual emergencies. In remote regions where transportation may require significant time, cost, or coordination, having access to immediate clinical guidance can make a meaningful difference for patients and providers alike. Our model emphasizes clear communication, culturally respectful care, and coordination with local healthcare systems. Call documentation and communication protocols support continuity of care while ensuring the service integrates smoothly with existing providers and healthcare infrastructure. By providing trusted, evidence-based clinical guidance through a scalable telephonic model, this approach helps bridge geographic barriers, improve access to care, and strengthen the sustainability of healthcare delivery for rural and frontier populations.	\$1M-\$5M	Home- and communit y-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Kabo Health LLC DBA Avalia HEALTH	Support for Innovative Outreach and Multidisciplinary Team Services	AK	Many individuals experiencing homelessness in Anchorage are actually are rural residents who suffer from untreated mental illness, substance use disorders, trauma, and chronic health conditions. These individuals frequently interact with emergency services but have limited access to ongoing behavioral health care and coordinated support. Bean’s Café operates one of Anchorage’s largest warming and feeding centers and provides services to hundreds of individuals experiencing homelessness each year, including people who have migrated from rural Alaska for services or opportunity. Despite the presence of multiple service providers, many individuals remain disconnected from treatment due to lack of on-site behavioral health staff able to perform assessments, crisis intervention, and navigation into appropriate care. This project addresses that gap by embedding two outreach LCSWs within the Bean’s Café service model and the Anchorage Multidisciplinary Outreach Team. These clinicians will serve as behavioral health anchors both within the shelter environment and during proactive outreach activities, providing immediate clinical assessment, stabilization, and connection to treatment and housing resources.	The project will fund two full-time Licensed Clinical Social Workers to operate as integrated behavioral health specialists within Bean’s Café and the Anchorage Multidisciplinary Outreach Team and to provide Kabo Health with technical assistance to be able to provide 1115 waiver services. Key functions of the LCSWs will include: • Behavioral health intake assessments for individuals presenting at the warming center or encountered during outreach • Crisis intervention and stabilization for individuals experiencing psychiatric or substance-related crises • Short-term behavioral health counseling and trauma-informed support • Case management and care coordination with medical providers, substance use treatment programs, and housing services • Navigation and referral to appropriate treatment programs including outpatient therapy, residential treatment, medication-assisted treatment, and psychiatric services • Participation in multidisciplinary case conferences with outreach workers, medical providers, and shelter staff • Engagement with unsheltered individuals during outreach activities The LCSWs will operate as integrated members of the Bean’s Café service model and will coordinate with the Anchorage Multidisciplinary Outreach Team to identify individuals in need of behavioral health services. This model places clinical capacity directly within the environment where vulnerable individuals already seek assistance, reducing barriers to care and improving engagement.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Kachemak Bay Family Planning Clinic	Bridging the Distance: Advanced Learning for a Stronger Rural Workforce	AK	Alaskans on the Kenai Peninsula experience several significant barriers to accessing care including rural transportation challenges, high cost of all health care, trouble navigating public assistance enrollment, housing and food insecurity, limited provider expertise in reproductive health, a siloed healthcare system, lack of a medical home, and lack of childcare, among others. Women, including new moms, face compound barriers to care, including geographic isolation, their families’ nontraditional work schedules, past trauma, and social stigma around reproductive healthcare topics such as postpartum depression, maternal deaths, infertility, and contraception for family planning and birth spacing. Additionally, high rates of substance misuse and domestic violence remain leading contributors to maternal morbidity and mortality in Alaska. Rural regions also present unique challenges for healthcare provision due to the vast geography, sociocultural variety, sparse infrastructure, logistical difficulties, limited pool of licensed staff, and high costs associated with providing care in remote areas. As part of the Bridging the Distance program proposal, KBFPC is requesting funds to support current staff pursuing advanced healthcare degrees. As the region’s only dedicated reproductive health provider, KBFPC stands as a critical lifeline for many, particularly in a state where access to care, including for maternal health, is limited and expensive to deliver.	As described in the Bridging the Distance: Remote Maternal and Reproductive Health Services on the Kenai Peninsula LOI, with RHTP programmatic support KBFPC will expand the Remote Services program in reach and in scope – including a new Postpartum Home Visit Program – to improve rural Alaskans’ access to preventative healthcare and reduce the significant social and economic costs of undiagnosed medical conditions for individuals and their families. KBFPC’s work already strengthens and complements regional and statewide public health efforts. The proposed expansion and new service pilot will develop a model built on insights from community-based participatory research and impact assessments to inspire and help scale impactful rural health programs throughout the state and across the country. When all Alaskan women get the care and health information they need to live, work, and play, their families thrive and communities are stronger. RHTP funding will allow KBFPC to set a transformative precedent for rural healthcare delivery, creating lasting impact in a region where reproductive healthcare needs are acute. This funding will build the infrastructure, capacity, and systems necessary to expand the pilot-tested program across the Kenai Peninsula and beyond. Three KBFPC staff members would like to pursue advanced healthcare degrees over the next four years, but are limited by the high cost of education. RHTP funding would support their pursuit of higher education while these staff members remain employed by KBFPC and actively involved in the Bridging the Distance proposal work. These employees understand the needs of rural Alaska and are committed to working in Alaska long-term.	Under \$50,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Kachemak Bay Family Planning Clinic	Bridging the Distance: Clinic Renovations to Support Expanded Access to Care	AK	Alaskans on the Kenai Peninsula experience several significant barriers to accessing care including rural transportation challenges, high cost of all health care, trouble navigating public assistance enrollment, housing and food insecurity, limited provider expertise in reproductive health, a siloed healthcare system, lack of a medical home, and lack of childcare, among others. Women, including new moms, face compound barriers to care, including geographic isolation, their families’ nontraditional work schedules, past trauma, and social stigma around reproductive healthcare topics such as postpartum depression, maternal deaths, infertility, and contraception for family planning and birth spacing. Additionally, high rates of substance misuse and domestic violence remain leading contributors to maternal morbidity and mortality in Alaska. Rural regions also present unique challenges for healthcare provision due to the vast geography, sociocultural variety, sparse infrastructure, logistical difficulties, limited pool of licensed staff, and high costs associated with providing care in remote areas. As part of the broader Bridging the Distance program proposal, KBFPC is requesting funds for overdue clinic renovations to support expanded access to care. As the region’s only dedicated reproductive health provider, KBFPC stands as a critical lifeline for many, particularly in a state where access to care, including for maternal health, is limited and expensive to deliver.	As described in the Bridging the Distance: Remote Maternal and Reproductive Health Services on the Kenai Peninsula LOI, with RHTP programmatic support KBFPC will expand the Remote Services program in reach and in scope – including a new Postpartum Home Visit Program – to improve rural Alaskans’ access to preventative healthcare and reduce the significant social and economic costs of undiagnosed medical conditions for individuals and their families. KBFPC’s work already strengthens and complements regional and statewide public health efforts. The proposed expansion and new service pilot will develop a model built on insights from community-based participatory research and impact assessments to inspire and help scale impactful rural health programs throughout the state and across the country. When all Alaskan women get the care and health information they need to live, work, and play, their families thrive and communities are stronger. RHTP funding will allow KBFPC to set a transformative precedent for rural healthcare delivery, creating lasting impact in a region where reproductive healthcare needs are acute. This funding will build the infrastructure, capacity, and systems necessary to expand the pilot-tested program across the Kenai Peninsula and beyond. Additional funding to support renovations at KBFPC’s already owned clinic building will offer the updated physical infrastructure needed to support this program. Clinic renovations will take place during the initial phase of the 5-year project to help staff focus on caring for Alaskans.	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Kachemak Bay Family Planning Clinic	Bridging the Distance: Remote Maternal and Reproductive Health Services on the Kenai Peninsula	AK	Alaskans on the Kenai Peninsula experience several significant barriers to accessing care including rural transportation challenges, high cost of all health care, trouble navigating public assistance enrollment, housing and food insecurity, limited provider expertise in reproductive health, a siloed healthcare system, lack of a medical home, and lack of childcare, among others. Women in the region, including new moms, face compound barriers to care, including geographic isolation, their families’ nontraditional work schedules, past trauma, and social stigma around reproductive healthcare topics such as postpartum depression, maternal deaths, infertility, and contraception for family planning and birth spacing. Additionally, high rates of substance misuse and domestic violence remain leading contributors to maternal morbidity and mortality in Alaska. Rural regions also present unique challenges for healthcare provision due to the vast geography, sociocultural variety, sparse infrastructure, logistical difficulties, limited pool of licensed staff, and high costs associated with providing care in remote areas. KBFPC’s Remote Services Program, with its offered services and responsive model, is essential for overcoming these obstacles. As the only dedicated reproductive health provider in the region, KBFPC and its expert staff stand as a critical lifeline for many, particularly in a state where access to care, including for maternal health, is limited and expensive to deliver.	Traditional healthcare models often fail to meet the needs of rural populations. In response, for over 40 years KBFPC has integrated innovative, community-centered models into its care delivery. In late 2022, KBFPC launched the Remote Services Program to directly address the logistical challenges of accessing care in rural communities. This small-scale initiative combines KBFPC’s expertise and logistical support with regional partners’ physical space for colocation and referrals. A mix of Pop-Up Clinics, outreach education, mail-out services, and telehealth options are used to bring services to where the region’s underserved communities need care the most. The Remote Services Program represents a key model for collaborative and responsive rural healthcare delivery, ensuring that those living in remote areas receive the reproductive and mental health services they need. With RHTP support, KBFPC will expand this program in reach and in scope – including a new Postpartum Home Visit Program – to improve rural Alaskans’ access to preventative healthcare and reduce the significant social and economic costs of undiagnosed medical conditions for individuals and their families. The Postpartum Home Visits will offer new families one-on-one support from a trained clinical provider and postpartum doula; including screening and connection to community resources for mental and physical health conditions associated with birth, as well as interpersonal violence. Because KBFPC already supports women through all stages of their reproductive life, from adolescence through menopause, the addition of this home-visit service is a natural fit for the agency. KBFPC’s work already strengthens and complements regional and statewide public health efforts. The proposed expansion and new service pilot will develop a model built on insights from community-based participatory research and impact assessments to inspire and help scale impactful rural health programs throughout the state and across the country. When all Alaskan women get the care and health information they need to live, work, and play, their families thrive and communities are stronger. RHTP funding will allow KBFPC to set a transformative precedent for rural healthcare delivery, creating lasting impact in a region where reproductive healthcare needs are acute. This funding will build the infrastructure, capacity, and systems necessary to expand the pilot-tested program across the Kenai Peninsula and beyond.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Kachemak Bay Recovery Connection	Expanding and Sustaining Peer Support Services on the Southern Kenai Peninsula	AK	The SKP has a critical lack of available and accessible recovery support services. Since 2008, five Community Health Needs Assessments conducted by the local health improvement coalition have identified substance abuse as a top factor negatively affecting community health. KBRC serves Alaskans at high risk of and most affected by Opioid Use Disorder (OUD) and other Substance Use Disorders (SUDs). Individuals in early recovery are at high risk of relapse; about half relapse within three months after intensive treatment, many more in the first three to five years, and many overdose deaths occur during relapse. RCOs provide proven, evidence-informed recovery support that reduces relapse and overdose risk. Local demand for peer support exceeds KBRC’s current capacity - our two PSS are already serving 40 participants, which is not a sustainable case load. We receive referrals from multiple partners yet we are often unable to fully meet their needs because KBRC lacks sufficient staff and an agency vehicle. Currently, if a participant needs transportation support, we are often unable to meet that need or our facility must temporarily close to provide that transportation. When we do provide transportation, we are using personal vehicles and mileage reimbursement. This approach is neither sustainable nor ideal. A MRU will reduce risk and allow us to reliably meet a high transportation need and added staff will allow us to do that without closing our facility during business hours.	The proposed approach will increase the availability and accessibility of recovery support across the SKP. KBRC is currently the only entity in the region offering peer support to individuals in recovery, and our current staffing level is not sufficient to meet demand. With additional staff, we can better meet local need and strengthen relationships with our partners. We will then have the capacity to keep our facility open to walk-ins during normal business hours while simultaneously supporting participants and partner-referred clients with transportation needs. With increased funding we could also offer full-time positions, which would have a positive impact on both staff recruitment and retention. There is no local public transportation system, and many participants lack a driver’s license and/or a vehicle. In addition to providing local rides, we often need to transport community members 75 miles to the nearest detox facility. Entering detox is a highly vulnerable stage in the recovery process and is safest with a trusted support person, not alone on a shuttle or in a taxi. The ability to provide personalized transportation supports connection and builds trust, two critical aspects of a successful recovery journey. In addition to increasing staff hours, we propose to purchase a MRU. An agency-owned vehicle will have a two-fold benefit: 1. It will allow us to transport participants, whether locally to weekly food pantries or further up the road for detox; and 2. It will allow us to bring our services to various locations throughout the region. The MRU will make regular visits to nearby communities and serve as a highly visible mobile hub where people can access resources and support. Both uses, local transport and regional outreach, will transform how we provide services and fill an unmet community need. Additional staff hours and an MRU will allow us to truly meet people where they are by establishing a regular presence providing services at local food pantries (in Homer, Anchor Point and Ninilchik) and local libraries (in Homer, Anchor Point, Ninilchik, and Seldovia). A regular presence at community food pantries has proven to be an effective engagement strategy, but one we have not been able to staff. Establishing “office hours” at local libraries will further support this approach, as many community members who could benefit from KBRC services frequent libraries as the only warm, free spaces with internet access.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Kachemak Emergency Services	Radio Communications	AK	Due to topography, several locations in Kachemak Emergency Services' area of responsibility have poor or non-existent radio communications. In these locations, EMS units are unable to communicate with their dispatch center or other responding units. As a result, pertinent and time-urgent information is not relayed in a timely manner.	Expand Alaska Land Mobile Radio (ALMR) capability or conventional radio capability to improve coverage at the head of Kachemak Bay. Radio towers on the south side of Kachemak Bay would have visibility to mobile and portable radios on the north side of the Bay.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced
Kachemak Emergency Services	Station 2 volunteer pre-fab quarters	AK	Kachemak Emergency Services (KES) provides fire and EMS coverage across 214 square miles in the Kenai Peninsula Borough, serving roughly 4,500 residents. Station 1, on the eastern side, is staffed with three shifts of two full-time firefighter/EMTs, ensuring reliable district-wide response. Station 2, on Diamond Ridge, houses apparatus but lacks living quarters. Installing a prefabricated modular facility would allow volunteers to take scheduled duty shifts, increasing on-site coverage in the western portion of the district. This project enhances KESA's ability to respond to emergencies where rapid intervention is essential, including severe trauma, cardiac events, and strokes. On-site volunteer quarters also support recruitment and retention, expanding operational capacity and improving timely access to emergency care for residents in this rural service area.	KES proposes installing a prefabricated modular living quarters structure at Station 2, providing bunk rooms, a kitchen, day/living room, and bathroom/shower facilities for volunteers to remain on duty. The unit will be delivered largely complete and installed without a permanent foundation, connecting to existing electrical and septic infrastructure with minimal site preparation. Volunteers could staff Station 2 during scheduled shifts, allowing apparatus to respond directly from that location. This approach expands operational coverage in the western portion of the service area while maintaining readiness from Station 1. On-site living quarters also make scheduled shifts practical, supporting volunteer recruitment and retention.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Kachemak Rapid Care Ambulance	Expanding Rural EMS Access on the Kenai Peninsula	AK	Advanced Life Support (ALS) transport is required for patients needing continuous monitoring and complex interventions, particularly during long-distance transfers. Many transports involve heart attacks, strokes, respiratory failure, severe trauma, or patients requiring cardiac monitoring, ventilator support, intravenous medications, or advanced airway management. Stroke treatment is highly time-sensitive, with the clot-busting drug tPA typically required within 3–4.5 hours of symptom onset, and studies show that each minute of delay results in the loss of approximately 1.9 million brain cells. The Kenai Peninsula Borough spans over 25,000 square miles, and communities outside our service area face no access to long-distance ALS ground transport. Homer and Seward hospitals are not PCI-capable facilities, meaning patients experiencing heart attacks or strokes must often be transported to Anchorage, 200+ miles away, for definitive care. When air transport is grounded due to weather, delays can cause stroke patients to miss the four-hour treatment window, leading to permanent disability. Developing long-distance ALS transport requires significant upfront investment in ambulances, monitors, ventilators, and specialized transport systems. Critical patient monitors alone cost approximately \$30,000, and equipment donations are limited. Currently, there are no dedicated state resources supporting development of this infrastructure.	This project will expand emergency medical transport capacity and improve healthcare access for residents across the Kenai Peninsula by strengthening the region’s only Advanced Life Support (ALS) and long-distance ambulance service. 1. Regional Integration and Service Expansion We will strengthen regional care coordination by establishing formal partnerships with hospitals, Tribal health organizations, fishing industry employers, borough leadership, and EMS partners. Structured outreach will result in hospital MOUs, Tribal health coordination agreements, and integration with regional EMS dispatch systems. These agreements will expand service coverage beyond our current Soldotna base to support communities such as Seward and Homer that lack reliable long-distance ALS transport. This approach improves continuity of care within the Peninsula. 2. Workforce Expansion and Rural Workforce Pipeline The project will fund a dedicated Project Manager responsible for operational expansion, partnership coordination, workforce recruitment, and performance tracking. A targeted recruitment and relocation strategy will attract 1 EMT and 1 Paramedic to support expansion. Staff will also receive training to support specialized transports, including oncology transfers, dialysis patients, hyperbaric-related transfers, and medically complex patients. 3. Community Engagement and System Sustainability A regional communications strategy will position the ambulance service as critical healthcare infrastructure supporting rural access to care. Public education will clarify appropriate EMS utilization and the role of long-distance ALS transport within the regional healthcare system. The project will also produce a five-year sustainability plan including service line break-even analysis, reimbursement optimization strategies, and a capital expansion roadmap to ensure the service remains viable beyond the grant period. 4. Equipment and Infrastructure Investment Grant funding will support acquisition and full ALS outfitting of an additional ambulance based in Seward, enabling expanded service coverage across the Peninsula. Investments include an ambulance vehicle, advanced monitoring and transport equipment, durable medical equipment, medical supplies, IT and dispatch systems, and facility setup required to support safe and reliable emergency medical transport operations.	\$1M-\$5M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Kachemak Swim Club	Kate Kuhns Aquatic and Wellness Center	AK	The community pool currently operated by the Kenai Peninsula Borough School District is facing closure due to the loss of operational funding. This closure would negatively impact youth, families, and seniors who rely on it daily. In rural Alaska, aquatic facilities are essential not only in recreation but also in water safety education, youth development, injury prevention, and chronic disease prevention. The loss of the facility would also significantly reduce opportunities for afterschool programming for children and teens. Kachemak Swim Club (KSC) has the organizational experience and community support to assume operational responsibility for the pool through a nonprofit model that continues to partner with the school district and the Kenai Peninsula Borough. By stabilizing operations and or expanding programming, the facility can continue to be a community health asset that supports youth development, family wellness, rehabilitation, and lifelong physical activity. At this time there is no governing body that has offered to assume operations of the aquatic center and so we anticipate it closing at the end of June 2026. Through support of the RHTP there is an opportunity for KSC to transition oversight. This opportunity aligns with broader rural health priorities by improving access to safe physical activity, strengthening community infrastructure, and expanding prevention-focused programming that supports both physical and mental health across the lifespan.	The proposed project will stabilize the existing aquatic facility and transition operational responsibility from the Kenai Peninsula Borough School District to Kachemak Swim Club through a community-based nonprofit operating model that continues to partner closely with the school district and the Kenai Peninsula Borough. Immediate grant funding would support transition costs, operational planning, and the initial improvements necessary to reposition the facility as a community aquatic wellness center. Once operational stability is achieved, the project will focus on targeted improvements that expand the facility’s ability to serve community health needs. Accessibility upgrades such as pool lifts, family changing rooms, and accessible restrooms and showers will ensure the facility meets the standards of the Americans with Disabilities Act. Operational improvements may include energy-efficient filtration systems, water conservation technology, heat recovery systems, and solar-assisted heating where feasible in order to reduce long-term operating costs. Future planning will explore the feasibility of adding a small warm-water therapy pool, pending engineering feasibility and building approvals. A warmer pool environment would support rehabilitation programs, arthritis exercise classes, and potential partnerships with the local hospital for wellness or physical therapy programming. Additional enhancements may include a zero-entry pool area with modest play elements for young children, as well as a hydrotherapy zone with hot and cold plunge pools to support recovery and therapeutic use. With these improvements the aquatic wellness center will be able to expand programming across the lifespan. Youth swim instruction, afterschool programs, and swim team development will support child and teen wellness and mental health through structured recreation and sports participation. The facility can also host infant swim programs, toddler play groups, aquatic fitness classes, and community wellness activities that support families and seniors. Together, these improvements and programs will transform the pool into a year-round community wellness resource.	\$250K-\$1M	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Karousel Kidz Learning Center 2 LLC	Karousel Kidz building updates	AK	Our building was build in 1982 and needs some major updating. We need to hire an electrician to rewire some of the classrooms for safety and energy efficiency. The fluorescent light fixtures need replaced with LED fixtures. We would like to upgrade our HVAC units to more energy efficient units. We would like to change out some of the store front windows to egress windows that open to allow natural air flow during the summer. Doors need upgraded as they leak and blow open during our windy days. Floors need upgraded as the carpet has many rips and damage, the hardwood floors are separating and have old drill holes where cables used to be. We would like to install more security systems to have better safety measures for our kiddos. Toilets need upgraded to energy efficient toilets. Sinks need repaired. Walls that are cracked and pulling apart need fixed. The outside of the building needs fixed of random holes and areas that leak water into our walls. The piping in the ceiling leaks condensation. The ceiling tiles need replaced after to get rid of the water marks. It is a very old building that was not kept up very well.	The initial plan is the electrical fixing. I have an electrician available to do the work once we have the funding. I am in close contact with a flooring store for flooring. The HVAC company that maintains our units is also aware of our want to upgrade to better units and is on board. I can upgrade toilets and sinks myself as well as some basic patching of walls and caulking. Steven's glass has given us a quote on upgrading a few windows as well, just waiting for payment to order the windows.	\$250K-\$1M		Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced
Kathy Hurlburt Medical Group LLC	Addressing Metabolic Disease in Rural Alaskans: A Multi-disciplinary Hybrid Care Model	AK	In Dillingham and Naknek, metabolic syndrome—including Type 2 diabetes and hypertension—is a primary driver of premature mortality. While Alaska Native beneficiaries have access to IHS services, a significant population of non-beneficiaries, including the local workforce and seasonal residents, has zero local access to specialized metabolic care. This disparity leads to delayed diagnoses and poor adherence. This project presents an opportunity to create a scalable specialty care bridge for this underserved cohort, preventing the acceleration of costly co-morbidities like stroke and renal failure.	We will implement a three-phase "Fly-In/Tele-Health" model: In-Person Intensives: Quarterly mobile diagnostic hubs in Dillingham and Naknek for high-risk screenings and clinical intake. Clinical Integration: Simultaneous medical management by an Internal Medicine Physician and culturally tailored medical nutrition therapy (MNT) by a Registered Nutritionist. Digital Continuity: Utilization of a HIPAA-compliant telemedicine platform and Remote Patient Monitoring (RPM) to provide monthly follow-ups and real-time coaching, ensuring Anchorage-level care frequency within the rural setting.	\$50,000-\$250,000	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bristol Bay Borough; Dillingham Census Area	Advance to Implementation Application

Kawerak, Inc	Community Led Health and Wellness Program.	AK	The Norton Sound region faces a suicide rate more than twice the national average, driven by deep-seated intergenerational trauma. A primary barrier to healing is the "hub-village gap," where 80% of communities are off the road system and rely on weather-dependent travel. Current reactive models fail because the "golden hour" for emergency response is rarely achievable in frontier Alaska. Domestic violence, sexual assault, and substance abuse often remain siloed or unspoken, preventing rural Alaska Native communities from building the internal accountability necessary for long-term safety. This project transforms regional health by shifting from a reactive, crisis-based model to a proactive, community-led prevention framework. By utilizing an area-specific version of the PC CARES model, we will empower village members to be the primary facilitators of their own wellness. This shifts the burden from a fragile, high-turnover clinical workforce to a stable, village-based social infrastructure, ensuring care remains "close to home". By normalizing difficult conversations and strengthening the Nome/hub wellness forum, we ensure regional resources are directly driven by village-identified needs. Prioritizing internal village-led accountability establishes the stable, relational foundation required to break the cycle of intergenerational trauma and protect our youth.	Our approach utilizes a community-led, trauma-informed framework rooted in strength-based and harm reduction ideologies. By implementing a localized version of the PC CARES model, we move away from deficit-based interventions to activate the inherent resilience and cultural wisdom within our rural Alaska Native communities. Our approach follows a three-part logical framework: Activating Community Assets (Strength-Based): Instead of focusing solely on gaps, we identify and support local leaders to serve as facilitators. This recognizes that our villages already possess the relational knowledge required for healing. By centering the project on community strengths, we ensure the wellness journey is self-determined, which increases the probability of long-term sustainability. Safety through Normalization (Harm Reduction): Facilitators lead "Community Conversations" to break the silence surrounding DV, SA, and SAM. We apply harm reduction principles by meeting the community exactly where they are—reducing the shame and isolation that often lead to crisis. Creating a safe space to discuss these issues provides an immediate layer of protection and an "on-ramp" to support, even when professional resources are distant. Relational Infrastructure: We integrate these village-led strategies into the Nome/hub wellness forum coordination. This ensures regional support is a direct response to local priorities. By formalizing this coordination, we provide the consistent foundation needed to address intergenerational trauma and disrupt repetitive patterns for future generations	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Kawerak, Inc	Expansion of regional Emergency Management capacity for Resilience and Health System Preparedness	AK	Despite ongoing preparedness efforts, significant capacity gaps remain across the Bering Strait Region. The region’s geographic isolation, limited transportation infrastructure, and small local populations create challenges in maintaining sufficient emergency preparedness and response capacity. Many communities rely heavily on volunteer responders and have limited emergency infrastructure or trained personnel available for sustained response operations. Disruptions caused by storms, coastal flooding, or infrastructure failures can quickly affect access to health care, emergency medical response, and essential services that support community health. Currently, a single regional emergency preparedness staff member provides technical assistance and coordination support to fifteen tribal communities. This limited capacity restricts the region’s ability to support mitigation planning, responder training, emergency exercises, and disaster recovery assistance. Expanding regional preparedness capacity represents an important opportunity to strengthen transformative health system resilience, improve coordination among communities, and protect the health and safety of rural residents during emergencies.	This project will strengthen rural health system resilience by expanding regional emergency preparedness capacity and improving coordination across the Bering Strait Region. The initiative will focus on supporting tribal communities in strengthening preparedness planning, improving response coordination, and maintaining continuity of essential services, including health, during disasters and severe weather events. Key activities include: • Expanding regional emergency preparedness staffing to support tribal communities. • Providing technical assistance for local emergency planning and hazard mitigation in all communities. • Supporting responder training, exercises, and coordination with regional partners. • Strengthening collaboration between tribal governments, health providers, and emergency response agencies. • Promoting household and community preparedness to improve resilience during storms and extended disruptions. • Improving communication and coordination systems to support effective emergency response, including injury and other health needs. These activities will strengthen and continue to reinforce the ability of our rural communities to protect residents during emergencies and maintain access to health services when disasters occur.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Kawerak, Inc.	Bering Strait Wellness Initiative Planning Grant	AK	Rates of chronic illness and mental health challenges are high in region, with 75% of adults having at least one chronic condition, and nearly a quarter of Alaska Native youth having considered suicide (19% attempted). The region is not connected by road to the rest of Alaska, requiring food to be flown or barged into communities. Combined with limited food storage capacity in many village stores, these logistical and financial constraints restrict availability of nutritious foods, leaving many residents reliant on cheaper, imported alternatives. The resulting decline in food quality, reduced access to healthy foods, and loss of wellness practices have directly contributed to poor physical and mental health outcomes. Inupiat, St. Lawrence Island Yupik and Yup’ik cultures have thrived in the region for millennia developing systems of wellness grounded in traditional foods, land-based practices, and intergenerational knowledge sharing. However, these systems have been disrupted by historical and structural barriers, including language loss, challenges translating traditional wellness knowledge into Western medical models, and diminished access to traditional foods and harvesting opportunities. Kawerak sees an opportunity to improve regional health outcomes by restoring traditional foodways, expanding access to healthy and locally produced foods, and increasing opportunities for traditional knowledge exchanges to strengthen food sovereignty and cultural wellness.	For the first year of funding, Kawerak proposes to complete the initial planning phase of its five-year Bering Strait Wellness Initiative (BSWI), which aims to reduce chronic illness and expand culturally appropriate, community-based wellness education across the region. During this planning year, project partners – Kawerak’s Pilgrim Hot Springs (PHS), Reindeer Herders Association (RHA) and Environmental (ENV) Programs; the UAF Northwest Campus Cooperative Extension (CES), and the Village of Solomon (VOS) - will collaboratively develop culturally grounded curricula informed by a regional needs assessment. Curriculum development will focus on two core priority areas: traditional foods and nutrition education, and community wellness education. Partners will also establish agreements for shared use of facilities, including the Village of Solomon’s Traditional Foods Processing Facility, the PHS Wellness Center at Pilgrim Hot Springs, UAF NWC Cooperative Extension classrooms and a distribution-focused Bering Strait Food Hub located in Nome. These facilities will serve as central locations for workshops and trainings during the implementation phase. Project partners will collaborate on traditional foods curricula and workshop planning focused on reindeer husbandry, traditional wellness practices, food preserving and preparation, and village-based healthy food trainings. ENV and PHS will also develop curriculum for expanding in-village garden education, building on new agriculture sites recently established in several communities.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Kawerak, Inc.	Remote Health Care Workers Program	AK	There are three problems we would like to address with this project. They are as follows: 1) Itinerate health care workers cycle in and out of rural and remote communities in Alaska on a regular basis. Few stay and make their homes here. Most do not reinvest in the communities they serve. 2) We are facing a severe shortage of health care workers across rural and remote Alaska. 3) Rural communities in Alaska have a very high rate of unemployment. The good news is that the newly enhanced services provided by GCI’s broadband internet and Starlink’s high speed satellite internet make remote work is possible where it never has been before. All three problems can be solved at once by growing our own health care workforce and providing good jobs that pay a living wage in communities like Gambell, where the unemployment rate is 37.8%. Many jobs can be done remotely by rural residents. With the right training programs offered by distance learning, cohorts of students would never have to leave their communities. Employment opportunities in medical coding and billing, health information management and health adjacent roles such as IT support have never been more accessible. We propose to strengthen the health care workforce across the Bering Strait Region by training and certifying our own residents to fill these vital roles.	We propose to recruit and run a cohort of 10 students every six months. The cohorts will receive training in vital health care roles such as Clinical Medical Assistant, Patient Care Technician, Medical Billing and Coding, Electronic Health Records, EKG and Phlebotomy Technician, Pharmacy Technician, Dental Support Assistant, Mental Health Technician, Medical Administrative Assistant, Information Technology Specialist, Cyber Security Professional and roles that require CompTIA Certification. We plan to recruit graduating seniors from high school and retrain adults that may already have work experience. We currently have an existing partnership with MedCertify that students can utilize as they pursue these certifications. All programs listed above are available through Med Certify and can be done remotely. This program will be housed under the Vocational Rehabilitation Department at Kawerak, Inc. Individuals with disabilities will receive priority in the program in the event that we receive more applications then we have spaces available in a given cohort. Case workers, including a vocational rehabilitation case worker, will be on staff to help students and trainees every step of the way. Internet, laptops, necessary office furniture, books and supplies will be provided to students in each cohort. Once graduated, an employment coordinator will assist with a resume, job search, cover letter, LinkedIn profile set up and travel to and from interviews (if required) for each program participant.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Advance to Implementation Application

Kawerak, Inc.	Early Childhood Education Health, Wellness, and Development	AK	The current federal and State funding that we receive to offer Head Start and childcare services has not kept up with the cost to operate over the years. The intent of this project is to fill in staffing gaps, increase staff hours after our summer of 2025 hour reduction due to budget restraints, and ensure all our programs continue to offer health, wellness, and development for the youngest people in our region. Kawerak, Inc. operates the only comprehensive birth-to-five early childhood education (ECE) program across 11 remote Bering Strait communities, with the exception of one Nome private preschool with limited seats. The qualified applicant pool in our remote region is extremely small, compounding staffing shortages that directly reduce the quality and availability of services for children. Children's needs are greater than ever. Physical health challenges, developmental delays, and social-emotional difficulties are escalating, requiring more staff and specialized support that current funding cannot cover. Six Kawerak-owned Head Start facilities face deferred maintenance that threatens safe, compliant learning environments. Communities are urgently requesting Native language immersion classrooms to combat endangered language loss and strengthen cultural identity among young children, to promote wellness. Without this program, approximately 95 jobs would be lost and parents who depend on our services to maintain employment would face impossible choices.	Through this project, we will: -Restore staff hours -Rehire 9 positions that we recently discontinued due to budget restraints -Create and hire 3 new positions that are desperately needed -Address severe deferred maintenance needs -Continue our language immersion efforts -Continue to grow new teachers through our Teachers in Training program -Continue our Uiivilat Play & Learn Center (UPLC) childcare services without causing undue financial hardship on parents/guardians by keeping the monthly rates within reason	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Kay Brooke Properties, LLC	Interior Alaska Healthcare Workforce Housing Stabilization Initiative	AK	Interior Alaska healthcare facilities rely heavily on temporary, contract, and newly recruited clinicians to sustain services for rural and frontier communities. Fairbanks functions as a regional referral hub, and workforce instability in this community directly impacts access to care across Interior Alaska. A persistent shortage of available, furnished, and short-term rental housing creates delays in provider onboarding, contract acceptance, and assignment stability. Incoming clinicians frequently face extended housing searches, short-notice cancellations, or temporary lodging arrangements that are not sustainable for multi-month contracts. These housing barriers contribute to staffing unpredictability, increased administrative burden for healthcare organizations, and interruptions in care continuity for rural patients who depend on rotating and specialty providers. The lack of dedicated workforce housing represents a structural infrastructure gap rather than an isolated recruitment challenge. Addressing this targeted barrier supports workforce stabilization, improves onboarding reliability, and strengthens rural healthcare sustainability.	Kay Brooke Properties, LLC proposes acquiring and converting 8–10 existing residential units in Fairbanks into dedicated healthcare workforce housing. Units will be fully furnished and reserved for verified healthcare workers, with priority given to temporary, contract, and newly recruited providers serving Interior Alaska communities. Occupancy will require verification of employment or contract status with a licensed healthcare organization to ensure alignment with workforce stabilization goals. The project will be implemented in phases to manage risk and ensure financial stability. Following funding approval, properties will be identified and acquired based on location, condition, and suitability for furnished workforce housing. Light renovations and furnishing will be completed to prepare units for immediate occupancy. Units are anticipated to be operational within approximately 90–120 days of acquisition. A recorded 15-year healthcare-only use restriction will ensure long-term public benefit and prevent diversion to unrelated uses. The program will maintain clear occupancy policies, centralized turnover coordination, and separate financial tracking for transparency and accountability. An advisory committee composed of local healthcare representatives (hospital, clinic, and EMS leadership) will provide workforce insight and periodic review to ensure housing supply aligns with regional demand patterns. The advisory role will strengthen coordination between housing availability and workforce recruitment timelines. This acquisition-based model allows rapid implementation without construction delays, reduces capital risk, and maintains manageable project scale aligned with current organizational capacity. By focusing on existing housing inventory, the initiative addresses an immediate workforce infrastructure gap while ensuring long-term sustainability and operational stability.	\$1M-\$5M	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced

Kay Brooke Properties, LLC	Interior Alaska Rural Healthcare Workforce Infrastructure Stabilization Initiative	AK	Interior Alaska’s rural and frontier communities depend on Fairbanks-based healthcare providers for specialty referrals, outreach clinics, emergency coordination, and rotating clinical coverage. Fairbanks functions as a regional hub, and workforce instability within this hub directly affects access to care across Interior census areas. A persistent barrier to recruitment and retention is the limited availability of workforce-designated housing aligned with healthcare employment timelines. Incoming providers and clinical trainees frequently encounter delays securing appropriate housing, resulting in postponed start dates, shortened assignments, or reduced participation in rural outreach services. These housing constraints increase administrative burden for healthcare employers, contribute to service gaps, and disrupt continuity of care for rural patients who rely on consistent provider availability. The absence of structured healthcare workforce housing represents a system-level infrastructure gap rather than an isolated housing shortage. Addressing this barrier creates an opportunity to strengthen workforce stabilization, improve onboarding reliability, and enhance sustainability of healthcare access for rural and remote communities served through the Interior Alaska hub model. This project addresses a structural barrier to rural health system performance and supports long-term workforce resilience in Interior Alaska.	Kay Brooke Properties, LLC proposes to acquire, renovate, furnish, and activate six residential units within the Fairbanks North Star Borough as dedicated Healthcare Workforce Stabilization Housing. This initiative addresses a structural workforce barrier affecting rural healthcare access by establishing permanent infrastructure that supports recruitment, onboarding, retention, and rural service participation. The project will utilize existing housing inventory to enable rapid deployment. Following anticipated funding release in 2026, properties will be selected based on suitability, location, and workforce demand alignment. All acquisition, renovation, furnishing, and activation activities will be completed by September 2027 per RHTP timelines. Renovations will prioritize safety and workforce-ready standards, including necessary repairs and essential upgrades. Units will be fully furnished to enable immediate occupancy and reduce onboarding delays. A recorded 15-year Healthcare Workforce Use Restriction Covenant will be placed on each property to ensure long-term public benefit. During the covenant period, units will be used exclusively to house licensed healthcare professionals, clinical trainees, and essential healthcare support personnel directly engaged in providing or supporting healthcare services serving rural or frontier communities in Alaska. Eligible occupants may include physicians, advanced practice providers, nurses, behavioral health clinicians, pharmacists, emergency medical personnel, allied health professionals, trainees participating in rural rotations, and operational personnel supporting healthcare service delivery. Occupancy may rotate among qualifying individuals over time in alignment with workforce demand while supporting sustained stabilization. Units will remain restricted to eligible healthcare workforce occupants for the duration of the covenant. Structured eligibility verification will align housing activation with recruitment timelines and rural service needs. Performance tracking will include occupancy rates and provider categories served. Financial sustainability will be supported through structured occupancy fees and reserve planning to preserve workforce designation beyond the RHTP funding period. By establishing permanent workforce infrastructure in the Interior Alaska hub, this approach strengthens recruitment reliability, reduces service disruptions, and enhances rural healthcare access and sustainability.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

KB5 Consulting	KB5 Consulting Rural Health Workforce and Community Capacity Initiative	AK	Rural health organizations in Alaska frequently have the community trust and mission commitment needed to deliver impactful services, but lack the strategic, operational, and workforce capacity to do so effectively or sustainably. This capacity gap is particularly acute for organizations serving individuals with disabilities, who face compounding barriers to care in rural and frontier settings. At the same time, Alaska faces a persistent rural health workforce shortage that undermines the stability of community health programs. KB5 Consulting sees an opportunity to address both challenges simultaneously by providing targeted technical assistance, workforce training, and program development support to rural health organizations. We can strengthen the entire rural health care delivery ecosystem in Alaska.	During the Readiness Grant period, KB5 Consulting will conduct a comprehensive landscape assessment of rural health organizations across Alaska to identify common capacity gaps and priority needs. We will engage rural health organizations, community members, individuals with disabilities, and Tribal partners through interviews, surveys, and community convenings to ensure our program designs are grounded in real need. In parallel, we will develop framework designs for five program components: a technical assistance program for rural health organizations; a workforce training curriculum for rural health and human services workers; a community outreach support model; a disability-inclusive program development guide and consultation service; and a strategic planning and program development consulting model. The Readiness Grant period will culminate in a detailed, fully costed implementation plan and a portfolio of program frameworks, ready for launch in a future RHTP funding cycle.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Fairbanks North Star Borough	Deferred or Not Advanced

Kenai Local Food Connection	Let's Cook! Program Expansion	AK	Rural residents on Alaska’s Central Kenai Peninsula face overlapping challenges that undermine health: high food prices, limited year-round access to fresh produce, fast-food culture, and a health care system strained by growing demand. Many households—especially low-income families—lack both reliable access to healthy local foods and the practical skills to prepare them in affordable, culturally meaningful ways. At the same time, small local food producers often struggle to connect with consumers, leaving potential health benefits unrealized. These conditions contribute to chronic disease, food insecurity, and preventable use of emergency and specialty care. Regional providers increasingly see health outcomes shaped less by genetics than by what happens in people’s kitchens and communities, yet few sustained, place-based programs link local food access, hands-on nutrition education, and support for small producers. This project positions local food and practical cooking skills as essential rural health infrastructure. By expanding our Let’s Cook! offerings, we will leverage community assets—a local grocer and café, small farms and fishers, schools, health care providers, and Alaska’s traditional culture of harvesting and preserving—to create an integrated, preventive approach. Let's Cook! will help close the gap between what rural Alaskans know they “should” eat and what they can realistically access, afford, and prepare, easing pressure on the health care system.	We will expand Let’s Cook! into a multi-component program that combines access to local foods with practical health education, including: 1) Wellness & Resilience Center: We will build a welcoming teaching kitchen and meeting space within a Soldotna grocer and café. Our Wellness & Resilience Center will host year-round classes, support groups, and events. Co-location with a grocer ensures that skills learned can be immediately applied in a real shopping environment. 2) Targeted Cooking and Wellness Education: - Homeschoolers and within public schools: We will develop and deliver curricula integrating nutrition, cooking, basic gardening, subsistence, and food preservation skills. Lessons will align with educational standards and reflect Alaska’s seasons and food traditions. - Low-income households: We will give a sliding-scale class series focused on cooking with affordable local ingredients, planning balanced menus, and preserving seasonal foods. A child-friendly classroom, classes held in different locations, and collaboration with partnering organizations will help reduce participation barriers. - In-person summer cooking demonstrations across the community with live, virtual versions will extend our reach statewide. - We will develop a nutritionist-approved, Alaska-rooted, weekly menu and shopping guide that features in-season, locally available foods, with recipes that reflect Alaskan tastes, cultures, and realities (limited time, mixed-use of store-bought and harvested foods). Accessible, low-cost memberships will include budget-conscious plans that support chronic disease prevention and management. - We will bring our Local Food Directory online, creating a user-friendly platform where residents can locate nearby farmers, fishers, wild harvesters, and local food retailers. The directory will be integrated into classes and the shopping guide, closing the loop between education and access. Planning for two community gardens, on social service partner sites in Soldotna and Kenai, in collaboration with our Soldotna Seed Library. Throughout the project, we will collaborate with Peninsula health care providers, schools, food producers, and community organizations to refer participants, align messaging with clinical recommendations, and gather feedback. Our evaluation will track participation, changes in knowledge and behavior, increases in (self-reported) consumption of fresh, local foods, and impact on household health and stress.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Kenai Peninsula Borough	Central Peninsula Mobile Integrated Healthcare Community Paramedicine Program	AK	Many Central Kenai Peninsula residents face significant barriers to healthcare access due to long travel distances, limited primary care availability, weather-related transportation challenges and high rates of chronic disease, which often results in reliance on emergency responders and emergency departments for non-emergent medical needs. High-utilizer patients often cycle through emergency medical services and emergency department system with limited follow-up care after discharge due to barriers such as a lack of transportation, housing, substance abuse and medical conditions causing the patients to be homebound. These challenges lead to increased healthcare costs, strain emergency services and reduce quality of life for Alaskans. When low-acuity cases utilize 911, first responders can only provide transport to a hospital, further reducing the hospital's capacity to treat emergency cases. The MIH program can provide transport to walk-in clinics and other non-emergency healthcare facilities for low-acuity cases. MIH programs have already been implemented in several Alaska cities with data clearly demonstrating that MIH programs lead to reduced EMS call volume and emergency department utilization, reduced hospital admissions, improved patient outcomes, and lower healthcare system costs. By providing access to non-emergent care, first responders and emergency department personnel and resources are more readily available to respond to and treat true emergency cases.	Implementing the MIH program through a collaborative partnership between CPH and CES will expand access to healthcare for residents in rural and outlying communities within the hospital service area. Under this model, Community Paramedics will be employed by CPH and operate under hospital medical oversight and clinical protocols, allowing the program to function within the hospital's broader healthcare jurisdiction while leveraging the operational coordination, community relationships, and referral pathways of CES. Together, the hospital and EMS system will identify patients who may benefit from proactive healthcare services, including individuals recently discharged from the hospital, those with chronic medical conditions, and patients who frequently utilize emergency services for non-emergent care. Community Paramedics will conduct scheduled home visits and follow-up services that may include chronic disease monitoring, medication reconciliation, post-discharge assessments, wound care checks, fall risk evaluations, and facilitation of telehealth consultations with healthcare providers. Patients may be referred to the program through hospital providers, emergency department staff, EMS personnel, or primary care providers, allowing for coordinated care across the healthcare system. These services will be appointment-based for non-emergent conditions to ensure that there is no impact on emergency response and resources. CES will provide space within their fire station for a MIH program vehicle, and Community Paramedics, allowing for seamless collaboration between all partners. CPH Partnership with CES will provide clinical oversight, medical direction, shared funding and equipment, referral pathways and data analytics support with the Kenai Peninsula Borough contributing grant oversight, management, compliance with service area boundaries. Upon implementation of the MIH program, residents within the CPH service area will experience improved access to timely healthcare services without the need to travel long distances for routine or follow-up care. This program is expected to increase access to in-home healthcare visits for rural patients, improve continuity of care following hospital discharge, and provide proactive monitoring for individuals with chronic medical conditions within the first 12 months. These early interventions will help patients better manage their health while connecting them more effectively with primary care and hospital services.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Kenai Peninsula Borough	Critical Emergency Medical Service Equipment Replacement	AK	The four ambulances being looked at for replacement are 16,18, 25, and 26 years old and are posing an increased cost in maintenance & repair to ensure the ambulances can remain in operation for emergency response. WES is located between two hospitals- South Peninsula Hospital in Homer & Central Peninsula Hospital in Soldotna. As such, transport times routinely are between 20 minutes and upwards of an hour one way, depending on where in the service area they initiate, contributing to accelerated wear & tear on the emergency vehicles. With all ambulances well past their useful life span, there is an increased risk for an ambulance to require removal from service for an extended period of time in order to complete repairs & maintenance. A reduced ambulance fleet creates an increased response time to critical emergency situations and decreases the department's ability to respond to emergencies within the service area or provide assistance to other departments if needed. Additionally, repair & maintenance costs are exponentially increased with aged, high-mileage vehicles, putting a strain on the department's financial resources & a potential financial impact to taxpayers.	WES intends to replace the four Type-1 ambulances that are 16, 18, 25, and 26 years old that are currently in service and have long surpassed their useful life of 10 years with modern Type-1 ambulances. WES has pursued several other funding opportunities through various grant opportunities, which have not been chosen to be funded. Funding the ambulance upgrades through grant funding is critical to the continued service and operation of WES, as replacing the aged equipment through borough funds will mean implementing a tax (mil) rate increase on property taxes within the service area boundaries, which many residents within the service area are not able to afford. Household incomes in the area range between \$36,700 - \$59,000 with approximately 8.4% to 13.3% of rural Alaskans at or below the federal poverty line, depending on their location. The April 2023 Denali Commission report on Distressed Communities, which includes employment and earnings information, specifically named the communities of Anchor Point, Nikolaevsk, Ninilchik, Happy Valley and Clam Gulch as Distressed Communities. This status is determined by comparing average income to full-time minimum wage earnings, the percent of the population making over minimum wage, and year-round and salaried employment. Additionally, the service area receives a substantial increase in summer population due to world-class sport fishing tourism, placing a significantly increased demand on emergency services. With rural fire districts funded primarily through property taxes, the increased demand in services does not provide an impactful contribution to the costs for these services which leaves increased tax levies as the only option to provide additional funding, placing the cost burden on rural Alaskan community residents. The rural communities within the service area do not have the population to support a significant increase in funding without a substantial mil rate increase. Pursuing grant funding opportunities such as the Rural Health Transformation Program to assist with the critical need to replace WES' aged ambulances prevents rural Alaskans from having to shoulder the burden of increased service demands from seasonal tourism while allowing WES to continue to provide prompt emergency response during the increased service demands of the tourist season.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Kenai Peninsula Borough	Interoperability Communication Upgrades for Eastern Kenai Peninsula Volunteer EMS Responders	AK	The volunteer departments are in need of essential radio communications equipment to replace outdated equipment that is more than 20 years old, is no longer serviced or supported by the manufacturer, experiences a high failure rate and will not be compatible with the Alaska Land Mobile Radio (ALMR) system after December 31, 2026. The VHF digital statewide communications system is used primarily on the road system and southeast Alaska, consisting of over 130 repeater sites and controllers. Partners on the system include the State of Alaska, Alaska Municipal League (Local Government - public safety), Municipality of Anchorage, Federal partners, and the Department of Defense. In 2021, ALMR began a system and equipment upgrade at repeater sites including P25 Phase II TDMA and Dynamic Dual Mode (DDM) repeaters at all the State of Alaska sites. In order to continue to operate effectively, all agencies and subscriber units on the site should have TDMA (Time-Division Multiple Access) capable equipment. This will enable “splitting” of the channels, allowing multiple access on a single channel; effectively doubling the ability of the current system. With additional communication challenges due to the area's geographic topography and limited communication towers, upgraded radio equipment can also address these existing challenges, allowing for prompt emergency response and coordination with neighboring departments.	In order to address the significant expense for these departments to upgrade their radio equipment and to ensure equipment compatibility and standardization across all eastern peninsula departments, EPHESA seeks to further the existing partnership by securing funding to purchase and provide updated radio equipment to the volunteer departments. As a Borough service area, EPHESA has already developed a relationship with a preferred vendor for radio communications equipment for public safety, allowing for a streamlined purchase process and ensuring equipment compatibility across all departments. Additionally, EPHESA has the capacity to assist with coordinating delivery and installation of the radio equipment, easing the financial and logistical burden on these 100% volunteer operated departments with extremely limited budgets. Replacing the departments' outdated radio equipment ensures continued access to emergency response without delay or service interruption for all rural Alaskans within the eastern peninsula and the communities served by these departments.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Kenai Peninsula Borough	River City Academy Behavioral Health and Workforce Integration	AK	Alaska's adolescent mental health crisis is a present emergency. The 2023 Youth Risk Behavior Survey found that 23 percent of Alaska high school students considered suicide in the past year and 19 percent attempted it, more than double the rate from a decade earlier. In rural areas, youth suicide rates are nearly double urban rates. AI/AN people are 91 percent more likely to die by suicide than the U.S. population overall. CDC research identifies school dropout as a public health issue, finding that education is one of the strongest predictors of health. Without upstream intervention, at-risk adolescents become chronic, high-cost users of behavioral health and medical systems. River City Academy is a small, mastery-based alternative school in Soldotna serving 65-100 students in grades 7 through 12 who have disengaged from every other educational option. Of its students, 94 percent carry at least one formal risk flag on the district intervention list, 31 percent have three or more simultaneous risk factors, 23 percent have IEPs, and 12 percent are Indigenous education students. Four students had suicide risk assessments this year after the school counselor position was cut in summer 2025. RCA functions as an upstream behavioral health intervention inside a school. RHTP funding would allow KPBSD to formalize this model with dedicated behavioral health and workforce staff, creating a documented, replicable approach to adolescent mental health intervention for rural Alaska.	RCA's model rests on three evidence-aligned elements that function as behavioral health interventions. First, mastery-based, non-punitive learning allows students to progress at their own pace without penalty, reducing anxiety and removing the primary trigger for students whose trauma or mental health challenges cause them to shut down in traditional graded environments. Second, mentoring and goal-setting are embedded in every school day, with each student assigned a teacher-mentor and engaged in weekly goal review tied to life planning, providing scaffolding that clinical intervention alone cannot offer for students experiencing depression or executive dysfunction. Third, the school's small size of 65-100 students with the same teachers year to year creates the belonging, safety, and known relationships that research identifies as protective factors against disengagement, and that for students with social anxiety, trauma histories, or histories of bullying represent a clinical need rather than a preference. RCA also provides structured independent living and workforce development through career courses, job shadows, personal finance, community service, and student-led enterprises. The Statewide Independent Living Council of Alaska delivers Pre-Employment Transition Services at RCA including youth leadership training, person-centered planning, and First Aid and CPR certification under a formal memorandum of agreement. RHTP funding would add two full-time positions. A Behavioral Health Coordinator would bridge the school and the broader health system, provide direct support for students with documented mental health needs, and coordinate with community providers. This position was cut from RCA in summer 2025, leaving four students with suicide risk assessments this year without consistent mental health access. A Rural Health Workforce Development Coordinator would formalize the existing career and independent living curriculum into intentional health-sector pathways including community health worker certification, elder care, medical administration, and health-supporting trades, building a workforce pipeline from the peninsula's most at-risk adolescent population into its most acute health workforce shortage. A program evaluation framework would document behavioral health indicators, educational engagement, and post-secondary outcomes to demonstrate impact and support replication at other rural Alaska schools.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Kenai Peninsula Homeless Coalition INC	Kenia Peninsula Homelessness Coalition/Shelters of Hope Community Resource Campus	AK	Many of Kenai Peninsula's residents are facing barriers that prevent them from accessing appropriate care. Housing instability, food insecurity, limited transportation, and financial hardship create challenges for individuals already navigating medical and/or behavioral health needs. In rural communities, these barriers are compounded by long travel distances and services spread across multiple agencies and locations. As a result, residents frequently must navigate several organizations just to meet basic needs before they can effectively engage in healthcare. This project represents an important planning and development phase focused on creating a more coordinated approach to these challenges. The coalition will work with community partners to plan a centralized community resource hub that improves access to services supporting health and stability. Planning efforts will focus on strengthening partnerships, identifying service gaps, and developing the operational model for a shared space where multiple providers can work alongside one another. When housing, food, or transportation needs go unmet, people cannot prioritize their health—they are focused on survival. This planning effort will lay the groundwork for a centralized entry point where residents can access housing assistance, food resources, transportation coordination, and connections to healthcare and behavioral health services in one location, improving service navigation and collaboration across providers.	Communities across the Kenai Peninsula have long recognized the need for stronger collaboration among organizations addressing the social determinants of health. While the region benefits from dedicated nonprofits, health providers, and community agencies, services are spread across a large and geographically rural area. Residents experiencing housing instability, food insecurity, transportation barriers, or behavioral health challenges often must navigate multiple systems and travel significant distances to access support. This fragmented structure can delay care and contributes to preventable crises that place additional strain on rural health systems. For many years, Love INC of the Kenai Peninsula has served as a key entry point for residents seeking assistance with housing, utilities, food access, and other essential needs, including programs supported by the Alaska Housing Finance Corporation. As demand for services grows, community partners have identified the need for a more integrated and coordinated model of service delivery. This project proposes establishing a collaborative community resource hub in Soldotna where partner organizations can work alongside one another to improve access to the ten vital services identified by 100% Communities, including food, housing, medical and behavioral health care, transportation, parent supports, education, job training, and youth mentorship. The hub will strengthen care navigation and upstream prevention by allowing residents to access multiple services in one location. The space will support job searches, workforce readiness and GED classes, and provide hygiene resources such as showers and laundry—key supports for individuals seeking employment or housing stability. Designed around a welcoming “living room” model, the hub will also provide a neutral, relationship-centered space where mobile crisis peer support staff can meet with individuals for follow-up engagement and early intervention. By strengthening collaboration among community partners and reducing barriers to essential services, this project improves rural health access, supports prevention-focused care, and builds a more sustainable community-based support system for Kenai Peninsula residents.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Kenai Senior Services - City of Kenai	Enhancing Access and Communication for Rural Senior Services	AK	The current automatic door system at the main entrance has aged and requires frequent maintenance. In addition, several interior areas of the facility would benefit from improved accessibility to allow individuals with mobility limitations to move safely and independently throughout the building. Improving accessibility within the facility will help ensure that seniors can consistently participate in nutrition programs, wellness activities, and other services that promote health and reduce isolation. The Senior Center also operates transportation and meal delivery services throughout the community. Reliable communication between drivers and the center is essential for coordinating routes, responding to changing conditions, and ensuring staff safety while serving rural residents. The Center’s current radios operate on the Alaska Land Mobile Radio system and will become obsolete under new requirements that mandate the removal of non-TDMA radios by December 2026. This project will address these challenges by improving accessibility within the facility and implementing a reliable communication system for staff delivering services throughout the community.	The Kenai Senior Center will address these challenges by improving accessibility throughout the facility and strengthening communication systems that support the delivery of services to rural older adults. The project will replace and upgrade key entryway doors with automatic door openers and improve accessibility at selected interior passageways within the Senior Center. Accessible doorways will be installed at critical locations, including restrooms, the library, and the game room. These improvements will allow individuals using walkers, wheelchairs, or other mobility aids to enter and navigate the building more safely and independently. By reducing physical barriers, these upgrades will help ensure that seniors can consistently participate in congregate meals, wellness activities such as exercise classes, educational opportunities in the library, and social programs in the game room that reduce isolation and support healthy aging. Enhanced accessibility also promotes dignity, independence, and comfort for all participants while encouraging engagement in services that prevent health decline. In addition, the project will provide Rapid Radios for staff operating transportation and meal delivery services. These devices allow instant, reliable communication between drivers and the center without complex programming or licensing. Improved communication will support coordination of routes, allow staff to respond quickly to changes in weather or client needs, and ensure the safety of both staff and clients while traveling throughout rural areas with limited cellular coverage. With the December 2026 ALMR system changes requiring replacement of the Center’s existing radios, Rapid Radios provide a sustainable, cost-effective solution for maintaining essential communication capabilities. Together, these improvements will strengthen the Kenai Senior Center’s capacity to serve rural Alaskans by improving accessibility, increasing participation in health-supporting programs, and ensuring reliable communication for outreach services. By addressing both physical and operational barriers, the project will promote consistent, safe access to programs that enhance health, independence, and quality of life for rural older adults, while supporting the sustainability and effectiveness of essential services across the community.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Kenaitze Indian Tribe	Kenaitze Indian Tribe's Recovery and Transitional Housing Planning Project	AK	Kenaitze is exploring the development of a recovery-oriented housing program to support individuals transitioning from substance use disorder treatment into stable community living. On the Kenai Peninsula, many individuals who complete treatment or detoxification return to environments that lack stability, structure, and recovery support, increasing the risk of relapse and disconnection from ongoing behavioral health services. At the same time, rural geography and limited transportation create additional barriers to maintaining engagement in care. While the Tribe provides a strong continuum of behavioral health services, including mental health and substance use disorder treatment, a gap remains between treatment and long-term recovery. Recovery-supportive housing could help bridge this gap by providing a structured living environment that supports continued participation in treatment, peer recovery support, and culturally grounded wellness practices. By providing a structured environment that supports engagement in care, recovery housing can reduce relapse, decrease avoidable emergency service utilization, and lower the likelihood of involvement in the criminal justice system.	Kenaitze proposes a structured planning process to determine the most appropriate strategy for developing recovery-oriented housing that supports individuals transitioning from substance use disorder treatment into stable community living. The project will focus on three primary areas of planning: community needs assessment, housing model evaluation, and facility feasibility analysis. First, the project will conduct a community needs assessment to better understand the scope and characteristics of recovery housing needs of Alaska Natives on the Peninsula. This work will include analysis of behavioral health service data, consultation with Tribal behavioral health staff, and engagement with community partners involved in treatment, recovery support, and housing services. The goal is to identify gaps in the current continuum of care and determine the types of housing supports most needed for individuals in recovery. Second, the planning process will evaluate a range of recovery housing models to determine which approach best aligns with community need and the Tribe’s behavioral health system. This analysis will include transitional housing, supportive housing, and recovery residence models such as those aligned with National Alliance for Recovery Residences standards. Considerations will include population served, expected length of stay, staffing requirements, service expectations, and integration with behavioral health services. Third, the project will assess potential facilities that could support a recovery housing program. This will include an evaluation of Tribal properties or locations within the community that may be more suitable. The feasibility assessment will examine building configuration, safety considerations, infrastructure needs, transportation access, and operational requirements. Throughout this process, the Tribe will coordinate across all relevant Departments including Behavioral Health, Wellness, Primary Care, Facilities, and Transportation to ensure that planning reflects Tribal priorities and operational realities. The project will also develop preliminary operational frameworks, policies, and sustainability strategies needed for future implementation. The result of these efforts will be a clear recommendation regarding the most appropriate housing model, location, and operational design for a Tribal recovery housing program that strengthens the continuum of behavioral health care and supports long-term recovery in the community.	\$50,000-\$250,000	Clinic	Other	Kenai Peninsula Borough	Advance to Planning

Kenaitze Indian Tribe	Kenaitze Indian Tribe's Dena'ina Wellness Village Concept	AK	Kenaitze has operated the Dena'ina Wellness Center, an Indian Health Service facility, for nearly 30 years and in 2025 opened the local Tuten charter school designed to serve kindergarten through sixth grade. While both of these facilities provide quality services, the Tribe still faces challenges implementing a traditional land-based operational approach including traditional healing services and educational services that utilize traditional healthy living models as their service model. One obstacle is that our current traditional healing integration models fall short because they try to fit traditional healing into Western medicine frameworks instead of rethinking the western model of care from the perspective of indigenous healing priorities and methodologies. The result is traditional healing is underutilized and not well understood by Western medical practitioners. The same situation is felt by our students who experience adverse health effects due to Western education approaches. Our traditional education model is centered around healthy activity, foods, and mental and behavioral health supports. The Dena'ina Wellness Village planning project will help outline the practical steps to create the long-term infrastructure to support these models while addressing the need for locally trained in-house certified practitioners and Tribal educators with well vetted tools who can encourage healthy children and families through our educational programming.	Our approach is to develop a no-nonsense, locally viable plan that takes into consideration the strengths and weaknesses of our current services and community capacity and will set a clear direction for how to increase access to active healthy living opportunities for our community. The plan will articulate how to develop the Dena'ina Wellness Village concept, which can grow and expand with the tribe as community needs shift over time. The planning process will use a multi-phased approach to frame the risk factors, feasibility considerations, and community need. Tribal traditional healers and culture and language educator experts will provide the main development concepts the plan needs to consider for operations, necessary facilities, training program development, and how to implement this plan progressively across related tribal programs. The project will cover campus planning activities such as surveying for land selection needs and architectural design to include: traditional healer practitioner spaces, outdoor education spaces for participants of all ages, and building or expanding on gym and fitness facilities. The planning group will develop a master plan that is ready to be implemented in various stages. Programming planning will follow a similar method with scope and sequence feasibility implementation benchmarks. These benchmarks will be created through community needs assessments, reviewing organizational charts and assessing staffing needs, collaboration across Kenaitze Departments including Health Systems, Culture and Language, Education, and Na'ini Social Services, and developing a Traditional Healer Working Group that would ideally extend beyond Kenaitze to include other Tribes throughout the State. The plan will consider education opportunities for western medicine providers to learn about and understand traditional healing and assessments to better grasp the qualifications or accreditations needed for a traditional healer to be able to move towards billable services, and would also review additional educational supports, including building out high school career pathway development partnerships with healthcare, career technical education, and other future workforce development needs.	\$1M-\$5M	Clinic	Other	Kenai Peninsula Borough	Deferred or Not Advanced

Kenaitze Indian Tribe	Kenaitze Indian Tribe's Naqut'ana Correspondence Support Program	AK	AN/AI correspondence students, particularly those connected to the traditions of the Dena’ina people, face a unique intersection of geographic isolation, limited culturally grounded programming, and reduced access to integrated academic and wellness supports. While correspondence education offers flexibility and autonomy, it can also unintentionally deepen disparities when culturally responsive systems of support are not intentionally built around students and families. Geographic isolation limits access to activities, tutoring, and mental health supports, often delaying identification of mental health needs. For youth experiencing intergenerational trauma, limited access to consistent peer and adult connection increases the risk of anxiety, depression, educational disengagement, substance misuse, and school non-completion. Additionally, most academic models prioritize Western frameworks over Indigenous ways of knowing. This disconnect can weaken cultural identity, which research consistently identifies as a protective factor for Indigenous youth. While these challenges are real, correspondence education also presents a powerful opportunity to integrate a culturally immersive, strengths-based model by embedding social-emotional skill development; physical wellness activities; academic tutoring; and cultural mentorship- all of which strengthen protective factors strongly associated with reduced behavioral health risk and improved long-term outcomes for Alaska Native youth.	To address the identified gaps for AN/AI correspondence students, the proposed approach is to create a structured, culturally grounded enrichment and support model that integrates Dena’ina cultural immersion, place-based physical activity, academic intervention, and social-emotional development into a coordinated system of care. Grounded in the traditions and values of the Dena’ina people, this model centers identity, belonging, and community connection as core drivers of academic and health outcomes. Core components include cultural immersion and identity development, structured social-emotional skill building; outdoor physical activity and wellness promotion; academic support and graduation pathway planning; and integrated community partnerships. These components will be delivered through a three-tiered model— universal, targeted, and intensive supports—ensuring all students receive prevention services while those with greater needs receive additional intervention. This model addresses the root causes of disparity rather than only responding to the symptoms. Ultimately, the Naqut’ana Correspondence Support Program will strengthen protective factors; integrate culture as prevention; reduce isolation; improve academic outcomes; and build community-connected systems. For AN/AI correspondence students, the solution is not simply more services, it is coordinated, culturally grounded, relationship-based support that integrates identity, education, and wellness into one cohesive model.	\$50,000-\$250,000	Clinic	Other	Kenai Peninsula Borough	Deferred or Not Advanced

Kenaitze Indian Tribe	Kenaitze Indian Tribe's Prescription Produce Project	AK	In 2025, the State of Alaska Department of Labor reported that overall price levels of major spending categories— including food, housing, transportation, education, and medical care— have increased by 18 percent since 2020. This sharp rise in costs is placing significant strain on household budgets, weakening food security for many families and increasing reliance on community resources, including food banks, many of which are operating beyond capacity. The burden is especially severe in rural communities where fresh produce and quality proteins are disproportionately expensive and often difficult to access. As a result, many Alaskans are forced to alter their spending habits, often turning to cheaper, ultra-processed foods that contribute to poor long-term health outcomes. It’s estimated that 49% of Alaskan households with children and 35% of households with elders receive SNAP, while more than 8,000 state households receive WIC benefits. While some local farms accept SNAP benefits and the WIC Farmers Market Nutrition Program provides \$45 of electronic food benefits to be used at farmers Markets across the state, the majority of these venders are seasonal, operating June- September, severely limiting access to fresh produce for Alaska’s most vulnerable populations. The proposed project will address food insecurity by planning for the implementation of a produce prescription program and the development of additional infrastructure to support this programming.	Numerous studies have shown associations between food insecurity and poor health outcomes, including hypertension, hyperlipidemia, and diabetes. Often, household responses to food insecurity include reductions in quality food consumption, such as lean proteins and fresh produce, instead relying upon ultra-processed foods (UPFs) which are frequently more accessible and less expensive. Emerging research outlined in the Make America Healthy Again (MAHA) report shows correlations between high levels of consumption of these foods and poor health outcomes including cardiovascular disease, diabetes, hypertension, and obesity. In an effort to address food insecurity and reduce chronic disease among Alaska Native and American Indian (AN/AI) community members throughout the Kenai Peninsula, Kenaitze will undergo extensive planning and research to implement a produce prescription program at the Tribe’s Food Security Campus (FSC), which will include the development of an additional year-round hydroponic unit and a mobile chicken coop. The phased project activities will consist of examining best practices for flock management in the south central region; conducting a community needs assessment for eggs and poultry needs; completing a cost/benefit analysis; undergoing a land survey at the Tribe’s Food Sovereignty Campus (FSC); hiring a hydroponics/greenhouse consultant; completing utility assessments and installation; Developing appropriate procurement and financial policies and procedures; completing a community market analysis for pricing produce; Developing a culturally relevant community education program curriculum; establishing a Tribal food sovereignty working group; participating in local Food Connection group; and collaborating with the ANTHC Tribal Food Sovereignty Network.	\$50,000-\$250,000	Clinic	Other	Kenai Peninsula Borough	Deferred or Not Advanced

Ketchikan Agricultural Producers Association	Ketchikan Shared-Use Kitchen: Community Food Access and Nutrition Hub	AK	Ketchikan faces a significant gap in community food infrastructure. Despite strong local interest in food production and preservation — and a documented need for commercial kitchen access among small food businesses, cottage food producers, and community members — no shared-use commercial kitchen facility currently exists in the region. This gap has real health consequences. Ketchikan is a rural, road-isolated community where fresh, nutritious food is expensive and often scarce. Residents — particularly Alaska Native peoples, elders, and low-income families — rely heavily on imported processed foods, contributing to elevated rates of chronic disease including diabetes, heart disease, and obesity. At the same time, significant community interest exists in producing and preserving local foods: wild-harvested seafood, foraged foods, and value-added products. Without access to a compliant commercial kitchen, this interest cannot be translated into action at scale. A vacant commercial bakery facility in Ketchikan represents an immediate opportunity to address this gap — activating existing infrastructure as a shared-use kitchen and food education hub to expand local food access, support nutrition education, and build long-term community food resilience.	KAPA proposes to lease and renovate a vacant commercial bakery facility in Ketchikan to establish a shared-use kitchen and community food hub. The facility would serve as accessible, affordable, DEC-compliant commercial kitchen space available to community members, small food businesses, and nonprofit food programs on a scheduled-use basis. The project will be implemented in two connected phases: Phase 1 — Facility Activation: KAPA will secure a lease on the existing facility, assess renovation needs, and complete improvements necessary to bring the space into full DEC compliance for shared commercial use. The renovation will leverage existing infrastructure — ovens, prep surfaces, ventilation — to minimize costs and construction complexity. Phase 2 — Programming and Operations: Once operational, the facility will support: - Shared-use kitchen access for cottage food producers, small food businesses, and community members seeking to produce and preserve local foods - Nutrition education and food preservation workshops focused on wild-harvested seafood, foraged foods, and traditional Alaska food practices - Food business development support through KAPA's Technical Assistance Program, including certification training, business basics, and one-on-one consulting - Partnerships with Alaska Native organizations, the Ketchikan Indian Community, local schools, and senior programs to deliver targeted programming for priority populations KAPA brings existing organizational infrastructure, established funder relationships, and a documented pipeline of community interest to this project. The shared-use kitchen will also generate real-world demand data to inform the development of a larger regional food hub facility currently in planning, providing a low-risk proof of concept for community food infrastructure investment in Southeast Alaska.	\$250K-\$1M	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

Ketchikan Gateway Borough	Ketchikan Gateway Borough Recreation Center Expansion	AK	The Ketchikan Gateway Borough proposes to use RHTP planning funds to advance the design and programmatic offerings for a planned expansion of the Gateway Recreation Center, positioning the facility as a cornerstone of community based preventative wellness. Planning funds would support completion of architectural and engineering design work while also retaining a specialized consultant to evaluate how expanded space and facilities could be intentionally programmed to improve rural health outcomes. This analysis would focus on increasing access to preventative wellness services, evidence based fitness and aquatics programming, rehabilitation and injury prevention activities, and inclusive offerings for seniors, low income residents, and individuals with chronic health conditions. The planning effort would also assess opportunities to scale the Borough’s summer camp and youth programming, which provides reliable childcare during non school months and enables parents—particularly those working in healthcare and other essential services—to remain in the workforce. Together, these planning activities will ensure that the Recreation Center expansion is purpose built to function as an integrated, non clinical preventative care asset that aligns with RHTP goals of improving access, population health, and system sustainability in a rural community.	The Ketchikan Gateway Borough’s approach to this RHTP planning effort is to intentionally link facility expansion planning with rural health transformation outcomes. The Borough will pursue a coordinated planning process that integrates architectural and engineering design with programmatic and operational analysis to ensure the expanded Recreation Center is purpose built to function as a preventative health asset. Planning funds will be used to advance design work for a planned facility expansion while engaging a qualified consultant with expertise in community health, recreation based wellness, and rural service delivery. The consultant will work in collaboration with Borough staff, healthcare providers, and community stakeholders to evaluate how expanded space, equipment, and layout could support increased access to evidence based wellness programming, chronic disease prevention, rehabilitation, and inclusive activities for priority populations such as seniors, low income residents, and individuals with limited access to non clinical health services. The planning process will also assess operational models, staffing needs, partnerships, and phased implementation strategies that align with RHTP goals. The outcome will be a shovel ready design and a clearly defined programmatic roadmap that positions the Recreation Center expansion as a scalable, sustainable, and community based solution for improving rural health outcomes.	\$250K-\$1M	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

Ketchikan Gateway Borough School District	Strengthening Community: A Scalable Systemic Model for Rural School-Based Resilience	AK	The Problem: Ketchikan youth face a mental health crisis exacerbated by isolation. Historically, our District relied on a few grant-funded specialists. A 66% reduction in our clinical staff—driven by housing and recruitment barriers—created a critical bottleneck. Needs significantly outpace capacity, leaving high-risk youth on months-long waitlists for overextended community providers. This specialist-dependent model is no longer a viable or safe front line of care. The Opportunity: We will strengthen the local health system by transforming the District into a Universal Tier 1 Health Hub, initiating fundamental care delivery transformation. Our approach drives long-term system-level change by: Workforce Transformation: Shifting from clinical dependency by equipping 200+ permanent staff with mental health literacy for universal prevention and early intervention. Clinical Realignment: Repositioning social workers to focus on high-acuity Tier 3 interventions and systemic consultation, rather than basic triage. Integrated Access: Leveraging the District’s unique position to address Social Determinants of Health, acting as the primary “No Wrong Door” entry for rural health needs. This project converts a staffing crisis into sustainable, community-wide resilience infrastructure designed for Alaska’s unique rural context.	The Multi-Tiered Transformation: Our approach shifts the burden of behavioral health from a shrinking pool of clinical specialists to a district-wide "Resilience Infrastructure." We will implement a three-pillar strategy: 1. Workforce Multiplication (Tier 1 & 2): Instead of the school social worker being the primary point of contact, we will transform our 200+ educators and support staff into a trained "front line." a) Mental Health Literacy: All staff will receive evidence-based training in early intervention, trauma-informed response, and mandated reporting. b) Universal Screening: We will move away from fee-heavy software (such as BIMAS) to a sustainable, staff-led Tier 1 model, identifying student needs before they escalate into clinical crises. c) Direct Support: Educators will be equipped to manage low-acuity behavioral needs in the classroom, preserving specialized clinical time for those in greatest need. 2. Specialized Clinical Excellence (Tier 3): By offloading Tier 1 & 2 tasks to trained staff, our licensed school social workers will transition into "High-Acuity Specialists" and "Clinical Consultants." a) Evidence-Based Interventions: Clinicians will be trained in and deploy high-fidelity interventions including CBT-SP (Cognitive Behavioral Therapy for Suicide Prevention) and DBT (Dialectical Behavior Therapy). b) Clinical Consultation: Social workers will provide "curbside" consultation to teachers, creating a continuous feedback loop that improves the quality of care throughout the school. 3. Technology-Driven Early Warning & Coordination: We will integrate modern technology to bridge the "rural distance" and response-time gaps. Some potential tools might be: a) AI Surveillance: Utilizing tools like Gaggle to monitor school-based digital platforms for indicators of self-harm or ideation, enabling near-instant intervention. b) Data Integration: Using PowerSchool alongside some custom-built data tools (such as our MTSS referral system) to track intervention outcomes and identify community-wide trends. c) No Wrong Door Referrals: Formalizing "warm hand-off" protocols with KIC Behavioral Health, Community Connections, and the Ketchikan Wellness Coalition (KWC) to address Social Determinants of Health (SDOH) such as housing, vision, and food security. These strategies transform the school from a place that simply "hosts" a counselor into a comprehensive community health hub that is resilient to individual staffing vacancies.	\$250K-\$1M	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

Ketchikan Indian Community	Realizing Health Through Partnership (RHTP) – KIC’s Salmon Falls Healing Center	AK	KIC has a real opportunity through the Rural Health Transformation Program to transform how behavioral health and addiction recovery are delivered in rural Alaska. For too long, individuals seeking treatment have been forced to travel far from home, or even leave the state, separating them from the families, culture, and communities that support lasting recovery. For thousands of years, Alaskan communities sustained health and wellness through connection to culture, land, and relationships. KIC’s Salmon Falls Healing Center offers an opportunity to restore these pathways to healing within a modern system of care. KIC is transforming Salmon Falls into a regional Healing and Wellness Campus that integrates residential recovery services, behavioral health care, peer support, and culturally grounded healing practices. Rooted in Alaska Native values, Salmon Falls will incorporate traditional activities, cultural teachings, elder guidance, and sober living to support whole-person healing. By bringing treatment closer to home and integrating Indigenous knowledge with coordinated healthcare services, Salmon Falls will strengthen recovery outcomes while expanding access for rural and remote communities. Salmon Falls represents more than a treatment program: it is a model for how Alaska can build healthier systems of care grounded in culture, community, and resilience. Our goal is not simply to create another program, but to help transform how healing happens across Alaska.	Ketchikan Indian Community’s approach to the Salmon Falls Healing Center is grounded in the understanding that lasting recovery requires more than treatment alone—it requires restoring connection to culture, community, and purpose while strengthening the systems that support health. Salmon Falls will be delivered as a coordinated recovery campus where residential treatment, behavioral health care, cultural healing, and workforce development operate together within KIC’s broader ecosystem of care. At Salmon Falls, individuals will receive residential recovery services integrated with KIC’s outpatient behavioral health programs, medical care, case management, and peer recovery navigation. This coordinated approach allows participants to move seamlessly between levels of care while remaining connected to family and community supports. By emphasizing early stabilization, continuity of care, and long-term recovery planning, the model reduces reliance on crisis-driven responses and supports lasting recovery. Cultural knowledge and Indigenous healing practices will be central to program delivery. Participants will engage in traditional activities, cultural teachings, Alaska Native foods, peer mentorship, and guidance from elders and culture bearers. These practices help restore identity, belonging, and connection to the lands and waters that sustain Alaska Native communities, addressing the deeper drivers of addiction including trauma, disconnection, and loss of cultural continuity. Salmon Falls will also serve as a workforce development hub for rural Alaska. KIC will prioritize local hiring and develop training pathways for Peer Support Specialists, Behavioral Health Aides, and Community Health Aides. Participants advancing in recovery will have opportunities to pursue workforce training and employment, strengthening the behavioral health workforce while creating pathways for individuals with lived experience to support others in their healing journey. Evaluation will begin in Year 1 through partnership with an Indigenous evaluator who will develop culturally relevant measures tracking recovery stability, improved coordination of care, workforce outcomes, and reductions in crisis utilization. Through this integrated approach, Salmon Falls will demonstrate how culturally grounded healing, coordinated healthcare, and workforce development can be delivered together to strengthen recovery systems and improve long-term health outcomes for Alaska communities.	\$1M-\$5M	Clinic	Statewide	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Advance to Implementation Application

Ketchikan Indian Community	Regional Health Talent Pathways (RHTP) -- Ketchikan's Health Workforce Development Program	AK	Southeast Alaska faces a growing healthcare leadership and workforce development crisis. KIC and PeaceHealth collectively employ 500+ people and together form the primary healthcare delivery infrastructure for the greater Ketchikan region—an island community accessible only by air or sea. Both organizations face persistent difficulty recruiting and retaining qualified medical providers and managers, particularly individuals from Alaska. When leadership vacancies occur, they often remain open for months due to Ketchikan’s geographic isolation and limited local talent pool. Recruiting from outside Alaska is costly and uncertain, and many external hires leave within a few years. At the same time, tribal citizens promoted from frontline roles into management frequently receive little structured preparation, contributing to burnout, turnover, and operational disruption. No dedicated healthcare leadership development program currently exists in Ketchikan or Southeast Alaska to prepare local talent for management and executive roles. This gap directly affects the approximately 13K residents of the Ketchikan Gateway Borough and surrounding communities who rely on KIC and PeaceHealth for care. KIC has a unique opportunity to address this challenge by developing the next generation of healthcare leaders locally, building a sustainable workforce that can support the region’s growing healthcare system for years to come.	The Ketchikan Health Workforce Development Program is designed as a five-year leadership and workforce initiative to support the rapid expansion of healthcare services in Ketchikan and across Southeast Alaska. Ketchikan Indian Community (KIC) and PeaceHealth Ketchikan Medical Center maintain a strong collaborative relationship and together employ more than 500 healthcare workers who form the backbone of healthcare delivery in this rural island community. To strengthen this system, the program will recruit up to 12 participants annually (six at each organization), preparing 60+ healthcare leaders over five years. Participants will include Alaska Native and American Indian individuals, non-Native residents, and individuals with disabilities seeking meaningful career pathways in healthcare. Through paid Management Associate positions, leadership training, and structured rotations across KIC and PeaceHealth departments, participants will gain the experience necessary to advance into supervisory and management roles within the regional healthcare system. This program ensures that the healthcare transformation already underway in Ketchikan is supported by a stable and locally rooted workforce. Over the next several years, KIC is expanding services through initiatives such as the Salmon Falls Healing Center, the Rural Family Health Access Center, and KIC’s clinic expansion and transition toward Federally Qualified Health Center (FQHC) readiness. As these programs grow, the need for trained supervisors, program managers, and operational leaders will increase significantly. By building a sustained leadership pipeline over five years, the program will help ensure these roles are filled by individuals from the region who understand the needs of rural communities. The ripple effect of this investment will extend far beyond the program participants themselves. Healthcare managers typically oversee teams of 10–20 staff members, meaning that 60 trained leaders could collectively support and guide 600–1,200 healthcare workers over time. As leadership capacity expands, so does the system’s ability to improve care coordination, strengthen workforce stability, and expand access to culturally responsive healthcare services. In this way, the program will help ensure that the healthcare transformation underway in Ketchikan translates into lasting improvements in health outcomes for rural communities across Southeast Alaska.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Advance to Implementation Application

Ketchikan Indian Community	Regional Health Transformation Project (RHTP) -- KIC's Clinic Expansion & FQHC Readiness Initiative	AK	KIC's Clinic Expansion & FQHC Readiness Initiative will serve as the clinical hub connecting KIC's broader health transformation efforts, including the Salmon Falls Healing Center (residential recovery), the Rural Family Health Access Center (trauma-informed entry point for families), and the Regional Health Talent Pathways workforce program. The expanded clinic will also support aging in place by strengthening access to elder home care services that allow elders to remain safely in their homes while receiving coordinated medical, behavioral health, and supportive services. Investments in care team capacity, quality systems, data infrastructure, and access-enabling services—including care coordination, eligibility support, transportation assistance, and culturally responsive outreach—will expand same-day and next-day access, strengthen continuity of care, and reduce avoidable emergency department utilization. These services align with Alaska's Section 1115 Medicaid waiver, which emphasizes integrated behavioral health and community-based care. KIC is also exploring enhancements to strengthen access and diagnostic capacity, including urgent care services, on-site imaging, expanded telehealth, and patient self-service kiosks. Together, these improvements advance KIC's readiness to serve as the region's future FQHC while strengthening a coordinated system of care that supports recovery, family stability, and healthy aging in Southeast Alaska.	KIC will implement our clinic expansion and FQHC readiness through four operational workstreams: 1) Access & Capacity. KIC will expand team-based primary care by integrating care coordinators, CHAP/BHAs, peer navigators, and panel management support to improve patient flow and continuity of care. Advanced access scheduling will support same-day and next-day appointments, while proactive outreach will prioritize high-risk patients and those transitioning from the Salmon Falls Healing Center and the Rural Family Health Access Center. Standardized care pathways (SUD/ODU, diabetes, maternal/child health) will incorporate culturally responsive elements including elder guidance, traditional healing, and traditional foods. 2) Quality, Safety & Data. KIC will implement a clinic-wide quality system aligned with FQHC expectations, including UDS-style reporting, clinical dashboards, and monitoring of key indicators such as HbA1c control, blood pressure control, depression screening, and SUD/ODU engagement. Closed-loop referrals with PeaceHealth and regional partners will strengthen coordination, while warm handoffs and care gap registries improve continuity and preventive care. 3) Enabling Services & Equity. KIC will expand enabling services that reduce barriers for rural patients, including benefits enrollment, transportation support, care navigation, culturally grounded education, and traditional healing. Stronger linkages with housing, food access, employment, and legal supports will ensure care plans reflect the realities of rural families. 4) Financial Sustainability & Readiness. KIC will advance FQHC readiness through revenue cycle improvements, payer enrollment, compliance systems, and documentation aligned with federal standards. A staffing model aligned with patient demand and a diversified payer strategy—including Medicaid, private insurance, 105(l) lease reimbursement, and grants—will sustain expanded services while the Regional Health Talent Pathways program strengthens the workforce pipeline. KIC is evaluating several enhancements as part of the expansion, including include developing urgent care capacity for same-day needs, integrating on-site imaging, expanding telehealth to improve, and implementing patient self-service kiosks to streamline intake, screenings, eligibility verification, and patient flow. Together, these improvements support efficient team-based care and align with FQHC standards for accessible and equitable healthcare delivery.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Advance to Implementation Application

Ketchikan Indian Community	Rural Health Trauma Prevention (RHTP) -- KIC's Rural Family Health Access Center	AK	KIC recognizes we cannot continue doing the same things and expect different results. Across rural Alaska, trauma and adverse experiences are major drivers of long-term health challenges, including behavioral health conditions, substance use, chronic disease, and family instability. Yet individuals and families experiencing trauma often face significant barriers when seeking care. Geographic isolation, limited providers, and fragmented systems make it difficult to access coordinated support, often forcing families to navigate multiple agencies for medical care, behavioral health services, youth support, and social services while repeating their experiences and missing opportunities for prevention and early intervention. We need a new approach that transforms how rural communities respond to trauma by centering healthcare and weaving supportive services around it. KIC proposes to establish a Rural Family Health Access Center to focus on prevention, trauma recovery, and family stability by creating a coordinated access point where individuals and families can connect to behavioral health services, medical referrals, youth programming, and wraparound supports. No coordinated model like this currently exists in Alaska. By bringing healthcare, prevention, and community partnerships together, the Center will reduce barriers to care, improve provider coordination, and strengthen early intervention, ensuring care is organized around health, healing, and long-term community wellbeing.	KIC's approach is rooted in the understanding that if we want different results, we must take different actions. For too long, individuals and families experiencing trauma have been asked to navigate fragmented systems that treat a single issue or one person at a time. KIC believes meaningful change requires meeting people where they are, operationalizing our community values, and centering healthcare while recognizing that healing must support the entire family. While many models describe “wraparound services,” healthcare is often only one component. At KIC, wraparound services are already integrated across our tribal programs. KIC provides healthcare, behavioral health services, housing support, social services, cultural education, and family programming within one tribal system. The Rural Family Health Access Center builds on this foundation by coordinating these services more intentionally and creating a single access point where families can connect to care. The Center will serve as a coordinated entry point where individuals and families can access behavioral health services, medical referrals, youth programming, and supportive services in one place. Rather than expecting families to navigate multiple agencies and locations, the Center will wrap services around individuals and families by strengthening collaboration among healthcare providers, behavioral health professionals, housing services, social service programs, and community partners. Prevention and early intervention are central to this approach. Modeled in part after the nationally recognized Family Justice Center framework, the Center will emphasize resilience, trauma recovery, and family stability, particularly for children and youth who have experienced adversity. By investing in prevention and family-centered support, KIC aims to interrupt cycles of trauma before they escalate into more serious health challenges. Grounded in Alaska Native values of family, respect, and community wellbeing, this model shifts the burden of navigating services away from families and onto systems of care, ensuring individuals and families can access coordinated support through a single, trusted entry point. KIC is also incorporating workforce and economic development into the approach, such as an Alaska Native artist market, gift shop, or cafe on the first floor of the 306 Building, creating community opportunity while strengthening the long-term sustainability of the center.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Wrangell (City and Borough)	Deferred or Not Advanced

Ketchikan Wellness Coalition	Malasakit Matters: Filipino Health Access Improvement Project	AK	“You’re the doctor.” “You know what’s best, I trust you”. In many Filipino households, particularly those shaped by the cultural value of pakikisama, prioritizing harmony, respect, and group cohesion, health-related decisions are often met with respectful silence or a reluctance to question authority figures. While this can promote social peace, it can discourage open dialogue, limit self-advocacy, and create barriers to culturally responsive care, especially in under-resourced or remote communities. In rural Southeast Alaska, Filipino communities in towns like Ketchikan Gateway Borough and Prince of Wales Island are navigating these cultural dynamics alongside barriers of isolation, underinvestment, and limited access to culturally competent care.	The project evolves the clinical dynamic by engaging youth and storytelling to promote health, wellness, and empowerment. KWC will expand a community health worker (CHW) network that places trained CHWs in a local high school, local hospitals, and public health organizations to serve as trusted cross-generational liaisons. Simultaneously, we will launch a youth-led storytelling initiative that equips Filipino youth to advocate for the health and wellness of their elders. Through interviews, music, dance, and digital storytelling, youth will collect and share narratives that reflect their community’s lived experiences. They will serve as tools for building trust, advancing wellness, and rebalancing power in health communication. Our project is grounded in the hypothesis that activating youth as cultural health advocates can interrupt generational cycles of silence, increase system trust, and generate new pathways for community-defined health knowledge. This project will extend shared resources, knowledge, and outreach strategies throughout KGB and Prince of Wales Island and the surrounding communities. In doing so, we build a regional network of cultural health advocacy, connecting voices, experiences, and solutions across island boundaries. Our goals are threefold 1.Advance intergenerational health equity by training youth to serve as community health storytellers, shifting internal narratives, and strengthening both youth and elders’ confidence to speak openly about health. 2.Expand the CHW workforce in Ketchikan with two new positions embedded in community institutions, schools, and hospitals while serving as a regional hub for outreach to outlying communities. 3.Create a Southeast Alaska community health storytelling archive featuring personal and collective narratives that can inform future health education, clinical interactions, and community dialogue. By combining CHWs with culturally resonant storytelling, this project aims to prototype a future model of rural and island health leadership, one that challenges who holds knowledge, how care is communicated, and what it means to be a health expert within one’s own family and culture. Youth are not just beneficiaries of health education but active co-creators of health knowledge. By equipping young people with storytelling tools rooted in tradition and pairing them with trained CHWs, we are building a community-led model of care that addresses clinical needs, cultural silence, stigma, and disengagement	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Advance to Implementation Application

Ketchikan Wellness Coalition	Community Food Security Planning	AK	KWC’s CFP Project addresses challenges and barriers around food security faced by Ketchikan’s rural residents. The remoteness leads to elevated food prices, periodic shortages, and restricted access to fresh produce, which disproportionately impacts the community’s Indigenous populations, Title I schools, and low-income neighborhoods. Ketchikan’s remote location contributes to high food costs, limited availability of fresh produce, and frequent supply interruptions. High food insecurity rates disproportionately impact children, where nearly 69% of Ketchikan’s children live in households where families are eligible for federal nutrition program assistance. Approximately 420 children in Ketchikan are considered food insecure and at the three key Title I schools, 26-57% of students rely on free or reduced meals. The project will mitigate the impacts of these challenges by creating a reliable source of fresh, nutrient-dense foods within the community in a strategic way that also fosters agricultural education and volunteer-based community models to promote sustainability and growth of food security efforts long term. KWC’s approach focuses on food production, preservation, and waste reduction to transform community reliance on costly imported goods and exported trash logistics by emphasizing agricultural education programming that leads to sustainable local food solutions. This project will include composting practices and use waste minimization strategies within the food forest.	The Community Food Forest will serve as a multi-generational learning hub, strategically situated behind Revilla High School and near Houghtaling Elementary School, which are two Title I schools in the area. Students can easily participate in food production and benefit from food security efforts. Through partnerships with after-school programs and the local recreation center, KWC will expand educational programming to students, providing hands-on opportunities to connect and learn about gardening, harvesting, and food preparation, led by gardening experts in the community. Promoting a youth engagement strategy is essential to support food literacy and understanding of sustainable food practices that carry on into adulthood. KWC’s plan to integrate this food forest with existing educational practices emphasizes self-sufficiency, and community efforts to help bring together youth and other populations that will engage in skill-based knowledge sharing on topics such as growing, preparing, and preserving food – a critical aspect of food security in isolated communities. KWC will minimize food waste and encourage community members to compost food scraps as part of the overall design of the food forest and educational awareness building. This, paired with knowledge that identifies key climate and composting practices in the curriculum, community members will engage in learning and sharing ways to keep resources within the local supply chain and economy, promoting a thriving ecosystem. The produce grown in the food forest will support local feeding programs and supplement low-income families’ access to produce, reducing the community’s dependence on important foods. Furthermore, this will focus on fresh produce, improving dietary health. Community garden members will play a vital role in maintaining the food forest, with plans for a structured volunteer system that encourages local involvement and support during months when school is out of session. The coordination and planning will take place in this phase to ensure the community-driven model is well coordinated to enhance the food forest’s sustainability, while also strengthening social ties and collective responsibility. With targeted educational programs, close alignment with community partners, and a focus on food waste reduction, the project is a timely and relevant response to Ketchikan’s food security challenges.	\$50,000-\$250,000	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

Ketchikan Wellness Coalition	Icelandic Prevention Model - Ketchikan & Community of Practice	AK	The Ketchikan Gateway Borough is geographically isolated from much of the state, not to mention the nation. Getting in and out of the area requires significant personal resources. In Ketchikan, 12.4% of the total population lives at or below poverty. The geographic isolation has been associated with increased substance use among youth with marijuana and alcohol leading in popularity. The most recent Youth Risk Behavior Survey found that 22.4% of Ketchikan High School (K-High) students reported consuming alcohol in the past 30 days. Among alternative school students the rate jumps to 41.6%. This clearly delineates between both high schools, and therefore can have empirical, measurable outcomes. By the time a K-High student graduates, 1 out of 2 will have had at least one drink with a significant number (12.5%) having had that drink before age 13. 8.9% of K-High youth reported current marijuana use; however, it is the most popular choice among Revilla (alternative school) youth with 46.7% reporting having used in the past 30 days and 77.5% reporting using at least once in their lifetime. Youth who consume alcohol and marijuana have higher rates of school absence, lower academic achievement rates, and increased rates of suicide and risky sexual behavior. Additionally, early onset of these problem behaviors has been closely associated with chronic illnesses (heart disease, liver disease, and cancer) in adulthood.	The project would be led and coordinated by two KWC staff, a Program Director and a Prevention and Data Integration Specialist. The approach consists of five inter-operational functions: 1) Applying a primary prevention approach that is designed to enhance the social environment. By working to increase social and environmental protective factors associated with preventing or delaying substance use and decreasing corresponding risk factors, the model prevents substance use by intervening on society itself and across a broad spectrum of opportunities for community intervention. 2) Emphasizing community action and embracing public schools as the natural hub of neighborhood efforts to support child and adolescent health, learning, and life success. The model will apply an ecological approach that addresses family, school, peer, and community social influences and other opportunities from within each neighborhood. 3) Engaging and empowering community members to make practical decisions using local, high-quality, accessible data and diagnostics. The project will utilize local data to (a) capture, focus, and sustain community attention on local factors essential to preventing substance use (b) guide the selection of strategies and the development of community capacity necessary to address the complex problem of substance use. 4) Integrating researchers, policy makers, practitioners, and community members into a unified team dedicated to solving complex, real-world problems. The IPM will convene a team-science-to-practice approach to prevention integrating researchers, policy makers, practitioners, and community members into a coalition that works to solve real-world problems in specific areas or neighborhoods over long periods of time. Partnerships already committed include the Alaska State Division of Population Health Sciences and University of Alaska Anchorage researchers Drs. Travis Hedwig and Alfgeir Kristjansson. 5) Matching the scope of the solution to the scope of the problem, including emphasizing long-term intervention and efforts to marshal adequate community resources. The project will work to improve our society toward one that protects young people from substance abuse, prioritizing creating the community capacity and long-term commitments necessary to achieve our goal.	\$250K-\$1M	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

Ketchikan Wellness Coalition	KGB Community Health Network Planning & Navigators Project	AK	The CHNA Planning & Navigation project presents Ketchikan Gateway Borough with an opportunity to improve access to care and support transitions between care providers by expanding the community health service network into digital domains. Navigators, both in person and via digital user interface, have been shown to improve access and reduce barriers by overcoming challenges like transportation, childcare, and language barriers to name a few. The guided support provided via navigation ensures patients reach necessary appointments, connect with key ancillary services, and elevate the level of coordination between providers. Navigators also serve to educate consumers on a personalized level to better position them to respond proactively to their healthcare needs. Studies have shown that patient navigation leads to higher satisfaction, more timely treatment, and improved outcomes.	Led by Ketchikan Wellness Coalition, the CHNA will facilitate the identification of root causes of chronic illness, barriers to accessing care (affordability, availability, accessibility, accommodation, and acceptability), and take the lead in the development of a comprehensive approach to improving quality of care that is not only easily accessible but also sustainable in perpetuity. A key component to the plan is the application of Health Navigators to facilitate patient access and guide them through the complex healthcare system. The navigation component is designed to provide a centralized virtual navigation system; we aim to simplify access to essential community resources such as mental health services, food security assistance, and housing support, which are often barriers to care for rural communities. The project will actively involve community members in the development and implementation process, ensuring that their voices and needs are prioritized. This inclusive approach will help create culturally competent resources that resonate with rural populations, fostering trust and engagement. Importantly, we will provide navigation with tailored support ensuring that unique individualized barriers do not impede access to necessary services. While the Ketchikan Wellness Coalition will lead the project, its success will depend on the active involvement and input from several key community partners, including PeaceHealth, the Mobile Integrated Healthcare Team (MIH), the Reentry Coalition, SAIL, Community Connections, and SEARHC. Our partners serve as vital direct service providers, and we are committed to incorporating their insights and addressing the needs identified through our collaborative efforts. Together with community stakeholders, the process will proceed through multiple phases including Defining the Community, Data Collection and Analysis, Health Needs Prioritization, and the development of a Health Improvement Plan that will articulate implementation, evaluation, and sustainability strategies. By leveraging the strengths and resources of these partners, we aim to create a comprehensive needs assessment and navigation system that effectively supports both service providers and community members, ensuring a well-coordinated approach to enhancing health access.	\$250K-\$1M	Single Community	Ketchikan Gateway Borough	Deferred or Not Advanced

Keystone Chiropractic	Ketchikan Integrated Wellness Center and Travel Clinics	AK	Currently the healthcare landscape in rural SE Alaska is reactive acute care rather than preventative care. Rural families often lack conservative options for musculoskeletal health, neurological wellness, and birth support because they are inaccessible or non-existent. 1. Workforce Vitality & Neurological Health: Our regional workforce is the backbone of our economy, yet it is struggling with a dual burden of acute and chronic musculoskeletal injuries. - Physical labor vs sedentary impact: We see a “pinch effect” where half our population suffers from heavy labor injuries, while the other half suffers from neurological and postural decay associated with sedentary lifestyles and heavy technology usage (“Tech Neck”). - Currently, many workers rely on pharmaceutical pain management because they lack consistent access to conservative rehabilitation. 2. The birth crisis and lack of perinatal support: The state faces a high rate of obstetric interventions. There are high rates of C-sections and a lack of specialized support in the birthing room. Mothers often lack access to: - Biomechanical preparations: Without conservative chiropractic care to optimize pelvic alignment, labor often becomes stalled, leading to preventable surgical interventions. - Immediate postpartum continuity: There is a critical shortage of lactation support and Doula/midwifery integration, leaving mothers without “fourth trimester” care necessary for successful breastfeeding and emotional recovery.	We plan to shift our community from reactive to preventative care. Our approach utilizes a hub and spoke delivery system to bridge the geographic gap in healthcare access between Ketchikan, Seattle, and rural underserved communities on POW. 1. The Keystone Chiropractic Wellness Center (The Hub): The physical expansion of our Ketchikan facility serves three strategic purposes: increasing regional clinical capacity, hosting specialized visiting providers, and establishing a community for maternal health. This expansion transforms a traditional practice into a comprehensive multidisciplinary Integrated Wellness Center. This larger footprint allows for: - Diversified conservative care: Integrating pediatric, perinatal, family wellness, nutrition, adding associate positions to train Drs. and staff. - Technical integration: The expansion of evidence-based non-invasive technologies will help arrest biomechanical decay and accelerate tissue repair. - Shockwave Therapy provides a non-surgical, non-pharmacological solution for pain management and functional restoration from overuse injuries. - Low-Level Laser Therapy provides a gentle yet powerful tool for cellular repair and systemic inflammation reduction and expediting healing time. - Digital Infrared Thermal Imaging: Adding training and thermographic imaging will serve as an early-detection and monitoring tool for neurological and vascular dysfunctions and eliminate travel to Seattle for these services. - Our larger footprint will include a dedicated rotational specialist room which allows us to bridge the "specialty gap" by hosting experts from Seattle and larger medical hubs on a periodic basis. - The "village" space: Peer Support and Perinatal Sanctuary. A portion of the new footprint is dedicated to Non-Clinical Peer Support. This is where the "birth crisis" is addressed through community connection: Lactation Peer Groups, Postpartum Resilience Circles, and Workforce Wellness Workshops. 2. Prince of Wales Remote Clinics (The Spokes): We will restore wellness care access to POW through a regular rotation of mobile and remote clinical pop-ups. 3. Workforce Development: The Community Support Network: Recognizing that the “birth crisis” cannot be solved by clinicians alone, we will launch a Community Perinatal Training Initiative. - Lactation & Birth Support Training: We will sponsor and train community members from Ketchikan, POW, and Metlakatla to become Peer Lactation Supporters and Birth Doulas.	\$250K-\$1M	Family or primary care	Multi-Community or Participating in Regional Hub-and-Spoke	Ketchikan Gateway Borough; Prince of Wales-Hyder Census Area	Deferred or Not Advanced

Kin Support Program Haa Yaitx'u Saiani	Kinship Navigator Evidence Project: Strengthening Community Wellness	AK	Our everyday work of expanding families' access to social determinants of health is about tangible supports at the surface level, but the core mission is healing from multi-generational trauma, which accounts for many of Alaska's gross health disparities. Our recent development of a formal evaluation plan will help us prove the connection between supportive kinship services and healing from trauma. We designed our culturally-based program utilizing Dr. Jessica Sanigaq Ullrich's Indigenous Connectedness Framework, which emphasizes the importance of spiritual and cultural connectedness in fostering relational well-being. In this framework, reciprocal external relationships with others (including extended family, land, and culture) are connecting forces that support a healthy internal relationship with self. Those external and internal relationships support healing from trauma, resilience, and prevention. Dr. Ullrich and Co-Director Vanessa George conducted focus groups with elder caregivers in Sitka and Petersburg in 2024 to help design our initial measures of intergenerational wellness. Taking this research a step farther through a collaborative program evaluation with Dr. Ullrich and Chapin Hall will: 1. Produce rigorous quantitative data on the intergenerational wellness benefits of services; 2. Complement anecdotal and survey data from clients with objective evidence; and 3. Build credibility for inclusion in evidence-based registries and funding streams.	This approach advances the program's long-term sustainability plan that Stellar Group created for our program through a grant from the Alaska Mental Health Trust Authority. The plan calls for program evaluation as a key element to align with federal prevention funding streams. The evaluation team - consisting of Chapin Hall, Dr. Ullrich, and our staff - have developed an evaluation plan and are ready to start now. Chapin Hall is a research and policy center focused on improving the well-being of children, youth, families, and their communities. Chapin Hall provides rigorous data analysis and achievable solutions to be a partner in improving the lives of people and communities facing adversity. Dr. Ullrich resides in Alaska and serves as Assistant Professor for Washington State University's Institute for Research and Education to Advance Community Health. IREACH is a large research institute that conducts transdisciplinary research devoted to promoting health and health care equity among Indigenous and rural populations. During Evaluation Phase 1, the team will engage internally and with community partners (including health partners) to formally document the program's unique kinship navigation model and rural service delivery context it is operating within. In addition to reviewing all available program documentation, the team will conduct interviews with key partners across the Southeast region and review relevant literature. In addition, the team will facilitate an in-person workshop to co-create the theory of change for our service model. The team will utilize the information already gleaned from our 2024 focus groups and build upon the measures of Intergenerational Wellness developed through that research. Phase 2 will focus on identifying the model's core components and determining how to assess fidelity to the model. The team will develop and refine a business process map for the program that can be replicated with adaptation in other Alaska communities and regions. Throughout this process, the logic model may be refined. During this phase, the team will also develop an evaluability assessment protocol. The evaluability assessment will determine how ready the Kin Support Model is for the next phase of evaluation, identifying where additional information or adjustments may be needed to prepare for the deeper dive into evaluation methodology.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Advance to Implementation Application

King Island Native Community	King Island Health Revitalization Plan	AK	Lack of social engagement opportunity for elders. Ensuring elders have access to healthy cultural foods. Hunters and youth that do not have access to hunting equipment. The community of Nome is known for its high rates of alcohol abuse and violence, the King Island Health Revitalization Program aims to organize community members in cultural activities that will improve the health and social outcomes of the community. Elders live in substandard, dilapidated homes. The community hall and carving room do not have an adequate HVAC system for the prevention of communicative airborne disease and risks posed with the dust of ivory carving.	The Ugiuvak Provider Health Program will revitalize the King Island community centered on Native ways of living in relationship with the ocean, land and marine mammals. The goal of this program is to convene experienced hunters and providers with youth to ensure the intergenerational transfer of knowledge of ocean hunting and harvesting methods for the purposes of sharing with elders and members of the community. This program supports healthy living, as local and ocean foods are the most nutrient rich foods. This program aligns with the Healthy Beginnings Initiative by establishing healthy habits for youth, building a foundation for lifelong health, nutritional education, and strengthening mental health. Hunting, harvesting and processing activities require both mental health and physical strength. Working together as hunting crews, as well as in support of the community strengthens social connections to ensure community health and cooperation. This activity will also support the establishment of youth cultural and language camps, to ensure elders and providers are instilling within the next generation a strong cultural foundation. Culture and language camp activities include hunting, harvesting, processing, sharing, sewing, singing, dancing and potluck gathering. As the cycle of each season from spring to fall, it's a busy time of year gathering, processing and sharing with community. This program will provide 6 ocean going aluminum boats, motors and hunting equipment, as well as convene cultural camps. The start-up costs of this program are \$491,200. This program aligns with the Health Care Access Initiative by supporting strong social engagement with elders to improve well-being; as well as provide elders with nutrient rich local foods. This program will serve the 28 elders in the King Island community. This program aligns with promoting healthy lifestyles with culturally appropriate community education focused on nutrition and physical activity, supports local food production and healthy eating initiatives, provides nutrition education support, harvesting knowledge of local foods and convenes the community in wellness programming. The King Island Native Community recognizes the need to install an HVAC system for the indoor environmental health and prevention of communicative airborne disease in the gathering hall and the ivory carving room. The estimated project cost is \$200,000.	\$1M-\$5M	Single Community	Nome Census Area	Deferred or Not Advanced

Knik Tribal Council	Creating a Rural Behavioral Health Access Hub	AK	Mat-Su communities face persistent barriers to timely and comprehensive behavioral health care due to workforce shortages, limited service environments, and the geographic challenges common to rural Alaska. Existing care models are often constrained by facility and infrastructure limitations that prevent organizations from expanding workforce capacity or implementing service delivery approaches such as tele-behavioral health, medication management, substance use treatment, prevention programming, and coordinated care. Our current outpatient services operate in a space-limited setting that restricts clinical staffing growth, group programming, and innovative behavioral health services. As a result, individuals and families in the region may experience delays in care, limited service options, or the need to travel long distances to access specialized behavioral health support. This project addresses the opportunity to prepare and activate a Rural Behavioral Health Access Hub that will transition services from a constrained outpatient model to a scalable system capable of supporting expanded workforce roles and coordinated service delivery. Establishing service-ready environments will enable tele-behavioral health, substance use programming, prevention services, and coordinated intake and care management. By addressing infrastructure barriers, the project strengthens system capacity and positions the region for expanded, sustainable behavioral health access in the Mat-Su Valley	Our proposed approach centers on renovating and equipping an existing facility to establish a Rural Behavioral Health Access Hub that expands service capacity in the Mat-Su Valley. The project responds to Alaska’s behavioral health crisis, including high rates of suicide, substance use disorder, and limited access to timely care in rural communities. Renovation will configure the facility to support a coordinated continuum of behavioral health care. The project will adapt the building to create service-ready environments supporting outpatient care for children and adults, tele-behavioral health access, prevention programming, traditional healing activities, workforce development, crisis response capacity, veteran support services, substance use disorder treatment, and medication management. Renovation will align the layout with operational needs by establishing spaces for individual and group counseling, telehealth delivery, coordinated intake, supervision, and culturally responsive programming. Equipping the facility will ensure clinical, telehealth, and program spaces are functional and able to support expanded workforce roles and integrated, coordinated care delivery. Furnished and technologically equipped areas will support care coordination, early intervention and prevention activities, and workforce training and supervision. By addressing infrastructure limitations that restrict workforce growth and service availability, the project prepares the facility to support expanded services and future workforce recruitment. Improved infrastructure will allow services to be delivered closer to communities through telehealth and coordinated care models that reduce travel barriers and improve continuity of care. This investment creates infrastructure enabling sustainable workforce growth and long-term behavioral health access. Through targeted renovation and equipment investments, the Rural Behavioral Health Access Hub will expand access to coordinated, culturally responsive services and strengthen the region’s response to suicide risk and substance use disorder. This investment advances long-term behavioral health system transformation by creating infrastructure that supports workforce expansion and sustainable rural service capacity. Over time, expanded access to coordinated care will contribute to improved community health outcomes, reduced crisis events, and stronger wellbeing for Mat-Su families.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Knik Tribal Council	Build Healthy Habits for Youth Program	AK	Alaska youth experience major health disparities related to chronic disease risk, behavioral health challenges, and limited access to prevention programming, especially in rural and frontier communities. Geographic isolation, transportation barriers, and limited recreational infrastructure often prevent youth from participating in physical activity, health education, and behavioral health supports. Prevention-focused programming is urgently needed. Alaska has one of the highest suicide rates in the nation, and youth behavioral health indicators remain concerning. According to the Alaska Youth Risk Behavior Survey, 41% of high school students reported persistent feelings of sadness or hopelessness and nearly 24% reported seriously considering suicide. About 16–20% of Alaska youth report attempting suicide. Chronic disease risk factors are also emerging early. Physical inactivity, poor nutrition, tobacco use, and stress contribute to conditions including diabetes, cardiovascular disease, and obesity. Research from the Centers for Disease Control and Prevention shows that Adverse Childhood Experiences (ACEs) increase the risk of chronic disease, mental illness, and substance use later in life. Many rural Alaska communities lack accessible prevention and health education programs. This project will expand youth wellness programs that promote physical activity, nutrition education, behavioral health resilience, and family engagement across underserved Alaska communities.	This project will implement a prevention-focused youth wellness initiative that integrates physical activity, health education, and behavioral health resilience through partnerships with schools, Tribal organizations, and community partners. The project will begin with a community readiness assessment to identify gaps in youth programming, available recreational spaces, and opportunities for prevention program. Community surveys and stakeholder engagement will help identify priority communities, program needs, and culturally appropriate strategies for implementation. Based on these findings, the project will expand youth wellness programming through three integrated strategies. First, the project will increase access to physical activity through school and community fitness programs, including activities modeled on the Presidential Fitness Test and culturally relevant outdoor recreation aligned with Alaska’s subsistence calendar. These activities support national recommendations that youth engage in at least 60 minutes of daily physical activity. Second, the project will expand evidence-based health education and chronic disease prevention program. Programs such as the National Diabetes Prevention Program (CDC) and Alaska’s Fresh Start program will be delivered through digital platforms supported by trained health coaches and community health aides. These programs reduce the risk of developing type 2 diabetes by up to 58% among participants who achieve modest lifestyle changes. Third, the project will strengthen youth mental health resilience through culturally responsive social-emotional learning and leadership development. Youth leadership, peer mentoring, and family engagement will build protective factors linked to positive mental health outcomes. Training in Question Persuade Refer (QPR), Adverse Childhood Experiences (ACE) awareness, and trauma-informed approaches will be provided to educators, families, and community leaders. To support long-term delivery, the project will expand Health Aide Academies that train local community members to deliver prevention programming and health education, increasing capacity and supporting culturally responsive services in rural communities. Through these strategies, the project will create a scalable model for youth health promotion that addresses chronic disease risk while strengthening mental health resilience and community wellness.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Knik Tribal Council	Rural Healthcare Simulation and Workforce Training Center	AK	Alaska faces persistent healthcare workforce shortages, particularly in rural and remote communities where geography, high costs, limited training infrastructure restrict development of local healthcare professionals. Demand continues to grow;estimates indicate Alaska needs 9,400 new healthcare workers annually, including 1,400 registered nurses each yearly. Access disparities are severe in rural regions. Many communities are accessible only by air or water, requiring patients to travel for care. Alaska has 229 Alaska Native villages, where residents face limited provider specialty care. Maternal health access illustrates these challenges:30.1% of births occur among women in rural areas, yet only 14% of maternity providers practice there, creating service gaps. Clinical training opportunities remain concentrated in large cities and very expensive, forcing many students to leave their communities for education and reducing the likelihood they return to practice in rural areas. Rural healthcare systems often rely on traveling staff or experience prolonged vacancies. This project addresses challenges by establishing a Rural Healthcare Simulation and Workforce Training Center with hands-on clinical training offered to youth(sparking early interest) and adults. By increasing regional training capacity, providing experiential learning in primary & emergency care, pediatric care, specialties certificates, the project will strengthen the healthcare workforce pipeline to rural Alaska	This project strengthens rural healthcare access, workforce capacity, and system resilience in Alaska by establishing a Rural Healthcare Simulation and Workforce Training Center that expands clinical training and prepares providers for remote and frontier care. There is nothing similar to this project in Alaska. Workforce → Expanded healthcare training pathways for rural Alaska students and providers Access → More providers trained for rural, remote, and telehealth care System Impact → Stronger regional healthcare workforce pipeline The center will replicate real-world healthcare environments and provide hands-on experiential training across care settings common in rural and frontier systems. The facility will include eight training environments supporting hospital care, emergency trauma response, rural primary care, maternal and pediatric care, clinical skills, telehealth technology, and simulation control/debrief operations. These spaces will use simulation equipment, task trainers, and audiovisual systems that allow instructors to run realistic clinical scenarios while monitoring performance. Training programs will support multiple levels of the workforce pipeline. Early exposure programs will introduce youth and young adults to healthcare careers through simulation demonstrations and exploration. Certification pathways will support training for Certified Nursing Assistants, Community Health Workers, and Emergency Medical Technicians. Clinical training will also support nursing students, Community Health Aide trainees, and other professionals through scenario-based learning in patient assessment, emergency stabilization, maternal and pediatric care, and chronic disease management. Telehealth training is a core component. Because many Alaska communities lack road access and depend on remote consultation systems, providers must deliver care through digital diagnostics and telemedicine platforms. Instruction will emphasize interdisciplinary teamwork, clinical decision-making, and rural emergency preparedness. Simulation scenarios will reflect conditions faced by providers in small clinics, tribal health systems, and remote villages, including limited staffing and delayed transport. By combining simulation technology with workforce training pathways, the project will expand regional training capacity, reduce barriers to healthcare education, and strengthen the pipeline of providers serving rural Alaska communities	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Knot Technology Solutions	Improving Public Health Outcomes Through Integrated Technology Solutions	MD	Through modern cloud platforms, secure data integration, telehealth technologies, and analytics, we help extend healthcare services beyond traditional facilities. These solutions support the Alaska Department of Health in improving access to care, strengthening clinical decision-making, and building sustainable healthcare systems for Alaska’s rural and frontier populations.	Our approach focuses on leveraging secure, scalable technology to extend healthcare services beyond traditional facilities. By implementing telehealth platforms, cloud infrastructure, and interoperable data systems, we help providers deliver care to patients in rural and remote areas. Through collaboration with local stakeholders and the Alaska Department of Health, we enable better care coordination, improve data-driven decision making, and support sustainable healthcare access for underserved communities.	\$250K-\$1M		Statewide	Aleutians East Borough; Bethel Census Area; Dillingham Census Area; Kodiak Island Borough; North Slope Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced
Kodiak Area Native Association	Kodiak In-Home Care Coordination Program	AK	Patients in the Kodiak region who require ongoing support at home often fall into a gap between routine ambulatory outpatient care and higher levels of care such as hospitalization or long-term facility placement. Individuals who need help managing medications, navigating their homes, monitoring and managing chronic conditions, or recovering after a change in health status may not require hospital level care, but they still need more support than periodic clinic visits can provide. Without a structured in-home care coordination model, patients and families are often left to manage these needs on their own or to pursue long swing bed or rehabilitation stays at the local crucial access hospital. This leads to worsening health conditions, increased caregiver strain, and preventable use of emergency or hospital services. This project addresses the opportunity to establish a coordinated in-home care model that provides consistent monitoring, support, and connection to clinical services for patients who need additional care at home. By creating this missing layer of support between clinic visits and hospitalization, the program aims to strengthen continuity of care and improve health outcomes for patients in the Kodiak region.	KANA proposes to develop a coordinated in-home care model that connects patients in their homes with KANA’s existing clinical services. The program would deploy trained home-based care staff to provide routine in-home support for patients who need additional monitoring and assistance between clinic visits. Home-based care staff would provide services such as medication support, monitoring and management of clinical conditions, assistance with basic personal care, and regular nursing and provider check-ins to help identify changes in a patient’s condition. These services would be supported by registered nurse oversight to guide care planning, monitor patient status, and coordinate follow-up care when concerns arise. Clinical providers would maintain medical oversight of the program and would support the care teams with telemedicine and home visits as appropriate. Telehealth technology would allow in-home staff to connect directly with providers for consultation and assessment, allowing changes in a patient’s condition to be addressed quickly without requiring onerous clinic or hospital visits. As the program develops, the model would expand to support a range of patient needs, including individuals with mobility difficulty, managing chronic conditions, patients recovering after hospitalization, and Elders who require additional support to remain safely at home. Over time, the program may incorporate additional services such as remote patient monitoring, mobile phlebotomy support, and coordination with other care team members including nutrition, rehabilitation, and behavioral health services. Through this coordinated approach, the program would create a structured in-home care model that strengthens continuity of care and expands the reach of the regional health system into patients’ homes.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Kodiak Island Borough	Advance to Implementation Application

Kodiak Area Native Association	Cultural Wellness Expansion	AK	Programs serving Alaska Native communities in the Kodiak region recognize the role cultural connection plays in wellbeing. Cultural engagement strengthens protective factors linked to mental health, resilience, and recovery from substance use disorders. KANA programs already incorporate cultural activities within peer support, community services, and other wellness initiatives, but the ability to offer them consistently is limited by program capacity, staff expertise, and challenges of coordinating activities across Kodiak and surrounding villages. As a result, access to culturally grounded wellness opportunities varies across communities, and many programs lack the resources or cultural expertise to sustain cultural activities that support connection and wellbeing. This project will expand cultural wellness programming through partnership with the Alutiiq Museum. By connecting KANA programs and initiatives with museum staff, artists, and cultural bearers, the project will expand access to cultural workshops, instruction, and enrichment opportunities across the Kodiak region. Programming will include in-person activities in Kodiak and the villages, as well as hybrid learning such as recorded instruction or virtual participation, making cultural engagement more accessible across the archipelago. Social media and community outreach will reinforce connections between cultural values, self-care, and health, encouraging community members to support wellbeing and access to care.	KANA will expand cultural wellness opportunities across the Kodiak region through partnership with the Alutiiq Museum, connecting cultural practitioners, artists, and educators with KANA programs and communities. Cultural workshops and enrichment activities will be offered in Kodiak and in surrounding villages, increasing opportunities for residents to engage with cultural knowledge, traditional practices, and language. Programming will include hands-on workshops and artist-led instruction, along with cultural activity kits and learning materials that allow programs and participants to continue activities beyond the workshop setting. To expand access across the archipelago, the project will incorporate hybrid delivery methods that combine in-person activities with virtual participation when possible. Workshops may also be recorded or streamed to reach additional programs and communities when travel is limited. These activities will complement existing KANA wellness, peer support, and behavioral health programs by strengthening culturally grounded approaches that support connection, identity, and community wellbeing.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Area Native Association	Cultural Workforce Training	AK	Organizations serving Alaska Native communities in the Kodiak region rely on a workforce that is often recruited from outside the region. While these employees bring important professional expertise, many arrive with limited familiarity with Alutiiq culture, regional history, and the cultural values that shape relationships within local communities. At present, there is no coordinated regional approach to preparing employees to work effectively across these cultural contexts. Without meaningful cultural orientation and learning opportunities, staff may struggle to understand the historical and cultural factors that influence how individuals and families engage with health and social services. This gap can affect communication, relationship building, and trust, and may limit the ability of organizations to deliver services in ways that feel respectful and responsive to community priorities. This project will develop a coordinated cultural workforce training program that supports employees across health care, social services, and partner organizations serving Alaska Native communities in the Kodiak region. In partnership with the Alutiiq Museum, the program will create culturally grounded learning opportunities that strengthen workforce readiness and support more effective engagement with the communities they serve.	KANA proposes to develop a coordinated cultural workforce training program in partnership with the Alutiiq Museum to strengthen cultural readiness among employees serving Alaska Native communities in the Kodiak region. The project will focus on creating structured cultural learning opportunities that help employees better understand the history, values, and lived experiences of the communities they serve. The project will begin with development of a cultural workforce training framework in collaboration with the Alutiiq Museum and other cultural knowledge holders. This work will identify priority learning topics, appropriate teaching approaches, and opportunities to incorporate local cultural expertise into workforce development. Training content will be designed to support employees across health care, social services, and other organizations serving Alaska Native communities in the Kodiak region. Building on this framework, the project will implement cultural orientation and workforce learning opportunities that may include structured orientation sessions for new employees, cultural learning workshops, and community-based learning experiences led by cultural practitioners and educators. These opportunities will provide employees with meaningful exposure to regional history, cultural values, and the cultural context that shapes community relationships and engagement with services. The project will also focus on integrating cultural learning into ongoing workforce development practices. By establishing partnerships, training materials, and delivery models that can continue beyond the initial project period, the program will help create a sustainable cultural workforce training model that strengthens the ability of organizations serving the Kodiak region to deliver services in culturally responsive ways. Through this approach, the project will help build a workforce that is better prepared to engage with Alaska Native communities and support services that affect health and wellbeing in rural communities.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Area Native Association	Kodiak Regional Village Wellness Center Development	AK	Remote villages in the Kodiak region have limited infrastructure designed to support community wellness activities outside of clinical care. While KANA operates village clinics that provide primary and behavioral health services, many communities lack dedicated spaces where prevention programming, cultural activities, behavioral health groups, and other wellness-focused programs can occur consistently. Existing community spaces are often shared facilities not designed for health-related programming, which can make scheduling difficult and limit opportunities for regular activities that promote wellbeing. This project addresses the opportunity to develop regional village wellness centers that provide flexible, community-centered spaces for prevention, cultural programming, and wellness activities. Through a planning and development process, KANA will work with village communities and local partners to evaluate facility options, including renovation of existing structures or development of new space. These centers will strengthen local infrastructure that supports prevention, cultural engagement, and community-based wellness activities that complement clinical services in rural Alaska.	KANA will lead a community-centered planning and development process to establish village-based wellness centers that support prevention, behavioral health, and community wellness programming. The process will begin with engagement with village communities, tribal governments, and local partners to identify priorities and assess potential locations. Planning efforts will evaluate options to renovate existing facilities or develop new multipurpose wellness spaces based on community needs and available infrastructure. KANA will work with planning and design professionals to assess site considerations, develop conceptual designs, and identify feasible development pathways. The project will also examine operational considerations such as facility management, scheduling, and coordination with visiting providers, peer support staff, and community partners. These spaces are intended to support health education, behavioral health activities, cultural programming, and telehealth connections. Given the logistical realities of rural Alaska, including transportation constraints and short construction seasons, the planning process will follow a phased approach that supports realistic timelines for development and future implementation.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Area Native Association	Kodiak Workforce Housing Planning and Design Project	AK	Health care organizations in rural Alaska face ongoing challenges recruiting and retaining qualified staff. In the Kodiak region, limited housing availability and high housing costs create significant barriers for health professionals considering employment in the community. These housing constraints can delay recruitment, shorten the length of time staff remain in rural positions, and contribute to ongoing workforce instability. For organizations responsible for delivering health services across multiple rural communities, these workforce challenges directly affect the ability to maintain consistent service delivery and meet community health needs. This project addresses the opportunity to plan and design workforce housing solutions that reduce housing barriers for health professionals serving the Kodiak region. By developing well-designed staff housing options, KANA can strengthen recruitment and retention of the health workforce needed to support rural health care delivery.	KANA proposes to undertake a planning and design process to develop workforce housing solutions that support recruitment and retention of health professionals serving the Kodiak region. The project will assess current housing barriers affecting recruitment and retention and identify appropriate housing models that meet the needs of clinical providers, behavioral health staff, and other health professionals working in rural communities. The planning process will include evaluation of potential housing configurations, site considerations, and design concepts that support safe, functional, and sustainable staff housing. This may include staff quarters designed to support permanent employees, rotational staff, and visiting providers who travel to rural communities to deliver care. KANA will work with appropriate planning and design professionals to develop conceptual designs, cost estimates, and implementation options that can support future development of workforce housing. The planning process will also evaluate operational considerations such as housing management, maintenance needs, and long-term sustainability. By developing well-designed workforce housing plans, the project will position KANA to address one of the most significant barriers to rural workforce recruitment and retention and support long-term stability of health services across the Kodiak region.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Area Native Association	School-Based Health Support in the Koniag Region	AK	Children and youth in the Kodiak region spend much of their day in school settings, where health concerns are often first noticed by teachers or school staff. However, schools and the local health system are not currently structured to work together as part of a coordinated approach to pediatric health support. When health concerns arise during the school day, there is often no clear pathway connecting those observations to timely clinical evaluation or care coordination. Recent reductions in school nursing capacity within the Kodiak Island Borough School District (KIBSD) further highlight this gap and increase the risk that emerging health concerns may go unidentified or unaddressed during the school day. This project addresses the opportunity to strengthen the connection between school settings and the regional health system so that health concerns identified in schools can be more consistently connected to clinical care, improving early identification and coordination of pediatric health needs in the Kodiak region.	KANA proposes to develop a coordinated school-based pediatric health support model that connects school settings with KANA’s clinical services. Through a partnership with the KIBSD, KANA would place registered nurses in participating Kodiak schools to serve as a direct link between students, families, school staff, and health providers. School-based RNs would support student health needs during the school day, assist with screenings and health monitoring, and help identify emerging health concerns that may affect a child’s health, attendance, or ability to participate fully in school. When health needs are identified, nursing staff would coordinate with families and KANA providers to connect students with appropriate clinical care and follow-up services. A central component of the model is strengthening coordination between schools and the regional health system. School-based nurses would serve as care coordinators who help translate school-based observations into appropriate clinical follow-up. This creates a more consistent pathway between the education and health care systems serving children in the Kodiak region and allows health concerns identified during the school day to be addressed earlier. Over time, the program would expand beyond basic nursing support to include enhanced care coordination and stronger integration with KANA’s clinical services. The model may incorporate telehealth connections between school settings and KANA providers when appropriate, periodic provider engagement in schools, and improved coordination for students with acute or chronic health needs. By linking school-based health observations, screenings, and care coordination with KANA’s clinical services, the project aims to establish a more proactive pediatric health support system in the Kodiak region, one that identifies needs earlier, improves communication between families and providers, and strengthens coordination between the education and health care systems serving children and youth.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Community Health Center	Bidirectional Exchange of Radiology and Laboratory Orders and Results with Providence	AK	Our clinic relies on radiology and laboratory services provided through our hospital partner. While these services are essential to patient care, the exchange of diagnostic orders and results between systems can still involve manual steps or delayed information transfer. These processes can create inefficiencies for staff and increase the risk of transcription errors or incomplete patient records. When providers do not receive results quickly, it can also delay follow-up care and clinical decision-making. Implementing a bidirectional interface will allow radiology and laboratory orders to be transmitted electronically and results to return directly into the patient’s electronic health record. Improving interoperability between systems will streamline diagnostic workflows and ensure providers have timely access to the information they need to care for patients.	This project will design and implement a secure, standards-based bidirectional interface to support the electronic exchange of radiology and laboratory orders and results between our clinic and PKIMC. The interface will allow providers to submit orders electronically and automatically receive completed results directly within the patient’s electronic health record. Using established health information exchange standards will ensure reliable and secure transmission of diagnostic data between the two organizations. Implementation activities will include interface development, system configuration, testing, and workflow integration to ensure the technology supports clinical operations. Staff training will also be provided so providers and administrative teams can fully utilize the new system. By improving interoperability between healthcare systems, this project will help ensure our providers have faster access to diagnostic information and can coordinate patient care more effectively.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Advance to Implementation Application
Kodiak Community Health Center	Improving Patient Access and Clinical Workflow Through a Real-Time Care Coordination Platform	AK	Efficient communication and coordination among clinic staff are essential to maintaining smooth patient flow and timely access to care. In many healthcare settings, communication about patient movement, room availability, and provider status still relies on verbal updates or manual processes. Our clinic currently uses several manual methods to coordinate patient flow and communicate changes throughout the day. While these methods work, they can make it difficult for the entire care team to quickly see patient status, staff availability, and appointment progress across the clinic. A real-time clinic coordination platform provides an opportunity to improve these processes by giving staff a shared view of clinic operations throughout the day. The system provides visibility into patient location, appointment progress, and room utilization while allowing staff to communicate updates quickly. Improving clinic-wide visibility and communication helps reduce delays, improve coordination among staff, and support a more efficient patient experience.	Grant funding would support the implementation of a real-time care coordination platform that improves communication and visibility across clinic operations. The system uses tablets and digital displays inside and outside exam rooms to provide real-time updates about patient status, staff location, and appointment progress. Care team members can quickly see which patients are ready, which rooms are available, and where providers or staff may be needed. The platform also includes communication tools that allow staff to send quick updates and alerts across the clinic. These features help streamline communication, improve handoffs between staff, and allow the care team to respond more quickly to changing clinic needs. Additional features support clinic safety and operational awareness, including the ability to quickly signal alerts or safety concerns when needed. By replacing manual coordination processes with automated communication and real-time visibility, the system helps improve patient flow, reduce wait times, and support better coordination among the care team.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Advance to Implementation Application

Kodiak Community Health Center	KCHC Health IT Service Management & EHR Support Initiative	AK	Health information systems play a central role in how we deliver care and manage clinic operations. As new features, reporting requirements, and care programs are introduced, staff frequently require technical assistance, system enhancements, or additional training to effectively use the EHR. Without a structured system for managing support requests, it can be difficult to track incoming issues, prioritize system improvements, or identify common areas where additional training may be beneficial. We see an opportunity to strengthen how our clinic manages Health IT support by implementing a centralized system for submitting, tracking, and responding to requests related to the EHR and other health information systems. Improving how these requests are managed will help ensure staff receive timely support while allowing leadership to better understand system needs and prioritize improvements that support patient care.	Through this initiative, we will implement a centralized Health IT service management platform designed to organize and track requests related to the EHR and other clinical information systems used throughout the clinic. The platform will allow staff to submit support requests, report system issues, request enhancements, and ask for training through a single structured system. Requests will be categorized and tracked, allowing our Electronic Health Systems Analyst to manage workload more efficiently and communicate progress transparently. The system will also provide leadership visibility into request trends and recurring issues. These insights will help identify opportunities for targeted staff training, workflow improvements, and system enhancements. Using this data-driven approach, we will strengthen how our clinic manages technology support while improving the efficiency and usability of the EHR and related systems.	Under \$50,000	Federally qualified health center	Single Community	Kodiak Island Borough	Advance to Implementation Application

Kodiak Community Health Center	KCHC Patient Access & Capacity Optimization Initiative	AK	Our clinic continually works to ensure that available provider time is structured in a way that best supports patient access to care. As services evolve and patient needs change, scheduling systems and appointment templates benefit from periodic evaluation to ensure they remain aligned with current demand. We have already begun reviewing scheduling guidelines, visit lengths, and clinical workflows to better understand how appointment structures support patient access. Through this process, we have identified an opportunity to take a deeper look at how appointment utilization, visit types, and provider scheduling templates function across our clinic. Working with a healthcare access and operations consultant will allow us to analyze scheduling data, appointment utilization patterns, and provider templates in greater depth. This analysis will help validate and refine the changes we are exploring and identify opportunities to improve appointment utilization while maintaining high-quality patient care.	Through this initiative, we will work with an experienced healthcare access and operations consultant to conduct a comprehensive assessment of patient demand, appointment utilization, scheduling guidelines, and provider templates. The consultant will analyze scheduling data, appointment utilization patterns, and provider templates to better understand how available provider capacity aligns with patient demand. This work will help validate and refine scheduling adjustments our clinic has begun exploring, including potential changes to visit lengths, scheduling guidelines, and appointment structures. The consultant will also review scheduling workflows and patient outreach practices to determine whether adjustments to scheduling processes or communication strategies could further improve access to appointments. Using these findings, our clinic will work with the consultant to implement refined scheduling structures and improved access strategies designed to better align provider capacity with patient demand. We will also monitor scheduling utilization and patient access metrics to evaluate the effectiveness of these improvements and ensure the changes result in measurable gains in appointment access and provider capacity utilization.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Advance to Implementation Application
Kodiak Community Health Center	Reducing Provider Documentation Burden Through AI-Supported Clinical Documentation	AK	Clinical documentation is necessary to support safe patient care, regulatory compliance, and healthcare reimbursement. However, the time required to complete documentation can create additional workload for providers and reduce the time available for patient engagement. AI-supported clinical documentation tools can assist providers by capturing and organizing documentation during patient encounters, reducing the time required to complete clinical notes while maintaining accuracy and compliance. This project presents an opportunity to support the continued implementation and adoption of an AI-supported clinical documentation platform across our clinical teams. Supporting this continued rollout will help ensure providers are able to fully integrate the technology into their workflows and realize the benefits of improved documentation efficiency.	Through this initiative, our clinic will implement and expand the use of an AI-supported clinical documentation platform across primary care and behavioral health providers. The platform captures patient-provider conversations during clinical visits and generates draft clinical documentation that providers can review and finalize within the electronic health record. This approach helps reduce the time required to complete documentation while supporting accurate and structured clinical notes. Funding would support continued implementation, provider onboarding, workflow integration, and training as the platform is rolled out across our primary care and behavioral health providers. These activities will help ensure the technology is effectively integrated into clinical workflows and supports improvements in documentation efficiency.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Advance to Implementation Application

Kodiak Community Health Center	Remote Patient Monitoring for Diabetes Management and Chronic Disease Care	AK	Diabetes remains one of the most common chronic conditions managed within our clinic, and effective glucose monitoring is essential to preventing complications and improving long-term outcomes. Traditional diabetes management relies heavily on periodic clinic visits and intermittent glucose readings, which can make it difficult for providers to identify patterns of unstable glucose levels between appointments. Patients who experience rapid fluctuations or who require insulin adjustments may benefit from more consistent monitoring and clinical support. Remote Patient Monitoring using Continuous Glucose Monitoring technology provides an opportunity to strengthen diabetes management by giving providers access to continuous glucose data and enabling earlier intervention when concerning trends emerge. Expanding RPM with a CGM focus will allow our clinic to proactively support patients with higher-risk diabetes, improve care coordination between visits, and strengthen chronic disease management through technology-enabled care.	Kodiak Community Health Center will implement a Remote Patient Monitoring program with an initial focus on Continuous Glucose Monitoring for patients with diabetes who would benefit from closer monitoring and support. Patients with higher-risk diabetes will be identified and enrolled in the program. Participants will receive CGM onboarding, education on device use, and guidance on how glucose data will be shared with care teams. Clinical workflows will be established to support routine CGM data review, patient outreach, and follow-up when concerning glucose trends are identified. Providers will use CGM data to support medication adjustments, reinforce diabetes self-management education, and help prevent complications associated with unstable glucose levels. The program will establish structured RPM workflows that integrate monitoring data into clinical care processes. While CGM will serve as the initial focus, the program is designed to support future expansion of RPM to additional chronic conditions such as hypertension or other monitoring needs. This staged approach allows the clinic to begin with a high-impact diabetes initiative while building a scalable RPM infrastructure that can support broader chronic disease management over time.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Advance to Implementation Application

Kodiak Community Health Center	Strengthening Financial Systems to Support Sustainable Rural Healthcare Services	AK	Healthcare organizations operate in a complex financial and regulatory environment. Rural health centers often manage these responsibilities with limited administrative capacity while still meeting the same financial oversight expectations as larger healthcare systems. We currently have a part-time Chief Financial Officer and internal financial staff who manage day-to-day financial operations. However, situations regularly arise where additional financial expertise can help evaluate financial systems, review procedures, or provide guidance on complex financial questions related to healthcare operations. Access to experienced financial professionals allows us to strengthen internal financial systems and ensure our financial practices remain aligned with regulatory and program requirements. This type of support is especially valuable when reviewing financial reporting practices, strengthening internal controls, evaluating reimbursement structures, or analyzing financial considerations related to service expansion. Strengthening financial infrastructure helps ensure the resources supporting patient care are managed responsibly and supports the long-term sustainability of healthcare services.	Grant funding would allow us to access external financial expertise that can support our leadership and financial staff in strengthening financial systems and processes. External financial professionals would provide guidance on financial reporting practices, review internal financial procedures, and assist with questions related to regulatory requirements and healthcare financial management. This support would complement the work of our internal staff and help ensure our financial systems remain well aligned with program requirements. Financial expertise can also assist with evaluating reimbursement structures, reviewing payer contracts, and providing financial analysis when considering new or expanded services. This type of support helps ensure financial decisions related to clinic operations and service development are based on sound analysis. Strengthening financial systems and planning capacity supports responsible management of healthcare funding and helps position our clinic to sustain existing services while exploring opportunities to expand care for the patients we serve.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Advance to Implementation Application

Kodiak Community Health Center	Technology Integration to Strengthen Patient Outreach and Preventive Care	AK	Our clinic currently uses HealthTalk AI to support patient outreach; however, the platform is not integrated with our OCHIN-hosted Epic electronic health record. Outreach workflows require manual list generation, data uploads, and response tracking outside of the EHR environment. These manual processes create inefficiencies and limit our ability to consistently manage preventive care gaps, chronic disease follow-up, and missed appointments across patient populations. Staff time spent managing outreach lists and tracking responses also reduces the capacity available for direct patient engagement and care coordination. Integrating HealthTalk AI directly with Epic presents an opportunity to streamline these workflows and embed automated outreach within our population health infrastructure. With real-time data exchange between systems, patient identification, outreach, and documentation can occur automatically within the EHR. This integration will allow our clinic to expand proactive outreach, strengthen preventive care completion, improve chronic disease follow-up, and make more effective use of workforce resources.	This project will establish a direct integration between HealthTalk AI and our OCHIN-hosted Epic electronic health record to automate patient outreach, documentation, and reporting workflows that support population health management. Working with OCHIN and HealthTalk AI technical teams, our clinic will configure a secure interface that allows data to move between the two platforms. Automated workflows will identify patients who are due for preventive services, chronic disease monitoring, or follow-up appointments and initiate outreach through the HealthTalk AI platform. Patient responses will be captured and documented directly within the Epic EHR, allowing care teams to view outreach outcomes and coordinate follow-up care when needed. The integration will also strengthen reporting and analytics capabilities so our clinic can better monitor care gaps, evaluate outreach effectiveness, and guide population health strategies. By embedding these workflows within the EHR, this project will strengthen care coordination, improve preventive care outreach, and support more efficient population health management.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Advance to Implementation Application

Kodiak Community Health Center	KCHC Workforce Sustainability & Operational Transformation Initiative	AK	In recent years, our administrative structure has evolved as leadership roles and departmental responsibilities have shifted. Functions that support patient care — including scheduling, front desk operations, billing coordination, and provider documentation support — now involve multiple departments working closely together. While our teams collaborate regularly, many workflows developed over time as responsibilities shifted between departments. This has created an opportunity to review how these functions interact, improve communication across teams, and ensure roles and processes are clearly aligned. Strengthening coordination between operations, finance, billing, and clinical support functions will help ensure scheduling systems, documentation workflows, and care coordination activities operate efficiently. Improved coordination between operations and billing functions will also support more efficient revenue cycle processes and reduce administrative burden across teams. Improving these connections allows staff to work more effectively together while supporting timely patient access to care.	This project will engage an experienced healthcare practice transformation consultant with expertise in rural health systems and federally qualified health centers. The consultant will work with our leadership and staff to conduct a comprehensive assessment of current administrative roles, workflows, and coordination across departments. This process will include leadership discussions, staff interviews, and workflow mapping across operations, finance, billing coordination, and quality improvement functions. The assessment will also examine how workflows move between departments, such as front desk operations, billing coordination, provider documentation support, and quality improvement activities to ensure these processes are clearly aligned. Based on this assessment, the consultant will work with clinic leadership to redesign key workflows, clarify roles and responsibilities, and develop implementation plans to improve coordination across departments. The project will also include facilitated workshops and staff training to support implementation of the redesigned processes. By improving communication and operational alignment across departments, this initiative will strengthen the systems that support patient access to care while creating a more sustainable and coordinated work environment for our staff.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Community Health Center	Kodiak Community Health Center Capital Expansion – Architectural and Engineering Design Phase	AK	Our health center faces an immediate opportunity to expand clinical capacity to meet growing demand for care in our rural community, but progress is constrained by required pre-development design work. Kodiak Island’s geographic isolation, limited healthcare infrastructure, and increasing population have placed sustained pressure on existing clinic space, limiting appointment availability and the ability to add services. We have received CDS funding to support clinic expansion, however, completion of full architectural and engineering design, beginning with schematic drawings, is a key prerequisite to advancing the project. While multiple predevelopment requirements must be addressed, this design work is foundational and directly informs subsequent project steps, including final budgeting, timelines, and required environmental and historic requirements. Until this design phase is completed, progress on the remaining components of the expansion remains constrained. By investing in this critical pre-construction phase, we can advance the project toward construction readiness and position our health center to better serve our community.	Our approach is to complete the required architectural and engineering design through construction documents needed to advance our clinic expansion and move the project to implementation readiness. This project will focus exclusively on preconstruction planning activities that support an existing federal capital award and enable future expansion of essential health services. We will engage qualified architectural and engineering professionals to complete full architectural and engineering design, including schematic, design development, and construction documents that meet applicable requirements and align with the overall scope of the planned expansion. This work will be coordinated with our leadership team to ensure consistency with project goals, timelines, and anticipated service needs. Completion of the full architectural and engineering design phase will establish the technical foundation needed to move forward with remaining pre-development steps, including refinement of project costs, scheduling, and required reviews. Advancing the full design phase allows the broader expansion effort to proceed efficiently toward construction readiness and supports future increases in patient capacity. This focused planning approach supports health care access by enabling timely expansion of clinic space, reducing delays that limit service availability, and ensuring prior federal investment can be fully realized. Advancing this work positions our health center to better meet growing demand for primary and preventive care for our community.	\$1M-\$5M	Federally qualified health center	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Community Health Center	Modernizing Payroll and Workforce Systems to Support Rural Healthcare Workforce Stability	AK	Our organization currently operates payroll and workforce management through a legacy configuration that was originally built more than a decade ago. As our workforce and services have grown, this system has become increasingly inefficient and difficult to manage. Although we currently use Paycom, we are not fully utilizing the platform’s integrated capabilities. Many employee status changes, including hiring, terminations, compensation updates, and benefits changes, require manual entry across multiple systems and workflows. This creates unnecessary administrative workload, increases the potential for payroll errors, and requires significant staff time to maintain accuracy and compliance. For a rural health center with limited administrative capacity, inefficient internal systems can divert staff time away from critical workforce support activities such as recruitment, onboarding, and employee support. This project presents an opportunity to modernize our payroll and workforce management system, reduce administrative burden, and strengthen the operational infrastructure needed to support a stable healthcare workforce.	Our approach is to complete the modernization and full implementation of our Paycom Human Resources Information System so that payroll, human resources, and benefits administration function as an integrated system. We will transition from our current legacy payroll configuration to Paycom’s updated payroll infrastructure and fully implement the platform’s integrated modules. This will allow employee data to automatically synchronize across payroll, HR, and benefits functions instead of requiring manual updates in multiple systems. The project will include system configuration, migration of existing workflows, testing of automated processes, and staff training to ensure the system is used effectively. Once implemented, employee status changes such as new hires, compensation adjustments, and benefit updates will flow automatically through the system, reducing manual data entry and administrative errors. Modernizing this system will streamline onboarding processes, strengthen payroll accuracy, improve internal controls, and provide leadership with more reliable workforce data to support planning and compliance.	\$50,000-\$250,000	Federally qualified health center	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Community Health Center	Strengthening Grant Development Capacity to Support Rural Healthcare Services	AK	Grant funding plays an important role in supporting healthcare programs and service expansion for non-profit FQHCs. Identifying relevant funding opportunities and managing multiple application timelines can be difficult when those processes are handled manually. Currently, one staff member manages grant research, proposal development, and reporting responsibilities. While this allows us to pursue funding opportunities, it limits how many opportunities we can realistically identify and apply for. Many healthcare grants have short application windows and complex requirements. Without a centralized system for identifying opportunities and organizing materials, maintaining a consistent strategy for pursuing funding that supports expanded healthcare services can be challenging. Implementing a grant discovery and management platform will help us strengthen our ability to identify relevant funding opportunities and organize the grant development process. Strengthening this capacity supports our goal of expanding services and sustaining programs that benefit our patients.	Grant funding will support the implementation of a centralized grant discovery and management platform that improves how we identify and organize funding opportunities. The platform will allow us to search for relevant funding opportunities, track application deadlines, organize proposal materials, and manage grant workflows within one system. Many of these activities are currently managed manually across spreadsheets and individual documents, which makes maintaining a consistent process more difficult. With a centralized platform, we will be able to organize funding opportunities more efficiently and spend more time developing strong proposals that support expanded patient services. Because the platform is cloud-based, implementation can occur quickly. Once the system is in place we will begin using it to identify funding opportunities, organize application timelines, and strengthen our overall grant development process. Improving our ability to pursue grant funding supports the sustainability of healthcare programs and allows us to continue exploring opportunities to expand services for our patients.	Under \$50,000	Federally qualified health center	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Community Health Center	Sustaining Community Pharmacy Services Through Workforce Support	AK	Kodiak’s rural island community faces persistent pharmacy workforce instability that threatens reliable access to medications and continuity of care. Recruitment challenges, staff turnover, and a limited local workforce have resulted in reduced hours and service disruptions. Because the pharmacy is open to the public and serves both clinic patients and the broader community, these disruptions directly impact medication access, treatment adherence, and patient outcomes. Operational strain is compounded by rising supply costs, increasing demand for medication delivery and curbside services, and limited internal training infrastructure. Reliance on external trainers to onboard new pharmacy staff is costly and inefficient, slowing workforce stabilization and increasing operational risk. This project presents an opportunity to strengthen workforce recruitment and retention, build internal training capacity, and improve pharmacy operations so that services can remain reliable and accessible. By investing in workforce stability, structured training programs, and operational improvements, the pharmacy can maintain consistent medication access and support high-quality care for patients throughout the Kodiak region.	This project will implement a comprehensive workforce stabilization and operational improvement strategy focused on recruitment, structured training, retention, and workflow optimization. Recruitment incentives and targeted hiring strategies will be implemented to attract qualified pharmacy professionals to our geographically isolated community and reduce vacancy timelines that contribute to service disruptions. Streamlined hiring processes and improved recruitment outreach will strengthen our ability to secure long-term staff. The project will establish a structured onboarding and training program supported by standardized operating procedures, competency-based training checklists, and leadership oversight. Developing internal training capacity will reduce reliance on external trainers, accelerate staff proficiency, and ensure consistent pharmacy practices that support medication safety and patient counseling. Retention strategies will include workflow redesign, improved role clarity, and workload monitoring to reduce burnout and improve staff engagement. Operational improvements will focus on enhanced inventory management, improved forecasting and ordering practices, and optimization of pharmacy management technology to strengthen documentation, reporting, and workflow efficiency. Stabilized staffing will also allow expansion of patient-centered services such as medication delivery and curbside support for individuals facing transportation or mobility barriers. Additionally, expanding billable pharmacy services such as medication therapy management and adherence support will improve provider efficiency and contribute to long-term financial sustainability. Together, these strategies will strengthen workforce stability, modernize pharmacy operations, and improve access to medications and pharmacy services for rural patients.	\$250K-\$1M	Federally qualified health center	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Kodiak Island Borough	Kodiak Island Hospital Chiller Replacement to Ensure Access to Care	AK	The current chiller system serves both Providence Kodiak Island Medical Center (PKIMC) and the Kodiak Community Health Center, which are co-located within the Kodiak Island hospital facility. It operates at approximately 35% capacity and requires continual repairs, leading to repeated service disruptions. These interruptions force patients—many of whom require time-sensitive or critical care—to travel off-island, or postpone care, creating significant barriers for families, providers, and the broader community. A replacement chiller is vital to the safe operation of the Sterile Processing Department, which directly supports the Emergency, Surgical, and Obstetrics departments. Without a reliable chiller system, these essential services remain vulnerable to shutdowns. The chiller is also critical for infection prevention protocols for environmental controls that limit the spread of infectious organisms, crucial to a larger public health landscape.	We propose to solve this challenge by replacing the chiller system. Engineering design for the new system is 95% complete and has been reviewed and approved by the Kodiak Island Borough Architectural Review Board, positioning the project for timely construction.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Kodiak Island Borough	Advance to Implementation Application

Kodiak Island Borough School District	KIBSD Health Documentation System Upgrade	AK	The Kodiak Island Borough School District (KIBSD) serves 2,000 students in a remote region where the district is often the primary point of healthcare access. Currently, our school nurses, counselors, and psychologists rely on SchoolCare, an obsolete platform with significant data privacy risks and operational silos. This system’s failure to update has caused unreliable immunization forecasting and a lack of secure parent engagement tools. Most critically, it lacks interoperability; nurses, counselors, and psychologists cannot collaborate within a single record. This fragmentation leads to a "documentation gap" where support plans for vulnerable students—particularly those without formal IEPs or 504s—are lost during school transitions. Modernizing our EHR with August Schools allows KIBSD to implement a secure, mobile-responsive "Whole-Child" model of care. This project ensures HIPAA-compliant data sovereignty and eliminates third-party data monetization. The transition will bridge linguistic barriers through automated translation (supporting our large Tagalog and Spanish-speaking communities), automate immunization safety via Alaska VacTrAK integration, and ensure seamless continuity of care across buildings. Finally, this platform introduces sustainable Medicaid reimbursement potential, turning our health infrastructure from a cost center into a self-sustaining resource for the Kodiak community.	Proposed Approach: Integrated Health Modernization KIBSD will address the current health infrastructure crisis by transitioning from a stagnant, third-party-monetized system to August Schools, a modern, comprehensive EHR designed for school-based health ecosystems. Our approach focuses on four key pillars: 1. Implementing a Unified "Whole-Child" Care Team We will deploy a multidisciplinary platform that integrates school nurses, counselors, and psychologists into a single secure environment. This approach replaces siloed email threads with role-based data segmentation, ensuring privacy while allowing for critical cross-referrals. For example, a nurse documenting frequent somatic complaints (stomach aches) can seamlessly flag the pattern for a counselor to investigate underlying academic or home-life anxiety, ensuring no student's needs go unaddressed. 2. Enhancing Rural Access through Frictionless Engagement Recognizing the unique barriers in remote Alaska, we will utilize August Schools’ "Magic Link" authentication and mobile-responsive portal. This eliminates the barrier of forgotten passwords for parents. To ensure equity across our diverse population, we will leverage automated translation features to communicate with families in their primary languages, specifically Tagalog and Spanish, moving beyond basic email to inclusive, real-time text and portal messaging. 3. Clinical Efficiency and Safety Upgrades We will modernize frontline care through: Safety Automation: Using integrated Medication Administration Records (MAR) and automated inventory/expiration alerts to eliminate manual errors. State Alignment: Direct integration with the Alaska VacTrAK registry to ensure compliance with state immunization mandates. Emergency Readiness: Implementing QR-code-based data sharing to provide EMTs and hospitals with vital health information instantly during a crisis. 4. Building a Sustainable Financial Foundation A core component of our approach is long-term fiscal sustainability. Unlike our current system, August Schools provides Medicaid reimbursement reporting utilizing ICD-10 codes. By capturing and documenting billable procedures, KIBSD will be positioned to leverage shifting Alaska legislation to generate revenue. Our goal is for the system’s reimbursement potential to eventually offset its operational costs, ensuring this transformation remains sustainable long after the 5-year grant period.	Under \$50,000	Single Community	Kodiak Island Borough	Deferred or Not Advanced

Koniag, Inc.	Alaska Native Partnership for Rural Health Innovation and Enablement	AK	Fragmented health data and limited interoperability across providers, health organizations, and partners make it difficult to coordinate care, manage chronic disease, and support population health across the Alaska rural health system. Limited access to user-centered digital tools for patients, providers, and community partners, reducing the ability to navigate services and coordinate care. Limited digital infrastructure, outdated legacy software, and insufficient cybersecurity protections that leave rural health systems vulnerable to cyber threats and data breaches, while restricting the ability to support modern analytics, AI, and telehealth-enabled care. Underutilization of health data, analytics, and artificial intelligence to identify risks earlier, strengthen care coordination, and support more proactive, value-based health management. Technology barriers in remote and frontier communities, where deploying and maintaining networks, devices, and secure digital systems is challenging due to geography, connectivity limits, and scarce local technical resources. Operational inefficiencies from outdated technology environments, which limit the ability to scale modern digital capabilities statewide. Technology and workflow inefficiencies which increase administrative burden on providers. Cybersecurity and data protection risks as health systems increasingly rely on digital tools, shared data infrastructure, and telehealth platforms to support care delivery.	Working in partnership with Tribal health organizations, providers, and technology partners which already support Alaska Rural Health needs, Koniag will identify, plan, and deliver: Human-centered digital tools to improve patient navigation, provider workflows, and care coordination across Alaska’s rural health system. Modernization of legacy health technology systems that support rural health programs and services. Data, analytics, and AI capabilities to strengthen population health management, supported by secure data pipelines, identity and access management, and protections for sensitive health data. Deployment of secure technology infrastructure in central and remote communities, including networks, devices, cloud-enabled platforms, and cybersecurity architecture designed for rural environments. Managed services and technical support to sustain modern digital health capabilities statewide, including cybersecurity monitoring, vulnerability management, and system protection. Cybersecurity protections to safeguard health data and critical health infrastructure, including threat monitoring, incident response readiness, and compliance with healthcare security standards. By combining secure technology deployment with long-term operational support, Koniag will help create a sustainable digital health backbone and ecosystem that strengthens access to care, supports rural providers, and enables coordinated care delivery across village clinics, regional hospitals, and statewide health partners. Koniag will establish a dedicated RHTP team in Anchorage partnering with the Alaska Department of Health, Tribal health organizations, providers, and technology partners. This team will include these roles: Rural Health Director – coordinates with DOH, Tribal partners, providers, and RHTP leadership Infrastructure Technology Director – network and infrastructure planning and deployment Software Solutions Technology Director – digital solutions, data, analytics, and AI-enabled solutions. Program / Engagement Director – program delivery, coordination with RHTP teams, and oversight of budget, personnel, and risks. Koniag's extensive teams throughout the U.S. will also support the effort. Koniag is uniquely qualified to provide hands-on technology implementation at all 600+ Alaska communities. Koniag will leverage our many years of Value-Added-Reseller experience to ensure competitive pricing and service on technology equipment.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Koniag, Inc.	Groundwork Alaska: Community Water & Sanitation Infrastructure Program	AK	Rural Alaska faces a water and sanitation infrastructure crisis that directly drives preventable illness and increases health care demand in the state's most remote communities. Over 200 rural communities lack adequate water and sanitation access; more than 3,300 year-round homes have no piped water. Alaska's RHTP Project Narrative documents the direct health consequences: severe skin infections, gastrointestinal illness, and systemic disease burden tied directly to absent basic sanitation. Washaterias, the primary hygiene resource in many communities, are mechanically fragile and are operated without dedicated technical staff. Failures leave communities without safe water for extended periods, triggering costly emergency responses. Existing water infrastructure, where present, largely lacks remote monitoring, so failures go undetected until service is fully lost. No scalable Alaska-based team currently closes this gap by combining licensed water treatment system engineering with SCADA-enabled automation and Alaska field deployment capacity purpose-built for remote, off-grid operation. This project addresses that gap directly under Initiative #3 - Healthy Communities.	Working in alignment with Tribal health organizations, community partners, and Alaska DOH, Koniag, through KEW, will deploy and operationalize water treatment and sanitation infrastructure in rural Alaska communities currently lacking adequate access, in partnership with licensed Alaska engineering firms providing water treatment system design. KEW delivers: water treatment system installation, automation, and controls; SCADA and remote monitoring with automated alerting, remote diagnostics, and predictive maintenance for washaterias and water delivery systems; electrical and mechanical systems integration; custom NRTL-listed control panels designed and fabricated in KEW's Wasilla facility; and field deployment by Alaska-based crews with logistics capacity for remote, fly-in, and off-road communities. Post-installation, KEW provides commissioning, operator training, and remote monitoring setup so communities can manage systems with limited on-site technical presence. All manufacturing occurs in Alaska, reducing supply chain dependencies and supporting Alaska workforce. Koniag aligns with Tribal health organizations and regional partners who identify infrastructure needs, secure their own RHTP awards, and engage KEW as the Alaska-based implementation partner. As a Regional Alaska Native Corporation, Koniag combines a mission-driven commitment to Alaska Native communities under ANCSA with proven infrastructure delivery experience across Alaska's most demanding environments. Licensed engineering partners are engaged for water treatment system design, ensuring each installation meets applicable regulatory standards and is appropriate for the community's specific water source and site conditions. KEW's installation and controls team executes against those designs, maintaining clear scope discipline and accountability across each project.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Koniag, Inc.	Secure Foundations: Rural Health Facility Infrastructure Modernization Pilot	AK	Rural clinics in Alaska's Kodiak Archipelago and off-road-system Interior communities face a physical and operational infrastructure deficit that directly limits care quality and access. Many facilities operate with electrical systems that cannot support modern telehealth and diagnostic equipment, mechanical systems that are unreliable and difficult to maintain remotely, and no meaningful OT or physical security posture. Emerging health technologies - advanced remote monitoring, telehealth platforms, require physical installation and building system integration that most vendors cannot provide in Alaska's remote operating environment. Simultaneously, rural health facilities increasingly rely on networked SCADA and building automation for operational continuity, creating OT security vulnerabilities. A compromised or failed building control system in a remote clinic can disable climate control, power management, or access control - directly interrupting care delivery. No scalable Alaska-based provider currently offers the combined electrical contracting, controls integration, physical security, OT security, and emerging technology commissioning that rural health facilities require. This project addresses that gap through a focused pilot.	Koniag, through KEW, executes a defined rural clinic infrastructure modernization pilot in the Kodiak Island Borough, in partnership with Kodiak Area Native Association (KANA). KANA serves as the Tribal health partner identifying clinic facilities with priority infrastructure needs; KEW delivers physical and operational infrastructure work. Engineering partners include DOWL (water treatment system design), CRW Engineering (civil/environmental), and EDC Alaska (electrical/controls). ACEP/UAF provides academic partnership and research credibility for remote energy and water system integration. Vervint and Koniag Cyber are named partners across the Koniag RHTP portfolio. Year 1 scope is deliberately bounded to build a replicable model. Working alongside KANA to confirm site access and facility priorities, KEW will: (1) conduct facility assessments at KANA-affiliated rural clinic sites in the Kodiak region, documenting electrical capacity, mechanical condition, building automation status, and OT/physical security posture - the number of sites will be determined jointly with KANA based on confirmed access and facility readiness; (2) complete ICS/OT security assessments at priority sites identified through the assessment phase, with a hardening roadmap for each; (3) install physical security systems - access control, surveillance, perimeter security at priority clinic locations; (4) initiate electrical and controls upgrades at priority facilities to support telehealth and remote monitoring equipment load. KEW's combined capabilities cover: electrical, mechanical, and controls upgrades to existing rural clinic buildings (upgrades to existing infrastructure only, no new construction per RHTP requirements); custom NRTL-listed control panel fabrication built at KEW's Wasilla facility; physical security system design and installation appropriate for remote Alaska environments; ICS/OT security assessment and hardening of industrial control systems and building automation; and physical installation and commissioning of emerging health delivery technologies. As a Regional Alaska Native Corporation, Koniag brings both a mission-driven commitment to Alaska Native communities and a proven track record of technical delivery across Alaska's most demanding environments. Bristol Bay Area Health Corporation is actively being engaged in the same manner.	\$1M-\$5M	Statewide	Bristol Bay Borough; Dillingham Census Area; Kodiak Island Borough; Lake and Peninsula Borough	Deferred or Not Advanced

Kooth	Alaska Upstream Child and Youth Behavioral Health Hub	IL	Alaska’s geography, limited behavioral health workforce, and fragmented service pathways make it difficult for children and youth ages 0–25 to find the right support at the right time. Rural & frontier communities often rely on a small number of providers across vast distances, resulting in long wait times, unclear referral routes, duplicated intake and assessments, and avoidable escalation to crisis care. Many young people fall into an “in-between” gap as they transition out of school-based supports, face stigma in small communities, and struggle to access timely, confidential care. Families and referring partners often lack a clear, consistent way to identify acuity, know what options exist, and miss the prevention window. This fragmentation makes accessing care and resources challenging for Alaskans, increases administrative burden on providers, contributes to preventable crises, and limits Alaska’s ability to measure engagement and outcomes across regions. The opportunity is to strengthen Alaska’s youth behavioral health ecosystem with a coordinated, prevention-first, measurement-driven digital front door that standardizes screening, clarifies pathways, improves navigation and follow-through, and tracks outcomes consistently statewide to improve rural access while preserving clinical capacity for higher-acuity needs.	This project will implement a statewide, measurement-based digital front door for children and youth ages 0–25 that standardizes how care and resources are found, matches support to acuity, and closes the loop on referrals. The approach combines (1) a single entry experience available by self-referral or by referral community partners (2) validated screening at intake to identify needs and risk; (3) proven stepped-care, prevention-first pathway that preserves clinical capacity; and (4) ongoing measurement to track outcomes and continuously improve the system statewide. Digital front door + measurement backbone by Greenspace expanding on their current footprint in the state. On entry, users complete a brief assessment using validated tools. Greenspace serves as the shared assessment, navigation, and outcomes layer: bi-weekly check-ins track progress over time and power real-time dashboards for providers and state leaders (reach, engagement, symptom change, and pathway flow) so Alaska can see what’s working and where gaps persist. Immediate prevention support by Soluna by Kooth. Users matched to low-to-high need can immediately access clinically informed, stigma-free digital supports, self-guided tools, moderated peer support, and 1:1 single session coaching for parents and youth through text, call or video via the Kismet telehealth platform with an average wait time of 3 minutes outside school/work hours, regardless of geography. This absorbs demand upstream and reduces preventable escalation. Step-up and safety. Screening and ongoing check-ins trigger defined escalation pathways for higher acuity needs. For imminent risk, the platform routes to crisis services (e.g., 988) and local emergency pathways. For non-imminent but high acuity, the front door supports warm handoffs to local services. Alaska alignment + implementation: ABHA serves as strategic advisor to align workflows with the local landscape, regional resource routing, and define quality measures. The Hub will include a curated, continuously updated local resource and service directory to ensure support recommendations remain locally and relevant. Implementation will phase: (1) workflow configuration, assessment battery determination, resources curation and development; (2) pilot with priority regions/partners; (3) iterate based on youth/parent/provider feedback; (4) scale statewide with usage and outcome reporting to continuous quality improvement and sustainability beyond grant funding.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Kooth	Kismet- Alaska’s Digital Front Door for Pediatric Behavioral Health Access and Care Coordination	IL	Alaska’s pediatric & young adult behavioral health system faces significant structural gaps that limit early access to care and contribute to preventable crises. Youth and young adults ages 16–25 represent approximately 110,000 Alaskans, yet the system remains largely oriented around crisis response rather than prevention or early intervention. The consequences are visible across the system. In 2025, Alaska’s only state psychiatric hospital had just 10 dedicated youth beds statewide. North Star Behavioral Health reported 440 inpatient admissions and 184 youth requiring psychiatric residential treatment, including 49 who were sent out of state due to insufficient in-state capacity. These numbers reflect a system that often intervenes only after needs escalate to the highest levels of care. Earlier access points are limited and fragmented. Families struggle to navigate multiple providers and referral pathways, and providers lack shared infrastructure to coordinate care across organizations. The behavioral Health Roadmap identifies limited technology infrastructure, gaps services & lack coordination as key barriers to improving outcomes. This project addresses those gaps by building technology infrastructure that strengthens early identification of b.h. needs, improves referral and care coordination pathways, and supports collaboration across providers.	This project proposes the deployment of a statewide technology platform that strengthens coordination, access, and continuity of care across Alaska’s pediatric behavioral health system. The platform will support earlier identification of behavioral health needs, improve referral pathways, and enable providers to collaborate more effectively across organizations and geographic regions. The approach focuses on three key capabilities. 1st the project will expand access to services through a digital entry point that complements existing access channels such as Help Me Grow Alaska’s Centralized Access Point. Families, caregivers, and providers will be able to initiate referrals, access care coordination support, and connect more quickly to appropriate behavioral health services. This capability is particularly important in rural and frontier communities where families often struggle to navigate multiple providers and fragmented referral systems. Second, the platform will strengthen care coordination across providers and levels of care. Behavioral health providers, hospitals, care coordinators, and community organizations will be able to collaborate through shared workflows, secure communication, and coordinated referral management. This infrastructure will improve transitions when children move between inpatient care, outpatient services, and community supports, helping reduce gaps in care following hospitalization or crisis events. Third, the platform will support remote behavioral health services delivered directly to families in their homes. Providers will be able to conduct telehealth therapy sessions, family counseling, and care coordination visits with children and caregivers regardless of location. This approach helps address workforce shortages and geographic barriers that often prevent rural families from accessing timely care. The project will also support secure documentation sharing and patient participation through a caregiver portal that allows families to access services and share relevant records with their care teams. Integration planning with Alaska’s Health Information Exchange will help ensure alignment with the state’s broader health data infrastructure. Implementation will begin with a collaborative planning and integration phase with Alaska partners to configure the platform, establish data-sharing agreements, and align workflows with existing programs and provider needs.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Kusilvak Rising, Inc.	Kusilvak Regional Resilience & Workforce Development Initiative	AK	Communities in the Kusilvak Census Area face persistent economic instability, limited local employment opportunities, and geographic isolation that contribute to housing insecurity, behavioral health crises, and disrupted continuity of care. Residents often relocate to urban areas for employment, education, or access to services without coordinated transition planning, increasing vulnerability to homelessness, untreated behavioral health conditions, and long-term instability. At the same time, rural villages experience workforce shortages and limited local capacity to support economic resilience, youth engagement, and culturally grounded opportunity. These structural challenges are closely linked to preventable health disparities and crisis-level service utilization. There is a significant opportunity to strengthen regional stability by integrating workforce development, transition navigation, and coordinated referral systems into a unified regional resilience model. By addressing economic capacity and transition stabilization as foundational determinants of health, the region can reduce avoidable crises, improve care continuity, and build sustainable community-based infrastructure that supports long-term well-being.	Communities in the Kusilvak Census Area face persistent economic instability, limited local employment pathways, and geographic isolation that contribute to housing insecurity, behavioral health crises, and disrupted continuity of care. Residents often relocate to urban areas for employment, education, or access to services without coordinated transition planning, increasing vulnerability to homelessness, untreated behavioral health conditions, and long-term instability. At the same time, rural villages possess strong cultural knowledge systems, subsistence practices, and intergenerational leadership that remain under-resourced as formal workforce pathways. There is significant opportunity to strengthen regional resilience by creating culturally grounded employment opportunities, including language nests, carving and artisan apprenticeships, subsistence and food security initiatives, community gardening, youth mentorship, and peer transition support roles, while integrating coordinated referral pathways for health and behavioral health access. By aligning economic development, cultural workforce creation, and transition stabilization into a unified regional model, this project addresses foundational determinants of health. Strengthening employment, cultural continuity, and coordinated access to services reduces crisis-level interventions and builds sustainable community-based infrastructure that supports long-term well-being across rural and urban settings for residents of Kusilvak origin.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Kusilvak Census Area	Deferred or Not Advanced

Kuspuk School District	Kuspuk Care Network: School-Based Wellness and Health Access	AK	Spanning nearly 12,000 square miles across western Alaska, Kuspuk School District is comprised of nine schools located in seven villages accessible only by air or river travel. According to the 2020 census, about 1,391 people live in the district’s villages. More than 96% of KSD students are Alaska Native, primarily Yup’ik and Athabascan. All schools qualify as Title I, with family income surveys indicating more than 96% of the district’s students are economically disadvantaged. Families rely on a health care system severely impacted by distance, weather, and staffing shortages that keep care episodic and crisis-driven rather than preventive. These barriers hit hardest in behavioral health and early intervention, where delays and missed follow-up care contribute to student disengagement, chronic absenteeism, and family stress. Kuspuk has begun redesigning student supports through Kuspuk Empowers, integrating trauma-engaged culturally responsive practices, tele-mental health access, and stronger partnerships with families and tribes. Kuspuk seeks to convert this momentum into a durable school-based access ecosystem that reaches children, caregivers, and staff where they already gather: schools and community spaces. The goal is to close three gaps: reliable private spaces for wellness supports and telehealth, predictable preventive wellness and health opportunities, and stronger coordination among schools, Tribes, families, and providers to ensure services reach all students.	Our approach is to build the Kuspuk Care Network, a ready-to-operate, school-based prevention and health access system that uses schools as stable village hubs, aligns with regional providers, and leverages nationally recognized supports. Funding will support multi-site wellness hub buildout across all seven communities, plus the coordination, training, and evaluation needed for immediate execution. The backbone of the system is a calendar-embedded, all-staff professional development convening where health professionals and staff build shared practice across a high-turnover, multi-village district. Workstream 1: Wellness hub buildout (space plus IT). In each school, we will create or upgrade a private, telehealth-ready wellness space with clear privacy and consent procedures, a calm/regulation area, secure storage for basic screening tools, and a playbook for staff (mandatory reporting, documentation, and referral steps). Workstream 2: Predictable access and navigation. Establish a yearly Wellness Access Calendar synced to the school calendars, so families and partners can plan for access. On scheduled access days, partners deliver screenings, education, and consults using mobile or itinerant teams and telehealth. A site-based Wellness Navigator will manage consent packets, scheduling, student data, and closed-loop referral follow-through (referral to first contact and completion). Workstream 3: Workforce training and continuous improvement, built around Kuspuk Empowers. Each year, Kuspuk Empowers, the district’s three-day October in-service, will serve as an Implementation Summit where school staff, school board members, and Tribal and community partners review district wellness data, strengthen shared understanding of student needs, and coordinate how village systems will respond. Staff leave with practical tools grounded in trauma-engaged and culturally responsive practices to support student regulation, strengthen relationships, and recognize early behavioral health needs. School board members gain a clearer understanding of the conditions affecting student wellness and the district systems being implemented to support students and families. Tribal and community partners participate as collaborators, ensuring village knowledge, cultural values, and family priorities shape the work. The summit strengthens coordination among schools, Tribes, and regional providers so student and family supports function as a connected village system.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area	Deferred or Not Advanced

Landsick Media	Alaska Midlife Initiative: Building a Permanent Alaska Rural Health Media Library	AK	Midlife health represents a critical but often overlooked opportunity to improve long-term health in Alaska. Women ages 35–65+ frequently experience hormonal, metabolic, and sleep health changes that influence risks for chronic disease, mental health challenges, and decreased quality of life. In rural Alaska, access to reliable health information and specialized care addressing midlife health is limited. Many communities lack clinicians with training in menopause management, metabolic health, and lifestyle medicine, leaving both patients and providers without accessible educational resources or culturally relevant guidance. Midlife women also serve as central health decision-makers within families and communities. Improving midlife health literacy can influence preventive health behaviors for entire households and support healthier aging across communities. This project addresses this opportunity by developing a statewide platform focused on midlife health in rural Alaska. Through community-informed storytelling, including a documentary highlighting voices of women across rural and Alaska Native communities, the initiative will translate medical knowledge into accessible educational resources for patients, families, and healthcare providers. By combining documentary storytelling, educational media, and provider training resources, the initiative aims to improve health literacy and strengthen the capacity of rural healthcare providers to address midlife health concerns.	This initiative will create a statewide health education platform designed to improve midlife health literacy and support rural health care providers serving women ages 35–65+. The project will be implemented by Landsick Media in collaboration with Dr. Jillian Woodruff, a board-certified gynecologic surgeon who will serve as Medical Director and clinical advisor. Dr. Woodruff is the founder of Modern Gynecology & Skin in Anchorage and specializes in women’s midlife health, hormone optimization, and preventive care. She also hosts Line One: Your Health Connection on Alaska Public Media, a statewide call-in program where Alaskans seek medical information. Her clinical expertise will ensure project materials are evidence-based and medically accurate. Media production will be led by Landsick Media producer Jaybird Oliver, a lifelong Alaskan multimedia artist who grew up in rural communities across Alaska. Oliver has produced culturally relevant media, including medical training videos for Southwest Senior Services focused on caring for Indigenous elders, helping ensure project content reflects the perspectives of rural and Alaska Native communities. The project will begin with community listening sessions conducted in partnership with rural communities, tribal health organizations, and health care providers. These sessions will prioritize Alaska Native voices and rural perspectives to identify gaps in midlife health education and guide development of culturally relevant resources. Landsick Media will also produce a feature documentary exploring midlife health through the voices and experiences of women across Alaska, including rural and Alaska Native communities. The film will help open a broader public conversation about menopause and healthy aging. Insights from listening sessions will guide development of educational media addressing hormonal changes, menopause, metabolic health, sleep health, mental health, and preventive care. Landsick Media will produce short educational videos and provider training modules with medical oversight from Dr. Woodruff. Educational resources will be shared through rural clinics, tribal health organizations, Community Health Aide networks, community gatherings, and digital access through the Alaska Rural Health Media Library. This permanent library will house project materials and could expand into a statewide platform supporting education on chronic disease prevention, behavioral health, maternal health, and aging.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Launch AK, LLC	Rural Futures AK: Creating Career Pathways from High School to Healthcare and Related Professions	AK	State data shows rural areas have significantly lower graduation rates and postsecondary attainment—including certifications and degrees—than urban areas, limiting locally trained professionals. In the last five years, rural Alaska graduation rates were at 75%.:The Alaska Hospital and Healthcare Association estimates the state must add more than 9,400 healthcare workers annually to meet demand and Native Alaskans are a a small fraction of the medical workforce. Current training pipelines produce far fewer workers than needed, particularly in nursing and community health roles. The most critical shortages occur in villages in Northwest Alaska, Bethel, and the North Slope, where medical emergency rates coincide with limited services. This initiative will strengthen a rural workforce by addressing academic gaps while connecting secondary education with healthcare career pathways. It will prepare students for careers in community health while equipping educators with tools to support executive functioning, self-advocacy, career planning, and transitions into healthcare training programs. High school graduates can pursue healthcare certificates (e.g., medical assistant, licensed practical nurse) through training programs. Individuals with caregiver certifications can work in skilled care units or provide home services for elderly and medically fragile residents. Those with some college but no degree could complete associate degrees or industry credentials with targeted support.	The Rural Futures AK project will implement a five-year strategic plan to address educational gaps and the healthcare workforce shortage in rural Northwestern Alaska, the Northern Slope, by focusing on academic learning, career skill development, and professional growth for educators. Yr 1– Needs Assessment & Goal Setting Engage rural community members, Native corporations, educators, and healthcare providers to identify current educational and healthcare gaps. Conduct surveys, focus groups, and community forums to gather data to determine critical need communities. Establish measurable goals for student outcomes, workforce development, and service delivery. Begin forming university and healthcare partnerships; hire 2 educators to oversee initiatives. Yr 2–Resource Development Develop professional development programs for educators focused on academic interventions and career pathway advising. Create structured tutoring, credit-recovery programs, and parent workshops. Build an online hub of curriculum and instructional materials for educators. Formalize partnerships with universities (e.g., UAF, UAA) and healthcare providers to support training programs. Yr 3– Pilot Implementation Launch pilot tutoring, credit recovery, and parent workshops in selected rural communities. Begin professional development programs for teachers and counselors. Introduce initial online healthcare certification courses and job shadowing opportunities. Start internships and community-healthcare collaborations with local providers. Collect baseline data on student academic progress and participation. Yr 4-Full Implementation & Expansion Expand tutoring, parent workshops, and professional development to additional communities. Broaden healthcare certification courses, job shadowing, and internships to more students. Strengthen community initiatives, involving families, Native corporations, and healthcare partners. Monitor student graduation rates, workforce participation, and program effectiveness. Year 5 – Evaluation, Refinement & Sustainability Conduct an evaluation of academic outcomes, workforce engagement, and healthcare training success. Refine programs based on data, community feedback, and lessons learned. Establish long-term sustainability plans, including continued university partnerships, ongoing professional development, and expanded community-healthcare networks.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough	Deferred or Not Advanced

Disseminate best practices for rural education and healthcare workforce development across Alaska.

LAUNCH ALASKA	Alaska Rural Health Technology Accelerator: Advancing Frontier-Ready Health Access and Innovation	AK	Alaska’s rural, remote, and frontier communities face structural barriers that limit access to timely, high-quality, and financially sustainable health care. More than 80 percent of communities are off the road system, requiring air or water transport for specialty services, diagnostics, and even routine care. Limited broadband, aging infrastructure, workforce shortages, and fragmented data systems further constrain care delivery. Patients often travel hundreds of miles for specialty consultations, behavioral health services, pharmacy access, and chronic disease management, resulting in high costs, delayed treatment, and avoidable medevacs. At the same time, Alaska presents a unique opportunity to leapfrog traditional infrastructure constraints by deploying technology-enabled care models designed for frontier conditions. Telehealth, remote patient monitoring, AI-enabled workflows, interoperable health IT systems, mobile diagnostics, and emerging delivery tools such as unmanned aerial systems can expand access, improve care coordination, and reduce costs. However, rural providers often lack the technical capacity, capital, and implementation support to procure, integrate, and sustain these solutions. This project addresses that gap by creating a structured pathway to recruit, test, deploy, and scale frontier-ready health technologies statewide, ensuring rural Alaskans receive secure, efficient, high-quality care closer to home.	Launch Alaska will address this challenge by establishing a statewide Rural Health Technology Accelerator that recruits, tests, and deploys frontier-ready health technologies in partnership with rural providers, Tribal Health Organizations (THOs), and community stakeholders. First, we will recruit a cohort of health technology companies whose solutions directly address rural access gaps, including telehealth platforms, remote patient monitoring systems, AI-enabled clinical documentation tools, mobile diagnostics, pharmacy automation, cybersecurity solutions, and emerging transportation and delivery technologies such as unmanned aerial systems. Companies will be screened for interoperability, alignment with CMS Health Technology Ecosystem standards, cybersecurity readiness, and applicability to frontier conditions. Second, the accelerator will provide structured technical assistance to rural clinics, hospitals, and THOs to support procurement, integration, and implementation. This includes workflow redesign, workforce training, cybersecurity compliance, HIE integration, and evaluation planning. Rather than simply introducing new tools, Launch Alaska will ensure that technologies are embedded into clinical operations in ways that strengthen care coordination, reduce administrative burden, and improve patient outcomes. Third, we will establish a Rural Technology Catalyst Fund to competitively pilot promising solutions in roadless and remote communities. These pilots will focus on operational feasibility, cost-effectiveness, clinical impact, and scalability. Evaluation frameworks will measure improvements in access (e.g., reduced travel or medevacs), quality (e.g., improved chronic disease monitoring, behavioral health follow-up), and system performance (e.g., interoperability and value-based readiness). Finally, Launch Alaska will convene state agencies, providers, technology partners, broadband entities, and private investors to align funding streams and scale successful models. As an independent, non-provider organization, Launch Alaska can serve as a neutral convener to reduce duplication and accelerate coordinated implementation statewide. Through this structured model, the accelerator will create a durable pathway for expanding technology-enabled, community-based care across Alaska’s rural and frontier health system.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Laux, LLC	Adult mental health residential step-down from acute psychiatric placement	AK	Alaska has never had a complete mental health system of care. The state has long lacked mental health residential step-down capacity, resulting in high recidivism rates for acute care admittees as they fall off the cliff and direct-discharge to home rather than stepping down in a more therapeutic and clinically appropriate fashion. The Department of Health has attempted to fill this void in the behavioral health system of care by adding adult mental health residential services, rendered in licensed assisted living homes, as a service available under the 1115 Medicaid waiver. To date, few assisted living homes have seized an opportunity to render adult mental health residential services, very likely due to the competing differences between what is historically an assisted living home service and what is a behavioral health residential treatment service. This project seeks to stand-up a 15 bed facility specifically intended to treat adult mental health clients in a post-acute step-down residential level of care without blurring the populations of mental health clients and, say, the physically disabled, who are the more traditional recipient of assisted living. This facility would work with, or perhaps partner with, acute levels of care throughout the state, e.g. Alaska Psychiatric Institute, Providence, Mat Su Regional, or many of rural access hospitals in the state that have to routinely flex a medical/surgical bed to accept a patient in an acute psychiatric episode.	Modeled after best practice standards for adult mental health residential treatment services as set forth in healthcare accreditation standards such as The Joint Commission or the Commission on Accreditation of Rehabilitation Facilities (CARF), a highly structured adult mental health residential treatment program could be launched in any suitable facility. Alaskan healthcare has long been brick-and-mortar infrastructure poor, thus such a facility need be constructed, or more likely renovated to suit from another pre-existing building or facility. Real estate acquisition, local permitting, and renovation to suit are the most time and resource consuming parts of this project, with programmatic launch being a relatively straight forward process once there is an appropriate residential facility to work from.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Chugach Census Area; Kenai Peninsula Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

Laux, LLC	Adult psychiatric residential step-down services	AK	Currently Alaska faces high recidivism rates among clients admitted to acute psychiatric facilities being readmitted due to lacking capacity to step-down in a more clinically effective and appropriate manner to transition back home. The Department of Health's current strategy for addressing this is to increase the number of assisted living homes in Alaska that are capable of rendering adult residential mental health treatment services under the Medicaid 1115 waiver. Assisted living home operation, and behavioral health services delivery are very different types of service and business. The state has struggled with expertise and technical assistance resources capable of successfully encouraging and assisting ALHs to navigate the 1115 process, or behavioral health providers to move into the area of assisted living home licensing. This project aims to remedy this issue.	Once funded, such an educational and consulting service could be promoted to potential ALH or BH entities that may be interested in moving more into the area of mental health residential services. This promotion could progress via means of professional association engagements such as the Alaska Behavioral Health Association, or the Assisted Living Association of Alaska. Further publicized by engagement with key foundations or philanthropic entities such as the Alaska Mental Health Trust, United Way organizations, or the Rasmussen and Foraker foundations. Direct engagement with potential clients is also possible, as the information of currently existing ALHs and BH providers is already publicly available, thus direct engagement could progress by moving down the list of ALHs not yet 1115 mental health residential approved, or behavioral health entities whose business lines and treatment models would align with further providing residential services but with whom have never operated or stood-up a licensed assisted living home.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Laux, LLC	Trauma-Informed Assisted Living Workforce Initiative for Behavioral Health Populations	AK	Anchorage's assisted living facilities serve a population with extraordinarily high rates of serious mental illness, yet staff lack standardized training to provide trauma-informed, behaviorally appropriate care. The prevalence of serious mental illness in US assisted living communities increased by 54% between 2007 and 2017, rising from 7.4% to 11.4%. Three-quarters of assisted living residents have a cognitive disorder, and 26% have a psychiatric disorder, yet 25% of dementia cases remain unrecognized by staff and only 43% of psychiatric disorders receive complete treatment. Residents of Medicaid-funded assisted living facilities report significant unmet mental health needs, including depression, anxiety, and substance use, accompanied by barriers to accessing care such as loss of autonomy, mistrust of organizational support, and isolation. Staff are expected to manage psychiatric crises, behavioral symptoms, and complex trauma without adequate training, tools, or clinical backup. A VA study of nursing home staff found that respondents identified lack of training of front-line staff as a key challenge in providing high-quality care to residents with serious mental illness, specifically noting needs to increase staff knowledge about SMI symptoms and diagnoses, improve staff communication and interactions with residents, and decrease mental illness stigma among staff.[12]	A. Establish Mandatory Training Standards All Anchorage assisted living facilities serving mental health populations will adopt standardized training requirements including: - Trauma-informed care principles (residents' need for safety, respect, and acceptance while minimizing retraumatization) - Mental Health First Aid and serious mental illness training - Crisis de-escalation and behavioral management - Person-centered communication using evidence-based curricula - Suicide prevention and overdose response B. Train and Certify All Frontline Staff Training will reach all staff members, including direct care and non-direct care staff (housekeeping, dietary), using a team-based approach. The OASIS curriculum model demonstrates that this comprehensive approach reduces antipsychotic use and improves resident outcomes.[5] Internet-based training modules will supplement in-person sessions, as research shows this approach produces significant positive effects on knowledge, attitudes, self-efficacy, and behavioral intention with medium-to-large effect sizes. Staff training will incorporate structured protocols, person-centered approaches, and communication techniques—elements associated with better staff and resident outcomes in dementia care settings. Training combined with external clinical support results in sustained improvements in both staff and resident variables, including reductions in challenging behaviors and improvements in staff self-efficacy. C. Implement Train-the-Trainer Model Each participating facility will designate an OASIS-style program coordinator and internal champion who will attend intensive training sessions and return to deliver staff training programs. The train-the-trainer model addresses sustainability by creating local educators who can continue training as staff turn over. A 12-year longitudinal study demonstrated that this approach produces sustained gains and substantial cascading effects.[6] D. Create Clinical Linkages Formalized linkages will connect assisted living facilities with: - Anchorage Health Department behavioral health services - Mobile crisis teams for real-time consultation - Emergency departments for coordinated crisis response - Community behavioral health providers for ongoing treatment Cross-sector partnerships that include shared personnel or resources and written agreements with mental health providers are associated with higher odds of participation in population-based mental health activities.[19]	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Learning Point Alaska	Katurrvik - The Gathering Place	AK	Katurrvik addresses the behavioral health crisis affecting Alaskan villages. Remote villages face disproportionately high rates of trauma, including suicide, domestic violence, child abuse, and historical wounds. Suicide alone is the second leading cause of death for Native youth aged 10-34, with rates significantly higher than those of other populations. Despite these challenges, culturally relevant mental health services are often unavailable, leaving many without support. Katurrvik leverages the proven "Healing the Wounds of Trauma" curriculum, which combines place-based healing with mental health best practices to foster personal resilience. This program is accessible and culturally sensitive, addressing the unique needs of Alaska Native villages. The project focuses on group healing sessions, where participants engage in discussions, lament, and forgiveness, while also training local leaders to sustain the program. The project overcomes logistical barriers by centralizing training and offering remote access for isolated villages. With a focus on spiritual restoration, Katurrvik not only helps individuals process trauma but also fosters long-term community healing by empowering local leaders to lead locally grounded trauma recovery efforts. This approach ensures both immediate relief and sustainable, culturally relevant care, bringing hope and renewal to Alaska Native communities.	The Katurrvik Project addresses the severe behavioral health challenges facing Alaska Native and American Indian communities, focusing on trauma healing through culturally relevant, place-based approaches. Our proposed solution builds on the proven "Healing the Wounds of Trauma" curriculum, which integrates spiritual principles with mental health practices to restore individuals and communities. Utilizing small group settings, the program provides a safe space for participants to explore trauma, grief, forgiveness, and resilience while engaging deeply with cultural identity. The healing process emphasizes lament, pain processing, and restoration, fostering mental health and emotional well-being. The project will strategically host events in central hubs like Anchorage or Fairbanks, allowing for cost-effective planning and access for participants from remote villages. Sessions will be tailored to address the unique challenges of these communities, including the stigma of sharing personal stories in close-knit settings. We will balance the needs of village participants through considerations like airfare and lodging, ensuring accessibility. To amplify the program's impact and sustainability, local leaders will undergo intensive training to facilitate future healing groups. This training equips leaders with the skills to continue trauma healing efforts within their own communities, ensuring cultural relevance and long-term cost-effective support. By addressing trauma as both a cultural and emotional wound, the program fills a critical gap in existing behavioral health services, which often lack a place-based component. The project strives to make villages hubs of healing and hope, equipped to meet community mental health needs. Through this approach, the Katurrvik Project creates a sustainable, community-centered model of trauma recovery, empowering Alaska Native communities to thrive emotionally, spiritually, and culturally.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area; Kusilvak Census Area; North Slope Borough	Deferred or Not Advanced

Let Every Woman Know-Alaska	Comfort Touch at Alaska Native Medical Center Oncology & Hematology Clinic Infusion Center	AK	Many cancer and infusion patients experience added stress to their disease simply by the delivery of often toxic intravenous treatments. The Comfort Touch program seeks to decrease many of common cancer treatment side effects, provide comfort to the patient, and improve the patient’s outlook for undergoing infusion treatment. This project aims to address two health care problems: 1. It will improve parity of care between Anchorage’s primary non-Native medical center and the Alaska Native Medical Center. 2. It will deliver a relaxation technique to ANMC infusion patients that could establish a more positive patient treatment experience and potentially improve longer-term outcomes. According to the Institute of Integrative Oncology based in California, therapeutic massage is a safe, noninvasive method of touch that is often recommended as a non-pharmacological adjunct for pain and stress management. Oncology Massage is the adaptation of massage techniques to safely nurture the body of someone affected by cancer and its treatments. Therapeutic oncology massage with a comfort-oriented touch is called “Comfort Touch”. Comfort Touch is available in Anchorage at the Providence Hospital Infusion Center. It is NOT currently available to the Alaska Native patients at the ANMC Infusion Center. This service is a reminder that the body and mind can find relief, comfort, and relaxation despite the emotional stress and physical discomfort experienced during treatment.	The Comfort Touch program is based on the “Greet the Day” Infusion Center Massage Program, which began in 2006 in California and has provided oncology massage to more than 56,000 intravenous patients. Visits to the Infusion Center can be numerous and time consuming, lasting between 1-6 hours. The high level of tension of a cancer diagnosis and the side effects often present during treatment add further anxiety to an already onerous situation. This initiative will provide inpatient Therapeutic Massage (“Comfort Touch”) sessions at the ANMC Oncology & Hematology Clinic - Infusion Center at no cost to the patients. Borealis Massage Therapy (BMT) is based in Anchorage and certified in the extensive “Greet the Day” protocols. BMT will provide licensed and accredited Comfort Touch to patients on request and with approval from the infusion nurse. Brief massage will occur at the patient chair or bed during their infusion. The program will offer 2-hour shifts in the Infusion Clinic, 3 days a week, as a standard of care through the therapists of BMT. Comfort Touch is performed on the lower legs/feet, and lower arms/hands of infusion patients. A non-greasy, no-fragrance lotion called Biotone is lightly used. At patient request, massage can be applied to target areas like neck/shoulders. Also at patient request, Comfort Touch can be offered over clothing with no lotion used. BMT will also offer the massage on a one-time basis to the infusion nurses to familiarize them with Comfort Touch therapy that their patients will experience. The BMT therapists are trained for oncology / hematology standards to perform Comfort Touch: - They observe the 3 Bs of patient care by confirming with the infusion nurse that: the Red Blood Count, the White Blood Count, and absence of Blood Clots are all adequate for physical stimulation of Comfort Touch. - They are thoroughly trained in the 3 Ps of patient massage therapy: applying the correct Positioning, Pressure, and Pace to make Comfort Touch a pleasant and beneficial experience. Cancer Patients receiving infusion treatments at the ANMC Infusion Center are the primary target. In 2025, the Infusion Center completed 17,608 appointments. Two therapists from BMT have been allocated a total of 312 Comfort Touch massage hours under this proposal, which allows for 3-7 patients per hour depending on volume of requests. A range of 1,000 – 2,000 patient Comfort Touch encounters per year are possible through this program.	Under \$50,000	Other	Anchorage (Municipality)	Deferred or Not Advanced

LetsGetChecked, Inc.	LetsGetChecked: Improving Biometrics and Diabetes Screening Rates With Education & At Home Testing	GA	Identify at risk populations early in the disease progression process. There is an opportunity to expand access to routine services closer to home to promote healthy communities and general health status knowledge. - 30% of Alaska adults did not have a routine checkup in the past year. - Approximately 33% of Alaska adults have not had a blood sugar test in the last three years creating the undiagnosed risk. - About 9% of Alaskans are living with diagnosed diabetes, but the state has seen a rise in prediabetes, with many residents unaware of their status. - 75% of Alaskans live with at least one chronic disease or a behavior (like smoking or obesity) that significantly increases their risk. The low screening rates directly correlate with Alaska’s high mortality in preventable areas. By offering free at-home kits, the state can bypass the key reasons for these low numbers: 1) Logistical challenges with limited road access: Residents wait for emergencies rather than prevention. 2) Systemic with workforce shortages: 50% adequacy of health care coverage means clinics prioritize sick people over healthy ones. Cost Travel Tax: The out-of-pocket cost of the travel to a physician’s office often exceeds the cost of the tests. Additionally, Alaska has the 4th highest uninsured rate in the US. 3) Psychological: Fear and a desire to avoid the risk of bad news when there is not an immediate feeling of being “sick”.	The lifecycle of care: 1) Announcement Campaign: Deploy a multi media campaign to rural populations & a targeted campaign to the local provider/ community resources to raise awareness of the new, no cost services available. 2) Ordering/ Enrollment: Residents self-enroll via a co-branded order page or a dedicated 1-800 call center. Providers, local Community Health Workers & other resources can order kits in bulk to have available for direct distribution to residents. 3) Ensuring Program Eligibility: LetsGetChecked uses a questionnaire to screen patients for eligibility based on: Demographic/ Age Verification: Residents confirm residency in a target county Clinical Triage: Residents answer basic questions to ensure suitability; those with high-risk factors are redirected to appropriate diagnostic care. 4) Taking the Test: Direct-to-Home Delivery: Kits are shipped with multilingual instructions, collection tips, & video tutorials. 2 drops of blood are collected on an ADX card. 5) Seamless Return: Residents use a pre-paid, trackable label to send samples to our CLIA-certified & CAP-accredited lab. 6) Support: A clinical care team and our digital platform are available 24/7 to assist with sample collection questions. 7) Engaging Patients to Take Action: Timely Reminders: Automated SMS and email remind patients to complete and return their kits. 8) Result delivery: Lab results are mailed to the patient’s home address and available on our Digital Dashboard. This allows participants to track sample status, view historical results, and download lab reports. Results And Clinical Support: Normal Results: Released via the patient dashboard and mailed to the home address. Abnormal Result Outreach: Our clinical team conducts high-touch outreach for all positive findings to explain results and discuss next steps prior to releasing findings digitally. 8) Provider Integration: We do a warm hand-off by providing result letters and clinical documentation to local practitioners to ensure continuity of care. 9) PatientsLikeMe: Peer- Led Empowerment by Fuze Health- a premier digital health community where residents can manage chronic conditions through real-world evidence and peer connection, reducing the common stressor of social isolation common in rural communities. 10) Real-time Reporting: EMR platform Halo, we maintain a comprehensive record of all activity that can be shared with the state to support their reporting requirements.	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

LetsGetChecked, Inc.	LetsGetChecked: Improving Screening Rates & Treatment to Reduce Impact of Chlamydia & Gonorrhea	GA	There is an opportunity to expand access to essential sexual health screening services closer to home and promote healthy communities through increased detection and treatment. Alaska continues to face some of the highest STI rates in the United States, frequently ranking in the top three for both Chlamydia and Gonorrhea, particularly in rural and "frontier" regions. Alaska currently ranks 3rd in the U.S. for Chlamydia rates with high prevalence in Anchorage, and the Yukon-Kuskokwim (Y-K) Delta in Southwest Alaska. Of additional note, the highest incidence is found among young adults (ages 15–29) and Alaska Native populations. Alaska has recently ranked 1st in the U.S. for Gonorrhea rates and has seen a recent surge in "invasive" cases that can potentially require hospitalization. The solution requires a program to be able to address the three concepts that have compounded the population health crisis. 1) Lack of Testing Access: In remote villages, the "travel tax" often prevents routine screening, meaning infections go untreated and continue to spread. 2) Clinical Staff Shortages: Rural regions often lack the consistent presence of specialized STI clinicians, OBGYN's or public health workers for contact tracing. 3) Social Factors: Socioeconomic disparities, stigma of sexual activity, lack of insurance, privacy concerns, high rates of substance misuse, and concentrated sexual networks in isolated communities contribute to the "persistence" of these high rates.	Program Lifecycle: - Announcement Campaign: Deploy a multi media campaign to rural populations and a targeted campaign to the local provider/ OBGYN's, community resources to raise awareness of the new, no cost, in-home- discreet screening services. . - Ordering/ Enrollment: Residents self-enroll via a co-branded order page or a dedicated 1-800 call center. Providers, local CHW's, OBGYN's and other resources can order kits in bulk to have available for direct distribution to residents - Program Eligibility: We use a questionnaire to screen patients for eligibility based on: Demographic/ Age Verification: Residents confirm age and residency in a target area Clinical Triage: Residents answer basic questions to ensure suitability for the kit - Taking the Test: Direct-to-Home: Kits are shipped with multilingual instructions, collection tips, and video tutorials. The test only requires a urine sample. - Seamless Return: Residents use a pre-paid, trackable label to send samples to our CLIA-certified and CAP-accredited lab. - Support: A clinical care team and our digital platform are available 24/7 to assist with questions. Engaging Patients to Take Action - Timely Reminders: Automated SMS and email remind patients to complete and return their kits. - Result delivery: Lab results are mailed to the home address and available on our Digital Dashboard. Participants can track sample status, view historical results, and download lab reports. - Results And Clinical Support: Normal Results: Released via the patient dashboard and mailed to the home address. Abnormal Result Outreach: Our clinical team conducts high-touch outreach for all positive findings to explain results and discuss next steps. A focus of these discussions is the education around th indeed for partner testing. Telehealth capabilities: As requested, patients can also be transferred to a telehealth provider for a full consultation and where appropriate e-prescribe services to a local pharmacy. - Provider Integration: We also offer warm hand-off by providing result letters and clinical documentation to local practitioners to ensure continuity of care. - PatientsLikeMe: Peer- Led Empowerment: To complement clinical care, we offer access to PatientsLikeMe powered by Fuze Health, a digital health community where users can manage chronic conditions through real-world evidence and peer connection, reducing the barriers of stigma and social isolation common in rural communities. .	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

LetsGetChecked, Inc.	LetsGetChecked: Improving Screening Rates for Colorectal Cancer With Education and At Home Testing	GA	There is an opportunity to expand access to essential screening services closer to home and promote healthy communities through increased preventative care and early detection. Despite being preventable, Alaska's colorectal cancer (CRC) screening rate is only 63.8%. Alaska Native populations face the world's highest CRC incidence (exceeding 60 per 100,000), with screening recommended to begin at age 40. With only 43 GI specialists (1.5 per 100,000 residents), Alaska ranks last in the U.S. with a 50% adequacy rate. The reasons why people avoid screenings are generally categorized into three main "walls": psychological, logistical, and systemic. To overcome psychological, logistical, and systemic barriers, we propose: 1) Psychological: An awareness plan to bridge the education gap and drive action. 2) Logistical: At-home kits via our dedicated user portal or customer service team, eliminate the need for provider visits, orders, or lab travel for sample evaluation and screening. 3) Systemic: A FIT-based triage model. By identifying the broader population for abnormal biomarkers first, clinicians can prioritize high-risk patients for limited time with GI specialists and colonoscopy slots, ensuring those most at risk move to the front of the line. While our solutions are designed to be accessed by individual residents, we also partner with the local provider community for test kits distribution and to ensure communication of all testing results.	The lifecycle of care: - Announcement Campaign: Deploy a multi media campaign to rural populations and a targeted campaign to the local provider/ community resources to raise awareness of the new, no cost services available. - Ordering and Enrollment: Residents self-enroll via a co-branded order page or a dedicated 1-800 call center. Providers, local CHWs, and other resources can order kits in bulk to have available for direct distribution to residents. - Program Eligibility: LetsGetChecked uses a questionnaire to screen patients for eligibility based on: Demographic/ Age Verification/ Target Location: Clinical Triage: Basic questions to ensure suitability; those with high-risk factors, such as a hx. of colon cancer, are redirected to appropriate care. - Taking the Test: Direct-to-Home Delivery: Kits are shipped with multilingual instructions, collection tips, and video tutorials. The FIT test only requires a Q- tip size stool sample. - Seamless Return: Residents use a pre-paid, trackable label to send samples to our CLIA-certified and CAP-accredited lab. - Support: A clinical care team and our digital platform are available 24/7 to assist with sample collection questions. - Engaging Patients to Take Action: Timely Reminders: Automated SMS and email remind patients to complete and return their kits. - Result delivery: Lab results are mailed to the patient's home address and available on our Digital Dashboard. This allows participants to track sample status, view historical results, and download lab reports. - Results And Clinical Support: - Normal Results: Released via the patient dashboard and mailed to the home address. - Abnormal Result Outreach: Our clinical team conducts high-touch outreach for all positive findings to explain results and discuss next steps prior to releasing findings digitally. - Provider Integration: We do a warm hand-off by providing result letters and clinical documentation to local practitioners to ensure continuity of care. - PatientsLikeMe: Peer- Led Empowerment: To complement clinical care, we offer integrated access to PatientsLikeMe powered by Fuze Health, a premier digital health community where residents can manage chronic conditions through real-world evidence and peer connection, reducing the common stressor of social isolation common in rural communities. . - Real-time Reporting: EMR platform Halo, we maintain a record of activity that can be shared with the state to support reporting requirements.	\$250K-\$1M	Home- and community-based services provider	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Level 3 Communica tions, LLC, A Lumen Technologie s company	Internet Connectivity to Support Health in Rural and Frontier Alaska	CO	Rural, remote, and frontier communities across Alaska face ongoing challenges accessing reliable internet connectivity necessary to support health care delivery and health workforce training. Geographic isolation, extreme weather conditions, limited terrestrial infrastructure, and high connectivity costs restrict the effective use of telehealth, distance education, electronic health records, and real-time clinical consultation. These barriers contribute to gaps in care access, training opportunities, and long-term workforce sustainability. This project addresses the opportunity to strengthen rural health care and training capacity by enabling resilient, secure connectivity in locations where traditional broadband solutions are unavailable or unreliable. By improving access to dependable internet connectivity, the project supports expanded use of telehealth services, remote clinical supervision, and virtual training models that are essential for improving health outcomes and sustaining Alaska’s rural and frontier health workforce.	Proposed Approach (Phased Delivery) We will address connectivity barriers in rural, remote, and frontier Alaska by deploying Lumen Managed Multi Connect to provide resilient, secure internet access that supports telehealth, distance learning, remote supervision, and access to clinical systems for RHTP-supported training and care settings. The solution uses bonded multi-satellite and wireless connectivity, leveraging multiple network paths to maintain reliable service in environments affected by extreme weather, geographic isolation, and limited terrestrial infrastructure. Phase 1 – Planning & Site Readiness: We will identify and prioritize RHTP training and care sites based on connectivity gaps and workforce impact, confirm satellite and wireless coverage options, establish performance requirements, and coordinate with clinical, training, and IT stakeholders to ensure alignment with care delivery and training schedules. Phase 2 – Pilot Deployment & Validation: A pilot deployment at select rural and frontier sites will validate performance for telehealth visits, virtual training sessions, remote supervision, and secure access to clinical systems. User feedback and performance data will be used to refine configurations and support processes. Phase 3 – Scaled Expansion: Based on pilot results, the solution will be expanded in waves to additional communities, prioritizing sites with the greatest training and clinical impact. Standardized configurations and centralized monitoring will support consistent delivery while allowing flexibility for local conditions. Phase 4 – Operationalization & Sustainability: Sites will transition to steady-state operations with proactive monitoring, ongoing optimization, and basic user training to support long-term use. This phased approach enables rapid impact, minimizes risk, and supports sustainable rural health training and care delivery across Alaska’s frontier communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

LifeMed Alaska	Bridging Distance to Care: Rural Access and Clinical Capability Expansion Across Alaska	AK	LifeMed is a medivac company serving the entire state of Alaska, where geography, weather, long transport distances, and limited local clinical resources can delay access to higher-acuity care. In the Yukon-Kuskokwim region, these challenges are compounded by the operational limitations of our damaged Bethel hangar door, which prevents timely aircraft access during common wind conditions and reduces our ability to launch quickly for medically necessary transports. In a region where communities are not connected by road, this creates a direct barrier to care. Rural Alaska needs stronger emergency-care capability, more reliable transport resuscitation tools, and more opportunities to train clinicians who practice in low-volume but high-consequence settings. This project addresses both needs: removing an infrastructure barrier to patient access and builds regional clinical capability through specialized equipment, simulation training resources, and workforce development. We already have an established education department and staff who teach not only our own nurses and paramedics, but community partners. This creates a significant opportunity to expand a proven platform. With additional simulation medical equipment and educators dedicated to this effort, we can help deliver training and clinical support across the state. Because we operate our own airplanes and helicopters, we can reach communities statewide and bring training directly to them wherever there is runway access.	Our proposed approach is a coordinated rural access, workforce, and technology project with two connected components. First, we will reinforce and replace the Bethel hangar door so aircraft can be accessed and launched more reliably in routine regional wind conditions, reducing avoidable barriers to patient transport from the Yukon-Kuskokwim region. This will improve access to higher-acuity care for patients who must be flown to Anchorage or other locations for services unavailable locally. Second, we will strengthen clinical capability through targeted equipment, training, and implementation support. Requested investments include additional simulation medical equipment, advanced blood-product transport coolers with integrated temperature monitoring, mechanical CPR devices, blood and fluid warmers, and point-of-care ultrasound. These tools will improve diagnostics, resuscitation, transport safety, blood-product reliability, and patient stabilization during prolonged rural transports and care in austere settings. This project is designed not only for LifeMed crews, but for broader rural benefit. LifeMed Alaska already has its own education department and staff with the expertise and structure to teach our nurses and paramedics and to provide training to other clinicians and community members. To make this program successful at the statewide level, we would also need to hire additional educators who can expand outreach delivery, support recurring training, and help sustain implementation over time. Using our own airplanes and helicopters, LifeMed can deliver training and support directly to communities across Alaska. As long as a village has a runway, we can access it and bring education closer to the point of need. We will pair the equipment investments with standardized training, simulation-based instruction, competency validation, outreach education, implementation protocols, and quality monitoring for rural clinicians, including EMS agencies, nurses, and community-based providers. This approach aligns with RHTP priorities by improving access, strengthening workforce capacity, and deploying practical technology through a sustainable statewide model.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

LifeStance Health, Inc.	Rural Mental Health Access Program	AZ	The Rural Mental Health Access Program (RMHAP) is focused on bringing the benefits of integrated care to rural communities providing early identification of and rapid intervention for behavioral health conditions that commonly present in the primary care setting consistence with LifeStance’s experience implanting programs with primary care groups and health systems in a variety of states and build on LifeStance’s experience providing mental health care for chronically ill patients in Alaska under existing CMMI innovation projects. The principal goals are to make it easier for individuals in access mental health care, both therapy and psychiatry, in their community and through their primary providers and, once care is accesses, bring the benefits of tight coordination between primary care and mental health providers in managing underlying conditions.	Elements of the RMHAP are anticipated to include * A LifeStance collaborative care clinician (CCC) embedded, physically or virtually in rural PCP offices, rural health systems or critical access hospitals supported by a consulting psychiatrist to support on-site mental health screening, provide brief, evidence-based treatment and medication management, * LifeStance will work with primary care providers and health systems to implement regularly screening for mental health issues when patients present for annual or other physical health appointments supported by clear referral pathways when issues are identified, * LifeStance will integrate its EHR system with local health providers’ EHRs to provide direct scheduling, bilateral data exchange and care coordination between physical and mental health, • The embedded LifeStance CCC is supported by psychiatric clinicians (psychiatrist and registered nurses) who support patients whose conditions required medication for effective management. LifeStance psychiatric providers delivering regular case consultation and treatment recommendations for patients who are not improving as expected, allowing local primary care providers to confidently prescribe medication or directly manage the patient medications depending on local needs. *LifeStance tracks treatment progress via a dedicated registry platform to ensure patients are engaged and improving with measurement based outcome tracking shared with local treating physicians through the EHR integration. •LifeStance intends to deploy technology tools to connect patients with providers between appointments and support clinical goals, measure progress and provide digital therapeutic support. •Care navigator overseeing patients’ journeys in the RMHAP to ensure strong connections with providers. The care navigator focused on capturing underlying data for metric informed care, reporting to providers to support clinical decision-making and ensuring patients are connected with additional care where necessary to support the underlying diagnosis. • LifeStance will provide periodical community-based mental health screenings to engage with community members that may not have a regular physician to identify mental health issues and connect them with providers. •As part of the RMHAP, LifeStance intends to recruit providers to be physically located in and deliver care within rural communities on either a full time or rotating basis depending on community needs.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Lightbeam Health Solutions	Population Health & Care Management Platform	TX	Lightbeam addresses the issue of patient data fragmentation across disperse provider organizations. Patient data is siloed into various systems ranging from insurance claims, electronic health record data (often not shared across provider/hospital groups) to social determinants of health information. This creates inequities in how patients are cared for as well as fosters patients falling through the cracks and not receiving the care they need. Additionally, there simply aren't enough resources available to adequately proactively engage these patients in their care. Lightbeam aggregates data across this fragmented ecosystem, enriches patient data with social determinants of health information, applies predictive analytics to call out patients who need help now, and has a powerful rules engine that enables automated workflows to activate based on desired outcomes. These workflows include, but are not limited to provider engagement via EHR overlays, automated reporting as well as patient engagement via automated phone calls, text messaging and agentic AI. Lightbeam illuminates care gaps, provides predictive analytics to stratify the population and then has automation tools to engage patients and drive action at scale.	Lightbeam will address fragmented patient data and limited care-management capacity by creating a unified, actionable data foundation and automating workflows that drive care-gap closure and targeted outreach. - Unify fragmented data into a single platform: Lightbeam aggregates data from multiple sources—including EMRs, clinical data, lab results, HIE data, post-adjudicated claims, billing, pharmacy, and social determinants of health (SDOH)—into a single integrated solution to create a comprehensive patient view. - Enable interoperability across systems: The platform supports interoperability standards to integrate diverse feeds and reduce silos. - Identify risk and prioritize interventions: Lightbeam applies multiple risk stratification models (e.g., Johns Hopkins ACG, Charlson Comorbidity Index, Area Deprivation Index) and AI/ML (including Lightbeam’s Ability to Impact (ATI) score) to identify high-risk patients and predict avoidable events, ED visits, and admissions. - Illuminate and close care gaps with automation: The platform identifies non-compliant patients and creates actionable, trackable Gap-in-Care Tasks that can be satisfied based on daily incremental clinical data. It can also automatically close quality measure gaps by integrating with EHR data (noting an average of 57% closed without manual intervention), and routes remaining gaps to the appropriate users for completion - Activate workflows at the point of care: Lightbeam pushes care opportunities into clinical workflows via point-of-care tools such as the “Lightbeam Ribbon” overlay within the EMR, displaying open care gaps and coding opportunities during the encounter. - Support segmentation and rules-based workflows: The Cohort Builder enables configurable, rules-based monitoring to automatically identify patients meeting cohort criteria and group them for assignment, tasking, outreach, and reporting; the rules engine also drives workflow actions such as assigning patients to care management resources and care plans. - Deliver actionable reporting and provider insights: Lightbeam provides dashboards, quality reporting down to the patient level where available, provider scorecards, and automated report distribution to drive accountability and performance improvement. - Enable timely interventions via real-time alerts: Lightbeam supports real-time notifications based on events such as ED/inpatient admissions and ADT feeds to prompt rapid follow-up and care coordination.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

LilyLink	Alaska Remote-First Maternal Diabetes Program	CA	Alaska sees approximately 9,000 births annually, with 60% or more from mothers outside of Anchorage who face significant travel burdens for care and delivery. Prevalence of gestational or pre-existing diabetes can be as high as 1 in 5 pregnancies, due to higher risk among Alaska Native/American Indian women. Diabetes is one of the most common and modifiable contributors to maternal and neonatal complications, including cesarean delivery and NICU admission. In rural and frontier communities, diabetes education, weekly glucose monitoring, and specialist oversight are difficult to access. Specialist maternal-fetal medicine (MFM) physicians are concentrated in urban centers, and often local providers manage high-risk pregnancies without structured co-management support. Traditional reimbursement models do not consistently cover frequent remote data review and care coordination, creating a gap in ongoing diabetes management. This project addresses that gap by implementing a remote-first maternal diabetes program that delivers continuous glucose monitoring, weekly clinical review, and structured MFM oversight without requiring travel to urban hubs. It represents an implementation-ready opportunity to improve maternal outcomes, reduce avoidable complications, and extend limited specialty workforce capacity across rural Alaska.	LilyLink will implement a structured, remote-first maternal diabetes care model in partnership with Alaska-based Maternal-Fetal Medicine (MFM) physicians to support rural prenatal providers across the state. Initially, our project management lead will engage providers that see patients in rural areas such as OBs, FQHCs, tribal health, and critical access hospitals, offering a streamlined referral pathway for gestational or pre-existing diabetes. Clinicians can easily refer directly to LilyLink’s monitoring platform. Patients receive 1:1 onboarding and education from a RD/CDCES clinician within five days and a connected glucose monitor as needed. The platform supports secure data transmission from home, allowing continuous monitoring without requiring travel. A dedicated telehealth clinical team (RD/CDCES) will review 100% of patient glucose data weekly. The team will provide ongoing nutrition counseling, medication recommendations, and proactive outreach when trends are concerning. Automated reminders and patient education tools will support adherence throughout pregnancy. Clearly defined escalation thresholds will trigger MFM review. MFM collaborators will provide structured oversight for high-risk or complex cases, including therapy recommendations and consultative support to referring providers. This ensures timely specialist involvement while allowing primary prenatal providers to remain central to care delivery. Implementation is designed for rapid deployment. The platform is fully operational, clinical protocols are established, and referral workflows can be activated immediately on award. No construction or major infrastructure buildout is required. Device inventory and staffing can be scaled in alignment with enrollment targets. The model will initially target 200 rural pregnancies in Year 1, followed by phased expansion. Performance metrics will include enrollment times, data review compliance, reduced in-person visits, and maternal/neonatal outcome tracking. This approach transforms care delivery by shifting from episodic, visit-based management to continuous, proactive monitoring with specialist-backed oversight. It strengthens rural provider capacity, extends limited MFM resources across frontier communities, and establishes durable digital infrastructure to support long-term maternal health improvement in Alaska.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

LINKS Mat-Su Parent Resource Center	Alaska Intensive Community Navigation Program	AK	Frequent emergency department (ED) use in rural Alaska reflects untreated behavioral health conditions, unmanaged chronic disease, and social determinant barriers that make routine care hard to access. In the Mat Su region, the High Utilizer Mat Su (HUMS) program was created to address these gaps for adults with multiple ED visits, providing transportation, appointment accompaniment/advocacy, benefits navigation, and linkage to behavioral health and basic needs supports. HUMS’ track record shows clear system impact - participants engaged two years or longer have driven more than \$7.25 million in ED related savings at Mat Su Regional - demonstrating a strong base for expansion. The opportunity now is to pair HUMS’ community rooted model with CBCS’s proven national playbook to scale outcomes in Mat-Su and replicate them in Anchorage. Across multi state implementations, CBCS’s trauma informed, boots on the ground navigation has achieved ~60% reductions in ED visits, ~a targeted 50% reductions in hospital admissions, and about \$40,000 annual cost avoidance per enrollee, with other programs showing 2:1 ROI and dramatic declines in psychiatric readmissions. Anchorage faces similar pressures. By integrating CBCS training, operational supports, and data driven workflows with HUMS’ frontline engagement, the project can targeted to enroll about 300 additional Mat-Su residents and about 600–700 Anchorage residents, reduce dependence on EDs, and strengthen rural care pathways at scale.	HUMS and CBCS will jointly expand a high impact model built on reducing ED overuse by addressing medical, behavioral health, and social needs among high utilizing adults. HUMS will remain the boots on the ground outreach team, continuing to meet participants at the point of care and in the community while providing transportation, appointment accompaniment, referrals, and support with housing, benefits, and behavioral health access. CBCS will supply training, operational structure, and growth support, strengthening HUMS’ existing model through standardized engagement protocols, advanced trauma informed training, interdisciplinary care planning practices, and consistent data tracking workflows. Mat Su Expansion: CBCS will help HUMS enroll about 300 additional high utilizers, leveraging HUMS’ demonstrated ability to reduce ED utilization and generate significant cost savings (over \$7.25M for long term participants). CBCS will refine referral pathways (ED alerts, EMS, provider and payer feeds), enhance real time communication loops, and support quality improvement cycles. HUMS staff will continue addressing immediate needs - behavioral health referrals, detox linkage, utility and housing assistance, food resources, and transportation - ensuring stability and improved outpatient follow through. Anchorage Expansion: CBCS/HUMS will replicate the Mat Su model by building a HUMS-aligned Anchorage team to engage projected 600–700 residents experiencing frequent ED or crisis-system use. Expansion is aligned with Anchorage’ growing behavioral health system needs and crisis response development, including increasing Mobile Crisis Team activity and rising monthly call volume. CBCS/HUMS will build team capacity, implement structured training, and support existing mobile crisis, establish referral workflows with hospitals, EMS/MCT, behavioral health providers, and housing programs. Core Methods: 1. Identify & Engage: Real time ED/EMS alerts and community referrals. 2. Enroll & Assess: Individualized care plans integrating behavioral health, medical needs, and SDOH. 3. Coordinate & Accompany: Appointment support, advocacy, and consistent follow up. 4. Stabilize: Rapid resolution of transportation, benefits, housing, and basic needs barriers. 5. Track & Improve: Joint dashboards monitoring utilization, linkage, SDOH resolution, and outcomes. This integrated approach strengthens HUMS’ operational capacity while enabling scalable replication across rural Alaska.	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Matanuska-Susitna Borough	Advance to Implementation Application

LINKS Mat-Su Parent Resource Center	Maternal & Early Childhood System Stabilization Initiative	AK	The first five years of life are critical to lifelong health, development, and educational stability. In rural and frontier areas of the Matanuska-Susitna Borough, services supporting mothers, infants, and young children operate across multiple systems, including pediatric and maternal health providers, MSBSD Child Find, the Infant Learning Program, licensed childcare programs, Early Head Start and Head Start, preschool and kindergarten programs, and pediatric therapy providers. While these systems provide essential support, coordination between healthcare, early childhood programs, and education systems is often fragmented. Referral pathways and follow-up processes are not always aligned across systems. As a result, families frequently navigate multiple programs during periods of heightened stress, particularly when developmental delays or behavioral concerns emerge. Gaps in early identification and cross-system coordination can lead to delays in evaluation and services, increased maternal stress, disrupted transitions between programs, and missed opportunities for early intervention during critical developmental stages. Strengthening coordination during the prenatal-to-five period offers a key opportunity to improve early identification, stabilize family systems, and promote more coordinated support for young children and families in rural communities.	LINKS Community Parent Resource Center proposes a Rural Healthy Beginnings Initiative to strengthen maternal and early childhood systems during the critical prenatal-to-five period. Project leadership serves as an Ambassador for the Division for Early Childhood (DEC) Recommended Practices, nationally recognized, research-based standards guiding high-quality early childhood and early intervention services. These practices emphasize family engagement, early identification, social-emotional development, coordinated transitions, and interdisciplinary collaboration. This initiative will apply these standards to strengthen rural maternal-child systems through the following strategies: Early Identification Alignment Strengthening collaboration between MSBSD Child Find, the Infant Learning Program, childcare providers, and pediatric healthcare providers to streamline referral pathways and reduce delays between developmental concerns and evaluation. Birth-to-Five Transition Stabilization Developing a standardized framework to support smoother transitions from early intervention to preschool and kindergarten, reducing service gaps and caregiver stress. Maternal Mental Health & Family Stabilization Improving provider awareness of maternal mental health indicators and strengthening referral coordination to appropriate supports. Evidence-Based Workforce Development Delivering workforce development sessions grounded in DEC Recommended Practices to improve provider competency in family-centered care, early identification, and cross-system collaboration. Rural Reflective Practice Cohorts Establishing small peer learning groups to reduce professional isolation and strengthen collaboration across rural communities. Workforce development will serve as the primary mechanism for improving maternal-child system coordination and stabilizing early childhood services across the region. At least 50% of workforce activities will be delivered virtually to ensure access for rural and frontier communities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Little Bears Playhouse	Creating a Community Outdoor Play Space to Support the Physical and Mental Health of Our Community.	AK	Like many states across the U.S., Alaska faces an obesity epidemic among children. Most communities across Alaska are rural, frontier, or remote, making the delivery of essential needs challenging. The rural nature of our communities results in increased consumption of processed and shelf-stable foods; harsh winters contribute to sedentary behaviors; and lack of sunlight during winters affects mental health. Little Bears Playhouse is committed to assisting Girdwood, AK, and the other communities of Turnagain Arm on the journey to mitigate childhood obesity and improve healthy living. In Fall 2026, Little Bears will open in a new 8,000 sq ft facility providing childcare and after-school programming with three outdoor playgrounds to meet the needs of our community. The lack of inclusive outdoor spaces for children to explore, with the mentorship of skilled educators, leads to a more secluded environment, sedentary lifestyles, mental health concerns, and a lack of a sense of belonging. Open spaces with intentional features allow children to experiment and learn with other children of all ages and ability types, fostering inclusivity, collaboration, and cooperation, all of which are essential to instill healthy lifelong behaviors and combat the ongoing fight against chronic disease, such as obesity, diabetes, and cardiovascular disease. Little Bears’ consistent dedication to our community’s youth stimulates respect and development for a foundation for healthy living.	Little Bears Playhouse commits to Girdwood and Turnagain Arm’s youth to create the foundation for healthy futures. These communities are passionate about outdoor engagement and community involvement. The greatest supports lacking in our community are ample developmentally appropriate childcare, after-school care, and outdoor spaces allowing children to be active in all weather environments. Little Bears took action to meet our communities’ needs through the expansion of our facility and increased capacity. Little Bears Playhouse designed three developmentally appropriate open play spaces to welcome youth from our communities to explore, develop, and build healthy physical activity habits. Engaging in outdoor play spaces encourages the acquisition of gross motor skills, social engagement, and diverse sensory skills. Through a variety of play experiences, children develop the skills necessary to engage in the world around them. Our inclusive design ensures all children, regardless of ability or skill level, can explore the space. The construction of our facility's playgrounds is crucial to instill healthy lifestyles in our youth. Playgrounds foster social interaction, team problem-solving, cooperation, and conflict resolution. Studies show that engaging in active play in outdoor play spaces reduces symptoms of anxiety and depression, improves mood, and increases self-esteem. The outdoor setting promotes exposure to natural light and fresh air, an important factor supporting mental well-being. Little Bears’ new playgrounds lay the foundation for social development, enhance confidence and self-esteem, and contribute to the emotional and physical health of the youth in our community. A substantial benefit of developing and constructing our outdoor play spaces is the sense of belonging and community engagement. These playgrounds will serve as social hubs, bringing our diverse community together to build friendships, reduce isolation, and assist families in creating a village of support within our community. This vital social infrastructure encourages regular interactions and community pride, an essential component of a strong neighborhood and community.	\$250K-\$1M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Little Bears Playhouse	Providing Afterschool Care for an Isolated Community to Support Our Youth	AK	Girdwood, Alaska, is a remote town approximately 40 miles south of Anchorage along the Seward Highway. This distance creates many barriers for our community and the surrounding communities of Indian, Bird, and Portage. Critical infrastructure is lacking, which would support the only medical service, Turnagain Community Health Clinic, Girdwood Fire Department, Whittier Police Department (who serve Girdwood), and the many medical professionals who call Girdwood home. One identified critical need for our community is after-school programming and child care. Our local school, Girdwood K-8, has no official after-school programming. This lack of programming leaves many children on their own from 2:30-6:00 pm. The lack of reliable and accessible after-school programming has led many families to leave our community. After-school care is a lifeline for working parents, providing an absolutely essential service that does not exist in our community. Little Bears Playhouse is expanding to a new 8,000 sq ft facility in Fall 2026. As part of this expansion, Little Bears Playhouse has developed the Girdwood Afterschool Program (GAP). Through the creation of GAP, Little Bears Playhouse offers a solution to meet this essential infrastructure need for Girdwood and the other Turnagain Arm communities.	Little Bears Playhouse will open its doors to the new Girdwood Afterschool Program on August 19, 2026. In our new facility, we have constructed an 800 sq foot multipurpose room designed to support 20 school-aged children from 2:30 pm to 6:00 pm for after-school programming. This program, led by 3 education professionals, will provide academic support, physical activity, and social connectedness to these students in our secluded town. GAP will provide a space for community youth to receive after-school tutoring and one-on-one academic support. The program curriculum will engage in Science, Technology, Engineering, Arts, & Mathematics (STEAM) focused activities to align with our educational philosophy. The integration of STEAM supports a hands-on approach, bridging the gap between classroom theory and real-world application. The ability to have dedicated, supervised time for physical activity in our outdoor play spaces or through teacher-led activities (cross-country skiing, hiking, etc.) allows our students to meet the national health benchmarks for moderate-to-vigorous activity. GAP will serve as a critical protective factor for our youth's mental and physical health. Our structured, safe environment will provide a spectrum of support, from basic emotional safety to intensive social-emotional learning. The primary mental health benefits will be a reduction in risky behaviors, a buffer to toxic stress, development of self-esteem, and behavioral improvements. GAP will allow students to engage with their peers, reducing the likelihood of developing problem behaviors associated with social isolation. Additional anticipated benefits include reduction in parental stress, use of trauma-informed care to assist our youth in navigating traumatic events, and building healthy coping mechanisms. Since reliable childcare and after-school care are a primary drive of stable parental employment, benefits of our after-school programming include improved workforce participation, parental job stability, and peace of mind. This program will support Girdwood's remote community health clinic by enabling recruitment, retention, and improved sustainability for current and new healthcare workers, to allow for the expansion of services, and improve healthcare access. Our broader community will see positive impacts, as engaged youth lead to a safer neighborhood and a decrease in risky behaviors, chronic disease, mental health conditions, and substance use.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Little Bears Playhouse	Workforce Housing for our Early Childhood Educators to Support Our Healthcare Workers	AK	The healthcare industry in Alaska faces ongoing challenges with recruiting and retaining healthcare workers, who are vital to a strong workforce. A major factor is the lack of reliable childcare. In Girdwood, Alaska, supporting and expanding healthcare services is also challenging due to childcare workforce shortages. Girdwood, located within the Municipality of Anchorage, has pursued independence and self-sufficiency since its incorporation. The town has established its own volunteer fire department, the Turnagain Community Health Clinic (the only medical service within a 45-minute drive), police coverage (supported by Whittier Police Department), a library, a community center, a post office, and a small mercantile. Little Bears Playhouse, previously too small to meet community needs, has built a new 8,000 sq ft early learning center opening Fall 2026. This expansion will increase capacity from 29 to 110 children and add much-needed infant care and afterschool programs. These additions will substantially improve childcare access for the 75-150 healthcare workers and first responders who live and work in Girdwood. Employers will benefit from reduced absenteeism and lower staff stress. By collaborating with existing healthcare infrastructure, Little Bears Playhouse will also provide early development interventions and screenings, further supporting the community's broader health. Increased childcare capacity directly benefits healthcare employee recruitment and retention.	Little Bears Playhouse identified a community need and set to work to solve the lack of affordable, accessible, and reliable childcare for our healthcare workers and first responders in the town of Girdwood with our new facility, increased capacity, and expanded childcare services as outlined above. To enroll our new early learning center to the maximum capacity needed by our community, Little Bears Playhouse will increase its number of early childhood educators by at least 6 employees to maintain adequate ratios. To recruit new, qualified childcare workers to support our community, we need to provide adequate housing, which is scarce in our remote town. Little Bears has begun our hiring campaign to support the opening of the expanded early learning center. To continue finding the most reliable, qualified, and intentional early childhood educators, we seek to provide housing during their employment. Little Bears has established two partnerships to provide housing for our new and potential early childcare workers. The first partnership is with a private owner of multiple rental properties in Girdwood, AK. This private owner has agreed to contract with Little Bears Playhouse to allow us to rent out 4 of their rental units beginning June 2026. Little Bears has a Memorandum of Agreement with Alyeska Resort, owned by Pomeroy Lodging, to lease at fair market value and sublet 6 of its housing units, upon the completion of their new workforce housing development. Little Bears will manage these properties and have a contract set in place that ties an educator's residence to their employment at Little Bears Playhouse. As a recruitment incentive, Little Bears will cover 50% of the rent for the first year of employment for our early childhood educators, beginning in June 2026. This support will allow qualified educators to relocate to our secluded town and provide the highest-quality education to our youngest community members. This financial support will provide relocation assistance for our educators, in turn enabling our early learning center to enroll to capacity.	\$50,000-\$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Little Rock Early Learning Center	Outfitting Little Rock Early Learning Center (Little Rock), a New Daycare and Preschool in Homer	AK	Little Rock ELC addresses the severe shortage of licensed childcare slots in Homer and surrounding area. Rising costs of living, which require many families to have two working parents, and access for parents who are fiscally challenged are extremely troubling. Little Rock is undergoing the process of becoming a fully licensed childcare facility able to qualify for state, military and tribal subsidies, which will help directly resource many of these families. Our long-term goal is to have a healthy scholarship fund which would provide tuition subsidies for those who are in a median income bracket. Workforce challenges faced by local employers are high due to limited childcare availability. Little Rock will provide opportunity for training in a variety of positions and skill-levels, bolstering the workforce and longevity in the childcare field. Individuals will be well equipped and trained, providing space to for passion to grow under good leadership and support. Awareness of childhood development and access to intervention is limited in our small community. Little Rock Early Learning Center will support and increase access for our rural hub community to the long-term benefits of early childhood education, including improved school readiness, social-emotional development, and lifelong learning outcomes. Down the road, we plan to incorporate therapy services and support for childhood development, across a scope of unique needs.	Being deeply rooted in the Homer community, our leadership team began asking how we could tangibly support families “where they are.” Through conversations with parents, educators, business owners, and civic leaders, it became increasingly clear that early childhood education was one of the most urgent and unmet needs. We have used data from South Peninsula Hospital, acute observations of their own childcare center and the MAPP steering committee findings from the Homer Community Health Needs Assessment in 2022 to accurately identify the need and scope of support. The decision to pursue Little Rock ELC grew out of years of curiosity, strategic planning, and community observation. Families throughout the greater Homer area have consistently expressed the difficulty of finding reliable, high-quality childcare. We are excited to invest in as many as sixty children ages three months to five years old as a fully-licensed, year-round establishment working to strengthen families, support the workforce and serve our community in practical and sustainable ways. Year-round childcare is extremely limited in Homer: Little Rock will have full-time, year-round staff, able to provide consistency, predictability, and continually strengthen families without an extended break for summer. This enables both children to have continued care and childhood development support, the parents to continue in the workforce, and the staff of Little Rock to continue in their goals.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Loon Medical LLC	MamaBear Health: Consumer Digital Tool for Right-Sized Pediatric Follow-Up in Rural & Tribal AK	MN	Rural and frontier Alaska needs a practical way to make timely care decisions for young children when symptoms change outside a scheduled encounter. In the village clinic system, children under five account for approximately 25% of CHA/P visits, and respiratory/ENT illness is the dominant workload—40.8% of diagnosed encounters—including URI, bronchiolitis, wheezing/reactive airway disease, and pneumonia follow-up. Care decisions for these low-acuity cases depend on trajectory: is the child improving, stable, or deteriorating? Alaska's eCHAM guidance reflects that reassessment is core to sick-child care: some pathways call for daily rechecks until improvement criteria are met, while others direct rechecks only if symptoms worsen or a caregiver is concerned. This creates decision-critical touchpoints after the child returns home—when symptoms may be intermittent, hard to describe, or absent at the time of evaluation. Repeat rechecks impose a disproportionate burden where distance, weather, staffing, and connectivity limit access. Alaska has strong store-and-forward infrastructure, but workflows are clinic-initiated and optimized for provider-to-provider consultations—not for follow-ups for low-acuity & sick-child illnesses. The opportunity is to establish a low-bandwidth pathway to collect and store meaningful clinical change between encounters, enabling right-sized decisions—home care, local evaluation, or escalation—to be made with better information and less travel/time.	MamaBear will be deployed as a consumer-facing, store-and-forward pediatric reassessment tool within existing rural Alaska care workflows (tribal organizations, RHCs, and FQHCs). The project does not create a new service line or 24/7 triage channel; it standardizes and documents existing non-urgent sick-child check-in processes. Rollout is designed for 30–60 days per site. Year 1: implement and evaluate in 1–3 sites; Years 2–3: scale based on results and partner demand. Partner recruitment (Months 1–2). With Alaska DOH RHTP facilitation and APCA support, recruit initial partners and confirm readiness: a clinical champion, a workflow owner, a privacy/security review path, and agreed-upon metrics. Initial focus: Kenai Peninsula and Mat-Su, with expansion to frontier/village settings (YK Delta/YKHC) in Years 2–3. Workflow integration & training (Months 2–4). MamaBear is triggered by a sick-child follow-up requested by a CHA/P at the conclusion of an in-clinic visit. At home, caregivers submit structured inputs aligned with eCHAM recheck domains—activity, hydration/urination, breathing, and medication response—plus a brief, quality-controlled video. Staff training is lightweight (≤2 hours via Zoom & conducted by a licensed pediatric pulmonologist) and includes job aids and safety-net scripting. Clinical review & documentation (Months 3–12). Clinicians and CHA/Ps review submissions during defined workflows—not continuous monitoring—and document next steps: home care with safety-net guidance, local evaluation, or escalation. Reports are delivered via secure link to a secure email or via EHR integration, where available, but not required. Family education (Months 3–12). Clinician-reviewed "what to watch for" guidance is tied to logged symptoms, reinforcing when to seek urgent care. Alaska-specific content will be co-developed with partners. Sustainability (Months 4–12). Where appropriate, establish compliant store-and-forward billing workflows. Track time-to-review, staff time per reassessment, and recheck substitution to inform ROI scenarios rather than assuming uniform billing uptake. Evaluation (Months 6–12; Years 2–3). Phase 1 metrics: adoption rates, recheck substitution, review time, time-to-response, travel-burden avoidance, and safety signals (escalations, short-interval return visits). Years 2–3 will scale to additional sites and add de-identified aggregate trend reporting.	\$50,000-\$250,000	Statewide	Kenai Peninsula Borough; Kusilvak Census Area	Deferred or Not Advanced

Love Alaska	Online Exploitation Prevention and Digital Safety Training for Alaska Communities	AK	Across Alaska, communities are increasingly encountering the realities of exploitation, particularly the rapidly growing issue of online exploitation and digital grooming. Social media platforms, messaging applications, and online gaming environments have dramatically expanded the ways predators can access and manipulate vulnerable youth. In many cases, exploitation now begins online long before it becomes visible in a community. Rural communities are particularly vulnerable because access to prevention education and specialized training is often limited. Parents, educators, and community leaders may not be aware of the tactics used by traffickers and predators or the warning signs that exploitation may be occurring. At the same time, online exploitation can result in significant trauma and long-term behavioral health impacts for victims. There is a clear need for prevention-focused training that equips communities with practical knowledge to recognize online risks early and respond effectively before exploitation escalates. Our organization has an established history of doing this work in Alaska. We have partnered with Homeland Security and the FBI on victim-focused operations, we have worked with Tlingit & Haida, Knik Tribe, and the Alaska Native Women's Resource Center for indigenous-focused trainings, we have trained students at UAF, Sitka Public Schools, Mt. Edgecumbe, and Job Corps, along with hundreds of other Alaskans who have been equipped through our trainings.	Love Alaska proposes to expand a statewide training initiative focused on online exploitation prevention, digital safety, trauma awareness, and community response. The project will deliver community-based trainings designed for educators, youth workers, parents, service providers, and community leaders. These trainings will focus on recognizing grooming behaviors used by traffickers, understanding how exploitation occurs through digital platforms, identifying warning signs that youth may be experiencing online exploitation, and strengthening early intervention strategies. Participants will also learn practical tools for supporting youth who may be at risk and connecting individuals with appropriate resources. The project will prioritize rural and underserved communities where access to this type of training is often limited. Trainings will be delivered through partnerships with local organizations including tribal entities, schools, universities, healthcare providers, and social service agencies. In addition to professional trainings, youth-focused workshops will provide young people with practical information about digital safety, healthy online boundaries, and how to recognize manipulation tactics used by predators. By equipping communities with prevention tools and trauma-informed knowledge, this initiative strengthens protective factors that reduce vulnerability to exploitation and improve overall community wellness.	\$50,000-\$250,000	Statewide	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Sitka (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Lowell Point Volunteer Fire Department	Ambulance/Rescue vehicle for the Lowell Point Community and Lowell Point Volunteer Fire Department.	AK	The Lowell Point Volunteer Fire Department currently offers fire, first responder medical care and rescue services. The fire and rescue vehicles owned and operated by the department are old, 42 and 53 years old. The vehicles lack adequate storage space and compartmentation to stock and transport a variety of medical and rescue equipment. Responder often have to make decisions about what equipment to bring and what to leave behind. The department currently has no ambulance or rescue truck and responds in one of our two Tanker/Pumper that cannot transport patients. Some medical and most rescue equipment is staged at the station and brought to the incident in Private Operated Vehicle because it does not fit on either Tanker/Pumper. Since the current units are too small to be stocked with a variety of rescue equipment, volunteer members must make decisions about which rescue equipment might be needed for the incident. Volunteers then take the time to load and stow the rescue equipment, if it fits, in the unit prior to departure. This decision making, loading and stowing delays incident response times. These old vehicles are difficult to retrofit with modern systems. The new vehicle would have integrated modern communication systems directing drivers to locations and allowing drivers to communicate in real-time with other members. Given the age of the vehicles, they require constant tinkering to maintain which cost money and depletes our limited budget.	Since the Lowell Point Volunteer Fire Department currently offers fire, first responder medical care and rescue services and has two tanker/pumpers the ideal vehicle would be a Type 1-AD (Additional Duty) Ambulance/walk in Rescue with transport capability. It will include a medium duty chassis with a modular, 14-foot ambulance/rescue body for both medical care and transport and to carry rescue equipment needed for vehicle accidents and back country rescue. This would be about 2 feet longer than the average Ambulance and has extra compartment space for medical and rescue equipment. It will have seating for two in the cab and three in the body/patient care area. Our fire station has an open heated bay for this vehicle. This ambulance will be for emergencies and to help evacuate patients to the hospital in Seward for advanced medical care. The addition of an ambulance to our fleet will provide both medical care and rescue services in one platform and will replace one of our Tanker/Pumper trucks. We will still own, maintain and operate two vehicles keeping our overall costs similar or less. Lowell Point wishes to be more self-sustaining since the road access to the community can periodically be cut off. The community and the Fire Department are three miles south of Seward and can only be reached by a dirt road or boat. The single access road is known for its landslides, rock fall and snow avalanches. Morning commuters often have to wait for avalanches to be cleared before going to work. On Saturday, May 7, 2022, a large landside occurred on the access road with an estimated 40,000 cubic yards of debris blocking the only road into the community for 17 days. Having our own ambulance will improve response times and improve patient care but is particularly important when access to Lowell Point is cut-off. The ambulance will allow our members to provide medical assistance, stabilize the patient and transport the patient to our dirt helicopter landing pad. The department aided in coordinating evacuation of visitors and aided community members during the landslide. Since the slide occurred on a Mother’s Day weekend at about 3 pm and the weather was beautiful, the community was full of numerous tourist and day adventures. The department worked with local businesses to offer water taxis to transport passengers and supplies in and out of Lowell Point from Seward. Fortunately, during this three-week period we did not experience any fire or medical emergencies.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

LTS/testand go	Expanding Testing and Medication Access Across Alaska Through Dispensing and Pharmacy Kiosks	VA	Rural and remote communities across Alaska continue to face barriers to timely access to prescription medications, health products, and diagnostic testing. Long travel distances, weather-related disruptions, transportation challenges, workforce shortages, and limited local pharmacy or health access points can delay care and make it harder for patients to follow through on treatment and testing recommendations. In many cases, patients may leave a care encounter with a prescription or recommended test but still face significant obstacles to obtaining medications, supplies, or testing in a timely and reliable way. This project addresses that gap by enabling organizations to expand access through prescription kiosks, dispensing kiosks, and self-collected diagnostic test kits that can be deployed to reflect local needs, care models, and operating environments. These solutions can help reduce barriers between diagnosis, prescribing, dispensing, and follow-up, while giving providers more flexible tools to improve access closer to home. For LTS, the opportunity is to serve as a scalable implementation partner for multiple Alaska entities seeking practical, technology-enabled solutions to strengthen access and continuity of care. Through this project, LTS would support participating organizations with the infrastructure, implementation planning, and deployment support needed to expand access in a way that is sustainable, adaptable, and responsive to rural service delivery in Alaska.	LTS’s proposed approach is to work with participating Alaska organizations to plan, configure, and deploy the access model that best fits each setting. Depending on the organization’s needs, that may include a prescription kiosk, a dispensing kiosk, self-collected diagnostic test kits, or a combination of these tools. The project would be implemented through a phased process designed to move from planning to deployment in a structured and operationally sound way. Initial work would focus on identifying participating sites, confirming pharmacy and provider partners, defining priority use cases, and determining the appropriate deployment model for each organization. LTS would then support site assessment, workflow design, product or formulary planning, connectivity and infrastructure review, and any needed integration with pharmacy systems or electronic health records. This phase would also include coordination around oversight requirements, security, testing protocols, staff training, and patient-facing education. Once implementation requirements are defined, LTS would support system configuration, installation, testing, and go-live preparation. After launch, the project would include early monitoring of utilization, workflow performance, and operational issues so that participating organizations can make adjustments and strengthen long-term performance. This approach is intended to give Alaska entities a practical implementation pathway, not just access to technology. LTS’s role would be to provide the equipment, planning support, integration coordination, and deployment assistance needed to help multiple organizations put these solutions into operation successfully.	\$1M-\$5M	Statewide	Anchorage (Municipality); Bethel Census Area; Copper River Census Area; Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area	Deferred or Not Advanced

Lumeris Companies	AI-Enabled Primary Care Infrastructure: Integrated Virtual, Remote & Community Care Orchestration	MO	Rural Alaskan communities face persistent barriers to timely care due to geographic isolation, workforce shortages, and limited service capacity. Long travel distances, severe weather, and uneven connectivity make it difficult for patients to access preventive services, manage chronic disease, and maintain continuity of care. Rural providers also face growing administrative burden and difficulty recruiting and retaining clinical staff. These challenges create an opportunity to strengthen care delivery through AI-enabled primary care infrastructure that expands access, strengthens prevention, and supports workforce capacity. By embedding advanced analytics and autonomous care orchestration within existing clinical workflows, providers can proactively identify care gaps, monitor rising-risk patients, and coordinate preventive outreach across dispersed communities. Tom™, Lumeris’ AI-enabled primary care platform, integrates directly with existing EMRs and health information exchanges while preserving local data governance. It also integrates with complementary technologies such as remote patient monitoring and digital health tools, strengthening the impact of existing investments and enabling coordinated care across solutions already used by Alaska providers. This approach helps providers modernize care coordination, strengthen continuity, and expand access to primary and preventive services while maintaining community-based care models essential to rural Alaska.	The proposed approach is to make Tom™, an AI-enabled rural primary care infrastructure platform, available to Alaska providers and Tribal health organizations that elect to deploy the platform, expanding care coordination capacity while integrating directly into existing clinical systems and workflows. Rather than replacing local technology or care models, Tom is designed to embed within provider EMRs and health information exchanges using standards-based interoperability (e.g., HL7 and FHIR), allowing organizations to strengthen care coordination while preserving local data governance and operational autonomy. Tom functions as an AI-enabled care orchestration layer anchored in primary care. By continuously analyzing clinical, claims, and patient-reported data, the platform identifies care gaps, rising-risk patients, and preventive needs. Using evidence-based clinical protocols, Tom can initiate outreach and care coordination actions across multiple communication channels—including text, voice, and landline—ensuring patients in low-bandwidth rural environments can still be reached reliably. The platform is designed to strengthen the impact of existing health system and community investments by integrating with complementary technologies already used by providers, such as remote patient monitoring and other digital health solutions. By coordinating across these systems, Tom amplifies the effectiveness of existing tools while reducing fragmentation across care teams and settings. For rural providers facing workforce shortages and increasing administrative demands, Tom functions as a force multiplier for care teams. By surfacing actionable insights, coordinating and autonomously executing routine outreach and follow-up activities, the platform helps clinicians practice at the top of their license while mitigating the need for additional staffing investments in hard-to-fill coordination roles. Implementation will emphasize thoughtful integration and clinician engagement, working with Alaska providers and Tribal health organizations to ensure AI-enabled tools are introduced in ways that build trust and familiarity among care teams and patients. Tom establishes AI-enabled primary care infrastructure that allows Alaska providers to adopt emerging capabilities without repeatedly rebuilding underlying systems.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

LumiCare, Inc.	LumiCare's LumiLink Nurse Connect: Improving Rural Access Through 24/7 Remote Nursing	PA	Rural, remote, and frontier communities face persistent barriers to timely, high-quality clinical care. Long travel distances, severe weather, limited nursing capacity, and chronic workforce shortages frequently lead to delayed interventions, preventable hospitalizations, and fragmented care. Traditional site-based nursing models cannot adequately support communities where skilled clinicians are scarce and where health concerns often go unaddressed for extended periods. This project aims to close that gap by introducing a remote nursing and real-time health monitoring model that expands clinical access and reduces avoidable emergencies. Through 24/7 Registered Nurse availability, proactive monitoring with medical-grade devices, and integrated dashboards, individuals can receive immediate triage, early intervention, and ongoing support regardless of location. The opportunity is to strengthen Alaska’s rural health system with a scalable, person-centered solution that improves access, enhances care quality, and eases pressure on an overstretched workforce. By extending clinical reach and enabling earlier, more consistent support, the project helps ensure that even the most isolated residents receive timely, reliable, and responsive care.	The project introduces a remote nursing and real-time health monitoring model that expands access to reliable clinical support for individuals living in Alaska’s rural, remote, and frontier communities. It is designed to address barriers that routinely delay care, limited on-site nursing capacity, long travel distances, severe weather, and seasonal disruptions. By establishing a centralized virtual nursing hub supported by medical-grade remote monitoring technology, the model strengthens local care systems while reducing the burden on overstretched providers. Participants and caregivers gain 24/7 access to Registered Nurses through a secure telehealth platform. Nurses deliver real-time assessment, triage, coaching, and care coordination, enabling concerns to be addressed early and often preventing escalation. Because many issues can be resolved safely at home, the model reduces avoidable emergency visits and ensures residents in isolated communities receive immediate support without waiting for in-person services. Bluetooth-enabled medical devices feed vital signs and symptom data into an integrated clinical dashboard. This allows the nursing team to identify trends, detect early warning signs, and intervene quickly, improving outcomes for individuals with chronic or complex needs. The standardized monitoring approach also supports providers who may lack access to a full clinical team. The model is built to integrate with partner workflows. Documentation and encounter summaries are shared in interoperable formats, and escalation pathways are customized to align with local protocols and available resources. When in-person care is required, the virtual nursing team coordinates directly with local providers or emergency responders to ensure smooth handoffs. By reducing travel demands and enabling limited staff to prioritize high-acuity needs, the model helps stabilize the rural workforce and reduce burnout. Caregivers and local staff also receive training and ongoing coaching, increasing confidence in managing lower-acuity concerns with remote clinical support. Together, continuous clinical access, proactive monitoring, and strong care coordination create a scalable, sustainable approach that improves access, strengthens care quality, and ensures individuals in Alaska’s most isolated communities receive timely, dependable support.	\$50,000-\$250,000	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Managing Me Enterprises	The PENNI Project: A Project Database Matching Platform for Creating Partnerships	AK	"Partnership is the foundation for transforming care in rural AK"(AKCMSRHTP, pg.17). Challenges include limited public health authority, infrastructure gaps, system modernization needs, and rural service reductions(pg 6,8,10). RHTP funds target improving access/outcomes through tech and collaboration(pg 12-14,17). The cost of siloing/uncoordinated projects is high but hard to quantify. AK spends more per capita than the US in 5/9 health cat., with care coordination failures ID'd as a top wasteful spending area(AKHCTPRoadmap, pg.23). National collab. resources don't meet AK's needs. Successful local partnerships demonstrate the power of coordination. The AK Rural Utility Collab., our CEO's CommCare work, and Stone Soup/Southcentral collab. increased access by leveraging synergies, coordination pathways, and workflow integration. But these required slow, heavy investment/had a narrow focus. The RHTP presents an opportunity to build on these lessons. By quantifying siloing costs, defining collab. enablers/inhibitors/automating their identification, a tech platform could reduce service gaps/duplication and increase access beyond the RHTP. The RHTP will already have the data on AK's most innovative initiatives and provide motivation/direction for specific partnerships. Now is the chance to build a centralized, automated, collaborative platform that replicates past collaborative successes in a scalable, tech-driven, efficient way that outlasts the RHTP funds that establishes it	PENNI is a statewide project matching platform that helps organizations find overlapping work and connect with the right partners. PENNI takes a searchable database to the next level by giving the option to automatically generate match scores with plain-language explanations based on partner-defined factors, so teams can quickly decide when to coordinate. In PENNI, “project” is a broad term that includes programs, initiatives, research efforts, current studies, pilots, evaluations, and other organized work happening across AK. PENNI is more than a searchable list: organizations can maintain project information, control what is shared publicly, and use match suggestions to coordinate early and reduce duplicated effort, especially in rural and remote communities where capacity is limited. Our approach is partnership-first and designed to strengthen collaboration within the RHTP ecosystem. In partnership with DOH/Alaska Community Foundation’s RHTP, PENNI will support DOH’s goals around efficient use of funding and improved project coordination starting in Year 1 by helping identify overlap, reduce duplication, and surface collaboration opportunities across awarded work. Year 1 focuses on validating collaboration needs and “fit factors” through structured Voice of Customer, facilitated workgroups, and mapping how projects are created, managed, and closed. Outputs include VoC-verified mind maps and workflow diagrams, a usable set of matching factors, an explainable match approach, and a baseline of the cost of siloed work (duplication and survey fatigue), resulting in a research paper and practitioner-oriented white paper. Subsequent phases build and pilot the platform with RHTP recipients and additional AK organizations, refine matching through real usage, strengthen governance and onboarding, and mature operations for sustainability. Over time, the platform will automate matching and coordination processes initially done by hand, reducing workload while improving efficiency and enabling more precise program and funding planning. Once fully launched in Alaska, we will extend our user base to the lower 48 as part of our sustainability plan. This will allow user fees outside the state to fuel in-state free use of the platform.After the organization-facing proof of concept is established, a later phase may include an optional public view of public projects and resources so community members and patients can discover opportunities and sign up for relevant updates	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Maniilaq Association	Maniilaq Association Behavioral Health AI Clinical Documentation and EmPATH Design Planning	AK	Our rural residents of the Maniilaq service (MSA) area face significant barriers to behavioral health care, including geographic isolation, limited crisis stabilization infrastructure, and Behavioral health (BH) workforce shortages. BH providers serving the MSA must manage high caseloads while meeting complex documentation requirements associated with Medicaid billing, accreditation standards, and regulatory compliance. These administrative demands reduce time available for direct patient care and contribute to clinician burnout. At the same time, the region lacks dedicated psychiatric crisis stabilization facilities. Individuals experiencing behavioral health crises often present to emergency departments or law enforcement settings that are not designed to provide therapeutic stabilization. This project addresses these challenges by implementing AI-enabled clinical documentation tools that reduce administrative burden while simultaneously designing a rural Emergency Psychiatric Assessment, Treatment and Healing (EmPATH) crisis stabilization unit. By addressing both challenges together, these efforts will strengthen Maniilaq's Behavioral Health service delivery, improve workforce sustainability, and expand access to crisis care across a geographically remote region of Alaska.	The Maniilaq Behavioral Health AI Clinical Documentation and EmPATH Design Planning project will improve the quality, efficiency, and accessibility of behavioral health services across the Maniilaq Service Area through the implementation of AI-supported clinical documentation and the design of a rural Emergency Psychiatric Assessment, Treatment and Healing (EmPATH) crisis stabilization unit. This project will implement two coordinated strategies to improve behavioral health care delivery in the Maniilaq Service Area. First, the project will deploy an AI-enabled clinical documentation and compliance platform to support approximately 50 behavioral health providers. The system will assist clinicians in generating compliant documentation for assessments, treatment plans, and progress notes while aligning documentation with payer requirements, regulatory standards, and accreditation expectations. Real-time compliance auditing will help identify documentation gaps before submission, reducing administrative rework and strengthening audit readiness. Second, the project will complete operational and architectural planning for a rural Emergency Psychiatric Assessment, Treatment and Healing (EmPATH) crisis stabilization unit. EmPATH units provide rapid psychiatric assessment and short-term stabilization in a therapeutic environment designed specifically for behavioral health crises. Planning activities will include workflow development, space design, staffing models, and integration with existing crisis response systems. The design will consider the unique conditions of rural Alaska, including transportation challenges, cultural considerations, and coordination with tribal health services. By combining workforce support through AI-enabled documentation with crisis stabilization infrastructure planning, the project will advance a comprehensive approach to improving behavioral health care access and system performance in rural Alaska.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Advance to Implementation Application

Maniilaq Association	Maniilaq Association Health IT Modernize End-User Access	AK	The Maniilaq Health Center (MHC) and our 11 rural village clinics must replace and upgrade our current aging health systems' computer workstations to take advantage of new technologies to improve both access and enhanced quality of care for our patients. Providing health services to a rural population, Maniilaq and our patients need better access to essential telehealth services, enhanced cybersecurity against growing and constant threats, ensure timely Electronic Health Record (EHR) interoperability, and ensure patient care continuity. Additionally, by replacing and upgrading our MHC and village clinic health system computer workstations, we will improve operational efficiency and be better able to attract future providers who expect advanced, digital capabilities. Other current challenges with our aging Health Computer workstations: 1. Need for better Healthcare Cyber Specific Security. Like other health providers, Maniilaq has seen an increase in cyber attacks. 2. Faster EHR access for our providers and health support staff is critical for improving our rural patient outcomes, decreasing errors, and reducing clinician burnout. 3. Reducing costly travel burdens on our rural patients by accessing more medical appointments through Telehealth. 4. Our health providers being able to access new Health AI Tools for better documentation and diagnosis of our patients. 5. Maniilaq Health computer workstations have either warranties about to expire or have expired.	Maniilaq Health IT Modernize End-User Access project will purchase new health computer workstations for the Maniilaq Health Center and the 11 village clinics in the Maniilaq service area. Within the first month of the grant award, the Maniilaq IT Director and CIO will put in order for the new health computer workstations. This will include a mix of both fixed and movable workstations. Maniilaq has a quote for \$675,909.20 from CDWG for a mix of Lenovo ThinkPad workstations with ThinkSystem infrastructure. Maniilaq IT and Health Services have already done both assessment and planning for this project to ensure the right equipment is ordered. They have concluded that these more modern workstations will help our rural hospitals and village clinics improve patient care by providing reliable, high-performance, and cyber-secure technology. They will enhance efficiency for our healthcare providers and support staff through fast access to digital health records, support advanced medical imaging, enable telehealth, reduce IT downtime, and provide dedicated support services. Additionally, Maniilaq IT Department will work with ANTHC to ensure all new health computer workstations have proper integration into the Tribal health shared Electronic Health Record (EHR) system. After the procurement in the first month, Maniilaq IT will start on the replacement and configuration of all new health workstations and ensure all have the right software, security software, and health-related access and tools to support all providers and health support staff. The last phase will be both the implementation and training of the provider and health support staff on the proper use of all new health workstations. This will be done in partnership with the vendor and Maniilaq IT staff. As Maniilaq Health Services is very large, implementation and training will be done by department covering all 11 Village clinics in the Maniilaq service area, and at the Kotzebue Maniilaq Health Center, the departments of Long-term Care, PHN, ER, Medical Inpatient and Outpatients, Radiology, Dental, Behavioral Health, PT, Eye clinic, Tribal Doctor, Pharmacy, and other health support services.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Advance to Implementation Application

Maniilaq Association	Maniilaq Association Medical Village Home Visit Starlink	AK	In the Maniilaq service area, our village Community Health Aides/Practitioners (CHA/Ps) perform rural home visits in our villages for patients who are unable to walk or make their way to the clinics without Electronic Health Record (EHR) access, which can create significant challenges that impair the quality, safety, and efficiency of our patient care. Challenges this project will address: 1. Without CHA/Ps having access to shared EHR, health providers doing home visits are unable to seamlessly share information with primary care physicians or specialists, leading to fragmented or delayed care 2. Inaccurate documentation due to relying on paper records can increase the likelihood of losing patient data, recording errors, or struggling to read handwriting. 2. Workflow Disruption due to CHA/Ps needing to "double-document" by writing notes by hand during the visit and later entering them into a computer system, which is time-consuming and inefficient. 3. Without patients or CHA/Ps having instant access to patient histories, recent lab results, or medication lists, clinicians cannot make informed, real-time decisions. 4. Increased risk of error with medication management, especially with patients taking multiple medications or managing several chronic medical conditions. 5. Delays in being able to submit 3rd party billing as paper-based or non-integrated documentation can slow down the submission of billing, which can impact the financial stability.	Maniilaq IT Department, working with our CHA/P program, will order 11 Portable Starlink dishes that can be used in all our villages in the Maniilaq service area. Within the first month of the grant award, the Maniilaq IT Director and CIO will put in order for the new 11 Portable Starlink dish units. Maniilaq has a quote for \$99,000.0 from Starlink for the equipment and 1st year of service. Future years to be covered by Maniilaq. These Portable Starlink units will be used by our village clinic CHA/Ps to give them secure high-speed during home visits. This technology enables real-time EHR access, video consultations, and remote diagnostics, bridging the digital divide where mobile and cellular infrastructure is unreliable. Maniilaq IT and Health Services have already done both assessment and planning for this project to ensure the right equipment is ordered. They have concluded that these Portable Starlink dish units will help our rural village clinic CHA/Ps have the needed access to our EHR during home visits. The Starlink dish units will be set up at the village clinics. CHA/Ps will be trained on their use and how to align them with LEO satellites to provide immediate broadband access for EHR access. Additionally, Maniilaq IT Department will work with ANTHC to ensure all new health computer workstations have proper integration into the Tribal health shared Electronic Health Record (EHR) system. After the procurement in the first month, Maniilaq IT will start testing and ensuring all new Portable Starlink dish units are working and configured so that all village CHA/Ps have the right EHR and other health-related access and tools to support performing home visits to patients who are unable to walk or make their way to the clinics. The last phase will be both the implementation and training of the provider and health support staff on the proper use of all new health workstations. This will be done in partnership with the vendor and Maniilaq IT staff. As Maniilaq Health Services has 11 village clinics, implementation and training will be done at one village clinic at a time in the Maniilaq service area.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Advance to Implementation Application

Maniilaq Association	Maniilaq Association Modernizing of Health IT Infrastructure	AK	The Maniilaq Health Center and Village Clinics' current Health IT infrastructure systems are nearing the end of life (end of support) and need to be replaced to allow for bridging significant health disparity gaps, improving rural access to care through improved telemedicine, and ensuring cybersecurity. These Health IT replacements/upgrades of core switches and IT infrastructure will allow Maniilaq Health Services to provide better coordination among health providers across vast distances, reduce travel burdens on patients, and support the integration of electronic health records (EHR) to improve patient outcomes. Additionally, Maniilaq's Health IT infrastructure is critical for our rural Arctic Alaska population to overcome geographical isolation to ensuring seamless care coordination through telehealth services, and ensure healthcare professionals maintain access through Electronic Health Records (EHR's) data for patients moving between remote villages and urban centers. Lastly, Health IT upgrades will allow for newer technologies to improve provider efficiency and help manage chronic diseases.	Maniilaq Association's IT department will purchase new core switch, infrastructure switches, and compute/storage platforms, which will be implemented side-by-side while the current Health IT systems are in operation. Based on our years of experience in providing Health IT services in rural Arctic Alaska, Maniilaq's proposed approach for this project will be to prioritize high-reliability IT upgrades made to deal with the extreme rural Arctic environment we provide services in, and that are equipment that is resilient and has low maintenance needs, so we are not dependent on outsourced support. Additionally, our Maniilaq Health IT team and Healthcare providers will review all potential upgrades and replacements to ensure the infrastructure supports improved telemedicine, high-definition imaging, and future AI-enabled diagnostic tools. Lastly, Maniilaq's IT team will ensure all upgrades and replacements will have the storage platforms to handle future potential data growth, reducing the need for frequent and difficult hardware refreshes. Maniilaq Health IT will be working with a proven vendor, and contracted support will be leveraged as needed to ensure the new systems are implemented following industry best practices. This method will allow for minimal downtime, clear progress tracking, and the ability to fall back to the current system if necessary. Once the migration is complete, the old Health IT systems can be taken offline (but powered on) until the new system is verified to be fully operational.	\$250K-\$1M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Advance to Implementation Application

Maniilaq Association	Maniilaq Association Pharmacy Modernization Project	AK	Our village patients often experience reduced medication access due to frequent medication shipment interruptions. Vulnerable patients with medication management difficulties do not have enough support for enhancing medication adherence through pill box/medication cassette utilization. The Maniilaq Pharmacy modernization project will address these and other current challenges, including the fact that pharmacy space is limiting program growth, and expansion is needed to enhance operational efficiency in response to growing service demands. Maniilaq Pharmacy Modernization Project (Three-part) Part 1: Medication management technology modernization for our 11 village clinics to address the multiple systems that are being used to manage village clinic medications, which are cumbersome, inefficient, and prone to errors. Our current system of PickPoints + Knoxware lockboxes + provider boxes does not have enough space for pharmacy products needed in our village clinics, and the 3 different medication storage/security methods are time-consuming and confusing to manage. Part 2: Pharmacy design will address the need for expansion to enhance both patient safety and operational efficiency in response to growing service demands. Part 3: Initiation of medication adherence, vulnerable patients with medication management difficulties do not have enough support for enhancing medication adherence through pill box/medication cassette utilization, known as a “Mediset” program.	As stated above, the intent of this pharmacy modernization project is to address challenges through a three-part, multi-faceted manner, to provide expanded access to pharmacy care to all of our patients and clinics. The Maniilaq Health Center (MHC) Pharmacy modernization project has three parts: Part 1: Medication management technology modernization for our 11 village clinics, through automated dispensing cabinet (ADC) upgrading and expansion. The project will cost an estimated \$1M for new equipment and setup, which would be performed by the vendor and MHC staff. Maniilaq Pharmacy's village medication management need for new ADC is absolutely necessary as the current systems have reached end-of-life and are no longer serving our needs due to size and reporting limitations. The new ADC system will be much more seamless for village clinic staff to manage, and MHC pharmacists to oversee and support. These remote automated dispensing cabinets will improve medication oversight capacity and faster/more efficient management and shipping of stock items; increased medication stocking capacity in village clinics will lessen the medication shipment delay impact on patients when weather interferes with shipping schedules; enhanced reporting capability with these cabinets will result in better adherence with documentation requirements, and improved visibility of what patients are receiving. Part 2: MHC pharmacy department remodel design project, to expand workspace and create more patient counseling/visit rooms, improve workflow, and add space for new pharmacy automation. The project will cost an estimated \$150,000 for design. The combining of the current 3 different systems into one comprehensive Automated Dispensing Cabinet system in each village clinic would enable MHC pharmacy to efficiently manage those remote stocks and reduce clinic staff time doing medication management. Part 3: Initiation of a medication adherence packaging system and program (Mediset) to improve medication adherence for patients with medication management difficulties. The project will cost an estimated \$50,000. Our identified patients needing extra assistance will be connected to licensed pharmacists via secure technology. Our in region Pharmacy technicians handle on-site dispensing, provide counseling, verify prescriptions, and manage care via video and phone. The Mediset program will support vulnerable patients with medication management difficulties across the entire rural region	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Advance to Implementation Application

Maniilaq Association	Maniilaq Association Portable X-Ray Units for Rural Arctic Village Clinics	AK	X-ray imaging is not available in our 11 rural off-road village clinics in the Maniilaq service area, and patients with injuries or illnesses in our villages have to fly to Kotzebue (Hub) to have imaging studies. Travel costs for both patients and Maniilaq Health are very expensive, as an round trip ticket can cost between \$405 - \$600 to travel to Kotzebue from our villages. This project would cut down on our travel expenses by being able to diagnose or rule out simple fractures, dislocations, pneumonia, or other issues in the villages. The benefits for the patients in our villages are that they can be treated more quickly and possibly not have to travel to Kotzebue, depending on the outcome of their exam. Currently, more than 2,000 exams annually require village patients to fly to Kotzebue for an X-ray. These delays of timely diagnosis and treatment can often add to the significantly high cost of healthcare in our rural area. Additionally, severe weather and the vast geography of our rural Arctic service area result in frequent flight cancellations cause additional delays in providing proper care. Large fixed X-ray units are not feasible in our small and crowded village clinics, which makes these portable X-ray units a perfect fit for our rural Arctic Village clinics. Maniilaq Health Center's existing integrated specialist radiologist partners are available 24/7 via remote data connection to interpret and diagnose digital radiographs from off-road village clinics.	The investment in this project to provide portable X-ray units for our rural village clinics will significantly transform the healthcare delivery in our rural isolated villages, and will provide immediate and clear improvement in our paitents albility to access this needed healthcare service. Additionally, this targeted investment in radiologic technology and strategic staffing integration to increase local village provider capacity to deliver secure, timely, high-quality care as close to home as possible, and to extend the reach of our specialist services. The Fuji AQRO has been used in other rural areas in Alaska by other Tribal Health Organizations. Moreover, by installing Fuji AQRO compact portable mobile digital x-ray units in our village clinics, the AQRO’s small footprint, light weight, mobile design, and digital technology solve three problems we currently face: • Can be used and stored in our small crowded village clinics. • Light enough to be transported by a small plane for service in rural Alaska. • Digitally integrates with our existing PACS and EHR radiology systems, allowing for remote virtual integration of specialty care providers and hospital-based radiology technicians. Historically, a secondary barrier to village-based x-ray is maintaining village medical staff competencies to operate x-ray units. However, our Maniilaq hospital-based Radiology Team will remotely guide every X-ray exam conducted in village clinics via live, multi-camera, two-way video interface. By the Maniilaq Radiology team, providing live remote video guidance from highly qualified hospital radiology technicians will: • Improve the quality of X-ray images for diagnosis for our rural patients. • Increase utilization of village X-ray units by giving village medical staff the support needed to conduct X-ray exams.	\$50,000-\$250,000	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Advance to Implementation Application

Maniilaq Association	Maniilaq Association Arctic Hub Health Transportation	AK	The Maniilaq Arctic Hub Health Transportation project will address challenges our underserved populations, including low-income, elderly, patients with disabilities, and patients flying in from rural villages, face in getting to medical appointments and picking up medications at the Maniilaq Health Center. Currently, Maniilaq sees a high rate of missed appointments due to challenges of a lack of transportation from the airport or for our patients unable to walk to our health center. The hub community of Kotzebue faces significant barriers to accessing healthcare due to a lack of personal transportation, reliable taxi cab services, long winters making it dangerous to walk, high cost of fuel, and no public transit system. These and other challenges often lead to many of our patients having high rates of missed medical appointments, particularly among the elderly, the disabled, and those with chronic conditions. These missed appointments can led to worsened chronic conditions, delayed diagnoses, increased mortality risk, and higher rates of hospitalization Other challenges: 1. Medication loss during long winter months, as temperatures are low enough to cause medication to freeze in transport without heat. 2. High risk of patient slips and falls, as winter months can create dangerous walking conditions that significantly increase the risk of falls, resulting in broken bones, sprained ankles, or even TABI and create 3. Financial barriers to accessing healthcare appointments.	The Maniilaq Association (MA) Arctic Hub Health Transportation project will address challenges our underserved populations (low-income, elderly, patients with disabilities, and patients flying in from villages), face in trying to arrange transportation to or just getting to medical appointments and picking up medications, as well as the high rate of patients missing appointments at the Maniilaq Health Center (MHC). The Maniilaq Facilities Department, working with Health Services and NANA NMS, will purchase and provide a dedicated shuttle bus service to address these transportation challenges. MHC will offer a proactive and coordinated transportation service aligned with current health appointment scheduling. This shifts from the current unreliable or no option patient transportation model for many of our rural patients, to a much more managed component of MA healthcare delivery. The Maniilaq Arctic Hub Health Transportation project is a targeted intervention designed specifically to address this documented barrier. By aligning shuttle routes and scheduling with clinic operations, the project offers a practical and community-informed solution that directly responds to identified needs. The main activity of this proposal is expected to take 6-7 months and will be completed in the RHTP 1st year: I: The MA Transportation project will purchase a Health transportation shuttle bus. This will be done by the MA Facility Department, which oversees all vehicle purchases at Maniilaq to ensure staff can provide proper maintenance of the vehicle. (Month 1) II: MA will sign an agreement with NANA NMS to provide the operation of the Health transportation shuttle bus. This project has already been discussed with NMS. This phase will include policy refinement and scheduling coordination. Month 1-2) III: will start advertising the new shuttle service through the Maniilaq Communication Department on social media, local radio PSA, and mailing out fliers. MA will also have health staff attend community meetings to share information about the program. (Months 3-6) IV: MA, working with NANA NMS, will begin providing health transportation services in Kotzebue from the airport and other identified areas to the MA Health Center. This will include data tracking, as well as performance and route optimization review. (Months 6-7) Cost: \$375,000 (Bus \$160k, Shipping \$15k, Operation \$200k). Seattle to Kotzebue (barge) will be arranged to save on transportation costs.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Deferred or Not Advanced

Maniilaq Association	Maniilaq Association Employee Health Activity Center	AK	This project will prioritize the retention of staff in high-need areas of healthcare and behavioral health. Maniilaq Association (MA) faces many challenges in the recruitment and retention of its healthcare workforce. Some of the many challenges, are dealing with the recruitment and retention of critical health workers as talked about above include long winters, extreme cold, long periods of darkness, geographic isolation, and high costs. Moreover, MA is dealing with very high burnout rates and high turnover rates among our healthcare workforce. This high turnover rate has forced MA to rely on high-cost private temporary duty staff (TDYs) to cover our needed health positions. From our employee surveys and health studies, the MA Employee Activity Center is a strong employee recruitment and retention tool and is seen as a high-value perk. This MA Employee Health Activity Center project will purchase new fitness equipment to both upgrade aging equipment and expand the number of exercise equipment options for our healthcare workers and their families to use. Upgrading and expanding the MA Employee activity center will help health workers by providing safe and convenient access to exercise, which reduces stress, lowers burnout, and improves mental health. This MA on-site center has been shown to boost our health staff morale, energy levels, and enhance overall well-being, while offering a safe, accessible environment for physical health, particularly during long winter months.	This project's proposed approach is aimed at prioritizing the retention of critical staff in high-need areas, including healthcare workers in our Community Health Center, Emergency Department, Long-Term Care, Community Behavioral Health, and other needed health services. Maniilaq Facilities Department, which will oversee the project, has worked with and received input from all of Maniilaq's critical departments on the need and benefits of this project to improve the Employee Activity Center. Having a workout activity center located near the hospital is a strategic tool that aids in the recruitment and retention of health workers by addressing high burnout rates, promoting work-life balance, and fostering a supportive, health-focused culture. This Maniilaq on-site facilities provide our staff with a safe, convenient, 24-hour, and easily accessible space that helps staff manage stress, reduce fatigue, and improve overall well-being, directly impacting turnover rates, which we hope to decrease by 25%. In the first month of the award, all equipment will be ordered through our Facilities department, with input from Maniilaq staff from all critical departments. Using the barge season and service to save on shipping cost, the equipment installations will be done over multiple phases due to the shipping schedule associated with our remote location & short barge season. The project will be completed in the 1st year of the RHTP award. The project will modernize and upgrade the Maniilaq Employee Activity Center, which promotes mental and physical recovery along with healthy physical activity. 1. Upgrade and expand the number of treadmills and ellipticals for an employee workout center that provides a "no-impact" workout that minimizes stress on knees and back, provides a full-body workout that engages both upper and lower body simultaneously, and features adjustable resistance and incline to target different muscle groups. 2. Upgrade and expand the number of new heavy, static strength machines to offer more durability, safety, and ease of use, while promoting consistent strength training for all fitness levels. These new machines, which can be fixed resistance machines and also multi-station units, will enhance employee health and reduce injury risks at the same time. 3. Upgrade the types of versatile strength training tools to facilitate diverse and full-body workouts that can provide for high-intensity interval training.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Deferred or Not Advanced

Maniilaq Association	Maniilaq Association Modernizing EMS transportation and training in rural Northwest Alaska	AK	An inventory of ambulances used by Maniilaq village health clinics revealed the poor status and condition of 4 village clinic ambulances. The rural communities of Ambler (pop.274), Kobuk (pop.191), Shungnak (pop.272), and Noatak (pop.570) all have ambulances older than 23 years, are in various states of disrepair, have become operationally unreliable, present patient safety issues (lack of heat), and would not meet the minimum Medicaid standards for a certified/billable EMS provider. To illustrate, Shungnak’s ambulance is an old Suzuki mini-truck with Japanese instrumentation, a driver’s wheel on the right side, a stick shift on the left, has cramped space for an average adult, and a cracked windshield. Currently, Maniilaq’s rural village health clinics perform all emergency patient transportation at no cost to the patient and without any revenue collection. Even if Maniilaq wanted to establish certified/billable EMS provider services in these communities, we currently do not have ambulances in a condition that would support that future development. Village clinic ambulances are not well organized and do not have emergency equipment and supplies stocked at the ready. Despite all our rural health care workforce’s EMS training and certifications, there is a knowledge gap, a lack of attention, and a lack of ownership to assume a scope of work that includes ambulance readiness. This RHTP is our opportunity to drive the transformation of rural EMS systems of care.	Within 5 business days of being awarded, Maniilaq would place the order for five (5) ASAP 911 MedStat 500s UTV ambulances costing \$435,875 and spending 87% of the amount requested in this proposal. We anticipate 12-18 months for the ASAP 911 order to be fulfilled. These modern ambulances have been Alaska-bush tested and support minimum Medicaid billing standards. Replacing the 4 dilapidated ambulances in Ambler, Kobuk, Shungnak, and Noatak will have an immediate and direct impact on EMS response reliability and quality of pre-facility patient care and transport. Freight booking confirmations of the ambulances to Seattle (truck) and then Seattle to Kotzebue (barge) would be arranged in close coordination with ASAP 911. Within 18-24 mo, we would spend the remaining \$63,710 in freight transportation to Kotzebue. Upon receipt of the ambulances in Kotzebue, each ambulance would be internally processed and reviewed by Extended Facilities who maintains our corporation’s vehicle fleet. Each ambulance would be tagged, registered with our insurance provider, and retrofitted with any outstanding items needed to ensure each vehicle is ready for village clinic deployment. Then Maniilaq will arrange distribution to the Ambler, Kobuk, Shungnak, and Noatak village health clinics. The EMS Program would then provide on-site orientation and training with village clinic staff to include daily ambulance checks and electronic reporting. Having modern ambulances also allows us to consider becoming a certified/billable EMS provider in the future. The 5th ambulance would be kept by the Maniilaq EMS Program in Kotzebue, where it will be incorporated into the routine/regular EMS trainings for CHA/Ps, village-based APPs, and volunteer EMS responders throughout the region. Currently, EMS certifications have not translated into the knowledge or empowerment where responders organize and maintain ambulance readiness. The training ambulance kept in Kotzebue would also serve as a spare replacement ambulance in the case that a village clinic becomes unserviceable. Maniilaq will arrange and cover additional costs to get new ambulances to the village health clinics. Maniilaq EMS Program would provide on-site ambulance orientation and training of village clinic staff. Later, CHAP, EMS Program, EMS Medical Director, and Maniilaq leadership would evaluate local economies to determine whether to move forward with developing certified EMS providers and Medicaid billability in the 4 communities.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Deferred or Not Advanced

Maniilaq Association	Maniilaq Association Northwest Arctic Regional EMS Workforce Training & Simulation Hub	AK	Maniilaq's service area is a rural area in the Northwest Arctic region that has a critical need for emergency medical services (EMS) training due to remoteness, limited infrastructure, and often long weather-dependent transport times to the Maniilaq Hospital. However, while we have this need for EMS training, this region faces significant challenges in maintaining a trained EMS workforce. Rural location, high travel costs, severe weather, no connecting roads, and limited training infrastructure restrict access to certification courses, continuing education, and hands-on skills training required for responders to maintain competency. These barriers are particularly significant in roadless communities where local EMS responders often serve as the first and only line of emergency care. This limited access to training contributes to workforce shortages, inconsistent training opportunities, and difficulty maintaining clinical skills for low-frequency, high-acuity emergencies. Many responders must travel long distances to participate in required education or are unable to attend training at all due to cost, staffing constraints, or transportation barriers. This creates gaps in workforce development and reduces system capacity in communities where timely emergency response is critical. There is a clear opportunity to strengthen rural emergency care by expanding access to workforce training and modernizing regional training infrastructure to support responders in remote communities.	The Maniilaq Northwest Arctic Regional EMS Workforce Training & Simulation Hub project will address these challenges by establishing a Northwest Arctic Regional EMS Workforce Training and Simulation Hub, a technology-enabled training environment designed to strengthen access to high-quality EMS education for responders serving rural and frontier communities. The project will modernize an existing training space by installing integrated audiovisual and instructional systems that support hands-on clinical training, scenario-based exercises, and hybrid instruction. Instructors will be able to deliver certification courses, continuing medical education, and skills training while also connecting with remote participants when appropriate. While certain portions of EMS education (such as hands-on skills verification and scenario-based assessments) will continue to require in-person participation, the technology will allow didactic instruction, case review, and portions of coursework to be delivered through a reliable hybrid format. Training scenarios conducted in the classroom can also be captured and used to develop reusable instructional materials. These materials will be distributed through the existing regional learning management system, allowing responders in remote communities to access continuing education modules, case reviews, and instructional content outside of scheduled classes. This approach supports flexible learning while maintaining the in-person training components necessary for high-quality clinical education. By strengthening regional training infrastructure and leveraging technology to support hybrid instruction, this project will expand access to workforce development opportunities, reduce unnecessary travel burdens, and support the development and retention of a skilled rural EMS workforce capable of responding to medical emergencies close to home.	\$50,000-\$250,000	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	North Slope Borough; Northwest Arctic Borough	Deferred or Not Advanced

MAPHABIT INC	ANCHOR: Aging & Neurodivergent Care through Health, Outreach, and Remote Support	AK	Alaska’s healthcare system is facing growing pressure from workforce shortages and increasing demand for home- and community-based services (HCBS). The state’s direct support workforce is projected to face significant shortages over the coming decade, making it difficult to provide consistent support for individuals with complex needs. At the same time, Alaska is experiencing rising prevalence of Alzheimer’s disease and related dementias (ADRD), traumatic brain injury (TBI), intellectual and developmental disabilities (IDD), and fall-related injuries among older adults. Many individuals lack access to structured preventive supports that maintain independence and reduce health risks. Traditional service delivery models rely heavily on in-person visits and are difficult to sustain across Alaska’s rural and frontier geography. Long travel distances, weather conditions, and limited workforce availability restrict access to services for many communities. These conditions create an opportunity to implement new care models that help individuals manage daily activities more independently while enabling caregivers and providers to extend their reach. MapHabit & Vivo are technology-enabled supports that reinforce daily routines, utilize preventive health programming, and can improve outcomes while strengthening Alaska’s community-based care system.	The MapHabit + Vivo initiative (ANCHOR) will deploy a statewide model integrating assistive technology, preventive health programming, and provider partnerships to strengthen home- and community-based services (HCBS) across Alaska. The program includes four complementary components. Digital Habit-Building Supports Participants receive a MapHabit-managed tablet and personalized onboarding with a coach. Using MapHabit’s library of more than 1,000 visual maps, or customized maps created with user-specific text/photos/videos, participants follow step-by-step guidance for daily routines. These routines support medication adherence, hygiene, meal preparation, and other activities essential for independent living. This neuroscience-based approach helps individuals with cognitive or functional challenges complete tasks more consistently while reducing reliance on constant caregiver supervision. Participants may also receive therapist-curated cognitive engagement kits designed for neurodivergent populations that reinforce routines, stimulate cognitive activity, and promote independence. Preventive Mobility and Strength Programming Participants engage in live virtual strength and balance classes delivered by Vivo using MapHabit tablets or their own computers/mobile devices. These classes are designed for older adults and individuals with mobility limitations and focus on improving balance, mobility, and functional strength. Regular assessments track progress and help identify improvements in mobility and fall risk. Caregiver and Provider Enablement Caregivers and direct support professionals incorporate digital routines and preventive exercises into daily care activities. Embedding these structured supports into existing care workflows enables providers to maintain consistent support for individuals across Alaska’s geographically dispersed communities. Outcome Measurement and Program Evaluation The platform captures engagement data and mobility metrics that measure improvements in independence, participation, and health outcomes. These analytics support program evaluation and provide evidence for long-term sustainability through Medicaid and HCBS programs. ANCHOR will launch through partnerships with Alaska organizations including the Association on Developmental Disabilities, Peninsula Independent Living Center, and Daybreak Inc., to complement existing community-based services while expanding access to preventive supports and independence-building tools.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Maserculig Incorporated	Marshall Community Telehealth & Meeting Hub	AK	Access to alcohol/drug rehabilitation in rural Alaska is currently underserved and difficult to access. Mas Inc has been planning to create a safe/secure space in Marshall with access to telehealth (i.e. two independent/private computer stations) and also create a space for group interactions as well with video access. Mas Inc currently owns a 16 bed residential & outpatient alcohol/drug rehab facility in Casper, Wyoming. Our senior therapist is currently in the last phase of licensing for the State of Alaska. Mas Inc currently has a successful telehealth IOP (intensive outpatient) operating in the lower 48. There is a need & desire in Marshall for secure/safe access to rehab services. What is lacking is a facility of any type where clients can have the necessary privacy and technology to receive that care. Because Marshall has "gone wet" there is a growing need for these services. Additionally this facility would be available for residents of Marshall, St Marys & the surrounding area for other healthcare telehealth services. The village is asking for help and we believe we can provide it due to the experience and staff we have at our Wyoming facility.	1) Awareness of the problem. Letting the community know that we are aware, that we care & that we are here to help. 2) Assistance with insurance, payments, continuing care, step up care to outlying facilities if necessary. 3) Providing safe/secure/private space for community members to be able to access professional help. 4) Providing a group space where community members can meet to join together in the process of healing (including 12 step type programs and cultural healing exercises). 5) Access to Alaska licensed professionals via safe & secure electronic connections. 6) Outreach to the youth of the community through telehealth meetings, introduction to family support groups and education concerning addiction. 7) The availability of currently available technology to other residents within the community for other healthcare issues.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kusilvak Census Area	Deferred or Not Advanced

MASH Property Managemen t	Build behavioral health workforce to deliver Medicaid-eligible shelter services-2 of 4 projects	AK	We aspire to create an integrated health model for Anchorage’s shelter system, but workforce capacity across the industry is currently insufficient. Staff serving individuals with co-occurring behavioral health, substance use, and medical needs lack access to formalized clinical training pathways, recognized credentials, or the administrative skills required for Medicaid billing compliance. This gap is structural, not individual. High-intensity service environments like shelters attract mission-driven staff but often struggle to offer professional development pathways. The result is high turnover and credential gaps that prevent Medicaid billing, and service quality inconsistencies that undermine clinical outcomes. Training will include Peer Support Specialist certification, Behavioral Health Technician training, trauma-informed care, motivational interviewing, and Medicaid documentation, and will emphasize evidence-based approaches widely used in homeless service systems. Administrative staff will also receive training in Medicaid documentation, billing procedures, and compliance standards to support accurate claims submission. Investing in workforce development addresses all three dimensions simultaneously: credentialed staff deliver better services, satisfy Medicaid supervision requirements, and are more likely to remain in their roles, improving continuity of care.	Professional Certification Staff will receive training and certification through recognized programs including Peer Support Specialist (PSS) certification and Behavioral Health Technician (BHT) training. PSS and BHT credentials enable staff to deliver Medicaid-billable services and meet Alaska’s supervision and documentation requirements under the 1115 Waiver service model. Clinical Skills Development Training will emphasize evidence-based approaches with strong applicability in homeless services: trauma-informed care, motivational interviewing, behavioral health screening tools (PHQ-9, AUDIT, DAST), recovery-oriented service delivery, and harm reduction practices. Both local training partners and nationally recognized online programs will be utilized. Administrative and Billing Competency Administrative staff will receive targeted training in Medicaid documentation standards, billing procedures, and compliance requirements to support accurate claims submission and audit readiness. This training is directly coordinated with the billing infrastructure development in Request 1. Operational Continuity Because shelters operate 24/7, training participation requires temporary staffing coverage to prevent service disruption. Grant funds will support temporary backfill staffing during training periods, ensuring both workforce development goals and shelter operations can proceed simultaneously.	\$50,000- \$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

MASH Property Managemen t	Buy Linda’s Place shelter to ensure long- term stability of integrated care delivery-4 of 4 Projects	AK	Linda’s Place is structurally essential to the MOA’s homelessness response. It is one of two year-round MOA-funded congregate shelters. It is the only facility with segregated space for men and women, which is critical for certain individuals that may have experienced trauma in their past. The facility’s lease structure creates ongoing financial and operational risk that is incompatible with the long-term investments in clinical integration, workforce development, and capital infrastructure that MASH is pursuing. The MOA’s shelter system has experienced significant instability since its establishment in 2020, with multiple facilities opening, operating briefly, and closing—disrupting services and displacing vulnerable residents. Ownership provides permanence. A permanently-owned facility can receive capital investment in clinical space (Project 3), serve as the platform for Medicaid-enrolled service delivery (Project 1), and provide the stable employment base that supports workforce development and retention (Project 2). The acquisition also enhances financial efficiency: the annual rental expense currently paid to a private owner can be redirected toward services. This internal cost savings is a sustainable, non-grant funding source for expanded behavioral health programming.	Property Acquisition Grant funds will be used to acquire the Linda’s Place property. MASH is working to establish a 501(c)(3) nonprofit entity to hold title, ensuring the facility remains permanently available for shelter use regardless of future operational changes. This structure protects the public investment by preserving the facility’s mission-restricted use. MOA Partnership MASH will negotiate a revised operational agreement with the Municipality of Anchorage that maintains MOA funding for shelter operations while transitioning property ownership to the MASH-affiliated nonprofit. Facility Stewardship MASH will maintain and improve the facility to sustain its suitability for integrated care delivery, including planned clinical space enhancements (Project 3) and technology and documentation infrastructure supporting Medicaid billing (Project 1).	\$1M-\$5M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

MASH Property Managemen t	Create Medicaid billing infrastructure for shelter-based behavioral health services-1 of 4 projects	AK	Despite serving one of Alaska’s highest-acuity homeless populations—individuals managing co-occurring behavioral health, substance use, and medical conditions—The MOA’s shelter system operates entirely outside the Medicaid billing system. Shelter services are funded as emergency housing, not as health care, even when the services provided are clinically substantive and would qualify for Medicaid reimbursement under other settings. Nationally, shelter-based Medicaid billing models have demonstrated both clinical and fiscal impact. States and localities that have successfully enrolled shelters as Medicaid providers report increased behavioral health engagement, reduced emergency department utilization, and improved care transitions. Alaska’s 1115 Behavioral Health Demonstration Waiver creates explicit authorization for expanding community-based behavioral health services and supports innovative service delivery models for high-need populations. By building provider enrollment, compliance, documentation, and billing infrastructure, MASH will create the administrative foundation required to transition shelter-based care from a purely municipal-funded emergency function to a sustainable, Medicaid-supported integrated care model. This project will build the Medicaid billing infrastructure that makes all other components of MASH’s integrated care strategy financially sustainable and not entirely dependent on municipal appropriations subject to annual budget cycles.	Medicaid Provider Enrollment and Compliance MASH will engage a consultant with demonstrated experience implementing Medicaid billing for safety-net providers. The consultant will guide provider enrollment application preparation, compliance framework development, clinical documentation standards, supervision structure design, and credentialing requirements. MASH has begun preliminary outreach to potential consultants and has engaged peer agencies that have successfully implemented Medicaid billing to learn from their experience. Service Model Design Working with the consultant, MASH will design a shelter-based service model aligned with Alaska Medicaid billing requirements and the 1115 Waiver. Target services include: behavioral health screening and assessment, peer recovery support, Substance Abuse Care Coordination (SACC), recovery coaching, relapse prevention, daily living skills training, adult day services, chronic disease monitoring, and post-hospitalization transition support. Service model design will be coordinated with the workforce development initiative (our second request) to ensure staff credentials align with billable service types. Billing and Data Infrastructure MASH will establish billing workflows, electronic documentation systems, and financial management procedures necessary to submit and track Medicaid claims, meet documentation standards, and support compliance monitoring. Implementation Phasing Year 1 Provider enrollment preparation, consultant engagement, compliance framework development, documentation system build. Year 2: Initial Medicaid billing launch for core service types. Years 3–4: Service expansion, utilization review, and ongoing optimization.	\$50,000- \$250,000	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

MASH Property Management	Install relocatable clinical buildings to expand on-site behavioral health services-3 of 4 projects	AK	Linda’s Place is a critical facility in Anchorage’s homelessness response system, but its physical layout was not designed for integrated health service delivery. The shelter’s shared spaces constrain the type, volume, and confidentiality of clinical services that can be offered. Partners such as Anchorage Neighborhood Health Center, Alaska Behavioral Health, Beans Cafe, and Team One are engaged with shelter residents but are limited by available space. Relocatable modular buildings offer a pragmatic solution: they are available through federal surplus property programs at substantially reduced cost, can be installed with minimal site modifications using existing utility connections, and remain available for shelter use regardless of future operational or ownership changes. Installing dedicated clinical space transforms Linda’s Place from a facility that provides shelter to a facility that provides care—consistent with national best practice models for health-supportive shelter environments. This Project is independently fundable and does not require completion of Projects 1 or 2. However, clinical space expansion amplifies the impact of both workforce development and Medicaid billing by creating the physical environment in which credentialed services can be delivered to a greater number of residents.	Building Acquisition MASH will acquire relocatable modular buildings through federal surplus property programs, significantly reducing capital costs compared to new construction. Preliminary review confirms available structures suitable for clinical use. Site Preparation and Installation Buildings will be sited adjacent to Linda’s Place and connected to existing utilities. MASH has reviewed zoning requirements and utility access and will coordinate closely with the Municipality of Anchorage on permitting, safety, and building compliance throughout the process. Dedicated Clinical Use Areas Installed spaces will support on-site paramedic and primary care services, Anchorage Neighborhood Health Center clinical visits, confidential behavioral health consultations, peer recovery support and counseling sessions, care coordination and case management meetings, small-group recovery programming and daily living skills, post-hospitalization transition services, and adult day services for elder residents. Partner Integration Existing clinical partners—Anchorage Neighborhood Health Center, Alaska Behavioral Health, and Team One—will be invited to expand on-site service hours using the new spaces. Additional partners will be recruited as capacity allows.	\$250K-\$1M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Mat Su Jewish Center	ARK Program	AK	Rural Alaska faces critical healthcare challenges from geographic isolation, limited clinical resources, and workforce shortages, compounded by social isolation that prevents people from noticing needs and supporting one another. For the past ten years, the Mat-Su Jewish Center has piloted the ARK program, testing ways to build community networks that strengthen early support, engagement, and pathways to care. Now is the time to scale this work in the Mat-Su Valley, where community interest is strong and the need is clear. By turning everyday interactions and community engagement into opportunities to contribute, ARK (Acts of Routine Kindness) creates a sustainable network where belonging, meaningful participation, and shared responsibility embed health and wellbeing into daily life, extending care beyond clinics into the fabric of the community.	Rural Alaska faces healthcare challenges from geographic isolation, limited services, workforce shortages, and social isolation that prevents people from noticing needs and supporting one another. The ARK program, Acts of Routine Kindness, strengthens the social fabric by cultivating belonging, participation, and shared responsibility, turning everyday interactions into pathways for health. Through giving-centered programs, home chefs share knowledge while families exchange trusted pediatrician referrals and learn to stretch food budgets and eat healthier. Seniors pass on skills and passions to younger generations, maintaining social connections across age groups. Children and families connect through shared activities, and adults with disabilities model inclusion and the value of every person. In these interactions, the community itself becomes a frontline of care, helping neighbors notice when someone is struggling, reach out, and connect each other to medical and behavioral health resources. By activating the entire community, ARK emphasizes that health is a collective responsibility, not just an individual one. Scaling a ten-year pilot, the program strengthens resilience, improves wellbeing, and builds a sustainable, community-driven model of care that extends far beyond any building. We will track outcomes through surveys, focus groups, and participant interviews, as well as monitoring program engagement and community-led initiatives, to measure changes in social connection, sense of belonging, resource-sharing, and access to care. Through these strategies, Acts of Routine Kindness transforms everyday interactions into pathways for health, creating a model of community-driven care that can be sustained and replicated across rural Alaska.	\$50,000-\$250,000	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough	Mat-Su Borough EMS Clinical Simulation Hub — Station 3-9	AK	Rural EMS systems develop clinical competency through repetition, but repetition requires access to training infrastructure that most rural systems have never had. Mat-Su Borough EMS serves 25,000 square miles from a network of geographically dispersed stations, and for the first time in the agency's history, a dedicated training facility is under construction. Station 3-9 will provide classroom space, a control room, and a dedicated simulation room — the physical shell for a high-fidelity clinical simulation program. The shell, however, will arrive empty. Without simulation equipment, the facility cannot deliver the high-fidelity, scenario-based clinical training it was designed for. A control room without an AV debrief system is a closet. A simulation room without a manikin is a storage space. The investment already made in constructing Station 3-9 is only realized when the facility can function as intended — as a hub for clinical simulation training serving MSB EMS personnel and the broader Mat-Su provider community. This project equips the Station 3-9 simulation center to fulfill that purpose, completing the investment already underway and activating a training infrastructure that rural Alaska EMS has never had access to before.	MSB EMS proposes to equip the Station 3-9 Clinical Simulation Hub with high-fidelity simulation technology, control room infrastructure, and supporting task trainers and consumables, activating the facility as a functional clinical training center for EMS personnel across the Mat-Su Borough system. The simulation center is purpose-built for flexibility. The control room features dual access; one side runs a dedicated simulation room. The other side is an adjacent classroom, allowing the simulation environment to be configured in either direction depending on training objectives. This design supports both controlled high-fidelity scenario runs and classroom-integrated simulation exercises without requiring fixed equipment placement. Core equipment will center on a high-fidelity, tetherless patient simulator. This letter highlights a platform-class equivalent to the Gaumard HAL S3201 — selected for its wireless, battery-powered portability, pre-hospital and EMS-specific scenario capability, and the absence of annual licensing fees that would create ongoing grant dependency. The manikin's tetherless design allows it to be moved between the simulation room and classroom, supports transport simulation scenarios, and is compatible with real clinical devices, including defibrillators, airway equipment, and monitoring systems. The final decision would rest on the appropriate decision process. Supporting equipment will include task trainers for advanced airway management, vascular access, and wound care; a high-fidelity wearable trauma simulation system for hemorrhage control and penetrating trauma scenarios; control room AV and debriefing infrastructure; a scenario software library tailored to rural EMS and frontier practice; and a consumables and maintenance package ensuring multi-year operational sustainability without immediate resupply costs. The Station 3-9 simulation hub serves as the fixed, high-fidelity anchor of a broader MSB EMS simulation training ecosystem. Distributed XR simulation capability at rural stations, addressed in a companion LOI, provides asynchronous, station-level training. The Station 3-9 hub provides a centralized, hands-on, high-fidelity simulation environment for skills and scenarios requiring physical manikins, real clinical devices, and structured debriefing. Together, they form a complete training infrastructure for a frontier EMS system.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Matanuska-Susitna Borough	Mat-Su Borough EMS Mobile Health Infrastructure Modernization Initiative	AK	Mat-Su Borough EMS operates across 25,000 square miles of frontier Alaska with a fleet and infrastructure designed for a previous era of emergency medical response. Over the past five years, call volume has increased 21% with no proportional expansion of fleet capacity or operational infrastructure. The existing ambulance fleet has never been redesigned; all units are remounts on aging configurations that predate modern telehealth capability, ergonomic standards, and frontier-optimized design. The result is a response system that is operationally capable but technologically constrained. Paramedics responding to frontier communities cannot initiate telehealth consultations from the unit. Treat-in-place decisions lack diagnostic support infrastructure. Extended transport times, a defining characteristic of frontier EMS, occur in vehicles not designed to support the clinical complexity that those transports increasingly demand. Modernizing mobile response infrastructure is not a luxury upgrade. It is the platform layer that enables every advanced clinical capability the EMS system needs to deliver — telehealth consultation, remote diagnostics, treat-in-place protocols, and mobile integrated health operations across one of the largest and most challenging municipal service areas in the United States.	MSB EMS proposes a phased mobile infrastructure modernization program comprising two integrated components: deployment of purpose-built quick-response vehicles for frontier and mobile health operations, and a ground-up redesign and pilot build of telehealth-optimized ambulances, establishing a replication template for fleet-wide modernization. Quick Response Vehicles. Procurement and deployment of two to four heavy-duty 4WD SUVs or utility body vehicles, platforms such as the Chevrolet Tahoe or Ford Expedition, configured for rural medical response, mobile integrated health operations, and behavioral crisis co-response. Vehicles will be equipped with medical response capability, Starlink connectivity, and telehealth infrastructure. QRVs provide flexible, fuel-efficient response capacity for non-transport MIH visits, frontier outreach, and behavioral health co-response without committing full ambulance assets to non-emergency deployments. Telehealth-Optimized Ambulance Program. A two-phase ambulance modernization initiative beginning with a dedicated design year, followed by pilot construction of two sets of two ambulances built to the new template. Year one design phase will produce a comprehensive ambulance specification that incorporates ergonomic overhaul, austere-condition optimization, thermal management, sound attenuation, integrated Starlink and AV wiring for telehealth consultations, diagnostic equipment mounts, and FLIR driver-assistance technology. The design year produces a replicable template applicable to the entire 18-unit fleet over subsequent RHTP cycles. Years two and three deliver four ambulances built to the new specifications, two units per build cycle, consistent with MSB EMS procurement and deployment practice. These pilot units validate the design template, establish supply chain relationships, and demonstrate telehealth-enabled ambulance capability in operational frontier conditions before fleet-wide commitment.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Matanuska-Susitna Borough	Mat-Su Community Health Response System	AK	The Matanuska-Susitna Borough faces a convergence of accelerating behavioral health crises, growing frontier healthcare access gaps, and an emergency medical system absorbing demand that should never reach 911 in the first place. Over the past five years, MSB EMS has absorbed a 21% increase in 911 call volume with no proportional increase in fleet or staffing. That trajectory is unsustainable without meaningful demand-side intervention. The behavioral health component of that demand is accelerating fastest. In 2025, Mat-Su residents generated 4,691 behavioral health crisis calls across community channels — including 786 calls directly to 911 — while the Mobile Crisis Team completed 476 visits against a backdrop of worsening indicators across every measured behavioral health category. Alaska Careline/988 calls from Mat-Su residents increased 65% in a single year, from 1,673 in 2024 to 2,753 in 2025. No indicator is trending downward. Simultaneously, frontier residents in communities like Meadow Lakes, Willow, and Glacier View lack reliable access to primary care, face transport distances that make routine medical needs into logistical crises, and depend on 911 as their default healthcare access point — not because of preference, but because no alternative exists. Mat-Su Borough EMS is already in those homes. This project builds the infrastructure to make those contacts count.	MSB EMS proposes to establish the Mat-Su Community Health Response System, a telehealth-enabled, hub-and-spoke mobile integrated health program designed to reduce avoidable emergency department visits, improve access to frontier healthcare, and build a sustainable community-based care model across the Borough's 25,000-square-mile service area. The program operates across three integrated service lines delivered from a single EMS operational hub: Urban High-Utilizer Stabilization. Intensive case management, ED diversion, post-discharge follow-up, medication reconciliation, and social service coordination for high-frequency 911 users in the urban core. Targeting the highest-cost, highest-acuity repeat utilizers reduces system burden while improving individual health trajectories. Frontier Outreach Spokes. Mobile response units equipped with Starlink-enabled telehealth and point-of-care diagnostics are deployed to remote communities for treat-in-place services, remote physician consultation, and social determinants of health intervention. Frontier residents receive hospital-grade clinical assessment without transport. Behavioral Crisis Response. Paramedic and peer support co-response model for behavioral health 911 calls, with tele-clinician backup and ED diversion protocols. Designed to absorb growing behavioral health demand documented in Mat-Su's crisis system utilization data and integrate with the existing Mobile Crisis Team infrastructure. Year one establishes program foundation: hiring a dedicated MIH Program Coordinator, acquiring initial point-of-care diagnostic equipment, obtaining CLIA waiver, developing clinical protocols and medical oversight agreements, executing partner MOUs, and completing benchmarking visits to five established community paramedicine programs. Direct service delivery begins in year two.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Matanuska-Susitna Borough	MSB EMS CORE Program — Clinical Operations and Rural Exchange	AK	Rural EMS providers in frontier Alaska face a structural clinical competency gap that geography alone creates and geography alone prevents from being solved locally. Extended transport intervals, low call volume, and geographic isolation mean that paramedics in frontier communities may go months without performing advanced airway management procedures — including endotracheal intubation and RSI — that define the ceiling of prehospital clinical capability. Clinical skills decay silently in low-volume environments, and the critical patient does not announce their arrival in advance. The inverse problem exists in urban EMS. High-volume systems produce clinically aggressive providers with limited exposure to resource-constrained, long-interval, autonomous practice. A paramedic who has never managed a patient more than fifteen minutes from definitive care has a fundamentally different (and incomplete) clinical posture for frontier operations. Neither system, in isolation, produces a complete provider. Rural Alaska needs access to the clinical volume it cannot generate. Urban EMS needs exposure to operational conditions it cannot replicate. A structured bilateral exchange directly addresses both gaps simultaneously, at pilot scale, with measurable outcomes and a replication framework designed from the outset.	The CORE Program (Clinical Operations and Rural Exchange) is a structured bilateral provider exchange between Mat-Su Borough EMS and University Hospital EMS in Newark, New Jersey, one of the highest-acuity municipal EMS systems in the United States. The program places one to two providers from each agency in a supervised two-week rotation within the operating environment of the other, creating reciprocal, documented competency gains in both directions. Both agencies operate under the National Registry of Emergency Medical Technicians certification standards, providing a common clinical framework that supports cross-state deployment without requiring scope-of-practice modifications or state licensure compacts. Alaska Provider → Newark Rotation. Mat-Su providers gain supervised exposure to advanced airway management volume, including live intubation, RSI, and video laryngoscopy; high-acuity trauma and medical volume; behavioral health emergencies at scale; and observation of urban EMS command structure and MCI operations. Rotations are conducted under the supervision of Newark EMS preceptors using a jointly developed standardized evaluation tool. Newark Provider → Alaska Rotation. University Hospital providers gain supervised exposure to prolonged field care, resource-limited autonomous clinical decision-making, aeromedical coordination, cold-weather operations, terrain-specific patient packaging, and communication failure contingencies. Rotations are conducted under Mat-Su EMS preceptors using the same standardized evaluation tool. Program administration, grant compliance, and reporting are managed by Mat-Su Borough EMS as the lead applicant. Newark participation is structured as a sub-award or direct reimbursement. A bilateral MOU will be executed prior to the first rotation. University Hospital EMS has provided a signed Letter of Intent confirming partnership commitment. The pilot is intentionally limited to 4-6 total participants in year one — a proof-of-concept scale designed to validate the model, generate outcome data, and produce a replication framework applicable across Alaska's seven EMS regions.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Matanuska-Susitna Borough	Mat-Su Borough EMS Rural Station Simulation Training Initiative	AK	Matanuska-Susitna Borough EMS provides emergency medical services across 25,000 square miles from a network of geographically dispersed stations. Maintaining consistent clinical training across that network is a persistent operational challenge. In-person training requires personnel to travel to centralized locations, pulling staff from rural posts and creating coverage gaps. Seasonal operational demands, including summer surge staffing that suspends formal training cycles, further compress the training calendar. Severe weather events routinely cancel scheduled sessions entirely. The result is an inequitable training experience across the system. Providers at rural stations receive less frequent access to high-fidelity simulation and scenario-based training than their counterparts at centralized facilities — not because of organizational intent, but because of geography and operational tempo. Over time, inconsistent access to training contributes to clinical skill degradation, reduced confidence in low-frequency, high-acuity events, and weakened workforce retention in rural posts, where professional development opportunities are already limited. Immersive extended reality simulation technology offers a proven solution: high-fidelity, scenario-based clinical training that can be delivered at any station, without travel, without centralized infrastructure, and without suspending operations.	MSB EMS proposes to deploy an immersive extended reality simulation platform across its rural station network, creating a decentralized, technology-enabled training infrastructure that delivers consistent, high-fidelity clinical education regardless of geography, season, or weather conditions. The project has three integrated components: Hardware Deployment. Procure and deploy XR simulation headsets and supporting equipment to four to five rural MSB EMS stations. Hardware will be selected through competitive procurement for portability, offline functionality, and operational durability in Alaska's environmental conditions. Offline-capable systems are a technical requirement given connectivity limitations across rural Mat-Su. Scenario Library Development. Develop a library of clinical simulation scenarios tailored to the high-acuity, low-frequency events most critical to rural EMS competency: including trauma, obstetric emergencies, pediatric resuscitation, and medical emergencies with extended transport times. Scenarios will be developed in partnership with the selected platform vendor and MSB EMS training personnel, ensuring clinical accuracy and operational relevance to frontier practice conditions. Training Program Integration. Integrate XR simulation into MSB EMS continuing education and competency verification programs. The Borough's existing training team will facilitate scenario delivery, debriefs, and competency tracking at rural stations, eliminating travel requirements for routine training cycles. This infrastructure is designed for expansion. The scenario library and deployment model are directly applicable to MSB's rural fire and first-responder network, creating a scalable hub-and-spoke training system across Borough public safety services in a future phase.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough	Mat-Su Borough EMS Transport Infrastructure and Workforce Protection Initiative	AK	Rural EMS systems across Alaska face a compounding workforce crisis: a shrinking pool of qualified candidates, extended recruitment timelines, and an aging, increasingly vulnerable workforce that is bearing the cumulative physical toll of EMS work. In a system where a single experienced paramedic may represent years of investment in training and field competency, a career-ending musculoskeletal injury is not just a personnel loss. It is a gap in emergency coverage across thousands of square miles that cannot be quickly filled. Nationally, musculoskeletal injuries are the leading cause of occupational injury and lost work time in EMS, with patient loading and unloading consistently identified as the highest-risk activity in routine operations. Powered stretcher and auto-load systems are a proven, evidence-based intervention that directly reduces this risk, yet deployment remains inconsistent across rural systems where capital equipment budgets are constrained and competing priorities are significant. This project addresses that gap for Mat-Su Borough EMS, protecting an experienced rural workforce, modernizing fleet infrastructure, and sustaining emergency access across one of the largest and most challenging service areas in the United States.	Matanuska-Susitna Borough EMS proposes to equip its operational ambulance fleet with powered stretcher systems and integrated automatic loading systems, eliminating the manual lifting forces associated with ambulance loading and unloading operations across the entire Borough fleet. The project scope includes deployment of 22 powered stretchers and 22 auto-load systems across the operational fleet, retrofit of 18 ambulances with compatible loading system infrastructure, procurement of additional units to ensure operational continuity during maintenance cycles, and fleet-wide maintenance contracts, extended warranties, and staff training. Powered stretcher systems reduce spinal loading forces during the most injury-prone phase of patient handling by automating the lift-and-load sequence. Auto-load systems eliminate the manual push-and-lock mechanism that transfers significant force to personnel during ambulance loading. Together, these systems allow EMS clinicians to focus on patient care and monitoring during loading operations rather than manual lifting mechanics, a meaningful safety improvement in Alaska's environmental conditions, where snow, ice, and uneven terrain increase the risk of loss of footing during patient movement. Implementation will proceed immediately upon award. Procurement will begin in Fall 2026, with installation and retrofits completed in Winter 2026 through Spring 2027, staff training and deployment in Spring through Summer 2027, and full operational deployment before September 30, 2027. The project is shovel-ready, with defined equipment specifications, confirmed vendor availability, and implementation infrastructure in place.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough	Mat-Su CLEANS Program: Neighborhood Cleanup, Clinical Outreach & Recovery Support Expansion	AK	The Mat-Su Borough’s CLEAN Program (Community, Lands, Enforcement, Abatement & Neighborhood Support) has conducted numerous cleanups across the community. The Mat-Su Borough is a second-class Borough and lacks the health and policing powers, so we have to think outside the box to get things done. We want to build on this program, and this is a wildly unique "ask" we're making. We want to transform neighborhoods visually and partner with nonprofits to address mental, behavioral, and substance abuse issues that plague many neighborhoods. We conducted a successful cleanup in the Williwaw area of Wasilla and left a huge transformation; however, we noticed that many of the issues are complex mental/substance/behavioral health issues. Coming to the neighborhood, transforming it visually, and bringing support to the residents would be a game-changer. Government is not fixing things; this is the community rallying together to make their home better.	We want to clean up neighborhoods, transform them, and partner with mental health and substance abuse professionals to provide wraparound support. Addressing environmental disorder directly aligns with this goal because it targets conditions that contribute to mental health strain, substance-use risk, and reduced engagement with care rather than waiting for crises to occur. Rather than punitive enforcement, it should be reframed as a public-health and recovery-support strategy. By removing hazardous debris, stabilizing properties, and restoring neighborhood order, while simultaneously embedding behavioral health and substance-use clinicians, CLEANS addresses both the environmental and human health impacts of disorder. We are a second-class Borough and lack the health powers, so this helps to bridge that gap. In this way, CLEANS operationalizes the health-relevant insights of Broken Windows Theory in a trauma-informed, non-punitive, and community-centered model, making it a strong fit for RHTP’s focus on sustainable, rural health transformation. We want to purchase the equipment to do these cleanups more effective and minimize people getting hurt and actually pay nonprofits to come in and provide all the professional mental/substance/behavioral health services that will be needed for the immediate care and long-term care. News Coverage https://matsugov.us/news/msb-program-supports-clean-up-in-williwaw https://www.frontiersman.com/news/the-williwaw-project-hopes-to-revitalize-community-de-incentivize-crime/article_85338238-c262-4555-85f9-18ac2a0465bd.html https://www.alaskasnewssource.com/2025/09/13/blessing-volunteers-remove-tons-trash-wasilla-neighborhoods/	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough	Northern Valley Ski & Snowboard Bus to Skeetawk	AK	Rural communities in Alaska experience persistent disparities in health outcomes driven by geographic isolation, limited transportation options, fewer structured recreational opportunities, and reduced access to prevention focused programs. These challenges are especially acute during winter months, when limited daylight and severe weather restrict safe and affordable physical activity. For many families in the communities of Trapper Creek, Talkeetna, Willow, Houston, and Big Lake, distance, cost, and transportation barriers make organized wellness activities unattainable. While the Mat-Su region contains strong recreational assets, access is uneven, without transportation. Families outside core population centers often lack reliable transportation or financial resources to access structured recreation. As a result, rural youth experience lower physical activity levels, increased winter isolation, and elevated risk factors for chronic disease later in life. The RHTP recognizes that improving health outcomes for rural Alaskans requires addressing upstream drivers of health outside clinical settings. Prevention, community wellness, and reduction of access barriers are central to improving access to care. This project responds directly by addressing one of the most persistent barriers to wellness in rural Alaska, transportation and focuses on youth gaining access to positive healthy choices that can lead to a lifelong active pursuit.	Mat-Su Ski and Snowboard Club has agreed to serve as the host organization for this project and brings established systems, policies, and experience in delivering this type of programming. The Club has a successful track record managing transportation logistics, coordinating with ski areas, enrolling families, and ensuring participant safety. Leveraging an existing organization with proven capacity reduces start up risk and allows the project to focus resources on expanding access rather than building new systems from scratch. In the first year of implementation, starting January 2027, the program will operate one coach bus and serve at least 50 youth from communities including Trapper Creek, Talkeetna, Willow, Houston, and Big Lake. After the first season, an evaluation of the program will be conducted to refine process and procedures and gauge interest to expand to two coaches for 2028. The hub based model also creates an opportunity to reach youth who have not previously participated in downhill skiing or snowboarding. By bundling transportation with access to rental equipment and instruction at Skeetawk, the program lowers the entry barrier for families who may lack equipment, experience, or familiarity with winter sports. This inclusive approach supports skill development, confidence, and sustained participation, increasing the likelihood that youth will continue engaging in physical activity beyond a single season. Expanding a proven model into remote communities represents a scalable and sustainable approach to improving access to prevention focused wellness opportunities. By adapting an existing system to new geographies and partnering with Skeetawk, the project maximizes impact while minimizing operational risk. This approach strengthens community wellness, supports positive youth development, and creates meaningful access to healthy choices that can become lifelong active pursuits for rural youth.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough	Northern Valley Youth Swim and Skate Summer Program	AK	Rural youth in communities such as Trapper Creek, Talkeetna, Willow, Houston, and Big Lake face limited access to structured summer recreation due to long distances, limited transportation options, and the cost of travel. Although the Wasilla Pool and Brett Memorial Ice Arena provide high quality opportunities for physical activity, many families in remote areas are unable to access these facilities consistently. As a result, youth have fewer opportunities for supervised physical activity, skill development, and social connection during the summer months. This project addresses that gap by combining reliable transportation with intentional, partner-led programming. Borough Recreation Facility staff will coordinate closely with nonprofit partner Youth360 to design and deliver swim and skate programming tailored to the needs of this targeted population. This partnership brings together facility expertise, youth development experience, and trusted community relationships to ensure programming is inclusive, developmentally appropriate, and responsive to youth who may have limited prior access to organized recreation. Through this coordinated approach, the project expands equitable access, strengthens community wellness, and provides positive opportunities that support physical health, social connection, and lifelong active habits for rural youth.	Youth360 has agreed to serve as the host organization for this project and brings established systems, policies, and experience in delivering youth focused programming for rural and underserved populations. Youth360 has a strong track record of coordinating logistics, engaging families, and creating safe, inclusive, and supportive environments for youth participation. Leveraging an existing nonprofit partner with proven capacity reduces start up risk and allows project resources to focus on expanding access rather than developing new administrative systems. Youth360 will work in close coordination with Mat-Su Borough Recreation Facility staff to plan and deliver structured summer swim and skate programming at the Wasilla Pool and Brett Memorial Ice Arena. This partnership combines Youth360’s expertise in youth development with the Borough’s facility operations, instructional capacity, and safety protocols, ensuring programming is well coordinated, developmentally appropriate, and responsive to the needs of the targeted population. The program will operate during the summer season for at least eight sessions, and at least one day per week, and will serve youth from remote communities including Trapper Creek, Talkeetna, Willow, Houston, and Big Lake. Organized and supervised transportation will be provided using a hub based model, allowing youth from multiple communities to access programming safely and consistently. The hub based approach creates an opportunity to reach youth who have not previously participated in swimming or skating due to transportation, cost, or lack of access. By bundling transportation with facility access and instruction, the program lowers entry barriers for families who may lack experience, resources, or familiarity with these activities. This inclusive approach supports skill development, confidence, and sustained engagement in physical activity. By adapting a proven access model to summer programming and partnering with Youth360 and Mat-Su Borough Recreation Facilities, the project offers a scalable and sustainable approach to improving access to prevention focused wellness opportunities. The approach strengthens community wellness, supports positive youth development, and provides meaningful opportunities for rural youth to build healthy habits that can become lifelong active pursuits.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough School District	Building the Mat-Su Healthcare Workforce: High School Pathways for Rural Alaska	AK	Communities across Alaska experience persistent healthcare workforce shortages that limit access to care and place increasing pressure on existing providers. Recruitment from outside the state is difficult and expensive, and many healthcare workers do not remain long term in remote communities. At the same time, many Alaskan students lack early exposure to healthcare careers or clear pathways into the healthcare workforce, coupled with a limited network of local testing centers for health career certifications. The Mat-Su Borough School District has an opportunity to address these challenges by refining our current CTE Healthcare programs and developing a high school-based healthcare workforce training network that prepares students for healthcare careers while they are still in school. By embedding healthcare training pathways within local high schools, the district can increase early career exploration opportunities, provide industry-recognized training, and connect students with regional healthcare employers. This approach builds a locally rooted workforce pipeline, allowing students to see healthcare as an attainable and meaningful career while helping communities cultivate the next generation of providers. With Mat-Su’s growing population and increasing healthcare demand, developing local talent is a critical opportunity to strengthen the region’s healthcare system and support rural communities throughout Alaska.	This project will establish a Healthcare Workforce Development Training Network across Mat-Su Borough School District high schools, with each participating school offering a specialized healthcare career program aligned with regional workforce needs. Rather than replicating identical programs, each high school will focus on a distinct health pathway, such as pre-nursing, emergency medicine, behavioral health, medical assisting, dental assisting, pharmacy technician, sports medicine, physical therapy, healthcare technology, or biomedical science. This network model allows all schools to offer similar foundational healthcare courses that lead to a specific program emphasis. The district can collectively offer a broad range of healthcare career preparation opportunities while maximizing available resources and partnerships. Students will participate in a combination of classroom instruction, hands-on skill development, career exploration, and real-world learning experiences. Training opportunities may include industry certifications such as Certified Nursing Assistant, emergency trauma technician, wilderness first aide/responder, registered behavioral health technician, or other entry-level healthcare credentials. The program will also build strong partnerships with regional hospitals, clinics, tribal health organizations, emergency services agencies, and postsecondary institutions to support internships, job shadowing, mentorship, and dual-credit opportunities. These partnerships will help students transition smoothly into employment or advanced training after graduation. Additionally, students will receive exposure to telehealth systems, community health outreach, and culturally responsive care practices, preparing them to work effectively in Alaska’s rural healthcare environments. By building a coordinated training network across high schools, the project will create a sustainable pipeline of students entering healthcare education programs and the regional workforce.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Matanuska-Susitna Borough School District	Growing Together in the MSBSD: Providing Resources and Connections for Families with Young Children	AK	Families with young children benefit from early support, parenting education, and opportunities to build strong relationships that support healthy development. However, many families have limited access to programs that provide practical parenting strategies, social connection, and early learning experiences. In our region, educators have reported a significant increase in disruptive behaviors among students entering kindergarten, and families have expressed a need for additional support in understanding how to help their children develop key social, emotional, and self-regulation skills. Young children learn best through play-based experiences that support language, social, emotional, and cognitive development. Programs that allow parents and children to learn together give caregivers the opportunity to observe effective strategies, practice new skills, and strengthen relationships that support early development and school readiness. This project will address these needs through community events, parenting classes, and parent–child workshops offered in partnership with MSBSD. These activities will build caregiver skills, increase awareness of developmental milestones and ready-to-learn behaviors, and connect families with local resources. By strengthening early supports for families, the project promotes healthy child development and helps reduce the need for more intensive behavioral and mental health services later.	This project will provide accessible, family-centered programming that supports parents and young children learning together while strengthening connections to the school district and community resources. The program will offer a combination of structured learning opportunities and community-based activities designed to build parenting confidence, support early childhood development, and foster social connection among families. A core component of the project will be weekly parent–child workshops facilitated by an early childhood educator. These sessions will provide play-based learning experiences for children while modeling effective strategies for parents to support development at home. Parents will have opportunities to observe, practice, and reflect on practical parenting approaches while engaging alongside their children. Activities will focus on building language, social-emotional skills, early literacy, and positive parent–child interaction. In addition to weekly workshops, the program will host a calendar of family social events designed to reduce isolation and build community connections. These events will be organized in partnership with local organizations such as libraries, small businesses, and outdoor recreation spaces. Activities may include family story times, community play events, and outdoor exploration opportunities at local state parks and trails. These gatherings will create welcoming spaces for families to connect with one another while strengthening ties between families and community partners. Families will also have the option to participate in evidence based parenting classes that provide more focused instruction on topics such as child development, positive discipline, communication, and supporting learning at home. These classes will offer practical tools and guidance while allowing parents to ask questions and share experiences with peers. Throughout all programming, families will be introduced to local resources and services that support child development and family well-being. By combining parent education, play-based learning, and community engagement, this project will create supportive opportunities for families and children to grow, learn, and build healthy beginnings together.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough School District	Health Facility HVAC Modernization for Safe Care Environments	AK	Several school facilities currently rely on outdated pneumatic HVAC control systems that limit the district’s ability to effectively manage ventilation, temperature, and indoor air quality. These aging systems are increasingly difficult to maintain, offer limited operational control, and contribute to higher energy use and inconsistent indoor environments. In rural Alaska communities where schools serve as important public facilities, maintaining safe and healthy indoor conditions is critical. This project will support the design of modern direct digital control (DDC) system upgrades at Colony Middle School, Colony High School, Palmer High School, and Sutton Elementary School. Developing these designs will position the district to replace aging pneumatic controls with advanced digital systems that enable precise, programmable control of heating and ventilation systems. The completed designs will support future implementation that improves indoor air quality, enhances system reliability, reduces energy consumption, and enables integration with centralized building automation systems for long-term facility management and sustainability.	This project will develop detailed engineering designs to modernize building control systems at four school facilities: Colony Middle School, Colony High School, Palmer High School, and Sutton Elementary School. The work will begin with a comprehensive assessment of existing pneumatic HVAC control systems, including site audits and evaluation of current mechanical equipment, control components, and building conditions. This assessment will identify system limitations, maintenance challenges, and opportunities to improve ventilation control and energy efficiency. Based on these findings, engineering consultants will develop facility-specific designs to transition from pneumatic controls to modern direct digital control (DDC) systems. The design phase will include development of control architecture, equipment specifications, integration requirements for centralized building automation systems, and preparation of construction-ready plans and specifications. The completed designs will position the district to implement future upgrades that replace aging pneumatic components with modern electronic controllers, sensors, and communication interfaces. These improvements will enable more precise monitoring and programmable control of ventilation, heating, and temperature regulation throughout the buildings. By advancing these facilities to a construction-ready stage, the project will support future implementation that improves indoor air quality, enhances system reliability, reduces energy consumption, and strengthens long-term building management for safe and healthy learning environments.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough School District	Rural Health Cybersecurity & Continuity Infrastructure Upgrade	AK	The district’s disaster recovery (DR) site backs up and protects critical systems and data that support school operations, safety systems, and services used by students and staff. The network firewall currently protecting this infrastructure is aging and approaching the end of its useful life, creating increased cybersecurity risk and limiting the district’s ability to defend against evolving cyber threats. Modern cybersecurity threats continue to grow in sophistication and frequency, making reliable network protection essential to maintaining secure and resilient systems. Without modern security infrastructure, critical data backups and recovery systems could be vulnerable to cyber incidents that disrupt essential services. This project will replace the existing firewall with modern cybersecurity infrastructure designed to provide advanced threat detection, stronger network protection, and improved system reliability. Upgrading this critical component of the disaster recovery environment will strengthen the district’s ability to protect sensitive data and ensure continuity of operations in the event of a cybersecurity incident or system disruption.	This project will replace the existing network firewall at the district’s disaster recovery (DR) location with modern cybersecurity infrastructure designed to strengthen network protection and system resilience. The project will begin with a review of the current network architecture and disaster recovery environment to ensure the replacement firewall is properly sized and configured to support the district’s backup and recovery operations. Technical staff and cybersecurity specialists will evaluate existing network traffic, system dependencies, and security requirements to determine the appropriate firewall solution. Once the appropriate system is identified, the district will procure and install the new firewall hardware and associated security software. Configuration will include implementation of updated security policies, network segmentation, threat detection capabilities, and secure access controls designed to protect replicated data and backup systems. Following installation, the system will undergo testing and validation to ensure that backup operations, network monitoring, and security protections function as intended. The new firewall will then be integrated into the district’s disaster recovery and cybersecurity management processes to support ongoing monitoring and system protection. Upgrading the firewall at the disaster recovery site will strengthen the district’s ability to protect critical systems and maintain secure backups, ensuring that essential systems can be quickly restored in the event of a cyber incident or other disruption.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough School District	Safe Routes Youth Activity & Community Wellness Infrastructure	AK	Many students in rural Alaska communities lack safe pedestrian routes to travel between neighborhoods and local schools. Limited sidewalks, pathways, and pedestrian infrastructure can create safety concerns for students walking or biking to school and accessing community recreation spaces located on school grounds. This project will focus on the design of infrastructure improvements located on school property that are necessary to complete safe routes to school campuses. While route planning and design for areas outside school grounds are being addressed by partner organizations, this project will ensure that safe pedestrian connections continue onto school campuses through appropriate pathway design and site improvements. Through the district’s Safe Routes to School ranking process, the Matanuska-Susitna Borough School District has identified approximately 30 potential on-campus projects that address safety needs and infrastructure gaps near school facilities. Design costs vary by location and complexity but are estimated to range from approximately \$30,000 to \$50,000 or more per project. Funding received through this project will allow the district to advance design work for as many prioritized projects as possible, creating construction-ready plans that support future implementation of safe routes improvements.	Projects have been evaluated and prioritized through the Safe Routes to School Rankings process based on safety needs and infrastructure gaps near school facilities. The district is coordinating with the Matanuska-Susitna Borough Safe Routes to Schools Committee to align project priorities and ensure that on-campus improvements complement planned off-campus route development led by community partners. Through this project, the district will advance engineering design for on-campus infrastructure improvements that support safe pedestrian access to school campuses. Design activities will include site assessments, development of pathway alignments, accessibility considerations, and preparation of construction-ready plans and specifications. The Matanuska-Susitna Borough School District has identified approximately 30 potential prioritized projects through its ranking process. Design funding will be used to advance as many of these projects as possible based on available resources, creating construction-ready plans that can support future implementation of Safe Routes to School improvements connecting surrounding neighborhoods with school facilities.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Matanuska-Susitna Borough School District	Youth Wellness Infrastructure Upgrade for Healthy Communities	AK	Many playgrounds across the district contain equipment that is aging and approaching the end of its useful life. While the existing equipment remains safe and operational, proactive planning is needed to ensure continued safe use and to prepare for future replacement as components age out. In many rural Alaska communities, school playgrounds serve as shared recreation spaces for students and the broader community outside school hours, making them an important part of local wellness infrastructure. This project will support a district-wide assessment of existing playground equipment to identify infrastructure nearing the end of its service life and develop plans for modern, safe, and inclusive replacements. The resulting designs and replacement strategies will position the district to pursue future funding opportunities for playground upgrades that support youth wellness and maintain safe, accessible recreational spaces for rural communities.	The district will conduct a district-wide assessment of playground equipment at up to 20 elementary schools to identify infrastructure that has reached or is approaching the end of its useful life. This effort will be completed in partnership with a qualified playground manufacturer that will provide technical expertise in equipment evaluation, safety standards, accessibility, and modern playground design. Design and assessment costs are estimated at approximately \$10,000–\$12,000 per playground, allowing the district to advance planning and conceptual replacement designs for multiple sites depending on the level of funding available. Together, the district and partner will review equipment age, condition, and compliance with current safety guidelines to identify priority locations for future upgrades. Based on this assessment, conceptual designs and replacement plans will be developed for modern, safe, and inclusive playground equipment. These plans will guide future implementation and position the district to pursue funding for playground upgrades that support youth wellness and community recreation in rural Alaska communities.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

MatSu Food Bank aka Food Pantry of Wasilla Food4Kids	A Hand Up: Building Food Independence and Nutrition Health in the MatSu Valley	AK	Food insecurity remains a significant challenge across Alaska, particularly in rural communities such as the Matanuska-Susitna Borough. High food costs, long travel distances to grocery stores, and limited access to fresh foods make it difficult for many households to maintain consistent access to nutritious food. As a result, many families rely on inexpensive processed foods or emergency food assistance, increasing the risk of chronic diseases such as diabetes, heart disease, and obesity. While food banks provide essential short-term relief, many households lack the knowledge, tools, and resources needed to build long-term food stability. Families often struggle with managing food budgets, growing food in Alaska’s climate, preparing healthy meals, and preserving food for future use. The MatSu Food Bank’s “A Hand Up, Not Just a Handout” program addresses this gap by providing practical education and tools that help families move from short-term food assistance toward greater food independence. Through training in financial stability, home food production, healthy cooking, and food preservation, the program helps families improve nutrition, strengthen household resilience, and reduce long-term reliance on emergency food assistance.	While food banks provide essential emergency relief, long-term food insecurity is often driven by a lack of practical knowledge and tools that help families manage food budgets, grow food in Alaska’s climate, prepare healthy meals, and preserve seasonal foods. While food banks provide essential emergency relief, long-term food insecurity is often driven by a lack of practical knowledge and tools that help families manage food budgets, grow food in Alaska’s climate, prepare healthy meals, and preserve seasonal foods. The MatSu Food Bank’s “A Hand Up, Not Just a Handout” program addresses this gap by providing hands-on education and practical tools that help families build food independence. The program focuses on four key areas: financial stability and budgeting, growing food through small hydroponic systems, preparing nutritious meals, and preserving food for year-round use. By combining education with practical tools participants can use at home, the program helps families improve nutrition, strengthen household stability, and reduce long-term reliance on emergency food assistance.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced
MatSu Food Bank aka Food Pantry of Wasilla Food4Kids	Food4Kids Mobile Summer Nutrition Program Expansion	AK	Food insecurity remains a persistent challenge for families across the Matanuska-Susitna Borough, particularly for children during the summer months when school meal programs are unavailable. The Food4Kids program provides meals directly to children in neighborhoods where families face transportation barriers and high food costs. Demand continues to grow. In 2025 the program served 30% more meals than in 2024. The MatSu Food Bank proposes expanding the program through the purchase of two dedicated mobile delivery vans to support reliable transportation of meals and milk to community distribution sites.	The Food4Kids Summer Nutrition Program distributes meals through neighborhood locations designed to reduce barriers to food access. The project includes three components: 1. Purchase two cargo vans dedicated to the Food4Kids program to safely transport meals and milk to distribution sites. 2. Operate three summer meal distribution locations in Wasilla serving approximately 13,000 meals during the summer months. 3. Expand the program beginning in 2026 to include one Saturday distribution per month to increase access for families unable to attend weekday distributions.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

MatSu Food Bank aka Food Pantry of Wasilla Food4Kids	MatSu Valley Grocery Rescue Program	AK	Food insecurity remains a significant challenge across Alaska, where approximately 1 in 7 residents experience food insecurity. At the same time, large amounts of edible food are discarded each year by grocery stores, restaurants, and food retailers. In the Matanuska-Susitna Borough alone, an estimated 36 million pounds of food may be wasted annually. A portion of this food remains safe and nutritious and could be rescued and redistributed to families in need. The MatSu Food Bank proposes establishing a coordinated Grocery Rescue Program to recover surplus food from grocery stores, restaurants, and food retailers across the MatSu Valley. This program will significantly increase the amount of rescued food available to families experiencing food insecurity while reducing waste sent to landfill.	The MatSu Valley Grocery Rescue Program will establish a dedicated food recovery system designed to capture surplus food that would otherwise be discarded. The program will include: • Hiring one full-time employee dedicated to food rescue coordination and partner outreach • Purchasing a dedicated box truck under 26,000 GVW to collect and transport rescued food • Full vehicle insurance and operating expenses • Purchase of a forklift and pallet jack to safely move palletized food • Development of scheduled pickup routes for restaurants and grocery stores • Expansion of food distribution to partner agencies across the MatSu Valley The MatSu Food Bank has recently begun partnering with the Knik Tribe through the use of their composting Connex system. This partnership allows any food that cannot be rescued for human consumption to be composted rather than sent to the landfill. Through this partnership and expanded food recovery infrastructure, the MatSu Food Bank has established a goal of achieving zero food waste by 2026, ensuring that no food handled by the organization enters the landfill waste stream.	\$50,000-\$250,000		Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Health Services, Inc.	Mat-Su Health Services RHTP Phase I	AK	Rural communities across Alaska face persistent barriers to accessing timely comprehensive health care, including workforce shortages, geographic isolation, and limited access to specialty services. These challenges are particularly evident in the Matanuska-Susitna Valley, where rapid population growth has increased demand for primary care, behavioral health, and specialty services. In contrast, the health care workforce has struggled to keep pace. Mat-Su Health Services (MSHS), a Federally Qualified Health Center and regional behavioral health provider, currently operates on an aging on-premises server infrastructure that limits system reliability, interoperability, and the ability to leverage telehealth and modern care delivery tools fully. Upgrading to a cloud-based electronic health record environment will modernize care delivery, improve connectivity with health system partners, and strengthen telehealth capacity for rural patients. At the same time, access to specialty services such as vision care remains limited in many communities. Tele-optometry technology offers the opportunity to provide remote eye care services at MSHS clinics without requiring on-site specialists. This project will modernize technology infrastructure, introduce tele-optometry services, and build workforce capacity through a Rural Health Transformation Program Coordinator and Community Health Worker, creating the foundation for a scalable model to expand integrated care to rural Alaskans.	Mat-Su Health Services (MSHS) will implement a phased approach to modernize technology infrastructure, expand service delivery capabilities, and build workforce capacity to improve access to care for rural Alaskans. Phase I will focus on foundational technology upgrades necessary to support modern health care delivery. MSHS will transition its electronic health record system from on-premises servers to a secure cloud-hosted environment through NextGen’s AWS-based platform, improving system reliability, cybersecurity, interoperability, and telehealth functionality. During this phase, MSHS will also upgrade its behavioral health technology suite to the newest available platform and enhance connectivity across clinical sites to improve coordination between primary care, behavioral health, and specialty services. In addition, MSHS will implement tele-optometry technology through Digital Optometrics at its three medical clinics, allowing patients to receive comprehensive eye exams supported by remote optometrists using advanced diagnostic equipment. This model will expand access to vision care, reduce wait times and eliminate the need for on-site specialty providers in rural settings. Phase I will also establish key staffing infrastructure by hiring a Rural Health Transformation Program Coordinator responsible for project management, data reporting, and partnership development, and a Community Health Worker who will begin training to support patient navigation, outreach, and care coordination. In Phase II, MSHS will build on this infrastructure through its Behavioral Health Modernization initiative, “Momentum,” integrating behavioral health clinicians, case managers, and support staff within primary care teams to improve whole-person care for patients with complex needs. Once this integrated model is fully operational within the Mat-Su region, Phase III will focus on expanding telehealth-enabled services to additional rural and frontier communities in Alaska that currently lack access to integrated behavioral health and primary care services. By combining modern cloud-based technology, innovative care models, and workforce development, this project will create a scalable platform that can expand high-quality care to rural communities across Alaska.	\$1M-\$5M	Federally qualified health center	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Advance to Implementation Application

Mat-Su Health Services, Inc.	Alaska Behavioral Health Population Management PMPM	AK	Behavioral health providers across Alaska operate in a system where the majority of patients are covered by Medicaid, yet reimbursement structures are largely built around fee-for-service encounters that do not fully support the level of coordination, outreach, and stabilization services required for individuals with complex behavioral health conditions. Recent statewide analyses, including the Guidehouse behavioral health rate study, have highlighted the ongoing gap between Medicaid reimbursement and the true cost of delivering comprehensive behavioral health services. This misalignment creates significant sustainability challenges for community providers and limits the ability of the system to invest in proactive, community-based interventions that can prevent crises and reduce costly downstream utilization such as ED visits, inpatient admissions, and out-of-region care. This project will explore the development of a sustainable care model that supports individuals through a flexible, population-based approach. Rather than relying solely on billable visits, the model would support wraparound services including care coordination, crisis prevention, and community-based stabilization designed to keep individuals connected to care within their communities. The project will initially focus on designing and piloting the model in the MSB, with the goal of developing a scalable framework across Alaska and strengthen the long-term sustainability of the state’s behavioral health system.	This project will design and pilot a sustainable care model that supports individuals with complex behavioral health needs through a flexible, population-based approach. The model will draw upon proven care management and value-based behavioral health systems implemented in other states, including Oregon’s Coordinated Care Organizations, Colorado’s Regional Accountable Entities, and New York’s Medicaid Health Home program. These models demonstrate that proactive care coordination, community-based stabilization services, and population-level care management can improve outcomes while reducing avoidable hospitalizations and emergency department utilization. While these models provide a strong evidence base, Alaska presents unique challenges that require adaptation. The state’s geographic size, rural and frontier communities, workforce shortages, transportation barriers, and limited access to psychiatric specialty care require a care model that can operate effectively across vast distances and support smaller community providers. During Years 1–2, Mat-Su Health Services will lead the design and pilot phase in the Mat-Su Borough. This phase will include development of the care model framework, identification of target patient populations, evaluation design, and collaboration with behavioral health providers and system partners to ensure the model is practical and scalable in Alaska’s rural environment. The pilot will test strategies such as enhanced care coordination, crisis prevention services, telehealth-enabled psychiatric consultation, and community-based stabilization supports designed to help individuals remain engaged in care and avoid behavioral health crises that lead to emergency department visits or hospitalization. Years 3–5 will focus on refining the model based on pilot results and developing a scalable framework that can be implemented by behavioral health providers across Alaska. The project will emphasize collaboration with rural providers, training and technical assistance, and the use of telehealth to extend specialty expertise to underserved communities. By adapting proven population-based behavioral health models to Alaska’s unique environment, this project aims to strengthen provider sustainability, expand access to coordinated behavioral health services, and reduce costly downstream utilization while allowing Alaskans to receive care within their own communities.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Mat-Su Regional Medical Center	AI-Assisted EEG: Bridging the Neurological Assessment Gap with AI	AK	When MSRMC Emergency Room or Intensive Care Unit patients present with unclassified seizure-like activity - to include altered mental status or subtle, unclassified movements (which may or may not be non-convulsive seizures or status epilepticus) - the hospital lacks on-site neurological monitoring required for definitive diagnosis. This includes limited in-house capability to provide neurology and electroencephalogram (EEG) interpretations. Therefore, MSRMC frequently transfers these patients to an Anchorage facility with the requisite capabilities. The transfer process introduces significant delays in diagnosis and treatment that are particularly dangerous in cases of ongoing, non-convulsive seizures that can cause irreversible brain damage. Therefore, MSRMC is requesting RHTP funding to procure an AI-enabled EEG system from a vendor such as Ceribell that will enable its in-house clinicians to diagnose, treat and avoid transfer of patients experiencing these symptoms.	MSRMC's approach to address the challenge of diagnosing and treating patients who present with seizure-like activity is to procure an AI-assisted EEG system along with an annual supply of the disposable headbands required for system use of such systems. An AI-assisted EEG system, like the Ceribell system, reduces the need for specialized training and lengthy electrode placement required for traditional EEG. An AI-assisted EEG system then enables physicians to quickly determine if a patient is experiencing status epilepticus. This rapid identification is crucial for making emergent treatment decisions prompting appropriate care locally and potentially avoiding the need for a costly, time-sensitive transfer that may contribute to negative outcomes. MSRMC's approach includes procurement of an AI-assisted EEG system along with an annual supply of the headbands required for use. Attributes specific to the Ceribell system identified by MSRMC include the following: 1. Objective Data at the Bedside: The portable, battery-powered Ceribell device captures and processes the brain electrical activity immediately. 2. AI-Driven Interpretation: Crucially, Ceribell provides a proprietary Brain Stethoscope feature, which is an auditory representation of brain activity, and utilizes AI-powered software to help the clinician identify seizures within minutes. The software provides quantitative metrics and assists in flagging patterns consistent with status epilepticus. 3. Immediate Local Decision Making: By providing immediate, objective confirmation (or exclusion) of seizure activity, Ceribell empowers MSRMC physicians—emergency medicine and critical care specialists—to initiate appropriate, life-saving anticonvulsant therapy at the bedside. This ability to "rule in" or "rule out" a neurological emergency locally prevents unnecessary patient transfers and helps patients who are seizing receive treatment when every minute counts. For patients who are not seizing, it rapidly directs the diagnostic path toward other causes of altered mental status, saving time and resources. This immediate diagnostic capability transforms the MSRMC standard of care from one of transfer-for-diagnosis to one of local-diagnosis-and-treatment, vastly improving critical neurological care access for the Mat-Su Borough.	\$50,000-\$250,000	Hospital	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

Mat-Su Regional Medical Center	Expanding neonatal critical care access by converting existing space into a Level II NICU.	AK	MSRMC currently provides neonatal care within existing space; however, limitations of the hospital's infrastructure and clinical capability require transfers for infants who need Level II monitoring or short-term intensive support. These transfers create significant logistical and emotional burdens for families, disrupt maternal-newborn continuity, and place additional strain on receiving facilities in Anchorage. According to Alaska Hospital Association data for 2024, at least 48 Level II–appropriate neonatal discharges for Mat-Su residents occurred at Anchorage hospitals, indicating that a meaningful number of infants are transferred primarily due to facility capability constraints rather than clinical necessity. This represents a clear (and widening) access gap within the region. Upgrading neonatal services within MSRMC’s existing footprint to achieve Level II capability presents an opportunity to reduce avoidable transfers, improve timeliness of care, and strengthen local maternal-child health capacity for rural and frontier families.	MSRMC will implement a phased approach to achieve Level II NICU capability within its existing footprint, without adding new square footage. Step 1: Clinical and Regulatory Gap Assessment - MSRMC will finalize its detailed review of current neonatal services against Level II standards to identify required infrastructure, equipment, workflow, and staffing enhancements. This assessment will guide design specifications and support compliance with regulatory and accreditation requirements. Step 2: Targeted Renovation and Equipment Upgrades - The project will renovate existing space to support appropriate patient care configuration and enhanced monitoring capacity. This approach aligns with RHTP allowable uses for targeted capital improvements that strengthen maternal and newborn care facilities, including conversion or updating of existing suites and installation of technology that expands appropriate care availability. Step 3: Workflow Integration and Implementation - Clinical protocols, interdisciplinary coordination processes, and staff training will be updated to align with Level II standards. Following completion, MSRMC will monitor transfer rates and neonatal outcomes to evaluate impact.	\$1M-\$5M	Hospital	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

Mat-Su Regional Medical Center	Strengthening the Mat-Su specialty workforce to promote sustainability	AK	The Mat-Su region faces sustained shortages across primary care and key specialties essential for rural and frontier populations. Rapid growth—40,000 additional residents since 2005—has intensified access challenges. Statewide, HRSA reports 338 primary care HPSA designations, with only 26.58% of need met. By 2029, Mat-Su is projected to face deficits of 28 family medicine physicians, 28 internal medicine physicians, 11 gastroenterologists, 7 nephrologists, 6 pulmonologists, and 6 neurologists. Behavioral health access is strained, with 342 residents per mental health provider—worse than the national average. Recruitment is further complicated by housing and childcare constraints; 43% of children under 5 rely on unlicensed care. Within this environment, MSRMC’s workforce data reflect ongoing instability. Among employed providers, 32% of those active one year ago and 55% of those active three years ago are no longer practicing at MSRMC. Recruitment yield remains limited: cardiology has produced 0 hires from 8 candidates in 10 months; family and internal medicine each yielded 1 hire despite 15–20 candidates; psychiatry 5 hires from 60 candidates over nearly six years. MSRMC currently has 8 multi-year provider vacancies and 2 unfilled therapist roles. The average third next available new PCP appointment is approximately 20 days. This project advances a coordinated regional strategy to improve recruitment yield, strengthen retention, and stabilize long-term workforce capacity.	MSRMC will implement a structured, outcome-driven recruitment and retention strategy to stabilize the highest-need primary care and specialty service lines and measurably improve patient access across the Mat-Su region. This initiative establishes a coordinated workforce stabilization framework aligned with the RHTP Strengthen Workforce initiative. Step 1: Data-Guided Prioritization. MSRMC will identify priority roles based on vacancy duration, patient access delays, service-line instability, and transfer patterns. Baseline metrics (including vacancy rates, time-to-fill, contract labor utilization, and appointment wait times) will establish performance targets. Step 2: Performance-Based Recruitment Incentives. RHTP funds will support time-limited recruitment incentives tied to multi-year service commitments, with staged payments linked to retention milestones. This approach is designed to shorten time-to-fill, improve multi-year retention rates, and reduce recurring vacancy cycles. Funds will not subsidize routine salaries. Step 3: Barrier Mitigation Supports. To address rural relocation challenges, MSRMC will provide wraparound supports such as housing navigation, time-limited housing assistance where appropriate, childcare coordination, and structured onboarding. Reducing these practical barriers increases the likelihood of long-term retention and workforce stability. Step 4: Professional Integration and Retention Infrastructure. MSRMC will strengthen mentorship, continuing education access, and specialty collaboration networks to reduce professional isolation and burnout—key drivers of rural attrition. Step 5: Ongoing Performance Monitoring. Progress will be tracked through recruited provider counts, retention rates, vacancy trends, contract labor reduction, and changes in appointment availability and wait times. By reducing persistent vacancies and strengthening long-term retention, MSRMC expects to improve continuity of care, decrease delays in access, reduce reliance on premium temporary staffing, and create durable workforce capacity serving rural and frontier patients.	\$250K-\$1M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Advance to Implementation Application

Mat-Su Regional Medical Center	Upgrade surgical robotics platform to enhance surgical quality and access for Mat-Su Borough.	AK	Mat-Su Regional Medical Center currently operates two surgical robots as part of its surgical robotics program. The program began in 2018 when MSRMC procured its first robotic surgical system. These systems are based on a platform originally introduced in 2014 and, while they have served the community well, they reflect technology that is now more than a decade old. Last year alone, nearly 650 surgeries were performed using these robotic systems, demonstrating the program’s strong utilization and importance to the region. In 2025, a new and more advanced soft-tissue surgical robotic platform was released and other competitor products are becoming available, offering substantial benefits to patients, surgeons, and operating room teams compared to MSRMC’s current systems. These advancements include improved imaging, advanced instrumentation, and expanded capabilities that support better clinical outcomes and workflow efficiency. Hospitals in Anchorage, AK, are already utilizing this latest generation technology. As a result, patients and surgeons in the Mat-Su Borough who wish to access these advanced capabilities must currently travel to Anchorage. MSRMC seeks to upgrade its existing surgical robotic systems to the latest platform released in 2025 to help the community it serves has the same level of access to state-of-the-art surgical robotics technology as patients treated in Anchorage.	MSRMC proposes purchasing two of the latest-generation surgical robotic systems, along with the necessary equipment, to upgrade its surgical robotics platform to the most advanced technology currently available. These two new systems will replace the existing robots and significantly enhance surgical quality, clinical capabilities, and access to advanced robotic surgery for patients in the Mat-Su Borough. MSRMC will select its vendor and coordinate with the vendor to have the new robotic systems shipped and installed within three months. After installation, current surgeons and operating room staff will complete required training on the new platform, which is expected to take approximately one month. Upon completion of training, MSRMC will fully transition to the upgraded systems and will be prepared to offer the most advanced surgical robotics technology available to patients and providers in the Mat-Su Borough.	\$1M-\$5M	Hospital	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

Mat-Su Regional Medical Center	Building Automation System and Cooling Plant Upgrade & Innovation	AK	MSRMC’s building automation system is 20+ years old and is now obsolete, unsupported, and unable to meet current IT and operational needs. The legacy system limits the hospital’s ability to analyze building performance and maintain reliable control of critical clinical environments. It lacks secure remote monitoring and cannot integrate with modern IT systems, making upgrades in other areas of the facility costly and complex. MSRMC, Community Health Systems (CHS) [MSRMC's parent], Facility Diagnostics, and Trane Technologies have developed a BAS modernization plan that incorporates innovative, cloud-based, autonomous AI technology to optimize building operations in real time. This upgraded platform enables secure remote monitoring, centralized management, and improved system reliability—capabilities essential for healthcare facilities serving Alaska’s growing and geographically dispersed communities. As part of the BAS modernization project, MSRMC also proposes to upgrade the hospital’s cooling plant utilizing modern equipment and controls. This plant services critical maternal care rooms and wellness centers throughout the facility. Finally, MSRMC proposes to train facility engineers and staff on these new systems. These efforts are expected to improve patient and staff comfort, support better clinical outcomes, and increase operational resilience.	The proposed project will modernize MSRMC’s building automatic system by replacing legacy controllers with network capable units fully integrated into the Trane Ensemble platform, enabling secure remote access, advanced analytics, and centralized management. It also includes the opportunity to pilot Trane's BrainBox AI, an artificial intelligence–driven building optimization platform that uses real-time operational data and predictive analytics to autonomously adjust HVAC systems for improved performance and efficiency. BrainBox AI was acquired by Trane Technologies and is now integrated into Trane’s building automation ecosystem, strengthening platform compatibility and long-term support. MSRMC also plans for the cooling plant effort to include a modernized chiller and upgraded plant controls. This will extend equipment life, improve serviceability, and reduce maintenance disruptions.	\$1M-\$5M	Hospital	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Regional Medical Center	Enhance endoscopy recovery and throughput with renovation.	AK	MSRMC faces a significant throughput bottleneck in its endoscopy program driven by limited recovery space. The existing endoscopy recovery area has reached physical capacity, creating a constraint that directly limits procedural volume and overall efficiency. Compared with typical Facility Guidelines Institute (FGI) planning expectations for a hospital of this size and service profile, MSRMC’s recovery capacity is undersized, currently operating with only two recovery bays where a larger complement is generally anticipated. Because recovery bay availability dictates the pace of procedures, insufficient recovery slots create a “stop-start” dynamic that delays cases, restricts daily throughput, and underutilizes specialized staff and equipment. This limitation could contribute to extended patient wait times for essential diagnostic and preventive procedures, thereby compromising timely access to care for rural residents. In some cases, patients must instead travel long distances to Anchorage, AK to receive needed endoscopy services. The constrained recovery environment also impacts workflow, patient experience, and safety. Crowded conditions reduce optimal post-sedation monitoring space and strain nursing operations. In summary, inadequate endoscopy recovery capacity restricts program growth, lengthens wait times, and places pressure on the clinical environment, necessitating a comprehensive solution to provide efficiency and access.	The solution employs an approach focused on strategic relocation and targeted renovation to lessen the capacity constraint in the endoscopy recovery area. This first move prepares the site by creating the necessary space to relocate the offices to minimize disruption to current clinical operations. This space will be across the hall from the OR area in the admin department. Once this is complete the inhabitants of the two offices will relocate. After the relocation occurs, the now-empty office and storage area will undergo a full clinical renovation that includes the following: Capacity Expansion: The renovation will be designed and executed to construct two new, fully equipped, modern endoscopy recovery bays. Clinical Goal Attainment: The new bays will immediately increase the unit's total capacity, reduce the current throughput bottleneck, and allow MSRMC to schedule the optimal number of daily procedures. This staged approach supports the needed capacity expansion with minimal, non-clinical displacement, adding two recovery bays that improve patient access and quality of care.	\$1M-\$5M	Hospital	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Regional Medical Center	Enhancing rural hospital capabilities with AI assisted biorobotics aquablation surgery for BPH	AK	Benign Prostatic Hyperplasia (BPH) is the leading cause of urologist visits for men. The condition affects one in two men aged 51 to 60, and its prevalence increases with age. Ninety-nine percent of men with BPH report that their symptoms negatively affect their quality of life. Despite the commonality of BPH, there is still a considerable unmet need in BPH treatment. This is primarily due to the side effects associated with current surgical procedures, patient reluctance to commit to long-term medication, and a general acceptance of quality-of-life impacts like frequent urination and incontinence. Side effects also include erectile and ejaculatory dysfunction. The rates of these side effects can be quite high and are often irreversible. Ejaculatory dysfunction can result in up to 89-90% during a simple prostatectomy. MSRMC plans to help solve this problem by improving access to state-of-the art care enabled by the AI-assisted biorobotic aquablation system. In the case of the Procept Hydros AI-assisted biorobotic aquablation system, the incidence of BPH side effects drops to under 11%, erectile dysfunction to 0%, and incontinence is 0.5%, according to the vendor. With these dramatically improved outcomes in mind, MSRMC anticipates that more men will seek the appropriate interventional care using an AI-assisted biorobotic aquablation system to stop the progression of disease so that more severe complications are avoided.	MSRMC proposes to address the problem of men with BPH avoiding care and experiencing a high degree of negative side effects by purchasing an AI-assisted biorobotic aquablation system. Procept Hydros has been identified as a potential vendor partner. This proposed purchase aligns to Alaska's Health Care Access initiative and the stated potential use of funds to increase access to high-quality, specialized services. The selected vendor will provide training to MSRMC's nephrologist to effectively use the system and begin serving patients.	\$250K-\$1M	Hospital	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Regional Medical Center	Expand Intensivist Coverage with Tele Health Technology	AK	MSRMC is the only full-service acute care hospital serving geographically expansive rural and frontier region larger than many U.S. states. Despite being the fastest-growing community in Alaska, the Mat-Su Valley and its surrounding frontier service area face critical specialist access gaps that place lives at risk and drive unsustainable costs. For example, MARMC sees the following challenges: Specialist access gaps: frontier communities typically do not have local specialist access. Patients requiring intensivist or critical care expertise face medevac transport at average costs of \$15,000–\$20,000 per flight. After-hours coverage strain: Reaching Mat-Su specialists after hours requires physical transport, causing preventable delays in time-sensitive conditions including sepsis, acute kidney injury, and other complex care cases. Workforce attrition: Clinical isolation — operating without specialist backup — is a primary driver of provider burnout and departure in frontier Alaskan settings. This initiative is designed specifically to strengthen specialty and critical care for rural, remote, and frontier communities across the Mat-Su region. By enabling real-time specialist collaboration between MSRMC and community health sites, the project expands the reach of advanced clinical expertise.	MSRMC proposes to partner with Omnicure Inc. and SickBay AI-enabled inpatient monitoring, to establish this hub-and-spoke telehealth network that extends Mat-Su’s intensivist capabilities to frontier communities across its service area. The model has three components: Component 1 — Tele-ICU & Critical Care Augmentation at Mat-Su: The project will deploy a tele-critical care platform that supplements Mat-Su’s existing intensivist program, providing 24/7 on-demand board-certified intensivist coverage for complex cases, overnight gaps, and surge periods. Paired with SickBay’s AI-enabled continuous monitoring in Mat-Su’s 14-bed ICU and 22-bed ED, this creates an always-on critical care safety net that reduces transfers to Anchorage and improves outcomes for the region’s highest-acuity rural patients. Component 2 — Virtual Specialist Access for Frontier Communities: Via Omnicure’s platform, community health aides, nurses, and clinic providers across the Glenn Highway corridor and Susitna Valley gain real-time access to Mat-Su-backed intensivists and specialists. This enables stabilization in community and avoids medevac transport for conditions manageable with specialist guidance. Component 3 — Virtual Nursing & Chronic Disease Management: Omnicure’s virtual nursing program supports post-discharge follow-up and chronic disease management for high-risk patients — particularly Alaska Native patients with ESKD, diabetes, and hypertension — reducing avoidable readmissions and emergency presentations. MSRMC notes that Omnicure’s platform integrates with major EHR systems via Rhapsody, typically requires no custom IT build, and typically deploys within 45–60 days of award. Satellite connectivity options are compatible with Alaska’s rural internet environment. This model enables rural clinicians to stabilize and manage more patients locally while maintaining immediate access to specialist consultation when needed. By strengthening MSRMC’s role as a regional hub, the program reduces unnecessary transfers and allows patients to remain closer to their families and communities whenever clinically appropriate. MSRMC will coordinate with regional clinics, community health aides, and Alaska Native health organizations to align the telehealth network with existing rural care delivery systems.	\$1M-\$5M	Hospital	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Regional Medical Center	Expanding access to Oncology services for the Mat-Su and surrounding populations	AK	Residents of the Mat-Su face growing demand for cancer services but limited access to coordinated oncology care within their community. Cancer incidence is highest in Alaska’s interior and rural regions, but most oncology services—including chemotherapy, radiation therapy, diagnostics, surgical oncology, and multidisciplinary care planning—are concentrated in Anchorage. Many rural, remote and frontier patients must travel long distances for treatment. Healthcare claims data show that 54% of Alaska cancer patients travel to Anchorage for chemotherapy and 36% for radiation therapy. Because cancer incidence increases with age, Mat-Su’s growth—combined with an aging population—means cancer cases will rise over the next decade. MSRMC estimates that the borough likely sees 500–700 new cancer diagnoses per year - a sufficient volume to support a regional oncology program. Within the borough, existing cancer services are limited and dispersed across multiple facilities. Patients must navigate separate locations for screening, diagnostics and treatment, creating fragmented care pathways that delay care and increase travel burden. These challenges are compounded by gaps in early detection. Alaska ranks among the bottom states for preventive cancer screenings, contributing to later diagnoses and poorer outcomes, and the state’s cancer mortality rate exceeds the national average. There is a clear need to improve access to coordinated cancer care services closer to where patients live.	In support of Alaska's RHTP goals to improve access to care—particularly access to specialty services in rural hub communities and including age appropriate cancer screenings—our vision is to develop a cancer center in the Mat-Su Borough with a full spectrum of cancer care services, from screenings through treatment and into survivorship that will improve the health of thousands of Alaskans. This cancer center would bridge the care gap between Mat-Su's growing population and the specialized oncology services concentrated in Anchorage. Today's cancer care landscape in the borough is fragmented, with individual physician practices delivering medical oncology and hematology, radiation therapy and surgical care at separate, disparate locations. The geographic challenge is one of several straining cancer care in Alaska, including provider shortages, cost barriers and SDOH constraints. Research shows that multidisciplinary, co-located cancer programs improve speed to treatment, quality of care, adherence to clinical guidelines, and patient satisfaction. Coordinated centers also operate more efficiently by reducing duplicative testing, strengthening communication among providers, and centralizing medical records. Most importantly, a cancer center shifts the focus from treating a disease in isolation to caring for the whole person. MSRMC proposes a feasibility study as the first responsible step in evaluating whether and how to develop a hospital-based cancer center in the Mat-Su Borough. Cancer care continues to evolve rapidly, and any long-term investment must be grounded in solid data and a clear understanding of community need. The study will evaluate current and projected demand, review the existing provider landscape, assess which clinical programs can be sustainably supported locally, and analyze facility, equipment, workforce, and technology requirements. It will also include financial modeling to outline capital needs, operating projections, phased development options, and long-term sustainability. Partnership opportunities and strategies to reduce patient outmigration will also be examined as part of the analysis. By the conclusion of the study, leaders will have an implementation roadmap that outlines scope, cost, timeline, and measurable outcomes. This roadmap is expected to provide a practical path forward for strengthening cancer care in the Mat-Su Borough.	\$250K-\$1M	Hospital	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Regional Medical Center	Improve immediate use sterilization capacity for surgeries	AK	The two Amsco immediate use autoclaves are essential for the daily operations of the operating rooms at MSRMC. They serve as a critical backup and specialized sterilization method when standard pre-packaged instrument sets are compromised, or when unique, one-of-a-kind surgical instruments are needed quickly. Specifically, if a sterile, pre-packaged set is accidentally dropped or otherwise contaminated mid-procedure, the contaminated instruments can be rapidly processed through the immediate use autoclave to be safely returned to use with minimal delay to the surgery. Similarly, for highly specialized or expensive instruments that do not have duplicates, this capacity allows for their immediate reprocessing and availability for subsequent cases, maximizing equipment utilization and preventing surgical bottlenecks that would arise if the team had to wait for a full, centralized sterilization cycle.	MSRMC proposes to use RHTP funds to replace its aging sterilization units by procuring two new Amsco 400 series immediate use autoclaves. This will directly resolve the critical capacity issue currently faced by MSRMC. The Amsco 400s are current-generation, high-speed sterilizers known for their reliability, efficiency, and compliance with the latest sterilization standards. By installing these new units, MSRMC will reduce the looming risk of catastrophic failure associated with the existing, near end-of-life machines, thereby increasing continuous immediate use sterilization capacity. This proactive replacement helps the operating rooms maintain optimal throughput, respond quickly to unexpected contamination events, and promptly reprocess specialized surgical instruments—supporting continued access to essential surgical services across the Mat-Su Borough while reducing the risk of delays or cancellations due to equipment failure.	\$50,000-\$250,000	Hospital	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced
Mat-Su Regional Medical Center	Nurse call system replacement	AK	The MSRMC nurse call system is nearing its end of life. The estimated end of life is December 2027. After this time, the current vendor will no longer support the system. Parts will be unavailable and only "best efforts" will be made for repairs. As expected with many systems nearing end of life, MSRMC is already facing challenges with the system. Specifically, aging system hardware is beginning to fail, to include failures of two staff consoles in the past year. The current system hardware is also incompatible with newer technologies implemented by MSRMC, resulting in the inability for the nurse call system to integrate with the hospital's wireless phone system. In addition, calls between patients, physicians and nursing staff are sometimes difficult to hear and are dropped before conversations are complete. These challenges ultimately diminish the quality of care MSRMC is able to provide its patients and adversely impacts nurse, doctor and patient satisfaction. Finally, the current system is not able to work with the modern technologies, including AI, that are essential to improving care delivery for rural, remote and frontier Alaskans at Mat-Su.	MSRMC proposes to use RHTP funds to procure and integrate a new Nurse Call System, such as the leading system offered by Ascom, to replace its current system that is approaching its end of life. MSRMC is currently working to determine an integration timeline that accomodates integration of the nurse call system along with the hospital's wireless phone system, clinical devices, workflows and the EHR for documentation support. We expect that this timeframe will be several months. During this time, MSRMC plans to work collaboratively with the selected vendor to deliver an on-time integration.	\$250K-\$1M	Hospital	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Regional Medical Center	Renovate clinic to make outpatient cardiac imaging department	AK	The Mat-Su Borough currently faces a significant bottleneck in local cardiology healthcare access, primarily driven by substantial waitlists for critical diagnostic tests, particularly cardiac stress tests. This backlog results in delayed diagnoses and postponed treatment initiation for patients with potential cardiac conditions. The existing infrastructure is unable to meet the growing demand for these essential services. MSRMC has identified this capacity gap and will be purchasing an additional nuclear medicine camera and echocardiography machine on its own. However, the clinic currently lacks adequate space to house this equipment. The absence of an integrated and consolidated cardiology imaging suite further exacerbates workflow inefficiencies and limits diagnostic throughput. As a result, patients requiring non-invasive cardiac evaluation are experiencing prolonged wait times or must travel to Anchorage for testing, delaying definitive diagnosis of conditions such as coronary artery disease. In some cases, patients wait weeks for necessary screening, directly impacting the timeliness of intervention. These delays in diagnostic services represent a significant barrier to access and jeopardize the continuity, quality, and effectiveness of advanced cardiac care for residents of the Mat-Su Borough.	This proposal reflects MSRMC's plan to solve the cardiology bottleneck problem by renovating and optimizing existing space at the Mat-Su Heart Clinic into a dedicated cardiology imaging suite. This suite will house the newly purchased diagnostic equipment. This will be accomplished in the following ways: Design and Planning: Assess clinic space, create architectural plans to accommodate the nuclear medicine camera, Echo machine, stress test treadmill, and EKG equipment, optimize patient and technician workflow. Construction and Installation: Renovate the space (including structural, power, and necessary shielding/lead-lining), professionally install and calibrate the nuclear medicine camera, Echo machine, and stress test equipment, and integrate the systems. Operational Launch: Train staff on new workflow and safety protocols, finalize scheduling to maximize use of the two nuclear medicine cameras and Echo machines to reduce the patient backlog, and initiate a phased rollout. This focused approach uses existing MSRMC real estate and equipment, offering a rapid, cost-effective solution to the critical diagnostic bottleneck. RHTP funds will be used to fund the renovation only.	\$250K-\$1M	Hospital	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Senior Services	Palmer Area Senior Meals and Services	AK	This project addresses the critical intersection of food insecurity, social isolation, and mobility limitations among adults aged 60+, aiming to strengthen access to home delivered meals, congregate dining, and reliable transportation. Addressing this issue is urgent due to four key challenges: rising unmet needs and service waitlists, significant transportation barriers, high rates of isolation leading to poor health outcomes, and most importantly the rising cost of food. To combat these challenges, the project focuses on several key opportunities. A "More Than a Meal" (Meals on Wheels America initiative) model will be implemented, which combines nutritious meals containing a balanced diet of fruit, vegetables and protein, and it will include regular safety checks, social engagement, and wellness activities. Additionally, the project will expand upon our door through door services where drivers are trained in Passenger and Sensitivity Safety (PASS) training. PASS trained drivers will not only transport seniors to and from medical and non-medical appointments, but will also accompany them into and out of all structures. Mat-Su Senior Services (MSSS) integrated transportation solutions will bring seniors to a congregate setting five days a week, reducing isolation and fostering community. Finally, the project aims to bridge the gap by utilizing technology and community partnerships to identify at risk, low-income, vulnerable seniors who are not currently receiving services.	Mat-Su Senior Services is prepared to restart the evidence-based More Than a Meal model, a transformative initiative that evolves traditional home-delivered meal programs into a high-impact platform for senior health, safety, and social connectivity. This comprehensive approach leverages daily nutritional visits as a critical touchpoint for wellness checks, effectively combatting social isolation while delivering well-balanced meals designed to improve long-term health outcomes for our community's most vulnerable seniors. To ensure the highest nutritional quality while addressing food insecurity, we will directly recover unsold, high-quality perishable food—including fresh produce, meat, and dairy—from the Palmer Carrs location to prevent waste and immediately redirect nutritious food to local tables. Recognizing that limited mobility serves as a primary barrier to health equity, the program will integrate specialized, “door-through-door” transportation solutions. These services go beyond standard transit by providing the physical assistance necessary to restore senior access to the community center and essential services. To maximize the program's efficacy, the project will specifically target underserved populations by conducting rigorous assessments of nutritional needs, Activities of Daily Living (ADLs), and Instrumental Activities of Daily Living (IADLs). By leveraging existing partnerships with the Food Bank of Alaska and Palmer Safeway (Carrs), both of which helped to offset overhead costs with their food donations, we will rebuild a robust support network that addresses food insecurity and promotes healthy aging in place with dignity.	\$1M-\$5M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Services for Children & Adults, Inc.	Increasing Available ABA Service in the Mat-Su Valley	AK	The Mat-Su Valley currently faces a critical behavioral health infrastructure gap, with families experiencing a 24-month waitlist for essential Applied Behavior Analysis (ABA) services. This delay occurs during crucial developmental windows, forcing families to choose between forgoing care or managing the severe logistical burden of traveling to Anchorage for multi-hour therapy sessions. Our agency has the opportunity to bridge this gap by expanding our established service network. We currently operate both an Infant Learning Program and Home and Community-Based Waiver services. By integrating ABA into this existing framework, we can provide a cohesive, life-course continuum of care that allows children to transition seamlessly between services within their own community. This project transforms the regional care model from one of exported services to a sustainable, local system that directly addresses the health equity challenges of our population.	To address the Applied Behavior Analysis (ABA) service gap in the Mat-Su Valley, our proposed approach focuses on the strategic expansion of our existing infrastructure to create a cohesive, life-course care model. We will utilize RHTP funding to recruit, onboard, and train a specialized team of ABA providers to operate directly within the Mat-Su Valley, effectively reducing the geographic barrier that currently forces families to commute to Anchorage. This local presence is essential for maintaining the treatment consistency required for ABA, ensuring that therapy sessions are not disrupted by weather, road conditions, or the logistical strain of long-distance travel. Our agency is uniquely positioned to bridge the divide between early and adult services, as we currently provide Infant Learning Program (ILP) services for children and Home and Community-Based Waiver services for adults. By introducing ABA as a specialized service line, we complete the continuum of care, allowing for a seamless transition for children graduating from ILP who require continued behavioral support, but are still on the waitlist for their waiver. This integration ensures that the developmental gains made during early childhood are not lost due to service fragmentation.	\$250K-\$1M	Home- and community-based services provider	Single Community	Matanuska-Susitna Borough	Advance to Implementation Application

Mat-Su Services for Children & Adults, Inc.	Behavioral Health Services for Individuals with Intellectual and Developmental Disabilities	AK	Data indicates that 30% to 70% of individuals with IDD also carry a mental health diagnosis. However, traditional BH agencies in Alaska are primarily designed to address trauma and substance use. Consequently, clinical staff across the state are often not equipped with the specialized training required to effectively treat individuals with IDD. This leads to a cycle of crisis: complex mental health behaviors in group homes or family settings go undertreated, often resulting in emergency room visits, out-of-state placements, or a complete breakdown of the home environment.	We will operationalize a continuum of care that embeds behavioral health into every stage of life: Early Intervention & Family Support: We will embed BH services within our Infant Learning Program (ILP), providing immediate family therapy and postpartum depression support to parents of children ages 0-3 that have been identified as having a development delay. Home-Based Family Services (HBFS): For children ages 4–17, our mobile clinical teams provide intensive, in-home behavioral support. This will allow us to address complex mental health behaviors in the child's natural environment, stabilizing the family unit, and preventing the need for more restrictive out-of-home placements. High-Intensity Adult Services: We will launch an IDD-specific Assertive Community Treatment (ACT) Team to support adults experiencing complex mental health behaviors in community or group home settings, alongside Individual Placement and Support (IPS) to integrate mental health care with meaningful employment for individuals with serious mental illness.	\$250K-\$1M	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Mat-Su Services for Children and Adults	Babies Can't Wait	AK	The Mat-Su Services for Children and Adults (MSSCA) serves individuals and families caring for young children from birth through 2-years with developmental delays and disabilities. Mat-Su families face significant barriers to accessing Infant Learning Program (ILP), health, and family services. Alaska has the highest eligibility thresholds in the country for ILP services, limiting access for families with children whose developmental delays are lower than 50%. National data shows that children with 25 – 49% delays also need ILP services for best outcomes and to reach maximum potential. The 2025 Community Health Needs Assessment (CHNA) published by the Mat-Su Health Foundation (MSHF) shows the number of children meeting most goals for kindergarten readiness has been declining in the Mat-Su since 2020. Through Babies Can’t Wait, families whose children do not meet the ILP eligibility criteria but fall within the 25 -49% delay range will be offered services, to include developmental guidance, family coaching, and coordinated resource navigation in home, community, and virtual environments, ensuring reliable, equitable services in all Mat-Su Borough communities. This project will expand targeted support for young children and their caregivers while promoting healthy starts, reducing future risk, and supporting resilient, thriving families in a thoughtful and sustainable manner.	Babies Can’t Wait will use a family centered model that tailors supports to best fit each family’s needs. While this is similar to ILP, services for children with milder delays are expected to have a lower frequency and shorter duration. This program will also have less, more streamlined paperwork and processes. Trained staff will partner with families to identify targets for their children’s development, provide coaching and strategies, track progress, and offer resources and connections to further support them.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Services for Children and Adults	Family Foundations	AK	Mat-Su Services for Children and Adults (MSSCA) supports individuals with developmental and intellectual disabilities and delays and their families and caregivers. The Infant, Child, and Family Supports Department specifically visits families caring for young children throughout the Mat-Su Valley from Chickaloon to Talkeetna/Trapper Creek, and out to Point Mackenzie, as well as the entireties of Wasilla and Palmer. According to the 2025 Community Health Needs Assessment (CHNA) recently published by the Mat-Su Health Foundation (MSHF), only 26% of the Mat-Su’s 8,999 children under six-years-old were served in licensed or approved early childhood education services, public pre-k programs, Head Start or Early Head Start programs, or military early childhood education services. The number of children meeting most goals for kindergarten readiness has been declining in the Mat-Su over the past ten years. Families enrolled in our programs frequently ask for child development training, parenting groups, and playgroup connections. Partner agencies often call to ask when we might be able to fill some of these gaps in supporting families as well. This project addresses these gaps directly by creating a program dedicated to providing ongoing Circle of Security Parenting Groups, community child development training (to cover both general development and special circumstances), and high-quality playgroup opportunities with built in access to child development experts.	Family Foundations will create a part-time position dedicated to organizing and scheduling groups and training events at locations across the Mat-Su Borough. We have current staff with expertise and certification across a variety of child development topics and who are certified facilitators of Circle of Security Parenting. A rotating scheduling system and close work with community partners to vary locations (to include virtual options) will allow more caregivers to access training, parenting groups, and playgroups more frequently.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Services for Children and Adults	Hello BABY Programmatic Build-out	AK	Mat-Su families face difficulties locating and accessing healthcare, mental health care, and specialized services, contributing to high rates of child abuse, neglect, and maltreatment. Challenges include transportation barriers, heating costs, adequate housing, and food insecurity. The 2025 Community Health Needs Assessment (CHNA) published by the Mat-Su Health Foundation (MSHF), shows that 30% of caregiver respondents were unlikely or very unlikely to ask for help childcare for medical appointments or school pick-ups. Hello BABY, a R.O.C.K. Mat-Su initiative designed to strengthen coordination across early childhood and family support systems for pregnant people and families with young children, connects families to information, referrals, and resources while building stronger relationships between community partners to reduce fragmentation in the service system. Hello BABY is piloting a shared data system to track referrals and identify service gaps, deploying a Family Support Fund across the region to provide rapid assistance for basic needs, and developing an information and referral website to improve family access to information and services. Proactive family check-ins and the development of a family- to-family support network also strengthen community connections and prevent crises before they occur. This work, grounded in Early Relational Health (ERH) principles, aims to transform system collaboration to support families with young children.	This project builds on existing infrastructure developed by the Hello BABY team. RHTP support would propel the project from structured collaboration to sustainable systems transformation and program implementation. Key components include: · Assessing, refining, optimizing, and scaling coordinated referral and follow-up systems through shared data infrastructure and cross-sector workflows. · Integrating ERH principles into maternal, pediatric, and community-facing systems through shared training, facilitation, and messaging. · Deploying a prevention-focused framework that supports families before crises emerge. · Contributing to development, launch and oversight of a dedicated Hello BABY website or webpage to include learning materials, information on resources, and methods for contacting the Hello BABY team. · Participation in guiding the initiative alongside the Steering Committee comprised of balanced representation from early childhood and community systems, families and family leaders, and health systems/child health champions. · Building a long-term sustainability strategy that blends philanthropic, community, and public investment.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Mat-Su Services for Children and Adults	ILP Integrated EHR System	AK	Mat-Su Services for Children and Adults (MSSCA) Infant Learning Program (ILP) serves families caring for children from birth through 2-years. Child records are kept in physical charts with many documents scanned and saved in an agency Shared Drive system. Information is entered into a State ILP database as well as the Medicaid billing system. Multiple reviews and duplicative data entry happens daily to ensure that records match between the multiple spaces and across the multiple media in which they are stored. We have been engaging in discussion sessions with other ILP programs across Alaska to explore adoption of an integrated Electronic Health Record (EHR) platform designed specifically for ILP that we could all use in partnership. There are systems used in other states which allow programs to collect data, interface with the state database and other ILP providers, produce forms, complete casework, template reports, report for oversight, bill public and private insurance, and transfer across the State smoothly when a family moves.	MSSCA ILP’s proposed approach leans into partnerships with other ILP agencies across Alaska to put as many of us as possible onto a complete EHR platform designed specifically for the nuances of Early Intervention work, including reporting and billing requirements. A key piece of the approach is for agencies to explore and evaluate platforms together, discussing the ways in which they could support or hinder work in each region and across the state as a collective. The EHR platform chosen as a best fit for Alaska will be implemented by MSSCA ILP and we will serve as a pilot, along with other willing ILP agencies, to work out systematic glitches and as a liaison for other agencies interested in implementing the platform next. Implementation will be phased in with newly enrolled children and families being the first to enter the system. We will expand the number of children and families within the system each month until the full program is held within the EHR.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

Maxim Healthcare	Expanding Alaska's Workforce through the Novice Nurse Program	AK	Maxim's Novice Nurse Program will allow us to train, hire and assign nurses to provide patient care who have less than one year of experience in rural Alaska. Today, home health agencies in Alaska are challenged by regulatory barriers that prevent the hiring and placement of nurses with less than one year of experience (7 AK Admin Code 12.650). The mission of the Novice Nurse Program is to better facilitate and support Novice Nurses by developing critical thinking skills, increasing nursing knowledge, and providing quality care to patients and their families in the home setting. It is a particularly important intervention for serving rural populations. The Novice Nurse Program addresses the policy dilemma of meeting federal program mandates affected by the shortage of trained skilled nurses in our community, while providing meaningful, structured employment to new nurses.	Maxim Healthcare is committed to collaborative, holistic training and support of our Novice Nurse population. Our experienced clinical team works in collaboration with operational, scheduling, and credentialing teams to facilitate successful completion of the Novice Nurse program. Maxim's Clinical Team is responsible for the following tasks under the Novice Nurse Program: • Collaboration with academic, vocational and community-based partners to support our Novice Nurse Program • Assistance with recruitment and hiring, and job placement of Novice Nurses • Maintenance of a comprehensive in-office skills lab to facilitate hands on training and competency of our Novice Nurses • Developing individualized training plans through initial needs and knowledge assessments with on-going monitoring and evaluation • Facilitating Maxim's Tracheostomy Management, Ventilator Management, and Pediatric Skills Advancement programs to support the advanced training needs of the novice nurse population • Performing final quality assurance and assessment audits of required competencies prior to independent nurse placement in patient homes Recruitment To recruit a cohort of rural-based Novice Nurses, Maxim Healthcare will conduct outreach with: schools of nursing, onsite job fairs, posters and other marketing materials, an unemployment office partnership, job board advertisement and email blasts. We will work with the Rural Alaska Community Action Program (RurAL CAP), Alaska Area Health Education Centers Program (Alaska AHEC), Alaska Center for Rural Health and Health Workforce (ACRH-HW), and the Alaska Native Health Board (ANHB). Our target training population consists of local Centrus-employed RNs and LPNs who are interested in learning new homecare patient care skills to include. All trainees/participants must be a RN or LPN license in good standing. RNs and LPNs will be focused on expanding their capability to fill nurse shifts and referrals to address critical healthcare workforce shortages for current patients, as well as becoming an RN/LPN for a dedicated patient at home. Readiness Maxim Healthcare currently operates the Novice Nurse program in a dozen states, including in Alaska. Dedicated funding allows us to scale our expertise and training program and robustly recruit caregivers in rural areas.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Ketchikan Gateway Borough; Matanuska-Susitna Borough; Sitka (City and Borough)	Deferred or Not Advanced

Maxim Healthcare	Travel Nurse to Permanent Alaskan: Expanding the Alaska Nursing Workforce	AK	Rural Alaska continues to face a persistent shortage of long-term, community-based healthcare providers, especially in home-based and person-centered care. Many communities rely heavily on travel nurses, which creates high turnover, inconsistent continuity of care, and significant financial strain on the system. At the same time, a subset of travel nurses are actively seeking meaningful, place-based work and are open to relocation when supported effectively. This project creates an opportunity to convert interested travel nurses into permanent Alaska residents by offering targeted recruitment, relocation incentives, seasonal support, and community integration. By pairing new residents with local welcome committees and providing structured bonuses for moving and winter retention, the project aims to build a stable, committed workforce that strengthens care quality, reduces reliance on temporary staffing, and supports the long-term vitality of rural communities. Currently, travel nurses make up 20 percent of Maxim Healthcare's overall nursing hours.	The proposed approach focuses on converting travel nurses into long-term residents who can provide stable, relationship-based care in rural Alaska. The strategy begins with targeted recruitment of nurses already interested in home-based, person-centered care and open to practicing in remote environments. By emphasizing the meaningful impact of rural nursing, the opportunity for deeper community relationships, and the unique lifestyle Alaska offers, the project aims to attract candidates motivated by purpose as well as professional opportunity. Recruitment will prioritize nurses with prior Alaska experience, backgrounds in similar rural settings, or a desire for continuity of care rather than short-term assignments. Once candidates are identified, the project offers a structured incentive package to reduce relocation barriers and support long-term retention. Moving bonuses will offset the financial burden of relocating, while winter bonuses acknowledge the challenges of the first year and encourage nurses to remain through the most difficult season. Incentives will be tied to milestones—such as six-month, one-year, and two-year commitments—to reinforce stability and help nurses build roots in their new communities. These incentives are designed as part of a broader strategy to make permanent relocation both feasible and appealing. A key component of the approach is intentional community integration. Each relocating nurse will be paired with a local welcome committee made up of community members, elders, and healthcare staff. This committee will provide practical support, such as help navigating housing, transportation, and local resources, as well as social and cultural connection. By introducing nurses to community events, traditions, and networks, the welcome committee helps reduce isolation and fosters a sense of belonging, increasing the likelihood that nurses will remain long term. To ensure nurses feel confident and supported in their new roles, the project includes a structured onboarding process tailored to rural practice. This includes training in home-based care protocols, safety considerations for remote environments, and culturally responsive care. Mentorship from experienced Alaska-based clinicians will provide ongoing guidance, while professional development opportunities will reinforce skills and strengthen long-term engagement. Together, these supports help nurses feel prepared, valued, and connected to their work.	\$50,000-\$250,000	Home- and community-based services provider	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Matanuska-Susitna Borough; Sitka (City and Borough)	Deferred or Not Advanced

McCarthy Emergency Services	Frontier Clinic Completion: Primary Care Access for McCarthy-Kennecott, Alaska	AK	The population of our remote community and medical needs are steadily rising, but our healthcare infrastructure has not kept pace. The closest advanced life support provider and primary care clinic is four hours away. The nearest hospital is six hours away. In 2025, our volunteers responded to 27 emergency calls and coordinated 6 air evacuations. Each flight costs \$35,000 - \$60,000. Many of these responses could have been prevented with earlier access to primary care. U.S. Census data shows our population increased 155% from 2000 to 2020. Peak seasonal population exceeds 1000, driven by visitation to Wrangell-St. Elias National Park and Preserve. Park visitation increased from 65,236 in 2022 to 81,635 in 2024. In 2022, McCarthy Emergency Services completed construction of a medical services building, the first healthcare facility in our community since 1938. The building is active, operational, and stages our ambulance. It hosts community meetings and events that generate rental income supporting our operating budget. However, its clinic space remains unfinished. This LOI requests RHTP support to complete and equip this space, enabling a frontier clinic that reduces delayed care, avoidable evacuations, and system costs. The building exists. The community need is acute and documented. What is missing is the final investment to make it real.	We're implementing a rural healthcare delivery model that integrates EMS, primary care, and telehealth. McCarthy-Kennecott sits at a rare convergence of readiness and need. A committed physician partner has been identified and helped design the clinic space to meet clinical and patient stabilization requirements. Our volunteer general contractor, a licensed professional and board member who oversaw original construction, is ready to lead the fit-out. Our organization is experienced, financially disciplined, and trusted by the community we serve. This project funds the interior medical fit-out of the existing north clinic wing of our medical services building. The building envelope is structurally complete. No new construction is required. Scope of work includes: interior insulation and drywall, flooring, medical-grade electrical and lighting, plumbing fixtures and connections, examination room cabinetry, telehealth infrastructure and connectivity infrastructure, and diagnostic equipment. We anticipate interior fit-out completion and expenditure of all first year funding before October 1st 2027. Initial clinic operations are planned for spring 2028. Our identified physician partner, who collaborated on the design of this space, has expressed intent to provide scheduled clinic days upon completion. A formal letter of intent is in progress and will accompany the full application. The clinic will operate on a rotating provider model supported by telehealth, enabling both in-person and remote care. EMS responders will coordinate with providers to stabilize patients, creating a continuum of care not currently available in the region. As facility landlord, McCarthy Emergency Services will charge cost-covering fees for clinic use, which will also support EMS operations, creating a financially sustainable operating model. Workforce capacity will be expanded through visiting providers participating in short-term service, sabbatical, or volunteer placements. This model addresses provider burnout while expanding access, a replicable approach for similarly isolated communities.	\$250K-\$1M	Home- and communit y-based services provider	Multi- Community or Participating in Regional Hub-and- Spoke	Copper River Census Area	Advance to Implementati on Application
McKinley Imaging LLC	Digital X-Ray System Upgrade for Rural Diagnostic Access	AK	The current X-ray system is aging and lacks the capabilities of modern digital radiography technology. This limits the quality of imaging and the range of exams we can provide. Upgrading the system will improve diagnostic accuracy and expand imaging services available to rural patients who otherwise may need to travel to Anchorage or other distant facilities.	Grant funds will be used to purchase and install a new digital radiography (DR) X-ray system with upgraded imaging software and detectors. The system will integrate with our existing imaging workflow and PACS environment. Vendors have already been identified, allowing for rapid procurement, installation, and staff training.	\$50,000- \$250,000	Clinic	Multi- Community or Participating in Regional Hub-and- Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

McKinley Imaging LLC	MRI Upgrade to Improve Advanced Diagnostic Access for Interior Alaska	AK	The current MRI system at McKinley Imaging Center is an older 1.5T unit with limitations in patient comfort, scan speed, and advanced imaging capabilities. These limitations reduce throughput and restrict our ability to perform newer imaging protocols that are becoming standard in many parts of the country. Patients from rural Alaska often must travel long distances or wait extended periods for advanced imaging exams. There is an opportunity to improve diagnostic access in Interior Alaska by upgrading to a modern wide-bore MRI platform with advanced software and hardware capabilities.	McKinley Imaging Center will upgrade its existing MRI system to a wide-bore 1.5T MRI platform with updated hardware and advanced imaging software. The upgrade will include improved gradient performance, faster imaging sequences, and expanded exam capabilities. The project will include: Replacement or upgrade of the current MRI system to a wide-bore platform, Installation of upgraded imaging software and advanced diagnostic protocols, Hardware improvements to allow faster scan times and higher image quality, Staff training to implement new imaging capabilities The upgraded MRI system will allow us to provide more detailed diagnostic imaging, faster exam times, and additional specialized exams not currently available locally.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Fairbanks North Star Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced
McKinley Orthopedic and Sports Medicine	McKinley Orthopedic Patient Safety Project	AK	McKinley Orthopedic and Sports Medicine provide orthopedic and musculoskeletal care for patients across Fairbanks, North Pole, and many rural and frontier communities throughout Interior Alaska. A key component of our non-operative treatment approach is Osteopathic Manipulative Treatment (OMT), which helps reduce pain, restore mobility, and return patients to full function without surgery. However, our current treatment tables limit our ability to provide care to a growing portion of our patient population. The existing tables only support between 200–250 pounds, which does not safely accommodate many patients in our community. In addition, the lack of electronically adjustable tables makes it difficult for patients with limited mobility or disabilities to safely access treatment surfaces. These equipment limitations also contribute to inefficiencies in clinic workflow and have resulted in a backlog of more than 90 days for OMT appointments. This project presents an opportunity to improve accessibility, expand the clinic’s ability to treat patients of all body types and mobility levels, and increase the efficiency of delivering essential non-operative orthopedic care to patients across Interior Alaska.	To address these challenges, McKinley Orthopedic and Sports Medicine, proposes to improve both facility accessibility and clinical equipment used to deliver Osteopathic Manipulative Treatment (OMT). The project will include upgrades to the clinic’s building to enhance handicap accessibility and the purchase of modern OMT treatment tables designed to better accommodate a broader range of patients. The new OMT tables will have a significantly higher weight capacity than the clinic’s current tables and will include electronic height adjustment features. These improvements will allow providers to safely treat patients who exceed the weight limits of the current equipment and make it easier for patients with limited mobility to safely access treatment surfaces. The electronic adjustment capability will also improve provider ergonomics and workflow efficiency during treatment. By improving both accessibility and treatment equipment, the clinic will be able to expand its ability to provide OMT services, increase patient throughput, and reduce the current backlog of patients waiting for care. This approach will allow the clinic to deliver more timely non-operative musculoskeletal care while improving safety and comfort for patients across Fairbanks, North Pole, and surrounding rural Interior Alaska communities	Under \$50,000	Clinic	Statewide	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

McKinley Orthopedic and Sports Medicine	McKinley Orthopedic X-Ray Enhancement	AK	McKinley Orthopedic and Sports Medicine currently utilize an aging X-ray system that limits our ability to efficiently evaluate certain orthopedic patients. The existing equipment struggles to adequately image larger patients and does not reliably produce full-length radiographs required for lower extremity alignment studies and spine evaluations. These limitations reduce diagnostic efficiency and can delay treatment planning for patients requiring orthopedic care. In addition, limited imaging availability within the clinic creates workflow bottlenecks that restrict patient throughput and access to timely evaluation. These challenges are particularly impactful for patients undergoing joint replacement procedures, where accurate imaging is essential for preoperative templating and the development of patient-specific surgical guides. Upgrading the X-ray system presents an opportunity to improve imaging capability, reduce radiation exposure, enhance diagnostic accuracy, and expand access to timely orthopedic care for patients in Fairbanks, North Pole, and surrounding rural Interior Alaska communities. New X-Rays technicians also struggle with the older system. As we move into a new generation of employees an updated machine is essential based on their training in machines that now do a lot of the exposures and set up automatically.	To address these challenges, McKinley Orthopedic and Sports Medicine proposes to upgrade its current X-ray system to a modern digital radiography platform capable of producing high-quality images across a wider range of patient sizes and imaging needs. The upgraded system will allow the clinic to reliably obtain full-length radiographs required for lower extremity alignment studies and scoliosis studies and improve imaging resolution for larger patients. The new imaging system will provide enhanced image clarity while reducing radiation exposure for patients. It will also increase imaging efficiency and capacity within the clinic, allowing providers to obtain necessary diagnostic imaging more quickly during patient visits. This will reduce workflow bottlenecks and improve the ability to evaluate and treat orthopedic patients in a timely manner. Improved imaging capabilities will also support more accurate preoperative planning for joint replacement procedures. Enhanced full-length imaging will allow surgeons to better template implants and develop patient-specific surgical guides, improving surgical precision and patient outcomes. Through this equipment upgrade, the clinic will strengthen its ability to deliver high-quality orthopedic care to patients in Fairbanks, North Pole, and surrounding rural Interior Alaska communities.	\$50,000-\$250,000	Clinic	Statewide	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

McKinley Sports Medicine, LLC	McKinley Sports Medicine Concussion Awareness	AK	McKinley Sports Medicine provides care for student athletes throughout the Fairbanks region. The clinic currently works with six athletic trainers who provide coverage for local high schools and athletes at University of Alaska Fairbanks. These trainers frequently serve as the first point of contact for sports-related injuries, including concussions. As awareness of concussion risks has increased, the management of these injuries has become more complex. Return-to-learn and return-to-play protocols now require careful monitoring, repeated follow-up, and coordination with schools, families, and healthcare providers. Staffing limits the clinic’s ability to provide the level of follow-up needed to appropriately monitor these athletes during recovery. Unfortunately, many athletes don’t get the follow up they need because of lack of resources. Evaluating concussions is time consuming and requires a high level of patient and parent education that does not reimburse well. This challenge is amplified by the geographic realities of Alaska. Fairbanks teams regularly compete with schools from rural and frontier communities where access to specialized concussion care may be limited. As a result, student athletes from across the region may experience delays in evaluation, monitoring, and clearance to safely return to school and sports. This project presents an opportunity to expand concussion care capacity and improve support for athletic trainers managing these injuries at schools.	To address these challenges, McKinley Sports Medicine proposes to add a dedicated concussion specialist to support the clinic’s sports medicine program and its network of athletic trainers serving local schools. This position would likely be filled by a mid-level provider or an additional athletic trainer with specialized training in concussion management. The concussion specialist would work closely with the six athletic trainers currently providing coverage for local high schools and athletes throughout the community. Their role would include evaluating athletes following suspected concussions, providing ongoing symptom monitoring, coordinating return-to-learn and return-to-play protocols, and ensuring appropriate follow-up care throughout recovery. Too many patients now are injured on the field and lost to follow up because there is not enough support in the community. This additional clinical support would allow injured athletes to receive more timely evaluations and consistent monitoring after injury. It would also provide athletic trainers with direct medical support when managing concussions in the field. By expanding staffing capacity focused specifically on concussion management, the clinic will improve care coordination, reduce delays in follow-up, and provide safer return-to-play guidance for student athletes throughout Fairbanks and surrounding rural communities.	\$50,000-\$250,000	Clinic	Statewide	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

McKinley Sports Medicine, LLC	McKinley Sports Medicine Trainer Support Program	AK	McKinley Sports Medicine provides sports medicine coverage and athletic training support for student athletes participating in Fairbanks North Star Borough School District athletics. Our team regularly provides medical coverage for practices and sporting events; however, many of the school training rooms currently lack adequate medical supplies and equipment to properly support injury evaluation and management. Essential items such as athletic tape, braces, crutches, and automated external defibrillators (AEDs) are limited or outdated in several training rooms. Without consistent access to these supplies, athletic trainers may face challenges providing immediate care for injured athletes during practices and competitions. This project presents an opportunity to strengthen the medical readiness of school athletic programs by equipping training rooms with the supplies and equipment necessary to properly evaluate and stabilize injuries. Improving these resources will allow athletic trainers and medical providers to deliver safer, more effective care for student athletes participating in sports throughout the Fairbanks area and for visiting teams traveling from rural and remote communities across Alaska.	To address these challenges, McKinley Sports Medicine proposes to expand and standardize the medical supplies and equipment available in athletic training rooms across schools within the Fairbanks North Star Borough School District. The project will focus on ensuring that each school’s training room is equipped with the essential tools necessary for athletic trainers and medical providers to properly evaluate and manage injuries during practices and competitions. Grant funding will be used to purchase and distribute key medical supplies and equipment such as athletic tape, braces, crutches, and automated external defibrillators (AEDs). These items will allow athletic trainers to stabilize injuries, support injured athletes, and respond quickly to medical emergencies when they occur on the field or in the training room. By improving the availability and consistency of medical supplies across schools, this project will strengthen the ability of athletic trainers and sports medicine providers to deliver immediate, high-quality care for student athletes. This approach will improve safety during athletic participation and ensure that both local and visiting athletes receive appropriate injury management when competing in Fairbanks.	Under \$50,000	Clinic	Statewide	Anchorage (Municipality); Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

McKinley Surgery Center, LLC	McKinley EHR Upgrade	AK	McKinley Surgery Center currently relies on a paper-based charting system to document patient care and manage surgical workflows. While this system has supported operations to date, it limits efficiency, makes coordination with referring providers more challenging, and does not fully support modern healthcare data management standards. As the surgery center continues to serve patients from Fairbanks and surrounding rural and frontier communities across Interior Alaska, the limitations of paper records create challenges in communication, documentation, and timely access to patient information. These inefficiencies can slow administrative processes and make it more difficult to coordinate care with referring clinics that often serve patients traveling long distances for surgical treatment. This project represents an opportunity to modernize the center’s clinical infrastructure by implementing an electronic medical record (EMR) system. Transitioning to an EMR will improve documentation, streamline workflows, enhance communication with referring providers, and support more efficient delivery of surgical care for patients throughout the region.	To address these challenges, McKinley Surgery Center proposes to transition from its current paper-based charting system to a comprehensive electronic medical record (EMR) platform designed to support ambulatory surgical care. The project will involve selecting and implementing an EMR system that integrates patient documentation, scheduling, clinical workflows, and communication with referring providers. The implementation process will include evaluating EMR vendors, selecting a system that meets the operational needs of the surgery center, and completing system installation and configuration. Staff and providers will receive training to ensure the system is integrated smoothly into daily clinical workflows. Once implemented, the EMR will allow providers and staff to access patient information more efficiently, improve documentation accuracy, and streamline coordination with referring clinics and providers. This transition will modernize the surgery center’s clinical infrastructure and support more efficient delivery of surgical care for patients traveling from Fairbanks and surrounding rural communities across Interior Alaska.	Under \$50,000	Specialist	Statewide	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

McKinley Surgery Center, LLC	McKinley Precision Surgical Capacity Expansion	AK	Since receiving ambulatory surgery center license on 10/25/2023, Mckinley Surgery Center (MSC) has continued to increase its volume every quarter since its inception. McKinley is the only interior surgery center dedicated to only orthopedics and spine patients. This dedication enables us to be more efficiency and reduce cost and complications. We consider our team the best at this specialized surgery because it is all that they do. Entering 2026 the number of operating rooms will be the limiting factor in providing patient care. We have started to see wait time for elective surgeries reach 90 days and the necessity of canceling elective surgeries for more urgent cases. All of these restraints would be mitigated by an additional operating room. Expanding McKinley Surgery Center from one operating room to two operating rooms will address this limitation by increasing surgical capacity and improving scheduling flexibility. This project will allow the center to treat more patients in a timely manner, reduce wait times for procedures, and better accommodate patients traveling from rural and frontier areas of Alaska who often face significant logistical and financial barriers to accessing care. By increasing surgical capacity within a high quality outpatient surgery center, the project represents an opportunity to improve access to cost effective specialty care while strengthening the regional health care system serving Interior Alaska.	Just over three years McKinly Surgery Center was founded. Within a year time frame, we were able to have a fully functional operating room. McKinley Surgery Center will address current surgical capacity limitations by expanding from one operating room to two fully functional operating rooms. We will use a similar plan to the creation of the surgery center expanding the footprint to include an additional operating room. This expansion will increase the number of procedures that can be performed each day and provide greater flexibility in scheduling patients, particularly those traveling from rural and frontier communities throughout Interior Alaska. The project will involve the build out and equipping of a second operating room, including surgical equipment, anesthesia capabilities, and necessary support infrastructure. Once operational, the additional operating room will allow surgical teams to perform procedures more efficiently while reducing delays caused by limited operating room availability. By increasing surgical capacity, McKinley Surgery Center will be able to accommodate more orthopedic and spine cases, reduce patient wait times, and improve access for patients who travel long distances for specialty surgical care. The additional operating room will also allow the center to better coordinate surgical schedules for visiting surgeons and patients arriving from remote communities who often face significant travel and lodging challenges. For example, we currently host the Shriners Hospital surgeons from Spokane, Washington. Their presence he enables complex pediatric cases to be done in Fairbanks. In the past these patients were travelling to Portland Oregon for care. Their outreach touches rural children throughout Alaska and giving them more surgical time and rooms would extend that outreach. This is just one of many patient populations that would benefit if this grant were awarded. This expansion will strengthen the ability of McKinley Surgery Center to provide timely, high quality outpatient surgical care while improving access for rural and frontier patients who rely on Interior Alaska’s limited specialty surgical resources.	\$1M-\$5M	Specialist	Statewide	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

McKinley Surgery Center, LLC	McKinley Surgery Center Enhancement	AK	McKinley Surgery Center serves patients from Interior Alaska and surrounding rural and frontier communities where access to specialty orthopedic and spine surgical care is limited. To maintain safe, efficient, and high quality surgical services for these patients, it is critical that operating room equipment and sterilization infrastructure remain modern, reliable, and capable of supporting current surgical standards. Some of the center’s existing equipment including arthroscopy systems, operating room beds, patient stretchers, and components of the sterilization area are aging and due for replacement or upgrade. Outdated equipment can reduce efficiency in the operating room, increase procedure times, and place additional strain on staff and clinical workflows. In rural regions where surgical resources are limited, maintaining dependable equipment is essential to ensure patients can receive timely care without delays or cancellations. This project presents an opportunity to upgrade key operating room and sterilization infrastructure to improve efficiency, support modern minimally invasive orthopedic procedures, and maintain the high standards of safety and quality required for outpatient surgical care. These improvements will help ensure that McKinley Surgery Center can continue serving patients from rural and frontier communities with reliable, high quality surgical services close to home.	McKinley Surgery Center will address the need for updated clinical infrastructure by upgrading key operating room and sterilization equipment that supports safe and efficient surgical care. The project will focus on replacing aging arthroscopy equipment, upgrading the operating room bed and patient stretchers, and improving the functionality and efficiency of the sterilization room. New arthroscopy equipment will enhance visualization and precision during minimally invasive orthopedic procedures, allowing surgeons to perform procedures more efficiently and with improved clinical outcomes. Upgraded operating room beds and patient stretchers will improve patient safety, support proper positioning during surgery, and allow for smoother patient movement throughout the surgical process. In addition, improvements to the sterilization room will strengthen the center’s ability to properly clean, process, and sterilize surgical instruments in a timely and reliable manner. Enhanced sterilization capacity will help ensure consistent infection prevention practices while supporting efficient surgical case turnover. By modernizing these critical components of the surgical environment, McKinley Surgery Center will improve the quality, safety, and efficiency of outpatient surgical care. These upgrades will allow the center to continue providing reliable orthopedic and spine surgical services for patients traveling from rural and frontier communities across Interior Alaska.	\$250K-\$1M	Specialist	Statewide	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

McKinley Surgery Center, LLC	Spine Surgery Enhancement	AK	Patients in Alaska who require spine surgery often face limited access to advanced minimally invasive surgical options within the state. Many procedures are still performed using traditional open or larger-incision techniques, which can lead to longer recovery times, greater postoperative pain, and increased time away from home for patients who travel from rural and frontier communities for care. McKinley Surgery Center has the opportunity to expand spine care services by introducing arthroscopic spine surgery techniques. Arthroscopic spine procedures use specialized instruments and small incisions to treat certain spinal conditions in a minimally invasive manner. This approach can reduce surgical risk, shorten recovery time, and allow patients to return to normal activity more quickly. Expanding access to arthroscopic spine surgery would represent a significant advancement in spine care for Alaskans. By offering these procedures locally, the project will provide patients with access to state-of-the-art surgical options within Alaska and reduce the need for patients to travel outside the state to receive advanced spine treatment.	To address this opportunity, McKinley Surgery Center proposes to expand its surgical capabilities to support arthroscopic spine procedures. This will involve acquiring specialized surgical equipment and technology required to perform minimally invasive endoscopic and arthroscopic spine surgeries. The project will include procurement of advanced visualization systems, specialized surgical instruments, and supporting technology designed specifically for arthroscopic spine procedures. In addition, surgical staff and operating room personnel will receive training to ensure the equipment is integrated effectively into existing surgical workflows and patient care protocols. By equipping the surgery center with the technology necessary to perform arthroscopic spine procedures, the facility will be able to offer patients a minimally invasive alternative to traditional spine surgery. This approach will allow the surgical team to treat appropriate spine conditions with smaller incisions, reduced tissue disruption, and faster recovery times, expanding access to advanced spine care for patients across Fairbanks and rural communities throughout Alaska.	\$250K-\$1M	Specialist	Statewide	Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Kusilvak Census Area; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced
MD, Inc dba Alaska Premier Health	Optimization of Metabolic and Preventive Medical Care delivery via technology and AI innovation	AK	Our clinic has served Alaskans for over 34 years. We have seen and experienced the benefits and results of individualized, patient focused, realistic, and flexible preventive care. We have seen repeatedly how individuals (and their families and coworkers) sieze the fundamentals of healthy living through medical oversight and coaching. Multiple health issues are improved and patients learn to take personal responsibilty for their health vs being a "patient for life." They become happier, more productive and significantly healthier. Because we are medical providers with intensive training in nutrition, physical activity and primary care, we can address the person as a whole, providing them a pathway to reduction of chronic disease.	Our entire staff will have access and training in the most current and evidence-based science regarding nutrition and chronic disease management and, where possible, reversal of chronic disease. Staff will become certified and participate in ongoing training so that we can stay on the leading edge of Metabolic Health care delivery. Our EHR will be upgraded to engage the power of AI in the development of programs and impactful quality improvement measures. Additional AI capacities will help us administer performance driven outcomes that will allow patient feedback and support in real time. As a result, our clinic will have capacity to hire more practitioners who can focus on specific patient groups (children, disabled, etc.).	\$1M-\$5M	Clinic	Statewide	Anchorage (Municipality); Chugach Census Area; Fairbanks North Star Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; North Slope Borough	Deferred or Not Advanced

Me-2-We, Inc	Day Courts+ Active Aging Program	AK	Project Concept Opportunity The Mat-Su Valley’s senior population is growing rapidly, yet many older adults have limited access to regular opportunities for movement, structured physical activity, and meaningful social connection. In rural communities such as Big Lake, Houston, and Sutton, limited local programming and long winter seasons often restrict seniors’ ability to stay active and engaged. As a result, many older adults spend extended periods isolated at home with few opportunities to participate in safe, guided physical activity or community-based programs. This lack of accessible programming contributes to significant health risks. Reduced physical activity can lead to declining mobility, loss of strength and balance, and an increased risk of falls and chronic health conditions. Social isolation and limited community engagement can also negatively affect mental health, contributing to loneliness, depression, and anxiety. In addition, prolonged isolation and inactivity can accelerate cognitive decline, increasing the risk of memory loss and conditions such as dementia. Without accessible spaces that encourage both movement and connection, these challenges can compound over time, reducing independence and overall quality of life. The Valley’s growing senior population highlights the urgent need for welcoming, community-based programs that support physical activity, cognitive health, and social connection for older adults.	Project Concept Approach Me-2-We’s Day Court+ Active Aging Program will address senior isolation and declining physical health by providing structured, guided daytime programming in a safe and welcoming environment. The program will include low-impact group exercise, strength and balance training, guided fitness classes, indoor track walking, and pickleball, along with light recreational activities and intentional social engagement opportunities designed specifically for older adults. These activities encourage participants to remain active while building meaningful connections with others in their community. All activities will be guided to ensure safety, proper movement mechanics, and accessibility for varying ability levels. Programming will be adaptable so that participants with different mobility levels can participate comfortably and confidently. Participants will be encouraged to progress at their own pace, gradually building strength, balance, coordination, and endurance over time. As these skills develop, seniors gain greater confidence in their ability to move safely in their daily lives, whether walking longer distances, navigating uneven terrain, carrying groceries, or participating in other community activities. Regular movement and social engagement will also support cognitive health. Physical activity, mental stimulation, and social interaction are important factors in maintaining brain health and may help slow cognitive decline associated with aging and conditions such as dementia. By offering consistent scheduling and affordable participation options, the program reduces common barriers faced by rural seniors. Outreach efforts, including community partnerships and text-based communication, will help increase awareness and encourage consistent participation. Through regular guided activity, social connection, and access to pickleball, indoor track use, and senior-focused classes, Day Court+ will promote mobility, improve balance and strength, reduce fall risk, and support chronic disease prevention. As participants build and maintain these physical skills, they are better able to apply them in everyday life, supporting independence, confidence, and overall well-being. By creating a reliable and welcoming place for seniors to gather and stay active, the program will help older adults lead richer, more connected lives across the Mat-Su Valley.	\$250K-\$1M	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Me-2-We, Inc	Night Courts+	AK	The Mat-Su Valley is a rapidly growing rural region with limited community-based wellness infrastructure and increasing strain on behavioral health and primary care systems. Youth and families face reduced access to affordable, structured recreation — particularly during late-night and weekend hours when risk for substance use, violence, isolation, and other harmful behaviors increases. The region lacks a YMCA and recently lost its Boys & Girls Club presence, leaving a significant gap in preventive, supervised youth engagement. At the same time, rural healthcare providers continue to experience high demand for services related to preventable behavioral health crises and chronic disease risk factors such as physical inactivity and obesity. Night Courts+ addresses this gap by expanding structured, supervised physical activity during high-risk hours. Sunday Family Courts access reduces financial barriers for families. This project represents an opportunity to strengthen upstream prevention, increase protective factors for youth, promote family wellness, and reduce avoidable strain on limited healthcare infrastructure.	Me-2-We will implement a dual prevention model: 1) Late-night youth engagement (weekly, 9:00 p.m.–midnight) with structured supervision, clear conduct standards, and trained adult mentors. 2) Sunday Family Courts providing no-cost facility access to entire households. Night Courts+ operates weekly from 9:00 p.m. to midnight, providing supervised, structured physical activity during hours associated with increased youth risk behavior. Trained adult supervisors and volunteer mentors ensure a safe, substance-free environment while building protective factors such as belonging, accountability, and positive peer interaction. The program includes access to basketball/volleyball/pickleball courts, weight training areas, cardio equipment, indoor track use, and turf training spaces, promoting strength, cardiovascular health, and healthy lifestyle habits. To further reduce barriers to preventive wellness, the project will add Sunday Family Courts (4:00–7:00 p.m.), allowing families to access the facility at no cost. This component increases whole-household participation in physical activity, strengthens family cohesion, and expands equitable access to health-promoting resources in the Mat-Su Valley. The approach focuses on upstream prevention by increasing protective factors and physical activity before behavioral or chronic health issues require clinical intervention. By operating during high-risk hours and removing financial barriers, Night Courts+ strengthens the rural health ecosystem and supports long-term sustainability of limited healthcare resources in the Mat-Su Valley.	\$250K-\$1M	Single Community	Matanuska-Susitna Borough	Deferred or Not Advanced

Me-2-We, Inc	Wellness Facility Acquisition	AK	The Mat-Su Valley is one of the fastest growing regions in Alaska yet lacks sufficient indoor recreation and wellness infrastructure to support community health. The region has no YMCA and has lost other youth-centered recreation resources such as the Boys & Girls Club. As a result, there are limited year-round facilities that provide accessible opportunities for physical activity, youth engagement, and preventive health programming. Grizzly Family Fitness is one of the largest indoor recreation and wellness facilities in Alaska and serves thousands of residents each year through fitness memberships, youth sports, and community programming. However, as a privately owned facility, its long-term role as a community wellness resource is not guaranteed as there's great potential for it to be sold as warehouse space or other business ventures. Me-2-We plans to enter into a five-year lease with an option to purchase the Grizzly Family Fitness facility for \$10,000,000, transitioning the property into nonprofit ownership and establishing it as a permanent community wellness hub. The building is valued at approximately \$18,000,000. Nonprofit ownership would eliminate mortgage and property tax obligations, allowing roughly \$500,000 annually to be reinvested into expanded wellness and youth programming and strengthening long-term access to preventive health resources for Mat-Su residents.	Me-2-We proposes to address this problem by transitioning Grizzly Family Fitness from private ownership into a nonprofit community wellness hub that expands access to preventive health and recreation programming in the Mat-Su Valley. Under the proposed approach, Me-2-We will enter into a five-year lease agreement with an option to purchase the facility for \$10,000,000. During the lease period, the facility will continue operating as a full-service fitness and recreation center while gradually expanding nonprofit programming and community partnerships. This structure allows the facility to maintain financial stability while transitioning toward long-term nonprofit ownership. The facility will serve as a central hub for community wellness by providing year-round access to indoor recreation, fitness facilities, youth sports, and health-promoting activities. Existing amenities—including 5 full-sized basketball courts, indoor running track, strength and cardio equipment, and training space—provide immediate capacity to expand preventive health and youth-focused programming. Me-2-We will expand programming to include: additional senior programming, low-moderate income persons, mental health, and youth/teen activities. Nonprofit ownership will also allow Me-2-We to expand partnerships with schools, health providers, community organizations, and other nonprofits to increase participation in programs that support physical activity, behavioral health, and healthy lifestyles. Additional programming may include expanded youth recreation, community wellness initiatives, and partnerships that promote preventive health and social connection. Me-2-We's Board will hire the current staff at the facility to maintain operations in order to ensure continuation of services and then oversee the growth of new services. This ensures a smooth transition. Through this approach, the project preserves an important wellness facility while expanding access to preventive health resources and strengthening the long-term sustainability of community health infrastructure in the Mat-Su Valley.	Over \$5M	Statewide	Matanuska-Susitna Borough	Deferred or Not Advanced

MedCerts, LLC.	Strengthening Rural and Tribal Allied Health Workforce Pipelines in Alaska	MI	Rural and tribal health providers across Alaska face persistent workforce shortages in allied health and administrative roles that are essential to care delivery. Geographic isolation limited local training infrastructure, high recruitment costs, and workforce turnover create ongoing vacancies that disrupt access to care and strain existing staff. Many rural hospitals, community clinics, and tribal health organizations rely on temporary staffing models or operate below optimal capacity due to credential gaps in roles such as Surgical Technology, Medical Billing and Coding, Dental Assisting, Behavioral Health, Healthcare Administration, and IT support. At the same time, rural and Alaska Native communities have residents seeking stable career pathways in health care but face limited access to industry-recognized training aligned to local employer demand. There is a clear opportunity to expand flexible credential pathways that allow providers to upskill incumbent staff, create entry points for residents, and strengthen internal workforce pipelines without requiring relocation or long academic buildouts. This project addresses the gap between employer workforce demand and accessible training pathways, strengthening rural and tribal health system sustainability through targeted allied health workforce expansion.	This project expands access to flexible, employer-aligned allied health credential pathways in partnership with hospitals, clinics, and tribal healthcare systems, and other rural providers. Building on existing enrollments and established partnerships across multiple boroughs, the approach focuses on scaling a proven workforce model rather than launching a new pilot. MedCerts will collaborate with partner organizations to identify high-demand roles, prioritize incumbent worker upskilling and entry-level career pathways, and align credential offerings to employer workforce plans. Programs such as Surgical Technology, Medical Billing and Coding, Dental Assisting, Healthcare Administration, and IT Helpdesk, roles essential to maintaining clinical operations and access to care in rural settings, will be delivered through flexible online and employer-supported models that allow rural residents to train without leaving their communities. The approach emphasizes three core strategies: Employer-Aligned Credential Expansion: Work directly with participating hospitals, clinics, and tribal health organizations to align credential pathways with documented vacancy data, workforce shortages, and employer demand. Rural-Ready Delivery Model: Provide flexible online coursework combined with employer engagement to reduce geographic barriers and support completion for learners in remote settings. Workforce Retention and Career Mobility: Support incumbent worker advancement and create local career pathways that strengthen long-term workforce sustainability and reduce reliance on contract labor. Data tracking and employer engagement will inform continuous improvement and alignment with RHTP workforce and access goals. By expanding credential pathways already in use across Alaska providers, this project strengthens health system capacity while creating economic opportunity in rural and tribal communities.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

MEDEVAC ALASKA	Rural Healthcare Prevention and Emergent Services	AK	Timeline/continuity of care and shortage of healthcare staff and equipment in rural communities of Alaska	Medevac Alaska proposes to address the critical shortage of health care providers in rural communities by deploying qualified health care personnel directly to remote locations and equipping them with modern medical technology. Through this initiative, trained providers will deliver essential medical services while utilizing telehealth systems and other digital health tools to connect with physicians, specialists, and larger medical facilities when advanced consultation is needed. This approach will help bridge the gap between isolated communities and comprehensive health care networks, allowing rural Alaskans to receive timely diagnoses, treatment, and follow-up care without the significant delays and travel burdens that often accompany remote living. By combining on-site medical support with advanced communication technologies, Medevac Alaska aims to improve access to quality health care, enhance patient outcomes, and strengthen the overall health infrastructure serving rural populations.	Over \$5M	Other	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah- Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska- Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

MedExpert International	INSIGHT: Integrated Network for System Intelligence, Guidance & Health Transformation by MedExpert	CA	Alaska’s healthcare system operates across one of the most geographically challenging environments in the world. Care delivery frequently occurs within a hub-and-spoke structure where rural clinics, community health aides, and EMS responders must practice at the top of their license while specialty services may be hundreds of miles away and reachable only by air. In these circumstances, critical clinical decisions are often made with limited access to reliable patient history or system context. The absence of timely information can lead to delayed escalation of care, fragmented coordination, avoidable transports, and strain on already limited rural health resources. At the same time, Alaska possesses valuable health data across hospitals, Medicaid programs, clinics, and other providers. However, these data sources remain fragmented across systems and are rarely available to individuals making decisions in the field. INSIGHT enables the State to provision role-based access to State-approved health information for EMS responders, rural clinicians, and other authorized professionals. Access to meaningful indicators such as recent utilization patterns, medication history, care coordination activity, and prior points of care strengthens clinical judgment at the moment decisions must be made. By connecting existing health information to frontline decision makers, Alaska can improve the quality of care delivered in rural and frontier communities.	Improving frontline decision-making in Alaska’s rural and frontier environments requires more than access to data—it requires a secure operational platform that delivers relevant information to the right responder at the moment care decisions are made. INSIGHT will be implemented as a State-governed operational intelligence platform that converts State-approved health data into role-based visibility for authorized rural providers and first responders. INSIGHT is powered by MedExpert with multiple years of experience assisting Alaska across the State including in frontier environments. The program was designed based on our experience in Alaska and in conversation with providers and first responders in the State. The system will be deployed across phones, tablets, and web interfaces, allowing frontline personnel to securely access operational dashboards tailored to their responsibilities. The State will define governance, data use policies, and role-based access permissions so that appropriate information is provisioned to authorized users while maintaining privacy and security protections. Initial deployment will focus on frontline response environments where timely context is most critical, including Community Health Aide Providers (CHAPs), EMS responders, fire departments, paramedics, and medevac coordination teams. When responding to a patient, authorized users may view relevant information such as recent emergency utilization patterns, admission history, known diagnoses, medication indicators, prior points of care, and active care coordination pathways. This operational context supports safer clinical judgment regarding treatment-in-place, local referral, or transport when clinically appropriate. Role-based dashboards will be configured collaboratively with State leadership to support operational needs. CHAPs may view patient care patterns that inform treatment protocols; EMS responders may access concise emergency utilization and clinical indicators to support field decisions; State health officials may view aggregated insights that strengthen oversight and resource planning. Transportation partners may use utilization and geographic patterns to better coordinate travel resources in remote regions. This approach advances Rural Health Transformation Program priorities by strengthening rural access to care, supporting value-based resource stewardship, modernizing EMS decision support, and enabling sustainable state-operated health system intelligence.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

MedExpert International	REACH-AI: Rural Engagement, Alignment & Coordinated Health powered by Advanced Intelligence	CA	Across rural settings, medical decisions are often made without timely access to current evidence-based knowledge. Providers and patients frequently operate in fragmented systems where information is difficult to access when decisions are required. Even when the correct clinical pathway is known, implementing that care can be difficult for patients and time-consuming for providers. REACH-AI addresses this gap by delivering current medical knowledge at the moment decisions are made while helping patients and providers navigate the healthcare system. The platform combines expert-system AI with human care coordination so the right information reaches the right person at the right time. REACH-AI addresses several healthcare challenges in Alaska: • Improved access to and quality of care by extending expert guidance and navigation into rural homes and clinics. • Prevention of avoidable escalation leading to emergency visits or transport. • Improved maternal and child health education/support when local obstetric capacity is limited. • Behavioral health support; our prior work in Alaska reduced opioid prescribing and use by ~33% annually. • Workforce sustainability improves as clinicians receive reliable decision support and reduced administrative burden. By improving access to medical knowledge and strengthening care coordination, REACH-AI helps patients navigate care more effectively while supporting better outcomes and responsible resource use across Alaska.	Across rural and urban healthcare systems, medical decisions are often made without timely access to current evidence-based knowledge. Providers and patients frequently operate within fragmented systems where information is difficult to access or disconnected from the moment decisions must be made. Even when the appropriate clinical pathway is known, navigating the healthcare system to implement that care can be difficult for patients and time-consuming for providers. REACH-AI addresses this gap by delivering current medical knowledge at the moment decisions are made while helping patients and providers navigate the healthcare system. The platform combines expert-system AI with coordinated care support so the right information reaches the right person at the right time and recommended care can be successfully implemented. REACH-AI addresses several critical healthcare challenges in Alaska: • Access to care improves by extending evidence-based decision support and care navigation directly into rural homes and clinics, helping determine when travel is necessary and when care can be safely managed locally. • Care quality improves through individualized guidance and proactive navigation that helps prevent avoidable escalation leading to emergency visits, hospital admissions, or transport. • Maternal and child health support improves through pregnancy and postpartum education and navigation when local obstetric capacity is limited in rural or frontier communities. • Behavioral health support expands through ongoing education, decision guidance, and care navigation; prior Alaska programs reduced opioid prescribing and morphine equivalents by approximately 33 percent annually. • Healthcare workforce sustainability improves as clinicians receive reliable decision support and navigation assistance, helping reduce administrative burden and avoidable utilization. By improving access to current medical knowledge and strengthening care coordination, REACH-AI helps patients navigate care more effectively while improving outcomes and supporting responsible stewardship of healthcare resources across Alaska.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

MedExpert International	SUMMIT: Statewide Utilization & Multi-payer Metrics for Integrated Transparency by MedExpert	CA	Healthcare in Alaska is among the most expensive in the nation, placing significant pressure on employers and on the state budget. Simultaneously, Alaska lacks reliable, timely, and comprehensive statewide information needed to determine whether healthcare spending is producing value for rural and frontier residents. Although substantial data exists within individual systems—including Medicaid, Medicare, Tribal health programs, commercial insurers, and state employee plans—these datasets remain fragmented and largely unavailable for meaningful cross-payer analysis. No single entity maintains a comprehensive and timely cross-payer view of how healthcare services are delivered across Alaska. As a result, policymakers and stakeholders often rely on delayed datasets that do not fully reflect Alaska’s unique geography, healthcare market, or population characteristics. More than 20 states have attempted to build All-Payer Claims Databases, yet few remain operational due to governance challenges, inconsistent data quality, or delayed reporting. SUMMIT addresses these limitations by establishing a disciplined, state-governed APCD that integrates multi-payer claims data into a secure, policy-ready analytic environment. This unified cross-payer visibility will strengthen cost transparency, support rural access planning, and provide the timely intelligence needed to guide modernization, accountability, and long-term healthcare sustainability across Alaska.	SUMMIT will belong to the State of Alaska and will be anchored within the Alaska Division of Insurance in coordination with the Department of Health and Medicaid. Governance will clearly separate regulatory authority, lead organization oversight, and data management vendor technical operations. MedExpert will build and manage the technical environment during implementation while state personnel are trained to oversee governance, vendor performance, and data access workflows to ensure long-term operational independence. MedExpert’s experience in large-scale medical data movement allows SUMMIT to transform raw claims submissions into validated analytic datasets rapidly, enabling administrators to receive updated policy intelligence within days of data ingestion rather than the extended delays typical of traditional APCD environments. SUMMIT will incorporate nationally recognized APCD best practices. Standardized submission specifications will align with established multi-state data layouts to reduce payer burden and promote interoperability. Claims, eligibility, and provider data will be normalized across payers, with structured reconciliation of Medicare–Medicaid dual eligibles to prevent double counting. Consistent with leading privacy approaches, SUMMIT will isolate individual identifiers within a secure identity management environment. Identifiable data will be segregated from analytic files and replaced with encrypted, tokenized identifiers to preserve linkage capability without exposing protected health information. This structure protects privacy while preserving advanced analytic integrity. The system will include a secure submission portal with audit logging, Azure-hosted encrypted infrastructure, network security, and strict single-role enforcement of role-based access. A life cycle data quality framework, covering intake validation, processing validation, enhancement testing, and fitness-for-use review, will ensure reliability for all reporting. Finally, SUMMIT will implement a disciplined tiered reporting roadmap tied to documented data readiness thresholds. By carefully sequencing governance, validation, and analytic complexity, SUMMIT will avoid common APCD pitfalls, such as premature advanced modeling or inconsistent data quality, and instead produce meaningful, policy-ready intelligence that supports modernization, accountability, and durable rural health system stability.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Medical Decision Logic, Inc. (dba mdlogix)	Bringing Innovation & Technology into Anchorage for Suicidality Treatment, Collaboration, & Synergy	MD	We will address the problem of harms and deaths from suicidality, a major problem in Alaska. Reducing suicidality across the connected continuum of different types of suffering, losing hope, thoughts of death, considering suicide, forming a suicide plan, and attempting suicide, is a complex challenge, and overlaps with drug overdoses, violence, and “accidents”. Alaska data show 1,186 suicide attempts in 2024, mostly ages 11-24. Federal data suggest for every suicide attempt, 25-50 people have developed a suicide plan. From this, we estimate 25-50,000 at-risk individuals in Alaska, and 10-20,000 in Anchorage (40% of the Alaska population). Two problems hinder suicide prevention efforts: 1) lack of data technology tools including a scalable infrastructure for multi-sector collaborative prevention, early intervention, and treatment referral; and 2) lack of effective, safe treatment of suicidality. A third problem 3) is resistance to new ways of doing things, related to previous failed reforms and cultural barriers. Adoption of new technology elicits concerns about data privacy and security, as well as the efforts needed to learn, understand, and develop confidence with use of new technology. Innovative treatment elicits resistance to changing local treatment practices. We plan to address these problems by deliberately building trust through education, availability, and transparency.	Building trust is our first step. We will work to understand the organizational priorities and problem perceptions of Anchorage regional urban and rural community, to engage with them to identify and support solutions with use of bhworks and participation of youth and adults with THI treatment. With guidance from Mr. Bernitz, and other advisors, we will engage with Anchorage School District, Department of Juvenile Justice, local hospitals, outpatient providers of mental and behavioral health services, and other social services. As part of this in-person engagement, we plan to open a physical office in Anchorage that will host a bhworks technology education, training, support, and career development center, and a THI center for outpatient treatment of suicidality. We will hire and train local residents to staff this office, and support them virtually from our primary offices. We will convene workshops to build community awareness and participation. bhworks offers a large set of off-the-shelf tools and features. Initial configuration for school or clinic use to screen and assess students or clients, and go live, can be accomplished in a week or two. To enable users to quickly grow benefit from use of bhworks, our Client Services team has developed a standard implementation approach, which entails putting in place a local user governance, such as a Steering Committee, with representation of all major roles. Weekly meetings are convened to introduce bhworks capabilities, and to listen to community members and potential bhworks users to learn what their work is, how they do their work, what their constraints and other problems are, what other tools they use or are considering using, and then how bhworks can be configured to support their work, overcome constraints, and solve other identified problems. This becomes an ongoing cycle of measurement-based experience, learning, articulating problems, solving them, generation of new knowledge, and collective learning. The implementation approach for a new THI site typically takes 8-12 months. The main reason for this length of time is the work needed to obtain Medicaid reimbursement approval in a new state. However, with support from RHTP we can start providing suicidality treatment services sooner. Recruiting and training clinical staff such as social workers, counselors, psychologists will take time, but once our THI site is established, Dr. Lee and his team can provide virtual services immediately.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Medical Decision Logic, Inc. (dba mdlogix)	Bringing Innovation & Technology into Kodiak for Suicidality Treatment, Collaboration, & Synergy	MD	The public mental health problem we aim to address is the high rate of harms and deaths from suicidality, especially among Alaskan youth. Preventing suicidality across the continuum—from loss of hope and suicidal thoughts to planning and attempts—is complex and often overlaps with prevention of drug overdoses, violence, and accidental deaths. In Kodiak, based on 2016-2019 data, the suicide mortality rate for Alaska Native people in the Kodiak region is 90.3 per 100,000. The state wide overage is 28.1 per 100,000. k12 schools play a central role via Multi-Tier System of Supports (MTSS), emphasizing universal screening, data-driven decision-making, progress monitoring, and multi-level prevention. Three major challenges hinder progress: (1) limited data technology and scalable infrastructure for multi-sector collaboration and early intervention; (2) lack of effective, evidence-based treatment for suicidality; and (3) resistance to adopting new approaches. Rural communities, in particular, may be cautious about new technologies and treatment models due to concerns about privacy, security, and the effort required to build trust and confidence in unfamiliar systems. Our project addresses these barriers by integrating accessible technology, evidence-based treatment, and local capacity building to strengthen suicide prevention and care in rural Alaska. A structured evaluation component will support continuous learning, measure outcomes, and guide improvement and sustainability.	Our first step is to build trust and understanding with Kodiak-area villages, tribal organizations, and schools. Schools are often the most consistent point of contact for youth and families, making them essential partners in identifying behavioral health needs and connecting students to care. Guided by Mr. Bernitz and other advisors, we will visit villages, meet with tribal and school leaders, and hold community town halls to listen, learn, and co-develop solutions that reflect local priorities and values. We will establish a physical office in Kodiak as a hub for education, training, and support for the bhworks™ technology platform, and as The Hope Institute (THI) center for outpatient treatment of suicidality. Local residents will be hired and trained to staff the office, supported virtually by mdlogix and THI teams. This approach builds local capacity and ensures sustainability. Kodiak Schools have a two year project addressing suicidality. They have trained 195 volunteers to spot and help high school peers. We will will approach them to help expand and support their current project. Use of bhworks increases efficiencies and the number of people helped, and THI provides effectiveness. bhworks provides a web-based infrastructure for screening, referral, and care coordination across schools, clinics, and community organizations. Implementation begins with a local Steering Committee representing these sectors. In Months 1-2, weekly meetings introduce bhworks capabilities and gather input to understand workflows, constraints, and goals. The system is then configured to support school-based screening, early intervention, and referral to THI treatment, while strengthening collaboration with clinics and social services. In Months 3-4, school and clinic personnel will start using bhworks for assessment, consent, referral, intake, monitoring, and reporting. This becomes an ongoing cycle of measurement-based experience, learning, articulating problems, solving them, generating new knowledge, and collective learning. Evaluation is embedded throughout this process to measure progress, outcomes, and community impact, and to guide adaptation of bhworks and THI to local needs. Implementation of a new THI site typically takes 8–12 months, largely due to Medicaid reimbursement setup and clinical staff recruitment. With RHTP support, we can accelerate service delivery by initiating virtual treatment led by Dr. Lee and his team while local staff are trained.	\$1M-\$5M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Kodiak Island Borough	Deferred or Not Advanced

Medical Decision Logic, Inc. (dba mdlogix)	Bringing New Technology & Innovative Suicidality Treatment Into Bethel	MD	The public mental health problem we aim to address is the high rate of harms and deaths from suicidality, especially among Alaskan youth. Preventing suicidality across the continuum—from loss of hope and suicidal thoughts to planning and attempts—is complex and often overlaps with prevention of drug overdoses, violence, and accidental deaths. k12 schools play a central role in prevention through Multi-Tier System of Supports (MTSS), which emphasizes universal screening, data-driven decision-making, progress monitoring, and multi-level prevention. However, three major challenges hinder progress: (1) limited data technology and scalable infrastructure for multi-sector collaboration and early intervention; (2) lack of effective, evidence-based treatment for suicidality; and (3) resistance to adopting new approaches. Rural communities, in particular, may be cautious about new technologies and treatment models due to concerns about privacy, security, and the effort required to build trust and confidence in unfamiliar systems. Our project addresses these barriers by integrating accessible technology, evidence-based treatment, and local capacity building to strengthen suicide prevention and care in rural Alaska. A structured evaluation component will support continuous learning, measure outcomes, and guide improvement and sustainability.	Our first step is to build trust and understanding with Bethel-area villages, tribal organizations, and schools. Schools are often the most consistent point of contact for youth and families, making them essential partners in identifying suicidality and other behavioral health needs and connecting students to care. Guided by Mr. Bernitz and other advisors, we will visit villages, meet with tribal and school leaders, and hold community town halls to listen, learn, and co-develop solutions that reflect local priorities and values. We will establish a physical office in Bethel as a hub for education, training, and support for the bhworks™ technology platform, and as a The Hope Institute (THI) center for outpatient treatment of suicidality. Local residents will be hired and trained to staff the office, supported virtually by mdlogix and THI teams. This approach builds local workforce capacity, ensures sustainability, and grows our social network for diffusion of innovation. bhworks provides a web-based infrastructure for screening, referral, coordination, and collaboration across schools, clinics, and other community organizations. Implementation begins with a local Steering Committee representing these sectors. The Committee will include multi-generation family members and cultural leaders. In Months 1-2, weekly meetings introduce bhworks capabilities and gather input to understand workflows, constraints, and goals. The system is then configured to support school-based screening, early intervention, and referral to THI treatment, while strengthening collaboration with clinics and social services. We will start with the villages that have high-speed web access. In Months 3-4, school and clinic personnel will start using bhworks for assessment, consent, referral, intake, monitoring, and reporting. This becomes an ongoing cycle of measurement-based experience, learning, articulating problems, solving them, generating new knowledge, and collective learning. Evaluation and reporting, with methods and expertise from our RAND partners, is embedded throughout this process to measure progress, outcomes, and community impact, and to guide adaptation of bhworks and THI to local needs. Implementation of a new THI site typically takes 8–12 months, largely due to Medicaid reimbursement setup and clinical staff recruitment. With RHTP support, we can accelerate service delivery by initiating virtual treatment led by Dr. Lee and his team while local staff are trained.	\$1M-\$5M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Bethel Census Area	Deferred or Not Advanced

Medical Decision Logic, Inc. (dba mdlogix)	Building Regional Behavioral Health Coordination & School Partnerships in Bristol Bay	MD	Led by Shannon Harvilla, former Superintendent of the Bristol Bay Borough School District, we will establish a coordinated behavioral health infrastructure connecting schools, healthcare providers, tribal organizations, and community partners across the Bristol Bay region of Southwest Alaska. The initiative will deploy the mdlogix bhworks™ technology alongside evidence-based innovative suicidality treatment services provided through The Hope Institute to strengthen prevention, early identification, referral coordination, and treatment access for youth experiencing suicidality and behavioral health challenges. Communities across the Bristol Bay Area Health Corporation service region face extraordinary barriers to care. Most communities lack road access and depend on aircraft transportation to reach regional hubs for basic services such as medical care, dental services, and behavioral health treatment. Schools frequently become the first place where behavioral health concerns affecting youth are identified, yet coordination between education systems and healthcare providers remains fragmented. This project will address these challenges by implementing shared behavioral health screening, referral management, case coordination, telehealth workflows, and regional reporting tools through the bhworks platform. We will center our project and its sustainability with a new physical office serving as a bhworks technology support center and the physical center of The Hope Institute.	The first step in implementing this initiative will be building trust and engaging communities across the Bristol Bay Area Health Corporation service region. With leadership from Shannon Harvilla, former Superintendent of the Bristol Bay Borough School District, the project will begin with outreach to tribal leaders, school districts, healthcare providers, and community organizations to understand local priorities and identify opportunities for problem-solving collaboration. Initial engagement will include meetings with school staff, tribal organizations, health providers, and regional partners to introduce the project and gather input on local needs. Community discussions will help ensure that the system reflects the priorities of participating communities and supports existing prevention and behavioral health initiatives. Coordination and collaboration are fundamental. Following this engagement phase, the project will establish regional coordination secure and scalable data and workflow infrastructure using the mdlogix bhworks™ behavioral health platform. The system will support behavioral health screening, consent management, referral coordination, case management, telehealth integration, and regional reporting. Schools will use the platform to strengthen behavioral health support systems aligned with Multi-Tiered Systems of Support (MTSS), so educators and community providers can identify concerns earlier and coordinate interventions. bhworks includes a comprehensive school nurse module. The initiative will support development of local treatment capacity through collaboration with The Hope Institute, which provides evidence-based outpatient and telehealth treatment for suicidality using the Collaborative Assessment and Management of Suicidality (CAMS) model and related clinical practices. As part of implementation, the project will establish regional training and coordination capacity in Naknek or Dillingham to support partner onboarding, technology training, and collaboration among participating organizations. Local staff will be hired and trained to support system adoption, community engagement, workforce careers, and long-term sustainability. Through phased implementation across participating communities, the initiative will create a coordinated regional network connecting schools, healthcare providers, and community partners to strengthen behavioral health prevention, early intervention, and treatment services across the Bristol Bay region.	\$250K-\$1M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Bristol Bay Borough; Dillingham Census Area; Lake and Peninsula Borough	Deferred or Not Advanced

Medical Decision Logic, Inc. (dba mdlogix)	We R H.O.P.E. for Anchorage Youth, A Full-Spectrum Behavioral Health Innovation and Technology Model	MD	Underserved youth are a priority population. Behavioral health access is among the most urgent unmet needs. We R H.O.P.E. is that model. Deployed five days per week, We R H.O.P.E. coaches deliver one-on-one brain health and wellness coaching to students in 30-minute sessions over structured 60-90 day cycles. Sessions focus on anxiety reduction, emotional regulation, and coping skill development, grounded in neuroscience to help students build new neural pathways through consistent, structured coaching practice. Coaches work with bhworks screening data, receiving referrals from the platform and documenting outcomes back into it, creating a closed-loop data system from identification through intervention. In parallel, We R H.O.P.E. deploys mental health literacy education to families and community members, building shared language and reducing stigma. We R H.O.P.E. trains community members in eCPR (emotional CPR), equipping them with skills to support others in emotional distress, and delivers early mental health awareness training for educators and school staff, ensuring they can recognize warning signs and coordinate with coaches before problems escalate. These layers create a whole-community approach that amplifies the impact of every coaching session. Based on data from 3,000 students across five states, We R H.O.P.E. consistently produces 35-66% reductions in anxiety and depressive symptoms within 60-90 days, tracked using validated instruments integrated into bhworks.	The mdlogix and We R H.O.P.E. partnership delivers to Alaska's RHTP vision with three integrated components: Component 1: mdlogix Population Screening and Data Infrastructure. bhworks deploys universal behavioral health screening across Anchorage School District schools and community sites, identifying students at risk and generating population-level data that drives all clinical and coaching decisions. bhworks readily connects with other systems, such as healthEconnect, directly advancing the Spark Technology and Innovation initiative goal of building interoperable, data-driven community health infrastructure. Component 2: We R H.O.P.E. School-Based Brain Health and Wellness Coaching. We R H.O.P.E. embeds trained Brain Health and Wellness Coaches in ASD schools beginning with 3-5 sites in Year 1. Each coach serves up to 12 students per day in 30-minute sessions over structured 60-90 day cycles. Coaches receive student referrals directly from bhworks screening workflows and document session outcomes within the platform, enabling real-time cross-system visibility into student progress. All coaches complete We R H.O.P.E.'s Brain Health and Wellness Coach certification program, a neuroscience-grounded, evidence-informed curriculum developed and refined across nine years of school-based practice. Consistent with Alaska's Strengthen Workforce initiative, We R H.O.P.E. will prioritize hiring coaches from within the Anchorage community, creating local behavioral health career pathways for community members without prior clinical credentials. Component 3: We R H.O.P.E. extends its reach beyond the coaching session through three interconnected programs, Mental Health Literacy, eCPR, and Educator Training. Mental Health Literacy is delivered to families and community members in ASD communities, building shared language around brain health and reducing the stigma that delays help-seeking. eCPR (emotional CPR) training equips staff at schools and other settings with evidence-based skills to connect with, empower, and support youth experiencing emotional distress, creating a network of supporters around every student. Educator Training is delivered to teachers and other school staff, ensuring they can recognize warning signs, respond appropriately, and coordinate effectively with embedded coaches. Together, these programs ensure that coaching services are embedded in a community that is informed, equipped, and engaged as an active partner in student brain health.	\$1M-\$5M	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality)	Deferred or Not Advanced

Medical Park Family Care	Workforce Development - Healthcare Providers (Physicians, Nurse Practitioners, Physician Assistants)	AK	The key to caring, is caring. Medical Park Family Care has been voted Best in Alaska for Family Health Clinics for the last 17-years straight because our staff and Providers develop long term relationships with our patients and care for their whole being even if it's "just a cold". Recruitment and retention is increasingly difficult as there is a shortage of family medicine providers across the U.S. As an independent practice, we can not compete with large healthcare entities with significantly more resources or have access to supplemental government subsidies and funding. In the last four years, we have had two Physicians and three Advanced Practice Providers (APPs) leave Medical Park to work at larger healthcare entities and compensation was a major factor. Additionally, several candidates have declined employment offers, citing other opportunities that offer more compensation through tuition reimbursement or significantly greater relocation and sign-on bonuses. Funding through RHTP is requested to help ensure we can recruit and retain the right providers in order to achieve our goal of serving Alaskans across the State for the next 50-years and beyond.	Funding from RHTP will be used towards a sign-on bonus for new providers and a retention bonus for current providers. We are requesting \$50,000 for physicians and \$30,000 for APPs with a minimum commitment of 3-years in order to receive these funds. Having a stable medical staff is critical in developing long-term relationships with patients and will help us achieve our overall goal of transforming Medical Park for the next 50-years as outlined in our other LOIs.	\$250K-\$1M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough)	Advance to Implementation Application

Medical Park Family Care	Pay for Value - Alternative Payment Models	AK	Primary care and preventive services are the keys to the overall health of a community and lowering the total cost of health care. There are many studies that support this. However, payment for medical care in Alaska favor high cost specialty services. Insurance companies have stated that their insurance rates have risen significantly due to the increasing cost of health care, more specifically, specialty care. Primary care, on the other hand has seen little or no change in reimbursement. Medical Park's largest insurance payer has not increased their reimbursement rates to us in 10 years. During this same period, preventive services covered at 100% have decreased, resulting in patients paying more for the same services as in prior years. This has forced our providers and patients to decide what care to provide based on cost and not on what is best for the patient's health. There are other payment models that exist or perhaps a new innovative approach can be taken to put the focus back to where it should be - primary care. Medical Park's goal is to explore different options and implement payment models that focus on and reward primary care and preventive services. A payment model that reimburses health care providers fairly for services rendered, does not burden the patient and results in improved health and lowers overall health care costs.	We have begun analyzing our data to identify groups that can be potential partners (employers, insurance companies or programs within insurance companies). Once identified we will begin discussions on program design, one that promotes preventive care and healthy habits. There are many examples across the U.S. of "pay for value" or "pay for quality care" with shared savings. For patients, the cost barrier to care should be minimal to encourage participation instead of hesitation or refusal because of cost. Payment to Medical Park can be designed to provide fair reimbursement to encourage customizing care based on the patient's needs, and not simply to get paid more for doing more. On an annual basis, an evaluation of health outcomes and overall costs will help determine success of the program with any overall cost savings shared between the participating entities. Medical Park has participated in some limited scope "value based contracts" with insurance companies. These programs have had some success but there is still a lack of trust and misaligned incentives that prevent us from greater success. Preventive care and screenings are still defined by the insurance company. Prior Authorizations, arbitrary down coding reimbursement all add barriers that work against achieving greater success. An ideal program would put trust in the Provider to determine what screenings and care are needed based on the patient. In turn, the Provider takes on the responsibility for the patient's care managing their overall health. A patient incentive, from their employer or insurance company or both depending on who's participating in this program helps ensure that the patient will follow through on the recommended screenings and care. By incorporating all of these factors into this program there is a tremendous opportunity to have a program that compensates Primary Care Providers fairly, promotes health and wellness and results in less overall health care costs.	\$50,000-\$250,000	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough)	Advance to Planning

Medical Park Family Care	Health Care Access - Expanding Specialty Care	AK	Alaska is remote and with a relatively small population there is often not enough health care providers in certain medical specialties. Primary Care Providers are the focal point for a patient's care and it's up to these providers to determine when a patient's medical care requires a specialist. Due to the shortage of some specialties, care may be delayed or require the patient to travel out of state for care. Endocrinology is one example of a specialty with a lack of providers in Alaska. Diabetes is a endocrine disease and according to Diabetes.org, over 42,000 Alaskans are affected by diabetes. Medical Park Family Care has two providers who specialize in and only care for patients with diabetes. They each have over 10-years of experience in diabetes management, however, they are family medicine providers and lack the training of an Endocrinologist. There are many endocrinologists in the US with the training and experience who can support our providers. Our goal is to facilitate this connection effectively and efficiently to ensure our providers and ultimately our patients receive the specialty care they need when they need it.	Medical Park seeks to partner with Picasso MD, a network of specialists across the U.S. who can provide on-demand, online medical consults. This service would provide our diabetes providers with the necessary resources and support to continue to provide excellent and timely care to our patients. This support can occur in several ways. During a patient visit, our providers can connect real-time to a specialist to discuss a patient's medical needs. The specialist can provide their assessment and recommendations and following the consult send a summary note that is included in the patient's medical record. Secondly, these specialists can be consulted to discuss long-term care management, helping to ensure patients are on track towards their health goals. These specialists can also provide recommendations when out of State care is necessary and who to refer the patient to. This service could also benefit our general family medicine providers who also care for diabetic patients, many of whom are not as complex as those seen by our diabetes providers but for whom would still benefit from having a specialist consult. The success of this project could also lead to additional collaboration with Picasso MD for other medical specialties and further improve care for all our patients.	\$50,000-\$250,000	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough)	Deferred or Not Advanced

Medical Park Family Care	Health Care Access - Facility Remodel and Infrastructure Upgrades	AK	Medical Park has operated in the same location for over 50-years. The infrastructure is outdated and does not promote safety for our team or facilitate efficient and effective care for our patients. Space heaters are needed in almost room during the winter and at times during the summer. There is not enough electrical power for our existing equipment and we often have to move equipment so as to not exceed electrical capacity. Network cabling is split and "daisy chained" resulting in sub-optimal IT performance. We do not have a back-up generator and risk losing tens of thousands of dollars in refrigerated vaccines and lab reagents in the event of a prolonged power outage. The fire suppression system is limited to the basement and does not cover the first or second floor. Our elevator is small and wheelchairs barely fit and EMS stretchers must be configured with the patient in a seated position to fit. Our physical layout also hinders our ability to care for patients or expand access to rural Alaskans. Separated suites introduce physical barriers to staff and provider collaborating with each other. There are not enough areas for support staff and what is available is poorly designed, cramped or originally intended for other usage such as storage closets. There have been some renovations over the years but primary care is essentially a break-even business so without the necessary monetary resources we cannot commit to the necessary physical and infrastructure upgrades.	Medical Park has been planning for a significant renovation and infrastructure upgrade that creates a "clinic for the future." Key concepts include clinical pods that group patient exam rooms and clinical teams to facilitate collaboration between providers and staff and allow for flexible use. Incorporating patient flow models to determine the optimal number and design of exam rooms and clinical space. Space and infrastructure design will also take into consideration a growing percentage of virtual patient visits and care management via telemedicine or other technologies. Staff and Provider space will also be more efficiently and effectively designed to facilitate collaboration while also providing space for independent or focus work. Multi-use space can also be used for group gatherings or quiet space. In addition to physical space renovations, infrastructure upgrades will include meeting current life and safety requirements, installing a back-up generator, upgrading the electrical and IT network infrastructure with capacity to expand or adapt to future needs. We anticipate that these renovations will actually reduce the total square footage needed for our clinic. We intend to repurpose the excess space and invite community partners to co-locate with us. We have not identified a specific partner but our intent would be to consider partners that would supplement or complement the services we provide to our patients - physical therapy, behavioral health, dieticians and nutritionists, pharmaceuticals, care coordinators or other community resource organizations - creating a health care hub for our patients.	Over \$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough)	Deferred or Not Advanced

Medical Park Family Care	Workforce Development - X-ray Training Program	AK	Medical Park has it's own Radiology department, performing X-ray and Ultrasound studies and Dexa scans to help diagnosis injuries and illnesses. We have one certified X-ray technologist and access to X-ray studies is limited based on their schedule. Training select staff to perform a limited number of X-ray studies will expand access when our technologist is unavailable and provides professional growth and development for our staff in learning additional skills. Expanded access will help minimize delays in diagnosis our patients or unnecessary referrals to more costly dedicated imaging centers.	Alaska regulations do not require a certified X-ray technologist to operate an X-ray machine, however, proper training is essential for patient and staff safety and to ensure a high quality image is produced so that proper diagnoses can be made. We are in the process of reviewing training programs from other clinics that have implemented such a program to mirror and fit to our needs. Key criteria will be in selected the right staff to be trained, adequate training time and a regular review of skill and competency. During the initial implementation we will select one to two current staff members and provide dedicated time away from their primary roles to properly learn and train to perform a set number of X-ray studies. These studies will be selected based on the most commonly performed and at a relatively low complexity. After meeting competency requirements, they will enter a phase of proctored mentorship where they will perform actual studies under the direct supervision of our technologist. Upon completion of this phase these staff members will be allowed to perform these studies unsupervised. We anticipate the first phase will take up to two or three months, the proctoring phase another two based on the volume of studies performed, bring the total timeframe to about six months from start to finish. A periodic review will occur to ensure competency is maintained with the possibility of future training to perform additional studies. This budget for this project is approximately 1 FTE of total time commitment from those being trained and the trainer and a total cost of approximately \$75K	\$50,000-\$250,000	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough)	Deferred or Not Advanced

Medicine by Movement Wellness and PT	Healthy communities with a focus on preventative and proactive health care for the aging population	AK	There is a significant gap in transitional services for the elderly population after they complete physical therapy (PT). Once patients no longer require “skilled services,” they are typically discharged, even though many do not yet feel confident or functional enough to safely continue progressing on their own. I have practiced physical therapy for over 20 years, the majority of that time in Alaska. One of the most common concerns I hear from our aging population is that they do not feel ready at the time of discharge. Outpatient physical therapy clinics are generally structured to treat the specific injury that brought the patient in. Care continues until the patient either achieves their primary goals or stops making measurable progress. However, many patients reach a plateau after making meaningful improvements, yet still lack the confidence, strength, or knowledge to independently continue advancing their exercise programs at home. As a result, these individuals frequently return to the clinic in the near future with the same injury or with new complications related to the original issue. This problem is even more pronounced in rural areas, where consistent one-on-one care and follow-up resources are limited. At the same time, the majority of Americans are overweight and do not meet recommended weekly exercise guidelines. This further complicates their overall health and places an increasing burden on the healthcare system.	I am providing a safe place for these individuals to continue to exercise, strengthen and work on balance and mobility activities that have been proven to decrease hospital visits, minimize medical issues, and improve longevity. It provides a sense of place, motivation in a group setting, but also instructed by a doctor of physical therapy where I can offer modifications and keep each client safe. I have started to offer this outside of Sitka with classes being offered via zoom and recordings. Traditional PT does not always work, nor do patients in rural communities always have access. I also offer specific low back pain, knee and hip osteoarthritis, and plan to continue to expand 6-week educational and exercise classes specific to this to help treat, prevent, and empower the patient to have the knowledge to treat themselves. Anyone who attends these classes live or via recordings have the ability to communicate with their PT without charge at any time, which eases the burden on other health care providers, and offers help in facilitation of appropriate care when needed. These classes will be offered live via zoom, but also in a pre-recorded fashion that can be an excellent resource for patients in rural areas with limited access.	\$50,000-\$250,000	Private practitioner	Statewide	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

Meetopolis	Meetopolis: Peer Support	AZ	Alaska faces some of the most significant behavioral health access challenges in the United States. Vast geographic distances make consistent access to mental health and substance use services difficult—particularly in rural and tribal communities. Many regions have few or no licensed behavioral health providers, and workforce shortages continue to strain existing systems of care. Individuals often experience long wait times, limited follow-up support after discharge, and gaps between crisis intervention and ongoing recovery services. Alaska also experiences high rates of substance use disorder, suicide, trauma exposure, and co-occurring mental health conditions. Social isolation, stigma, and cultural barriers further prevent individuals from seeking help early. After treatment, reentry from incarceration, or hospital discharge, many individuals lack consistent peer support and community connection—key protective factors against relapse and crisis recurrence. Meetopolis addresses these gaps by providing secure, virtual peer support communities that extend access beyond brick-and-mortar services. The platform connects individuals with lived-experience peer supporters, offers daily engagement tools and check-ins, and supports continuity of care during high-risk transition periods. By leveraging technology, Meetopolis reduces geographic barriers, strengthens community connection, and complements Alaska’s existing behavioral health infrastructure without replacing clinical care.	Our proposed approach is to deploy Meetopolis as a secure, technology-enabled peer support platform designed specifically to address Alaska’s unique geographic and workforce challenges. Alaska’s rural and frontier communities face extreme isolation, weather-related transportation barriers, limited broadband infrastructure, and significant shortages of behavioral health providers. These factors often result in delayed care, fragmented treatment, and high vulnerability during transitions such as post-discharge or reentry. Meetopolis would be implemented as a scalable digital extension of existing providers, tribal health systems, and community organizations. The platform enables structured peer support groups, one-to-one peer engagement, relapse prevention check-ins, and between-session accountability — all accessible remotely via mobile devices. The platform is designed to function in low-bandwidth environments and can be integrated into telehealth workflows already in use across Alaska. Our approach prioritizes collaboration with local partners to ensure cultural responsiveness, including coordination with tribal health entities and community-based behavioral health providers. Peer leaders can be recruited locally to support culturally grounded engagement while expanding reach across remote regions. By embedding Meetopolis into discharge planning, outpatient services, and community recovery programs, we will create continuous recovery touchpoints that reduce isolation, increase early intervention, and strengthen long-term engagement. This approach enhances care quality, supports provider sustainability, and reduces costly readmissions while respecting Alaska’s diverse and geographically dispersed populations.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Mercury Healthcare, Inc.	WebMD Ignite's Health Education & Access for Rural Transformations (HEART)	NJ	WebMD Ignite seeks to close the growing gaps in access, prevention, and care coordination for rural, remote, and frontier Alaskans, who face disproportionate burdens of chronic disease, behavioral health conditions, and preventable hospital use amid severe workforce and service shortages. Small clinics, Tribal health partners, and critical access hospitals struggle to reliably reach patients across vast distances, extreme weather, and inconsistent broadband, limiting their ability to deliver timely education, follow-up, and navigation support beyond brief, episodic encounters. At the same time, Alaska’s RHTP prioritizes investments that harness technology, reinforce hub-and-spoke care models, and build a durable foundation for prevention and chronic disease management in every community. In response, we aim to establish a shared, culturally attuned digital health education and engagement infrastructure that local providers and care teams can use to extend their reach, deliver consistent, high-quality information, and activate patients and families between visits, while generating actionable data to complement existing infrastructure.	We will implement a shared education and engagement backbone that rural providers and care teams across Alaska can plug into with minimal lift. WebMD Ignite, through its HEART for Rural Transformation framework, will partner with selected rural, Tribal, and critical access hospital sites to align digital health education and outreach strategies with RHTP priorities, and support the deployment of a configurable hub that surfaces trusted, plain-language health education across web, mobile, print, and point-of-care channels. Collaboration with Tribal, local, and rural partners will drive alignment and ensure the approach reflects Alaska’s diverse cultural and community contexts. A branded digital health education hub can then be linked from existing websites, portals, and patient communications, offering communities a simple, always-available front door for Alaska-relevant health resources. Content can be integrated into existing workflows such as care coordination, management, outreach, and follow-up, enabling staff to share consistent, culturally sensitive education across multiple formats, including print materials when digital access is limited. This collaborative approach may also help partners identify relevant priority areas, such as chronic disease, behavioral health, substance use, and maternal health, while engagement and utilization insights provide complementary data that enhance existing systems without duplicating or replacing them. Throughout the project, WebMD Ignite will provide implementation support, training, and technical assistance to help build a sustainable, low-burden infrastructure that Alaska providers and care teams can continue to use and adapt beyond the grant period. As part of this continuing support, content is regularly reviewed and updated through WebMD Ignite’s established content development process, ensuring accuracy, relevance, and alignment with evolving partner needs.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Metlakatla Indian Community	Strengthening the Behavioral Health Workforce and Expanding Access to Care in Remote Metlakatla	AK	Wil la Mootk Counseling Center faces significant workforce recruitment and retention challenges due to the extreme geographic isolation of Metlakatla and the unique governance structure of the Metlakatla Indian Community. The community is accessible only by ferry or float plane from Ketchikan, Alaska. Travel to and from the island is frequently influenced by weather conditions and limited transportation schedules. These factors make relocation and long-term employment in the community difficult for many behavioral health professionals. In addition, individuals who are not members of the Metlakatla Indian Community must obtain work and residency permits in order to live and work on the island. Together, these geographic and administrative barriers create persistent workforce shortages that impact the stability of behavioral health services and continuity of care for residents. This project seeks to strengthen the behavioral health workforce pipeline and improve infrastructure supporting care delivery through recruitment incentives, telehealth expansion, and transportation improvements.	Wil la Mootk Counseling Center proposes a comprehensive approach to strengthening behavioral health workforce stability and improving access to care in Metlakatla. The project will focus on three primary strategies: workforce recruitment and retention, expansion of telehealth service capacity, and improvements to transportation access that allow community members to more reliably connect with behavioral health services. To address workforce shortages, the project will implement targeted recruitment and retention incentives designed to attract qualified behavioral health professionals to the community. These incentives will be tied to two- to three-year service commitments to support workforce continuity and reduce the frequent turnover that disrupts service delivery in rural and remote areas. Recruitment efforts will focus on licensed clinicians, behavioral health aides, and support staff who can provide culturally responsive care within the community. The project will also expand telehealth infrastructure to supplement local service capacity and ensure that individuals can access behavioral health providers even when travel conditions or workforce shortages limit in-person availability. Telehealth services will support clinical consultation, therapy sessions, and care coordination, allowing Wil la Mootk Counseling Center to maintain continuity of care during transportation disruptions that are common in Southeast Alaska. Finally, the project will strengthen transportation support for behavioral health services. Because travel delays and limited transportation options often prevent individuals from attending appointments, the project will explore solutions that improve access to services both within the community and when travel to regional providers is necessary. Together, these strategies will stabilize the behavioral health workforce, improve reliability of service delivery, and increase access to care for residents of Metlakatla. By addressing both workforce and infrastructure barriers simultaneously, the project will create a more sustainable behavioral health service system capable of meeting community needs over the long term.	\$250K-\$1M	Behavioral health/substance use disorder treatment	Single Community	Prince of Wales-Hyder Census Area	Advance to Implementation Application

Metlakatla Indian Community	Installation of Float and Pilings at Annette Bay Boat Launch	AK	The Metlakatla Indian Community, Annette Islands Reserve in southeast Alaska is home to over 1464 residents who live and work on AIR. The Annette Bay Small Boat Launch was installed in 2023, and needs the float and pilings to complete this facility. The launch is concrete and vessels can safely be launched, however, without the pilings and floats, boarding the vessels becomes difficult, even more so if weather conditions are bad. The rocks and area around the concrete launch are slippery and uneven. The risk of slipping and falling is greatly increased. With the float in place, passengers could step safely on board the vessel and can travel to Ketchikan for services not available in Metlakatla. The cost to install the pilings and floats is known as the full project went out to bid in 2023 and MIC was faced with the difficult decision to reduce the scale of the project. The goal to install the pilings and floats is a priority project for the community.	MIC will post the project out for competitive bid, select the most qualified, and cost-effective bidder to install the float and pilings using approved materials. The bidder will follow the existing US Army Corps Permit to meet all regulations and environmental considerations. Once the float and pilings are installed, they will be inspected by the City Manager and the engineer of record. Once approved the project will be opened officially, acknowledgement of the contributions from funders will be announced and the site will be a safe fully useable Small Boat Launch in Annette Bay.	\$1M-\$5M	Single Community	Prince of Wales-Hyder Census Area	Deferred or Not Advanced
Metlakatla Indian Community	Wil Maamxsga Pts’aan- Totem Park Children's Playground	AK	The Metlakatla Indian Community, Annette Islands Reserve in southeast Alaska is home to over 1464 residents who live and work on AIR. There are over 600 persons under the age of 18 according to the last census. The primary playground equipment is located on the school grounds and not always open to the public. The playground also lacks accessible options for those with mobility challenges. MIC began construction of the Totem Park located near the harbor in 2024. The park is co-located with a small skate park, community forestry project and a growing totem pole park. To increase the use and enjoyment of the park, MIC applied for and was funded by LWCF grant funds to install a pavilion for covered seating, benches, picnic tables and bbq pits. The second year, MIC applied and was funded for the addition of a children's playground at the site. The equipment was selected using community feedback from surveys and public outreach. As MIC is a tribal fishing community, the equipment will resemble a commercial salmon fishing vessel and incorporate native art forms where possible. The estimated cost for shipping and installation is greater than the grant funds, therefore MIC is pursuing optional ways to fund this project.	The Wil Maamxsga Pts’aan-Totem Park project has been collaborative with the community, especially the Mom’s on a Mission community-based organization and tribal leadership. Planning for the playground engaged the community on all levels and this anticipated children's playground will provide a safe, accessible outdoor play area for ages 2-12. MIC applied for funding from LWCF for the playground equipment and was awarded funds in 2025. Grant funds will cover the cost to purchase the equipment. The costs associated with rural Alaska shipping and transportation are so great that professional installation of the equipment will cost nearly as much as the equipment itself. To ensure the project will be installed in such a manner that it will last for decades, benefit the youth, children, elders and all Metlakatla families, the equipment needs to be installed professionally. This will increase the value and lifetime of the equipment. It is possible to install it using local labor, and we will employ local members. The warranty will be valid and extended if the professional, certified installing team is engaged.	\$50,000-\$250,000	Single Community	Prince of Wales-Hyder Census Area	Deferred or Not Advanced

Micah Hahn	Climate and Health Integration Blueprint to Strengthen Alaska’s Rural Health Transformation	AK	Climate-driven environmental change is already affecting the health of Alaskans in measurable and growing ways, including increasing wildfire smoke exposure, emerging extreme heat events, and disruptions to subsistence food resources. These changes are worsening chronic disease and increasing stress on mental and behavioral health. These pressures are also compounding challenges for rural health care delivery. Climate-related disruptions to travel - changing winter conditions, wildfire smoke, and extreme weather - are creating new barriers to care. Permafrost thaw, flooding, and erosion threaten facility stability and the water and sanitation systems that support care delivery. Surges in demand from extreme weather events are adding workload pressure to an already stretched rural workforce. Taken together, these trends are increasing health needs, complicating access to care, and straining the infrastructure that supports rural health delivery. As they intensify, the costs of maintaining rural health services will grow. The RHTP presents an unprecedented opportunity to modernize Alaska's rural health system. Integrating climate resilience from the start will help ensure new investments in workforce, technology, and care delivery function reliably under conditions Alaskans are already experiencing. Alaska is uniquely positioned to develop and test climate-resilient strategies, and to become a national leader in building rural health systems prepared for a changing climate.	This project will be led by Micah Hahn, PhD, MPH, an Alaska-based epidemiologist with 19 years of applied research at the intersection of climate and public health. Dr. Hahn has worked with Alaska Tribal health organizations and federal, state, and local agencies to develop surveillance systems for emerging climate-related risks, translate climate and health research into decision-relevant tools, educate veterinary, clinical, and public health partners, and support public-facing communication. Through this project, Dr. Hahn will develop a Climate and Health Integration Blueprint for the RHTP that identifies practical integration options to strengthen effectiveness, durability, and financial sustainability of current and planned investments across RHTP initiative areas under changing environmental conditions. The Blueprint will be developed through three core activities. First, a structured review of Year 1 RHTP-funded projects will identify where climate-related risks may affect proposed work and where existing investments can be strengthened through targeted integration of climate-informed approaches. Second, a scan of national and international efforts will identify implementation models that can be adapted to strengthen care delivery, system reliability, and long-term financial sustainability. Third, consultation with national leaders in climate and health system integration and technology partners will identify practical implementation pathways, partnership opportunities, and infrastructure needs relevant to Alaska’s rural health system. This work will be organized around three cross-cutting domains that support long-term success of RHTP investments: workforce preparedness; integration of climate/environmental data into care delivery and operations; and coordinated communication infrastructure to support timely response to seasonal and emerging risks. The primary Year 1 deliverable will be a Climate and Health Integration Blueprint identifying integration opportunities, key partnerships, infrastructure and data needs, and financing pathways to support sustained implementation. The Blueprint will include a menu of implementation options aligned with RHTP initiatives and a phased action plan to guide adoption over time. Together, these elements will provide a practical guide that strengthens current investments, supports coordinated system-level integration, and improves the long-term effectiveness and sustainability of Alaska’s rural health system.	\$50,000-\$250,000	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Microbion Corporation	Phase 3 Clinical Study Preparations for Topical Pravibismane to treat DFI in Rural/Frontier Alaska	MT	Diabetic foot ulcers (DFUs) and lower-extremity amputations (LEAs) represent major complications of diabetes, a significant public health concern among rural Alaska communities. Epidemiologic surveillance from Alaska indicates that the prevalence of diagnosed diabetes among Alaska Native adults increased from approximately 5.2% in 2009 to 6.3% in 2019, representing a 21% increase in disease burden and expanding the population at risk for complications including diabetic foot ulcers (DFU) and diabetic foot ulcer infections (DFI), and resulting limb amputations. As diabetes prevalence increases in the rural Alaska population, complications related to diabetic foot disease are also expected to rise. Research using Medicare cohorts of individuals hospitalized with DFI shows that approximately 7.7% of patients undergo major leg amputation within 30 days, and racial and ethnic disparities persist, with minority populations—including Alaska Native individuals—represented among patients experiencing adverse outcomes. Similarly, national analyses examining racial disparities in DFI outcomes report that native and rural patients with DFI have significantly higher risk of major amputations compared with White or urban patients, even after adjustment for clinical and demographic factors. Many rural Alaska residents have limited access to vascular surgery, podiatry services, and wound-care programs, necessitating innovative trouble-free approaches for self-administered home care.	Current clinical treatments for DFI frequently leads to lower-extremity amputations (LEA), and to a devastating 70% five-year mortality rate following major LEA. Leveraging our 25-year history which started in Alaska and continues to this day in Alaska, our existing Investigational New Drug application (IND) which is maintained with FDA, our completed Phase 1 and Phase 2 clinical studies; and our FDA Fast Track and QIDP designations, Microbion is ready to initiate Phase 3 Pivotal Clinical Study preparations. These preparations comprise the first year of this project, include finalization of our draft Phase 3 clinical protocol, completing necessary meetings with FDA, completing necessary preparatory CMC (chemistry, manufacturing and controls) activities, ensuring quality and adherence to Good Clinical Practices (GCP) guidelines, and manufacture of regulatory and clinical drug product batches for advanced Phase 3 clinical studies in Alaska. This project is ready for implementation, with clear scope, objectives, budget, and sustainability plan. In this project, we are ensuring adherence to required quality standards, as well as readiness for Phase 3 clinical studies for our limb-saving, and potentially life-saving, topical pravibismane drug product. Pravibismane continues to demonstrate potency against all tested antibiotic-resistant and multidrug-resistant (MDR) bacterial and fungal infectious pathogens. This project provides a "Made in Alaska" solution that targets the root causes of limb loss in rural Alaska and the Tribal Health System. This clinical drug development program focuses on development of topical pravibismane, which uniquely and effectively addresses many of the key challenges facing diabetic patients in rural Alaska. This innovative, clinical-stage, targeted locally-administered drug product is a patient-facing therapeutic tool that has demonstrated 100% median patient compliance to date in a Phase 2 clinical study (funded by the U.S. Navy MTEC program), and in which the majority of treatments were administered at home by the DFI patients themselves, or their home-based family caregiver; it does not require healthcare doctors or nurses to administer. It has consistently been demonstrated safe and well-tolerated in 6 distinct human clinical studies. Topical pravibismane is not absorbed into systemic circulation, and does not present risk of drug-drug interactions or off-target organ effects. It does not require cold chain transport or storage.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Microsoft	Rural Healthcare Hub	WA	Rural, remote, and frontier communities face persistent barriers to accessing high quality health care due to geographic isolation, workforce shortages, fragmented technology, and financial instability among critical access hospitals and clinics. Many providers operate with limited IT capacity and must independently procure, secure, integrate, and maintain clinical and administrative systems. This results in uneven adoption of telehealth, poor data sharing, administrative burden on clinicians, and delayed access to care for patients. At the same time, significant public investment and advances in digital health create an opportunity to transform rural care delivery. However, without a coordinated approach, rural providers risk duplicative costs, inconsistent standards, and unsustainable technology investments that strain already limited resources. This project addresses the opportunity to establish a centralized, standardized approach to onboarding and managing health care technology for rural providers. By reducing complexity, lowering total cost of ownership, and ensuring consistent access to interoperable, secure digital tools, the project enables rural organizations to focus on patient care rather than infrastructure. The result is improved access to services, higher quality and more coordinated care, and a sustainable foundation that strengthens rural health systems over time.	The proposed approach addresses this problem by establishing a centralized and standardized model for onboarding, managing, and supporting health care technology across rural, remote, and frontier providers. Rather than requiring each hospital or clinic to independently procure, integrate, secure, and maintain digital systems, the project creates a shared platform with common governance, security controls, interoperability standards, and operational support. This reduces complexity for individual providers while ensuring consistency and reliability across the rural health ecosystem. Through this central approach, participating providers gain rapid access to preconfigured and interoperable solutions such as telehealth, health information exchange, analytics, and administrative automation. Centralized onboarding shortens implementation timelines, lowers total cost of ownership, and ensures that privacy, cybersecurity, and regulatory requirements are applied consistently from the start. Standardized configurations and shared vendor management prevent duplication of effort and allow small rural organizations to benefit from the same level of technical rigor typically available only to larger systems. The approach also includes shared training, technical assistance, and change management to support adoption by clinical and administrative staff. By reducing reliance on scarce local IT resources, rural providers can focus their limited workforce capacity on patient care rather than infrastructure maintenance. Centralized support helps reduce clinician burnout by streamlining workflows, automating administrative tasks, and embedding digital tools directly into existing clinical processes. Scalability and sustainability are core design principles. Shared infrastructure and standardized workflows create economies of scale that make ongoing operations more affordable over time. Secure aggregation of data across participating providers supports care coordination, population health insights, and program evaluation while preserving local clinical autonomy and data governance. As efficiency gains are realized, savings can be reinvested into workforce development, expanded services, and continued technology modernization. By pairing centralized technology enablement with locally delivered care, this approach improves access to services, strengthens quality and coordination, and builds a durable foundation that rural health systems can sustain and evolve over time.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Midsouth Medicine	Scaling Multi-Modality Technology-Enabled Chronic Care to Improve Rural Health and Quality of Life	MS	Rural communities often face limited access to consistent care for chronic illnesses due to provider shortages, long travel distances, and geographic isolation. Many patients must travel hours for specialty care or delay treatment, which can lead to worsening health outcomes, preventable complications, and higher long term health costs. This project addresses that challenge by leveraging a patient care model that has already proven effective in rural settings for managing chronic conditions such as diabetes, cardiovascular disease, and other long term illnesses. By combining this established care approach with the expanding capabilities of telemedicine, the project can extend physician expertise into remote communities while allowing patients to receive care closer to home. Telehealth technologies enable regular follow-up visits, specialist consultations, and coordinated care with local providers without requiring frequent travel. Remote monitoring tools and virtual consultations also allow clinicians to track patient progress more consistently and intervene earlier when problems arise. Building on a model that has already demonstrated success in rural environments, the project creates an opportunity to scale access to high-quality chronic disease management while supporting the sustainability and capacity of rural health systems and strengthening care delivery for underserved populations.	Our approach combines modern health technology with established models of chronic disease management to create a care system tailored to the needs of rural and remote populations. Rather than building an entirely new framework, the project leverages proven approaches to managing chronic illness while adapting them to rural environments through the use of telemedicine and digital health tools. At the center of the approach is a hybrid care infrastructure that integrates telehealth consultations, remote patient monitoring, and collaboration with local health providers. Telemedicine allows patients in remote communities to connect regularly with physicians and specialists without the need for frequent long-distance travel. Remote monitoring tools can track key health indicators such as blood pressure, glucose levels, and other chronic disease markers, allowing clinicians to identify changes early and adjust treatment plans quickly. The care model emphasizes coordinated, patient-centered management of chronic conditions while also promoting overall health and prevention. Patients receive regular follow-up care, education, and support that help them better manage their conditions and maintain healthier lifestyles. By focusing on prevention, early intervention, and continuous care, the model aims to reduce hospitalizations and complications related to chronic disease. This infrastructure is designed specifically with rural populations in mind. It recognizes the realities of geographic isolation, limited provider availability, and smaller local health systems. By extending specialist expertise through technology while supporting local clinics and providers, the approach strengthens existing health services rather than replacing them. Ultimately, the project creates a scalable system that combines technology, established clinical models, and community-based care to improve access, strengthen chronic disease management, and promote long-term health in rural communities.	\$1M-\$5M	Family or primary care	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Mo On the Go Transport LLC	Rural Care Access Transportation Coordination for the Kenai Peninsula	AK	Rural communities across the Kenai Peninsula face significant barriers accessing timely healthcare due to long travel distances, limited transportation infrastructure, weather challenges, and gaps in coordinated non-emergency medical transportation. These barriers contribute to missed appointments, delayed specialty care, prolonged hospital stays, and avoidable emergency department utilization. Many Medicaid beneficiaries, Veterans, elders, and individuals with mobility limitations rely on consistent transportation to maintain continuity of care, yet rural options remain limited and fragmented. This project addresses the opportunity to strengthen transportation as a key component of rural healthcare delivery by improving coordination between transportation providers, healthcare organizations, and community partners. By expanding reliable ambulatory and wheelchair transportation and integrating transportation into discharge planning and care coordination processes, the project aims to reduce access gaps, improve preventative care utilization, and support more sustainable healthcare access for rural Alaskans.	The proposed approach focuses on strengthening coordinated non-emergency medical transportation (NEMT) as a core component of rural healthcare access across the Kenai Peninsula. The project will expand reliable ambulatory and wheelchair transportation while improving coordination with hospitals, clinics, case managers, and community partners. Key activities include developing consistent referral pathways, supporting discharge planning, and improving communication between transportation services and healthcare providers to reduce missed appointments and delays in care. The project emphasizes a flexible, locally based transportation model that integrates into existing healthcare workflows rather than operating separately from them. By supporting preventative care visits, follow-up appointments, and access to specialty services outside the region when needed, the project aims to improve continuity of care and reduce avoidable strain on emergency services. Early implementation will focus on strengthening partnerships, refining scheduling and coordination processes, and building a scalable approach that can expand as community needs grow.	\$50,000-\$250,000		Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Kenai Peninsula Borough	Deferred or Not Advanced

Mobilizing for Action Through Planning and Partnership	Regional RHTP Planning Project	AK	The opportunity is for MAPP to lead a coordinated, local convening process on the SKP over the next year. This will position our region to be more coordinated, efficient, and effective during the next four years of RHTP funding. Two key developments over the last year prepared MAPP to realize this opportunity: 1. MAPP engaged Bridges as a fiscal sponsor. 2. The MAPP Steering Committee (SC) adopted a new 2026–2029 Strategic Plan. In fall 2025, formally established as a project under Bridges, MAPP first secured a grant from the Homer Foundation to support a strategic planning process for the MAPP SC. That process produced three core strategies: 1. Expand the reach of MAPP. 2. Strengthen the community culture of collaboration. 3. Define and steward data collection and action processes. This Regional RHTP Planning Project is perfectly aligned with that second strategy. That strategy was further defined to “Support a “next-level” collaboration opportunity that includes partners within and outside of existing MAPP network”. As part of strategic planning, the MAPP SC defined “next level” collaboration as proactive, community centered, inclusive, replicable, and capacity building. This reflects our belief that the region is ready to scale collaboration to achieve deeper, more equitable health impacts. The SC set a specific goal “to identify and support one new community collaboration opportunity to pursue.” The RHTP Planning Project is that opportunity.	MAPP has already begun groundwork around the RHTP opportunity. MAPP hosted a local convening on January 28, and the MAPP Coalition Coordinator, along with partner organizations, attended the regional convening on February 13 at Central Peninsula Hospital hosted by 100% Communities. As a result of these early convenings, partners determined that, given the short initial timeline, organizations would pursue individual projects and funding in this first round. While there was intention toward alignment, no large, shared initiative was ready. This highlighted a clear gap, and opportunity, for more deliberate, regional planning and collaboration before subsequent RHTP funding cycles. Over the next year, MAPP will lead a structured planning process to: • Convene a broad set of community stakeholders (health care providers, Tribal entities, behavioral health, social services agencies, local government, and community based organizations). • Use existing and emerging data (including MAPP’s 2023 Community Health Needs Assessment South Peninsula Hospital’s forthcoming 2026 Community Health Needs Assessment), respond to key findings, and identify health improvement initiatives. • Co design one or more “next level” collaborative initiative that can be implemented and scaled during the remaining RHTP funding periods. MAPP has a long, successful history of facilitating community collaborations and systems change across the SKP and maintains a strong, active coalition. The Steering Committee represents a broad cross section of the community, including: Bunnell Street Arts Center; Church on the Rock; Homer Public Health; Homer United Methodist Church; Hospice of Homer; Kachemak Bay Family Planning Clinic; Kenai Peninsula College, Kachemak Bay Campus; Pratt Museum; Sprout Family Services; South Peninsula Haven House; South Peninsula Behavioral Health Services; South Peninsula Hospital; and SVT Health & Wellness. Beyond the Steering Committee, the MAPP Coordinator has engaged additional partners in this first RHTP round, including: Homer Cycling Club; Homer Hockey Association; Homer OPUS; Homer Senior Center; Independent Living Center; Kachemak Bay Recovery Connection; and Kachemak Swim Club. Through this inclusive, data informed convening and planning process, MAPP will move the region from loosely aligned efforts to a coordinated, rural health collaboration that can leverage future RHTP resources for maximum impact.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Deferred or Not Advanced

Moda	Advancing Value-based Payment Readiness through PCMH Implementation on the Kenai Peninsula	OR	Moda Health, Central Peninsula Hospital, and South Peninsula Hospital propose partnering with the Alaska Department of Health to establish a Medicaid coordinated care demonstration project on the Kenai Peninsula. While the Alaska Department of Health determines a path forward for a CMS 1115 waiver, this project will prepare both hospital partners to operate within a Medicaid coordinated care model and participate in advanced value-based payment arrangements. Additionally, drawing on Moda’s experience implementing Medicaid coordinated care models in other states, the project will help CPH and SPH transition away from fee-for-service and support the state in managing Medicaid cost growth in the region. This initiative brings together Moda Health, as state-wide Alaska payer with experience designing VBPs across commercial and Medicaid programs, and two essential rural hospitals that provide emergency, primary, and specialty care in the Kenai Peninsula. Together, partners will design and test new VBP models that will strengthen foundational quality improvement infrastructure, expand reporting capacity, and support practice transformation through implementation of the NCQA Patient-Centered Medical Home (PCMH) model, which has been shown to improve quality of care, support chronic disease management, increase patient and provider satisfaction, improve quality metric performance, and lower overall cost of care (ncqa.org).	The proposed project supports Goal 2: Building Sustainable Outcomes-Driven Health Systems through the Pay for Value Initiative by advancing pay-for-value readiness on the Kenai Peninsula through implementation of the NCQA Patient Centered Medical Home (PCMH) model at Central Peninsula Hospital and South Peninsula Hospital’s primary care clinics. Moda Health will serve as the project convener, payer partner, technical assistance provider, and grant administrator, and will leverage extensive experience designing and implementing VBPs across multiple markets. Both hospital partners will receive upfront foundational capacity building payments to support PCMH implementation and develop the infrastructure needed to participate in more advanced value based payment arrangements over time. This proposal aligns with Alaska’s proposed use of funds to launch transitional grants to support the adoption of VBP arrangements, support VBP infrastructure, and provide TA to support Pay for Value projects. All project activities are designed to strengthen the foundational capabilities required for long term financial stability of rural providers and to support the transition to alternative payment models that support improved care coordination, behavioral health integration, chronic disease management, and quality improvement activities. The project is structured around the nationally recognized Health Care Payment Learning and Action Network (HCP LAN) Alternative Payment Model (APM) Framework, which provides a clear, phased roadmap of participation in advanced VBP pathways (https://hcp-lan.org/apm-framework/). This progression aligns with and will help partners prepare for Alaska’s planned 1115 Medicaid Waiver. In Year 1, Category 2A foundational payments and more advanced per-member-per-month (PMPM) payments will support PCMH implementation and three critical focus areas: behavioral health integration (BHI), community health worker (CHW) integration, and development of robust quality improvement (QI) infrastructure. Together, these investments will strengthen care coordination, expand community clinical linkages, enhance quality reporting capacity, and build the operational readiness required to move from foundational payments toward more advanced pay for performance arrangements, allowing partners to participate in more advanced VBPs based on readiness. Montis Corporation	Every Flight Matters: Improving Rural Health Outcomes in Alaska with Real-Time Weather Visibility	AK	Alaska’s aviation system is crucial to providing quality, affordable health care to rural communities across the state. However, frequent flight delays and cancelations limit patient and provider access, delay medication deliveries, and impose high costs on those seeking routine, urgent, and emergency health services. AWOS/ASOS outages are a leading cause of flight delays and cancellations. Less than half of all public-use airports in Alaska have adequate weather coverage, hindering pilots’ ability to fly under instrument flight rules. As FAA logs show, on an average day, one in three stations suffer an outage. As the Alaska Legislature found in 2024: “Station outages disrupt the critical flow of passengers and goods, create risks to human life and health in medical emergencies, and delay essential medication deliveries.” Despite multiple efforts to address the problem, missing weather data remains the single greatest challenge to Alaska’s aviation system. That is largely due to cost. An AWOS/ASOS costs \$2 million and takes 2-3 years to install in Alaska due to complex siting requirements. With only 2-3 stations built per year, it will take more than \$500 million and 100+ years for the FAA to install stations at the 257 airfields without coverage in Alaska. Meanwhile, rural Alaskans seeking access to quality, affordable health care continue to suffer. Improving rural air service thus presents one of the best opportunities to improve health outcomes statewide.	"Every Flight Matters" advances a commercial approach to aviation weather—as Congress encouraged in the FAA Reauthorization Act of 2024. In partnership with the State of Alaska, regional organizations, air carriers, and local communities, Montis Corp will install and maintain low-cost, ultra-reliable weather stations in tough-to-reach places, thus fixing a known problem in Alaska’s aviation system that directly contributes to poor health outcomes statewide. Our approach is built on the MWOS. Designed by Walter Combs, a 27-year FAA veteran, the MWOS is a self-contained system providing real-time visibility and weather data to pilots, flight dispatchers, healthcare providers, and community members at 1/100th the cost of an AWOS/ASOS. With minimal power requirements and 24/7 satellite or cellular (LTE) connectivity, it can be installed and online in less than 8 hours. In partnership with the State of Alaska, regional organizations, air carriers, and local communities, we propose to identify and install MWOS units at high-priority locations where missing weather data contributes to frequent flight cancellations and delays. That is, airports without existing weather coverage but also rural clinics, community centers, and even remote mountain passes—all places where government-owned stations are unlikely or unable to go in the coming years. Priority sites will be selected based on input from our partners, with an emphasis on communities served by tribal health organizations, medevac operators, and Essential Air Service carriers. For each site, we will collect baseline flight data prior to installation so that improvements can be measured over the lifetime of the project. During installation, we will work with community members to ensure the purpose of the MWOS is understood and supported by the people it serves. We named this project Every Flight Matters because in rural Alaska, every flight does. Even a single cancelled or delayed flight can mean a missed diagnosis or treatment, an expired medication, or a patient who doesn’t reach the hospital in time. As outlined above, our approach puts field-tested, affordable technology where it is needed most – in the hands of pilots, providers, and community members who will use it every day.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Mountain Pacific Quality Health	Transform Cardiometabolic Care for Alaskans Via Interoperable Systems & Pharmacy Enabled Prevention	MT	Through partnerships with the Alaska Pharmacy Association, the American Pharmacists Association Foundation, the Alaska Hospital and Health Association, and healthEconnect, this initiative will implement a proven model for cardiometabolic risk reduction across the state. By expanding clinical pharmacy services, the project will support high risk, dual eligible individuals through prevention, early detection, and enhanced transitions of care interventions. These efforts will strengthen Alaska’s rural health ecosystem by improving care coordination and communication between primary care providers and an underutilized but highly accessible healthcare resource—rural pharmacists. These partners have been intentionally convened to drive broader, system level improvements that include: • Increased patient access to care through expanded telehealth capabilities and pharmacist provided clinical services. • Greater use of accurate, up to date medication lists across care settings to improve safety and continuity of care. • Higher patient engagement with interoperable electronic health record (iEHR) portals, ensuring patients and care teams have reliable access to essential health information. Together, these coordinated efforts will advance a more connected, efficient, and patient centered healthcare system for rural Alaskans.	Mountain Pacific will serve as the primary administrator and project manager for the program to ensure alignment of priorities, collaboration and quick action throughout the state. Mountain Pacific will partner with the Alaska Pharmacy Association, the American Pharmacists Association Foundation, Alaska Hospital and Health Association, and healthEconnect to launch the IMPACT Cardiometabolic Risk Reduction initiative which will implement a population health, patient-centered, team-based care model to include pharmacists to enhance primary care in rural geographies throughout Alaska. Our goal is to engage over 60 community pharmacies across Alaska, ensuring broad, statewide impact. Technologies will be leveraged to improve efficiency, enhance cybersecurity capability development, and improve patient health outcomes as well as to promote sustainable access to high quality rural health care services. The American Pharmacists Association Foundation and Alaska Pharmacy Association will deploy established implementation-ready programs that have demonstrated benefit in cardiometabolic risk reduction. Services will expand access in medically underserved rural communities by providing pharmacist led cardiovascular, prediabetes, and diabetes care. Participating pharmacies will serve as access points for screening, detection, referral, prescribing, prevention, and collaborative patient care management. Activities include screening for Social Determinants of Health (SDOH), atrial fibrillation, and stroke risk, with patients enrolled into one or more tracks: • Atrial fibrillation and stroke risk referral: Pharmacist screening plus a comprehensive medication review to identify cardiovascular related medication problems. • Continuous Glucose Monitoring (CGM): Support obtaining devices, applying sensors, interpreting patterns, preventing hypoglycemia, and understanding food, medication, and activity impacts. • Medication Therapy Management (MTM): Comprehensive medication reviews shared with primary care providers. • Transitions of Care (TOC): Post discharge medication reconciliation to resolve issues common during care transitions. • Lifestyle change program: Enrollment in the CDC recognized National Diabetes Prevention Program through the American Pharmacists Association Foundation’s Umbrella Hub Organization, enabling pharmacies to deliver services with centralized administrative support.	Over \$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Lake and Peninsula Borough; Matanuska-Susitna Borough; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Yakutat (City and Borough); Yukon-Koyukuk Census Area	Advance to Implementation Application

Mountain Pacific Quality Health	Building Sustainable Health Outcomes Through Provider Incentives and Technical Assistance	MT	Participation in Alaska’s Fresh Start program offers significant benefits including improved health outcomes such as meaningful weight loss, blood pressure reduction, and better blood sugar control. By pairing stipends with robust technical assistance (TA), providers are better positioned to connect their communities to these proven benefits while sustaining high-quality program delivery over time. However, community clinics, primary care practices and other providers often face major barriers when adopting new health-support programs, including limited staff capacity, onboarding time, data reporting demands, and workflow integration challenges. Providing stipends or site funding helps reduce these burdens by compensating providers for time spent on training, implementation, outreach, and reporting, while also offsetting operational costs such as staff hours, IT needs, and participant engagement activities. This financial support makes participation more feasible for small or rural sites and encourages early adoption and long-term involvement. The role of TA equips providers with the skills, guidance, and operational support necessary to implement programs effectively, improving confidence, smoothing workflow integration, and reducing uncertainty. By offering hands-on training, implementation support, technology and data guidance, and ongoing quality-improvement coaching, TA strengthens program fidelity and builds lasting provider capacity.	To expand the reach and impact of the Fresh Start program across Alaska this project will combine provider stipends/site funding with comprehensive, hands-on technical assistance (TA). Our project is designed to lower participation barriers, strengthen provider capacity, and ensure long-term sustainability in delivering evidence-based chronic disease prevention and management programs. Provider stipends/site-based funding will offset the time, staffing, and administrative effort required for onboarding, outreach, participant engagement, and data reporting. By reducing the financial burden on clinics these stipends make participation feasible, especially for rural and smaller organizations. Funding allows providers to dedicate staff time, integrate workflows, adopt necessary tools, and maintain steady engagement throughout the program cycle. Alongside this financial support, our organization will deliver technical assistance that ensures providers have the knowledge, resources, and support necessary for high-quality implementation. TA will begin with thorough onboarding and training, orienting providers to program goals, workflows, and best practices while offering both live and virtual options to accommodate varying schedules and bandwidth. During implementation, we will provide site-specific support to align program activities with each provider’s capacity and operational structure. This includes troubleshooting enrollment challenges, adjusting workflows, and helping integrate Fresh Start activities into existing systems in a way that is realistic and sustainable. We will also offer technology and data assistance, ensuring providers can effectively use digital platforms, reporting tools, and participant-tracking systems. Templates, streamlined data processes, office hours, and rapid-response help will make reporting more manageable and improve data quality. To maintain strong outcomes over time, providers will benefit from ongoing quality improvement and coaching, including regular check-ins, barrier assessment, problem-solving support, and access to best-practice guidance and toolkits. This continuous improvement process strengthens fidelity and builds long-term capacity within each site. Together, this integrated approach ensures providers have the financial resources, operational supports, and expert guidance needed to deliver Fresh Start programming effectively and sustainably ultimately improving health outcomes across Alaska.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Mountain View Community Mental Health and Recovery Center LLC	Low-Barrier Clubhouse & Integrated Behavioral Health Program	AK	Alaska continues to experience some of the highest rates of suicide, addiction, and untreated mental illness in the nation, yet many residents are unable to access timely, coordinated care. Individuals in both urban and rural communities frequently fall through gaps created by transportation barriers, limited psychiatric availability, stigma, and fragmented service systems. This project addresses that opportunity by creating a low-barrier, integrated behavioral health program that offers walk-in access, Nurse Practitioner -led clinical services, peer-driven recovery support, and a clubhouse model that fosters community, purpose, and long-term stability. By reducing structural barriers and providing a welcoming, coordinated point of care. The program also aims to reach individuals who are currently underserved and at high risk for crisis, hospitalization, or homelessness.	Our approach centers on delivering accessible, person-centered behavioral health care that meets individuals where they are. The program combines outpatient therapy, case management, recovery support, and emerging services such as group therapy, medication management, and individual psychotherapy to create a comprehensive continuum of care. All services are grounded in trauma-informed and culturally responsive practices, ensuring that clients feel safe, respected, and empowered throughout their treatment. To strengthen coordination and reduce gaps in care requires to maintain strong partnerships with community providers, enabling warm handoffs, shared care planning, and integrated support for individuals with complex needs. This collaborative, whole-person approach allows the program to address mental health and substance use challenges simultaneously, improve engagement, and promote long-term recovery and stability.	\$1M-\$5M	Behavioral health/substance use disorder treatment	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Mountain View Health Services	Mountain View Health Services Mobile Health Services and Sustainability Project	AK	Mountain View Health Services (MVHS) has served as the healthcare access point for integrated primary care, urgent care, behavioral health for people experiencing barriers that prevent access to traditional health care for many years. We have experienced sustained financial losses after COVID due to: high overhead (lease, utilities, insurance), under-reimbursement with a high percentage of self-pay population, highly -complex patient population, uncompensated care, and workforce recruitment and retention challenges. The continuation of the current model is not financially sustainable and we anticipate closing our physical clinic location at the end of this month.	1. To preserve access to care for Mountain View and surrounding high-need populations—including individuals experiencing homelessness, serious mental illness, and substance use disorders—MVHS plans to close its clinic location and transition to a fully mobile and home-based integrated health care model. MVHS requests technical assistance, planning support, and funding to help us transition from a high-overhead fixed-site clinic to a low-overhead 100% mobile health and home-based delivery model offering integrated medical care and behavioral health. RHTP funding is requested to support: salaries and protected time for MVHS staff to conduct the planning and redesign work, start-up costs associated with mobile health infrastructure, financial modeling and sustainability planning, and operating expenses during transition. 2. To address the underlying issue of lack of viability of the clinic, we need help with developing a sustainable financial strategy, exploring partnerships and alternative payment models, and right-size services for long-term sustainability of a "brick and mortar" clinic.	\$250K-\$1M	Clinic	Single Community	Anchorage (Municipality)	Advance to Implementation Application

Mountain View Health Services	Mountain View Health Services Early Life Wellness Pilot	AK	Underserved communities like the Mountain View neighborhood experience disproportionately high rates of maternal tobacco and substance use, perinatal depression, housing instability, food insecurity, and early childhood developmental delays. Yet preventive services during pregnancy and the first five years of life remain fragmented, grant-funded, and workforce-limited. Many communities lack consistent access to behavioral health providers, pediatric specialists, and home visiting programs. As a result, risks go unidentified until crisis points child welfare involvement, emergency behavioral health care, and preventable chronic disease. Existing systems (tribal health, public health nursing, early intervention, WIC, schools) may often operate in silos and are often not structurally able to deliver Medicaid-billable prevention services. There is an opportunity to redesign the system by creating a Medicaid-enrolled Early Life Community Health Worker (Home-visitor) provider type to deliver evidence-based perinatal and early childhood prevention services under clinical supervision. This pilot would demonstrate a way to expand the rural workforce, integrate services across sectors, and establish a sustainable financing model that shifts Alaska’s maternal and early childhood health system from crisis response to prevention and early intervention.	Our project will pilot a new Medicaid-enrolled Home-Visitor: the Early Life Community Health Worker (EL-CHW). This paraprofessional workforce will be specially trained in maternal and early childhood health from conception through age five and will deliver structured, evidence-based prevention home-visit and community-based services under clinical supervision from a local healthcare organizations. The project will work with the State to establish a Medicaid enrollment category, fee schedule, supervision standards, and regulatory framework to support billing for defined preventive services. EL-CHWs may bill independently once accredited or operate within a Medicaid-enrolled healthcare group. A standardized education and credentialing pathway will prepare EL-CHWs in human development, perinatal depression screening, SBIRT, substance use and tobacco cessation counseling, nutrition education, trauma-informed care, and Medicaid documentation compliance. The pilot EL-CHWs will deliver Medicaid-billable services in homes, shelters, schools, and community settings. Services will include home visiting for prevention and early education, behavioral health screening and brief intervention, recovery and drug-use prevention counseling, care coordination, goal-setting, transportation and housing support coordination, Medicaid enrollment assistance, and warm handoffs to medical and behavioral health professionals. Services will be tied to measurable outcomes and aligned with evidence-based practices. The model is designed to integrate into existing systems rather than duplicate them. EL-CHWs can be embedded within existing organizations like schools and non-profits serving people experiencing homelessness.. This strengthens cross-sector coordination while allowing communities to tailor services from a defined menu of reimbursable interventions based on local needs. Financial sustainability is central to the approach. By establishing a Medicaid-financed prevention model, this pilot shifts early life services from grant dependence to a durable reimbursement structure. Over time, early identification and intervention are expected to reduce high-cost utilization, including neonatal intensive care, behavioral health crises, and child welfare involvement. This approach builds a scalable, community-based prevention infrastructure that improves maternal and early childhood outcomes while creating a sustainable financing pathway for rural, remote, and frontier Alaska.	\$250K-\$1M	Clinic	Statewide	Anchorage (Municipality)	Advance to Implementation Application

Mountain View Health Services	Mountain View Health Services Youth Prevention Health Worker (YPHW) Pilot	AK	Rural Alaskan communities are home to resilient and healthy populations that thrive in remote and extreme environments. Despite the general health and resilience of the population, many Alaskan youths suffer from the same lifestyle afflictions of obesity, prediabetes, cardiovascular risk factors, depression, anxiety, and substance use as other youth nation-wide. Yet broad societal forces and remote locations have limited some communities' (and neighborhoods') access to health-specific mentors and role models as well as access to structured physical activity, nutrition education, and behavioral health programming and supports. Schools often lack year-round prevention capacity, homeschool families have fewer organized wellness resources, and many communities lack dual-purpose spaces to host extracurricular recreation and resilience-building programs. Many components of our current healthcare systems are still largely reactive, addressing disease after onset rather than building lifelong habits early.	We propose establishing a workforce of Youth Prevention Health Workers that are embedded across healthcare organizations, school districts, homeschool networks, Tribal communities, and community organizations. The program is modeled after Alaska’s CHAP system and incorporates evidence-based home-visiting and CHW models, with broad adaptability based on community input. Tribal organizations and community organizations hire YPHWs and with the support of a state-wide TA network, and create unique community-based youth prevention programs. The project creates a new Medicaid billing provider, a menu of billable preventative services, and a training and support network with input from Tribal health experts as well as national and local experts. There is a priority given to input from local, rural communities. YPHWs will be trained in a variety of evidence-based prevention services including: physical activity programming (including Presidential Fitness metrics and strength/endurance training); nutrition education; family-based behavior change strategies; cardiovascular and metabolic screening (BMI percentile, blood pressure, risk assessment); evidence-based resilience and social-emotional skill building; and family engagement and motivational interviewing. YPHWs will not be tied to school employment, ensuring year-round availability and broader community reach. Programming will integrate in-school modules, after-school and homeschool programming (sports and employment conditioning, healthy meal opportunities, family fitness nights), home-visiting, and culturally-appropriate family-based prevention interventions adapted from evidence-based programs. Workforce will prioritize local hire, but include itinerant workers from non-rural areas as needed to support workforce needs and prioritize rural delivery. Minor modifications to community centers or gyms may be needed to create dual-purpose spaces. Mental and behavioral health prevention services and supports will include structured resilience curricula, peer connection activities, screening for depression/anxiety, and warm handoffs to clinical services when needed. Supervision by Tribal entities will ensure cultural relevance and local control. Supervision will combine digital tools, regular coaching, and quality improvement processes. The project intersects with Healthy Communities by linking youth programming to community-wide physical activity infrastructure, food systems access, and behavioral health supports.	\$250K-\$1M	Clinic	Statewide	Anchorage (Municipality)	Deferred or Not Advanced

Mountain View Hope Covenant Church	Mountain View Hope Center: A Community Hub for Health, Stability and Connection	AK	Mountain View is a diverse neighborhood in Anchorage where many residents face significant barriers to stability and well-being, including food insecurity, housing instability, behavioral health challenges, and social isolation. Despite the strength and resilience of the community, there are few consistent, low-barrier spaces where neighbors can gather, access basic needs, and connect with supportive services. Anchorage also serves as a regional hub for Alaskans traveling from rural communities to access medical care, behavioral health services, and other supports that may not be available in their home communities. For some individuals, these trips become complicated by housing instability, behavioral health challenges, or lack of resources to safely return home, leaving them without strong support networks while navigating care in the city. The Mountain View Hope Center is a space that strengthens community health by establishing a welcoming neighborhood hub where individuals can access basic needs, build relationships, and connect with the services and support systems that contribute to long-term well-being.	The Mountain View Hope Center will establish a welcoming, community-centered hub in the Mountain View neighborhood where residents and visitors can access meals, gather in a safe and dignified space, and connect with supportive services. The project will focus on creating a consistent place of belonging where people can build relationships and access resources that support health and stability. Initially, the Hope Center will focus on meeting basic needs by providing community meals, snacks, and a safe, warm gathering space where neighbors can connect and find support. The center will work in partnership with local food providers and community organizations to ensure reliable access to meals and essential resources while avoiding duplication of existing services. Over time, the Hope Center will expand partnerships with local service providers to offer additional supports such as resource navigation, connections to behavioral health services, financial coaching, and educational opportunities. By providing a consistent place for connection and early support, the Hope Center also has the potential to reduce reliance on strained systems such as crisis care, emergency departments, shelters, and law enforcement. Community-based gathering spaces that address basic needs and support social determinants of health can help stabilize individuals earlier and improve engagement with health and behavioral health services. In this way, the Hope Center contributes to a stronger, more robust and coordinated community health ecosystem.	\$250K-\$1M	Single Community	Anchorage (Municipality)	Deferred or Not Advanced

Mountain View Lions Club Foundation	Lions Club Free Health Clinic	AK	The largest obstacles in Alaska are the cost of healthcare and the accessibility of it. A single person qualifies for Medicaid if they make less than \$23,000/year. Someone who works a full-time job at minimum wage in Alaska is over that limit. As public healthcare options require \$700 premiums (now that subsidies have lapsed) and \$7,000 deductible at the cheapest program, healthcare costs at 10% of annual income (according to IRS affordability measures by the Affordable Care Act) means that someone must make \$154,000 to have their public insurance option deemed as "affordable". There is a huge gap of people who simply cannot afford care, deferring treatment and causing climbing costs. That is dependent on whether finding a clinic accepting new patients is plausible in a timely manner, or one who accepts insurance at all. As of 2021, our state ranks last in individuals accessing preventative clinical services and having a dedicated health care provider. We are 31st in avoiding care due to cost. Only six states have a higher percentage of uninsured residents. The US Institute of Medicine issued several reports in the early 2000s concluding that being uninsured is seriously hazardous to American health outcomes. A more recent (2014–2018) Commonwealth Fund survey discovered almost half of underinsured adults report medical bill and debt problems and 41% delay necessary care because of costs.	The goal of the proposed free healthcare clinic is directed toward Alaskans who: 1. Are “insured” yet cannot afford to access services because of high deductibles/copays. 2. Do not qualify for health care because they fall outside income or age thresholds. 3. Avoid the hassle of engaging with the healthcare system unless they are in acute need. Our approach is through multiple nonprofit and clinical partnerships to provide free popup clinics at various times of the year. Through various groups like Mobile Medics International and Remote Area Medical, we will host the largest multidisciplinary free pop-up health services clinics ever held in the state. These 2-day events in Anchorage and Fairbanks will provide hundreds of Alaskans with free, proactive health care services (dental, vision, mental, medical) by volunteer clinicians so they can get help now with undiagnosed, debilitating or life-threatening physical/behavioral health issues — regardless of ability to pay. This has proven immensely beneficial. Since 2023, these Alaskan pop-up clinics have provided almost a half million dollars of free healthcare, glasses, labwork, and medications for over a thousand Alaskans. Federally Qualified Health Clinics offer low-obstacle sliding fee services, but Alaskan FQHCs are overwhelmed and often have up to a 9-month waitlist for care. Our unique clinic model completely removes all barriers that stop so many Alaskans from accessing care — in particular 1) high deductibles/copays, 2) falling outside income/age thresholds for free coverage, and 3) “powering through” without preventive care until issues become intolerable. Our free clinics offer pro bono care — for all. Without funding these pop-up clinics for labs, disposables, venues, logistics, and lodging, dependence on expensive reactive treatments such as ER visits for urgent complications will remain a statewide trend. By addressing the acute need for free proactive health services to identify and treat issues early, we can improve health outcomes for hundreds of our friends, families, and neighbors. Due to extraordinary in-kind community and partner support, we will deliver these clinics for only one-fifteenth of the total cost. Today’s health care system is largely reactive and avoids addressing issues until a crisis situation demands an immediate response. These clinics are a pressure relief valve — care that changes things for struggling people NOW.	\$50,000-\$250,000	Other	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough	Deferred or Not Advanced

MPS Enterprises, LLC	Nome Nugget Inn Rural Health Housing Conversion (Planning Phase)	AK	The opportunity is to convert an existing, centrally located hotel into dedicated rural health lodging at a moment when Nome’s housing market cannot meet health-system demand. The Nome Nugget Inn is a known facility that underwent significant renovations in 2024, yet it has been closed since early 2025 and is not currently serving the public. Without intervention, this asset will remain underutilized while the regional health system and traveling patients continue to compete for scarce short-term rentals and limited hotel rooms. The problem is straightforward and urgent: lack of safe, consistent, and affordable lodging is a binding constraint on rural health care delivery in the Bering Strait/Norton Sound region. It limits recruitment and retention of temporary and permanent clinical staff, increases travel-related costs for providers and health organizations, and creates a barrier to care for patients who must travel for services that often require multi-day stays, including specialty consults, infusion, wound care, prenatal monitoring, imaging, and post-operative follow-up. This LOI proposes owner-led planning to reposition the Nugget as dedicated workforce and patient/escort lodging. The project leverages an existing structure to address an identified regional bottleneck and aligns with RHTP’s purpose by strengthening access to needed services, improving continuity and quality of care for rural residents, and increasing sustainability of the regional workforce pipeline.	We are requesting RHTP Planning Grant support to complete the due diligence and predevelopment work needed to renovate and reopen the Nome Nugget Inn as dedicated lodging for the rural health workforce and for traveling patients and escorts. The planning phase will deliver a feasible, code-compliant, partner-informed package that is ready for an RHTP implementation application. As the property owners, we can provide immediate building access, coordinate directly with qualified contractors and regulators, and ensure planning decisions support long-term stewardship. Planning will confirm technical feasibility, scope, cost, and operating requirements. We will complete engineering review and architectural programming to adapt the building from short-stay hotel use to longer-term workforce and patient-stay needs, including privacy, accessibility, durable finishes, storage, and practical shared amenities. We will obtain contractor assessments and detailed estimates for priority mechanical work, with emphasis on comprehensive plumbing repairs needed for reliable year-round operations. We will also complete life-safety and accessibility planning, including design requirements for a unified fire alarm and fire suppression system, egress, and permitting steps, coordinating early with the City of Nome to reduce redesign risk. In parallel, we will work with Norton Sound Health Corporation and other stakeholders to define an operating model that is workable in Nome, including referral and eligibility criteria, booking processes, safety policies, staffing and management needs, and an affordable, sustainable rate structure. Planning will culminate in an implementation-ready scope, budget, schedule, and business plan/pro forma (including utilization assumptions and a maintenance/capital reserve strategy) that reduces risk for funders and partners and positions the project to improve rural access and workforce stability.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Nome Census Area	Deferred or Not Advanced

Mt Edgecumbe Preschool Inc	Mt. Edgecumbe Preschool and Sitka Pioneer Home Strengthening Workforce	AK	The Sitka Pioneer Home is an assisted living program. Situated in rural Sitka, Alaska, the Pioneer Home employs nurses, doctors, and other medical specialists, as well as administrative staff, activities coordinators, janitorial workers, kitchen employees, maintenance workers, and more. All of these positions allow the Sitka Pioneer Home to function well in order to appropriately care for all of its residents. However, it has been challenging to find qualified applicants to fill all the positions at the Sitka Pioneer Home, and one barrier to finding quality healthy care employees to work at the Sitka Pioneer Home has been the lack of available childcare in Sitka. Additionally, Mt. Edgecumbe Preschool, a 501(c)3 nonprofit preschool residing on the Sitka Pioneer Home campus, struggles to retain high quality teachers due to the high cost of living in Sitka and the inability to increase wages without increasing tuition. A Memorandum of Agreement already exists between the two organizations. An opportunity exists for Mt. Edgecumbe Preschool to give preferential preschool placement for the children of Sitka Pioneer Home employees, as well as to increase the wages and professional development for teachers to keep offering high quality early childhood education, ensuring this preschool is a desirable place for parents to send their kids. These measures would strengthen the workforce at both organizations and improve quality of health care for Sitka Pioneer Home residents.	Mt. Edgecumbe Preschool and Pioneer Home have an existing Memorandum of Agreement allowing Mt. Edgecumbe Preschool to use the building in exchange for regular positive interaction with Pioneer Home residents. The preschool resides on the Sitka Pioneer Home campus, allowing easy access for parents to drop their children off and pick them up from preschool. Mt. Edgecumbe Preschool could give preferential placement of preschool-aged children of Sitka Pioneer Home employees, with spaces reserved for children of Sitka Pioneer Home staff. Administrators from both organizations would meet to discuss logistics, create a plan, and take steps to implement the plan. Ideally, the plan would be put into action by the beginning of the coming school year. Funds would be put toward administrators' time planning and coordinating this partnership; increasing Mt. Edgecumbe Preschool teachers' wages and professional development compensation to ensure a high quality of early childhood education is provided; expanding the Mt. Edgecumbe Preschool scholarship fund to decrease the financial barrier of tuition and improve access to care; and potentially hiring another preschool teacher to expand preschool hours so as to align with the medical staff shifts at the Sitka Pioneer Home.	\$50,000-\$250,000	Single Community	Sitka (City and Borough)	Advance to Implementation Application

Mt. Sanford Tribal Consortium	Securing Fiscally Sustainable Healthcare For Future Generations of Upper Ahtna Indigenous People	AK	Mt Sanford Tribal Health Consortium - located 4 hours northeast of Anchorage - serves an Alaska Native (AN) frontier community that has declined from 200 residents to approximately 60 in two decades. The current population is primarily elderly. We face structural fiscal instability driven by low patient volume and a fee-for-service reimbursement model that does not function in ultra-low-density settings. Annual revenue has averaged ~\$120,000 and only reached break-even when supplemented by itinerant provider services. Medicaid reimbursement is capped by provider type. When the Consortium had a Nurse Practitioner on staff, billing capacity ranged from approximately \$100,000 to \$120,000 annually. Following the loss of the NP, the clinic now relies on two CHAs, who generate approximately \$41,000 each per year under current billing rules, reducing total billing capacity to roughly \$82,000. In addition, elders who are not Medicaid-eligible require uncompensated care, creating further financial pressure. The Consortium lacks third-party insurance contracts, diversified payer sources, and operating reserves, leaving no margin for recruitment, infrastructure investment, or service expansion. Rural health policy literature consistently notes that the current model is poorly suited to very small or frontier providers with low patient volume. Without a structural redesign, the Consortium risks losing its ability to maintain even basic healthcare access for residents.	Following RHTP Initiative 4, this project will protect healthcare access by transitioning Mt. Sanford Tribal Health Consortium from a fragile encounter-based billing model toward a sustainable value-based care approach supported by APMs. 1. Fiscal Solvency and Care Model Realignment We will conduct a comprehensive fiscal sustainability and care delivery assessment to determine the most viable long-term operating model. This analysis will evaluate whether Mt. Sanford should function as: (1) a direct primary care provider with limited on-site services; (2) a coordinated access and transportation hub connecting residents to Anchorage or regional providers; or (3) a hybrid model combining local stabilization services with structured referral and care coordination. Financial modeling will assess the sustainability of each option under alternative payment pathways, including population-based payments, care coordination reimbursement, and access-based payments designed for low-volume frontier systems. Engage with regional Tribal Health Organizations and referral partners ensuring the selected model strengthens integration with the broader Alaska Tribal Health System. 2. Alternative Payment Model Development Working with technical advisors and payer partners, the project will complete a formal APM Readiness Assessment evaluating payer mix, cost structure, service capacity, and eligibility for participation in value-based or CMS-aligned arrangements. Based on this, the project will produce an APM Implementation Plan outlining how the Consortium can transition to voluntary alternative payment models beginning in Year 2. Potential payment structures include per-member-per-month payments for defined populations, bundled reimbursement for chronic disease management, care coordination payments tied to referral management, and value-based reimbursement supporting transportation-enabled specialty and behavioral health access. 3. Workforce Sustainability Aligned to the Care Model We will align staffing with the redesigned care and fiscal models to ensure long-term sustainability. This includes evaluating CHA and BHA roles, developing financially viable recruitment and advancement	\$50,000-\$250,000	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area	Advance to Planning

pathways, and strengthening attraction and retention strategies through employer branding and workforce planning. Aligning workforce structure with stabilized reimbursement pathways will reduce burnout risk and ensure staffing models match the realities of serving a small frontier population.

Municipality of Anchorage	Municipality of Anchorage: Connecting Crisis Care and Safety Net System to Rural Healthcare	AK	The Municipality of Anchorage (MOA) has a significant population of individuals and families with complex health and social needs including trauma histories, behavioral, physical, cognitive and functional impairments, high risk of infectious disease, and food and housing insecurity. This includes a high proportion of people from rural Alaska and Alaska Native individuals and families who come to Anchorage for health care and other services. The MOA is a healthcare hub that serves individuals from all regions. MOA’s Crisis Care and Safety Net System serves this priority population through coordinated emergency dispatch, crisis response, relentless engagement, low-barrier shelter, mobile and facility-based behavioral and physical health care, WIC nutrition support, infectious disease screening and treatment, and supportive housing. Our teams often serve the same individuals without the basic tools to coordinate care, improve outcomes, sustain services, capture data, or connect with each other, Tribal health organizations, healthcare providers, and partners. We have No shared client records No enhanced triage or assessment No bed registry for treatment or shelter No electronic referral or intake No billing or other revenue generation to sustain services No care coordination or secure communication among teams or with providers No ability to identify and track individuals in need of or receiving infectious disease screening and treatment No accurate data monitoring	MOA will procure and implement appropriate technology and test pilot approaches to integrate health and social supports to coordinate care, improve outcomes, sustain services, capture data, and connect clinical teams with local healthcare providers, rural Tribal health organizations, and other partners. Objectives: I. Enhance triage and emergency dispatch to identify alternative destinations and referrals where EMS ambulance response is not appropriate II. Establish interoperable client records for dispatch and clinical teams at MOA departments: Police (APD), Fire (AFD), and Health (AHD) -Procure and implement technology for screening and assessment tool connected to client records -Facilitate referrals, care coordination, and secure communication, between dispatch, clinical teams, physical and behavioral healthcare, and shelter, assisted living and housing providers III. Establish real time registry of treatment and shelter beds, and shared referral and intake for shelter, treatment, and housing options IV. Develop internal capacity to provide clinical oversight, documentation, and billing for reimbursable services to sustain and grow services to meet demand V. Launch and evaluate pilot projects to fill critical gaps in care for potential addition to Medicaid waiver services -Fully implement Mobile Integrated Health with dispatch of Advanced Practice Provider to calls for service and follow-up to reduce EMS utilization (AFD) -Pilot communicable disease testing and treatment care model with integrated behavioral healthcare, case management and supportive housing (AHD) -Pilot non-emergency transportation for individuals with physical mobility issues and other challenging behaviors (AFD) -Fully implement Medication-Assisted Treatment (MAT) for Opioid Use Disorder following positive screen with mobile clinic access (AHD/AFD) -Fully implement pre-arrest deflection from criminal justice system for eligible individuals to behavioral health treatment (APD) -Pilot a WIC-integrated maternal health model with embedded behavioral health support (AHD) -Increase supply of appropriate assisted living and other supportive housing to serve people with complex health and social needs (AHD) -Replicate existing pilot project of behavioral health treatment paired with microunits or other modular housing type (AHD)	\$1M-\$5M	Other	Statewide	Anchorage (Municipality)	Advance to Implementation Application

Municipality of Anchorage	Municipality of Anchorage: Alaska Rural Health Innovation Accelerator & Deployment Program	AK	Rural AK healthcare providers face persistent challenges related to workforce shortages, geographic isolation, limited resources, and disproportionate rates of chronic disease and other health conditions. At the same time, many promising health technologies and care delivery innovations are being developed across the US that could help address these challenges. However, AK lacks a structured mechanism to connect emerging healthcare companies with rural providers and move promising solutions into real world pilots or deployment within AK’s healthcare system. Without an organized pathway to identify, vet, pilot, and deploy new technologies, rural providers often struggle to evaluate emerging solutions or assume the risks of early adoption. As a result, many promising tools, such as remote monitoring tech, digital care coordination platforms, workforce support tools, and medical devices, remain underutilized in rural healthcare settings. This project seeks to address that gap by creating a structured accelerator and pilot deployment program that connects healthcare startups with AK providers to support testing and implementation of solutions aligned with AK’s priority healthcare needs. From 2020 to 2025, Health TIE (HT) was a healthcare hub that linked healthcare entrepreneurs and changemakers with health and human services organizations. This project will build on and incorporate learnings from HT – deploying and testing scalable solutions in AK and supporting their growth.	The proposed AK Rural Health Innovation Accelerator & Deployment Program (RHAD) will be a partnership between 49th State Angel Fund (49SAF), Municipality of Anchorage (MOA)’s venture capital arm, University of Alaska Center for Economic Development (UACED), and ecosVC, a scalable tech startup accelerator operator. RHAD will support early-stage companies developing solutions aligned with AK’s healthcare priorities, e.g. chronic disease management, telehealth expansion, emergency medical services modernization, and behavioral health access. Some healthtech startups in AK include: CallDr, a novel telehealth platform, and OpiAID, a wearable device for opioid misuse recovery patients. Similar to Launch Alaska, AK’s energy accelerator, RHAD will be a structured pathway linking promising healthcare startups with AK providers and pilot deployment opportunities. National Startup Recruitment RHAD will recruit AK and US startups whose solutions could improve healthcare access and outcomes in AK. Selection will be based on alignment with AK’s priority health needs and potential to deploy solutions in partnership with rural providers. Structured Commercialization Accelerator 8 startups will participate in a 3 month accelerator delivered with ecosVC, using the Lens of the Market Accelerated curriculum, which helps validate a business case, refine a business model, and develop realistic go to market strategies. The curriculum includes 4 sprints, 2 held in AK and 2 virtual, with mentorship and support between sessions. Direct Engagement with AK Healthcare Providers AK healthcare providers and organizations, e.g. rural systems, tribal health organizations, community providers, and HT's existing network of advisors will serve as mentors and advisors. They will help startups refine solutions based on AK’s healthcare realities while building early customer relationships and pilot opportunities. Deployment and Pilot Projects A pilot deployment fund will support 4 down-selected startups testing and launching solutions in AK. Providers will help identify solutions that align with their operational needs. Pilot awards will support early implementation costs in rural communities. Rural Health Innovation Investor Network RHAD will begin building an investor network interested in healthcare innovations addressing rural health challenges. Demo events and targeted outreach will connect selected startups with AK and national investors to support growth beyond initial pilots.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Municipality of Anchorage	Municipality of Anchorage: Child Care Needs Assessment and Infrastructure	AK	Access to safe, reliable, and licensed child care is a foundational component of healthy communities and a stable workforce. Across Alaska, families face significant barriers to finding affordable, high-quality child care. These challenges are particularly acute for the health care and essential workforce that supports both urban and rural communities. MOA aims to strengthen the connection between child care infrastructure and health system stability. Through a comprehensive early childhood needs assessment and the development of employer-supported child care cost-sharing models, this project will identify scalable strategies to expand licensed child care capacity and improve access for working families. Importantly, the project will generate insights and models that can inform similar efforts in rural Alaska, where child care shortages are even more severe and workforce challenges directly affect access to health care and other essential services. By strengthening child care infrastructure and exploring new partnerships between employers and early childhood providers, this project seeks to improve workforce stability, support family well-being, and contribute to healthier communities throughout Alaska. This project will focus on two complementary strategies designed to strengthen early childhood infrastructure while supporting the workforce needs of health care and related industries.	Develop a comprehensive assessment of child care supply, demand, and infrastructure needs in Anchorage and surrounding communities that influence the regional workforce, examining: • The current supply and capacity of licensed child care programs • Gaps in access for working families, including health care workers • Barriers to opening or expanding licensed child care programs • Workforce challenges within the early childhood sector • Infrastructure needs such as facilities, start-up capital, and workforce development • Opportunities for cross-sector partnerships between employers and early childhood providers The assessment will result in a strategic planning framework that identifies priority investments and scalable strategies for strengthening licensed child care capacity in the MOA and examine the ways in which child care infrastructure in regional hubs can support the recruitment and retention of professionals serving rural Alaska. Lessons learned from this process will be shared with partners working in rural communities and will help inform broader statewide conversations about child care infrastructure and workforce stability. The second component of the project will explore and pilot employer-supported child care cost-sharing models designed to expand access to licensed child care for working families. Employer-supported child care models represent an opportunity to leverage public-private partnerships while improving affordability and stability for families and providers. This work will: • Assess employer demand and workforce child care needs • Engage health care employers and other major industries in identifying potential partnership models • Design cost-sharing structures that support both family affordability and provider sustainability • Identify opportunities for collaborative pilot programs between employers and licensed child care providers These models may include shared cost arrangements, employer contributions to child care slots, or collaborative investments that support the expansion of licensed child care programs. Because health care employers play a critical role in serving both urban and rural populations, employer-supported child care partnerships have the potential to strengthen recruitment and retention of health professionals whose work supports communities across Alaska.	\$250K-\$1M	Statewide	Anchorage (Municipality)	Deferred or Not Advanced

MUSKEG Wellness	Peer Support Professional Development Project	AK	There are currently at least 40 community-based orgs and agencies utilizing Peer Supports to provide peer support, navigation, mentoring and/or advocacy in Alaska. While some (such as True North or Set Free) have had the impressive success expected from national peer support studies and have reported high staff morale, peer staff capacity, and efficiently achieved excellent client outcomes, others fall short. Many AK BH Providers experience high turnover rates in their Peer Support Teams, associated with burnout, lack of role clarity, inability to hold clear boundaries, inadequate supervision, and lack of new skills support. Additionally, agencies experience unacceptable levels of Medicaid billing losses. In this project, we will help address the drastic impacts on Alaska’s Peer Support workforce, protect Peer Staff retention, and provide our Alaskan Peer Supports with the continuing coaching and attention that they need to be safe and confident in their very demanding positions. There are now over 2,000 Peer Supports trained in Alaska, at great expense to the state. It is unknown how many are employed providing peer support and navigation services, but only 200 have actually received AK certification. This project is designed to both provide quality control and protect the State’s investment in this invaluable behavioral health workforce, as well as expand the number of qualified Peers trained up and certified in the state, by 100 each year.	Providing effective Peer Support can be challenging as we move beyond current limiting beliefs and support others through often very difficult or sad circumstances. By partnering with MUSKEG to help keep their staff skills and morale high, our 6 partnering agencies hope to find that productivity increases, thereby achieving more positive outcomes for clients, stability for the agencies, and cost savings for Alaska. Maximum effectiveness and efficiency can be achieved by: 1) Providing regular, culturally appropriate, professional training & coaching to new Peer Support Professionals. 2) Supporting supervisors with expert consultation and with best practice policies that combine flexibility with accountability. 3) Electronic records and documentation practice with Pear Suites (dialed in for Alaska’s medicaid systems with oversight from an in-state billing and compliance expert). 4) Providing a permanent, personal professional development records portal for each student. This is a multi-agency project designed in Alaska for our Behavioral Health Providers’ Peer Support Teams. We will provide at each site: a) An in-person State-approved training for both Peer Support Associates (38 hours) and EITHER Traditional Peer Support Associates (an additional 8 hours) OR a YES! Youth Empowerment & Support Workshop for Youth Mentors b) The 12 hrs of Extra Required Classes for Alaska PS Certification c) Personalized assistance to help each graduate go through the State certification process, to ensure success and track outcomes. d) Access to 38 Team Coaching sessions with our Peer Support Coach e) Key Authentic Cultural trainings for Alaskan Indigenous Peer Supports f) Private student portal into an innovative professional development platform, specially created for us by Opus EHR g) 8 hrs of professional consults for Supervisors of Peers h) 5 hrs of training in best-practice policies for agencies hiring Peer Support teams i) Six months of access to Medicaid compliance, billing & claims training with the innovative team at Pear Suites. j) Exclusive employment opportunities, statewide. Our training teams are a highly experienced, diverse mix of experts. We will work to expand the Alaska PS workforce by 100 yearly, improving retention rates, so that we have a larger pool of Peer Supports, Traditional Peer Supports, and Youth Mentors working statewide, accountable to national best practices and Alaska’s Core Competencies for Peer Workers.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Fairbanks North Star Borough; Kenai Peninsula Borough; Kodiak Island Borough; Matanuska-Susitna Borough	Deferred or Not Advanced

MY House	Jeffs Path Exspansion	AK	MY House intends to increase capacity for Youth face unnecessary risk factors when paired with older adults in treatment cohorts and are often negatively influenced, making their recovery that much more difficult. We often see young adults in groups and residential living situations with those older individuals who have a much longer and intense use history which creates an unhealthy social connection for young adults early in recovery. It is also safe to say that youth in 12-step meetings across Alaska are building potentially unhealthy social connections due to mentorships being developed that lead to negative consequences for the young adult. Examples of this are risky sexual relationships and an increase of level of use as well as more dangerous drugs being used. This population will benefit from holistic care to include Mental health service that address, the whole person, focusing on SAMHSA eight dimensions of wellness. • Emotional: Coping effectively with life and creating satisfying relationships. • Environmental: Living in a clean and safe environment. • Financial: Managing financial resources effectively. • Intellectual: Engaging in creative and stimulating activities. • Occupational: Finding personal satisfaction and enrichment in one’s work. • Physical: Maintaining a healthy body and seeking medical care when needed. • Social: Developing a sense of connection and belonging with others. • Spiritual: Expanding a sense of purpose and meaning in life.	To address the shortage of residential behavioral health services for young adults ages 18–25 MY House will expand our ASAM 3.1 to include 3.5 residential programs from 8 beds to 16 beds. This expansion combines targeted facility renovations, workforce development, evidence-based clinical programming, care coordination, and quality improvement to increase access, strengthen care, and ensure long-term sustainability. Facility Renovation and Expansion: We will renovate our existing residential home to safely accommodate 16 young adults while maintaining a safe therapeutic, structured, and youth-centered environment. Renovations include reconfiguring bedrooms, expanding shared living and treatment spaces, and upgrading safety features. These improvements support a recovery-oriented environment where young adults feel secure, engaged, and supported in their treatment, including spaces for group therapy, individual counseling, and life-skills development. Workforce Development and Training: A well-trained and stable workforce is essential to high-quality care. We will recruit, train, and retain clinicians and residential staff, emphasizing trauma-informed, evidence-based, and culturally responsive practices. Staff will receive ongoing clinical supervision and professional development, ensuring fidelity to ASAM guidelines and sustainable staffing to meet the increased capacity. Clinical Programming and Individualized Care: Residents will receive individualized treatment plans that integrate ASAM 3.1 and 3.5 levels of care to match clinical need. Programming includes structured daily schedules, evidence-based therapeutic interventions, skill-building, and psychoeducation. This ensures that young adults with varying levels of need receive timely, appropriate, and intensive support, reducing risks of crisis, justice system involvement, and long-term instability. Care Coordination and Rural Access: We will coordinate with community providers, tribal health organizations, and telehealth resources to ensure seamless admissions, discharge planning, and post-residential follow-up. Expanding in-state capacity allows young adults to remain connected to family, community, and cultural supports while receiving care, reducing the need for out-of-state placement and strengthening continuity of care for rural communities. .	\$250K-\$1M	Statewide	Matanuska-Susitna Borough	Advance to Implementation Application

MY House	Redemption Services	AK	Geographic isolation, limited access to behavioral health and social services, systemic inequities, and trafficking networks along transportation routes create a high-risk environment for youth exploitation. Traffickers increasingly target vulnerable youth through social media, online games, and highways, often recruiting youth within 72 hours of displacement. Many victims are homeless, involved with the child welfare or juvenile justice systems, or have experienced family violence or substance use challenges, placing them at heightened risk of sex or labor trafficking. The opportunity lies in expanding community-based, evidence-informed residential and behavioral health services that are trauma-informed and culturally responsive. By increasing the capacity of ASAM 3.1 and 3.5 programs and providing targeted, survivor-centered interventions, this project will improve access to care, stabilize youth, and reduce their vulnerability to exploitation. Workforce training for rural providers, schools, law enforcement, and tribal organizations will strengthen early identification, response, and prevention of trafficking, while formal referral pathways will ensure youth receive timely support across systems.	The MY House Redemption Program addresses the urgent risk of human trafficking among youth and young adults in Alaska’s rural Mat-Su Valley through a trauma-informed, survivor-centered approach. We combine residential and outpatient care, behavioral health services, workforce development, and cross-system collaboration to reduce vulnerability, stabilize youth, and build lasting capacity in the community. Youth in rural areas often face long travel distances, isolation, and limited local resources, which can delay access to care and increase risk of exploitation, homelessness, or unsafe living situations. By expanding residential and outpatient services at the Carson Cottle Center (CCC), youth ages 10–26 can access intensive, trauma-informed support without leaving their families or communities. Residential and Outpatient Care: Our ASAM 3.1 and 3.5 programs provide structured, evidence-based care in a safe, supportive environment. Youth receive individualized treatment plans, trauma-focused therapy, life skills development, and culturally responsive interventions. Outpatient services allow youth to continue care after discharge or receive intensive therapy while living at home, ensuring continuity and reducing gaps in support. Centralizing these services locally gives youth timely access to the level of care they need, when they need it, without traveling long distances. Workforce Development: CCC staff are trained in human trafficking identification, survivor-centered support, and evidence-based behavioral health care. Training extends to partner organizations—including schools, law enforcement, tribal entities, and domestic violence/sexual assault programs—to strengthen early recognition, referral, and follow-up, building rural capacity and ensuring consistent care. Cross-System Collaboration and Referral Pathways: Warm referral pathways link law enforcement, child welfare, tribal organizations, schools, shelters, and outpatient providers. These partnerships create a protective network in regions where trafficking services are scarce, ensuring youth are identified early, connected quickly to care, and supported through both immediate safety and longer-term behavioral health needs. By integrating residential and outpatient services at the CCC with workforce development MY House improves access to safe, trauma-informed, care for youth in Alaska, strengthens networks, and creates sustainable, long-term impact for vulnerable youth in the Mat-Su Valley.	\$250K-\$1M	Statewide	Matanuska-Susitna Borough	Advance to Implementation Application

MY House	Compensation Scale	AK	MY House is currently operating without a comprehensive, agency-wide pay scale, which creates significant challenges in maintaining equitable, consistent, and competitive hiring practices. Because multiple hiring managers are responsible for bringing new staff into different programs, salary decisions can vary widely from one department to another. Without a standardized framework, pay offers are sometimes determined by immediate staffing needs, individual negotiation skills, or budget pressures rather than a clear, equitable compensation structure. This inconsistency increases the risk of unintentional wage disparities between employees who hold similar positions or carry equivalent responsibilities, which can negatively impact morale, trust, and staff cohesion. A pay scale also creates a clearer path for professional growth. When MY House can publicly list competitive, well-structured wage ranges, it strengthens its ability to attract qualified candidates in behavioral health, case management, peer support, administrative roles, and program operations. This is particularly important because MY House does not currently offer fringe benefits, such as health insurance or retirement contributions. In the absence of those benefits, a well-designed pay scale becomes one of the most powerful tools available to remain competitive and appealing to prospective staff.	To address workforce instability and ensure equitable compensation across all MY House programs, we propose hiring an experienced human-resources compensation contractor to design and implement a comprehensive agency-wide pay scale. The contractor will conduct a full compensation analysis, including reviewing current salaries, comparing regional and statewide benchmarks, assessing job responsibilities, and identifying inequities created by having multiple hiring managers without a unified structure. They will develop standardized wage ranges for every position, create a clear advancement ladder, and produce guidance for future salary adjustments and promotions based on experience, performance, and training. This will provide MY House with a consistent, transparent, and competitive compensation system especially critical given our rural location and the absence of fringe benefits. Implementing this pay scale will strengthen recruitment by offering predictable salary ranges, and it will improve retention by giving staff a clear understanding of their growth pathways. With the contractor’s support, MY House will establish a sustainable compensation framework that supports workforce stability, enhances internal equity, and allows the organization to remain competitive within the rural health and social-service labor market. In addition to our current workforce this pay scall will be scaled for My House's new Carson Cottle Center to include night and weekend differentials.	Under \$50,000	Statewide	Matanuska-Susitna Borough	Deferred or Not Advanced

MY House	Leadership Training (Middle Management)	AK	MY House has an incredible opportunity to build leadership from within. We employ a large number of staff who are in recovery, as well as several individuals who have successfully completed our programs and now serve as valued employees. This lived experience is one of our greatest strengths. In addition, our Youth Board includes three MY House graduates, creating another meaningful pathway for developing leadership capacity internally. As our organization grows, many dedicated and experienced team members are eager to step into supervisory and management roles that would greatly benefit from formal middle management training. By investing in structured leadership development, MY House can intentionally cultivate the skills needed to guide teams effectively through expansion. Research consistently shows that when managers receive proper training, organizations perform more cohesively and efficiently. Strong middle managers foster communication, accountability, and collaboration, ensuring that the agency moves forward as one unified team rather than operating in silos. This project builds on the strengths already present within MY House, creating clear leadership pathways, strengthening team alignment, and positioning the organization for sustainable growth and high-quality service delivery.	MY House Middle Management Training Approach MY House proposes to contract with an experienced leadership development consultant or group to design and implement a structured middle management training program. The contractor will bring specialized expertise, provide neutral and objective facilitation, reduce the burden on executive leadership, create professional and structured training, build systems rather than informal practices, and help position MY House for long-term sustainability. While the exact steps will be finalized collaboratively with the contractor, the proposed approach includes four phases. Phase 1: Assessment & Planning (1–2 months) The contractor will assess organizational leadership readiness, identify skill gaps, and evaluate management and supervisory capacity. This phase will ensure that the training aligns with MY House’s goals and addresses the full range of management and supervisory needs. Phase 2: Core Management Training (3–6 months) Schedules sessions will provide training in supervisory skills, including accountability, communication, conflict resolution, trauma-informed leadership, managing staff in recovery, performance management, preventing burnout, team cohesion, and change management during organizational growth. Phase 3: Coaching & Mentorship (6–12 months) Emerging supervisors will receive 1X1 coaching to address challenges and apply leadership skills to day-to-day operations. Support will also be provided for Youth Board leadership development to strengthen pathways for young leaders. Phase 4: Integration of Internal Strengths (6–12 months) The contractor will help build a leadership model that leverages employees in recovery, program graduates, and Youth Board members. This will include developing peer leadership pathways, creating structured advancement tracks, training managers to supervise staff with shared lived experience, and formalizing internal promotion pipelines, further strengthening sustainability and reinforcing MY House’s mission-driven culture. Measurable Outcomes (12–18 months) The impact of the program will be tracked using metrics such as staff retention, supervisory turnover, staff satisfaction, communication effectiveness, internal promotions, and improved service capacity utilization. This data will demonstrate how structured middle management training directly supports organizational growth, team cohesion, and high-quality behavioral health services for rural communities.	Under \$50,000	Statewide	Matanuska-Susitna Borough	Deferred or Not Advanced

MY House	Peer Support Expansion	AK	MY House has an opportunity to partner with the hospital to strengthen staff skills while simultaneously supporting clients in workforce development. Many individuals with behavioral health needs face significant barriers to maintaining employment. Without stable income and workplace support, they are at increased risk of returning to homelessness, engaging in illegal activity for survival, or becoming vulnerable to exploitation and trafficking. Sustainable employment is not just an economic issue; it is a critical component of recovery and long-term stability. Through an employment-focused peer support model, clients can receive real-time feedback, coaching, and structured skill development within an actual work environment. This hands-on experience allows them to build practical job skills, improve workplace behaviors, and develop confidence in a supportive and supervised setting. Immediate feedback and guided accountability help reinforce positive habits that can be transferred to long-term employment opportunities, increasing job retention and overall stability. By partnering with the hospital, MY House will enhance skills that lead to certification and a stronger workforce. In addition, this collaboration can expand opportunities for peer work therapy sessions, creating employment pathways for clients who have progressed in their recovery and are prepared to move to full time employment.	We are proposing two coordinated but independent initiatives: A Hospital Workforce Development Partnership and developing a peer work therapy work force. While both projects support employment stability for individuals with behavioral health needs, each operates within a different setting and structure. Project 1: Hospital Workforce Development Partnership This initiative establishes a formal partnership with the hospital to strengthen staff capacity while creating supported employment pathways for individuals in recovery. The hospital-based project will create structured, supervised employment placements within hospital departments. Once placed, participants will: Work in designated peer rolls within the hospital as well as the MY House Carson Cottle Center. Receive real-time supervision and performance feedback Participate in structured training session that provide needed skills to work with individuals beginning a recovery journey Work toward industry-recognized certifications relevant to their assigned roles The hospital as well as MY House benefits from an expanded workforce pipeline and enhanced staff skill development, while participants gain transferable skills, work history, certifications, and increased job retention capacity. Project 2: Create a peer workforce that focuses on providing work therapy to individuals in recovery. The MY House Work Therapy initiative is a therapeutic employment program operating within our organization. This program integrates work-based learning with behavioral health support in a controlled, recovery-oriented environment. The Work Therapy Department will: Provide structured, in-house job assignments Integrate therapeutic goals into daily work activities Provide immediate coaching and behavioral feedback Prepare participants for transition into external employment opportunities Unlike the hospital-based placements, this program serves as a therapeutic steppingstone for individuals who may not yet be ready for competitive employment. It allows clients to practice consistency, accountability, teamwork, and task completion in a supportive setting. Participants who demonstrate readiness may transition into: Hospital partnership roles, Community-based employment, Certified peer support positions	\$250K-\$1M	Statewide	Matanuska-Susitna Borough	Deferred or Not Advanced

My House	Project to Coordinate Youth Behavioral Health Service Continuum	AK	We would like to coordinate services to support the youth continuum of care in the Mat Su - which actually serves the entire State of Alaska. We have started a group, called Jacobs Ladder, to identify and fill gaps for youth services in our area and are working to fill the gaps to create a smooth continuum to support youth coming from rural areas. MY House is leading the "Jacobs Ladder Project" and would like support for planning a program that offers transportation, education and shared staff to help our programs and our partner programs have warm handoffs to step-down services and continuing care for youth age 14-25. We have a great partnership with Mat Su Regional Medical Center, with a Behavioral Health expansion pending that will increase capacity and expand services to Alaskan youth from rural areas. We would like to be coordinated and prepared to support youth through a strong continuum of care as they exit hospital programs and move through recovery. Without partnerships and a solid continuum, the risks of relapse, arrest, incarceration and for many, homelessness, is inevitable. We would like to be prepared for the Hospital to have a key role, working together to coordinate a robust continuum that supports youth through to healthy adulthood with sobriety, managed behavioral health and job skills that help them to live here in the Valley or return to remote areas and thrive.	Our concept is to work with community providers to provide transportation from a youth/young adult hospital program discharge to safe housing and continued care for behavioral health and substance use disorder treatment. We would like to offer peer support and navigation/outreach services that connect with hospital staff to pick up patients at discharge to transport them to their next level of care. This may be a lower-level residential program, outpatient services, sober housing or supported housing. The goal being to insure that patients are not discharged without a treatment plan for continuing care and support, safe housing and wrap around services. We would also build a partnership for an education program that MSRMC and Behavioral Health staff would host that could offer training for certificates and tech positions that would elevate entry level staff to better wages, greater capacity and provide expanded workforce for the Region. We have consistent shortages in behavioral health workers at the levels of care we are building and would greatly benefit from a training program partnership where staff from all partner organizations can receive benefits for hours worked/internships, college credits and CDC or Behavioral Health training certificates as part of their work in our Continuum of Care. We would benefit from some technical assistance to develop this program out, but it offers entry level people in long term recovery pathways to better pay and elevated job status as a function of joining one of the service providers. It also lets partners support training programs through a variety of pathways, with Hospital-based accreditation backing the learning journey. This is an exciting way to empower staff and fill gaps in our Valley employment and labor sector. Lastly, we want to have a partnership with MSRMC that would allow them to share professional staff to keep our programs operating at top levels as we build our workforce here in the Valley. Mat Su Regional leads the State in many patient satisfaction areas and having qualified staff is a cornerstone of this achievement. Making some of these staff available to programs just starting up, or who experience a lack of clinical supervision, medication management staff and medical oversight for residential programs is a way for the Hospital to support the step-down services, create a community safety net and remain connected to partners on a "care" platform that serves patients and community very well.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

My House	Upstream Prevention Through Digital Media	AK	MY House is uniquely positioned to be the leader in Alaska for upstream video prevention work. We have access to a large number of young people in recovery with lived experience in homelessness, addiction, domestic violence, trauma and other related experiences. These youth will be essential for connecting with our primary target audience of at-risk youth and young adults from across rural Alaska. MY House also has a fully functional recording studio that includes professional grade cameras, lighting, microphones and editing equipment and has staff well trained on how to produce all manner of professional level content. Because of this, the cost of producing prevention materials is significantly lessened because we sidestep the cost of equipment rental, studio time or outside contracted video and audio editing staff. The funding in this request would be used to distribute the prevention materials that MY House has the staff and equipment to create. MY House also offers a unique job training opportunity for youth to engage in production, recording, voice over and editing in a working recording studio. We have several years of training interns and have placed them in jobs both in-house and across the community. This job training effort is popular among our clients and clients of our partner organizations like True North Recovery and the Mat Su School District. These interns would be helping produce the prevention and recovery themed content that is going across Alaska.	Our approach is utilizing our funding in the first year of the Rural Health Transformation Initiative to immediately and effectively fill a critical gap in the previously mentioned prevention messaging across the State of Alaska. MY House’s communications team will produce the following content, designed to provide upstream messaging to youth and young adults. Themes will be focused around recovery, prevention, treatment, suicide prevention, etc. Four short films with former clients (one a quarter) Limited Run “Prevention Podcast” with Sandy Snodgrass/other community partners “Wellness Wednesday’s” weekly shorts (similar to current program – Motivational Monday” 30 sec prevention advertisements distributed across social media, streaming services, music apps, YouTube and local television/radio (updated once a quarter) 15 sec prevention advertisements distributed across social media, streaming services, music apps, YouTube and local television/radio (updated once a quarter) Print ads in local newspapers (Updated once a quarter) This is the communication prevention base that we want to build on in the second year. Additionally, we are requesting funding for planning a physical expansion of our current communication department capacity to continue to produce and distribute recovery and prevention materials across the State, utilizing treatment and recovery partnerships for bigger and more in-depth projects. We need expanded space to increase our capacity to serve clients, staff and community. We have plans to continue to host panel discussions, Youth Mental and Behavioral Health Task Force meetings, empowerment and life skills classes and community engagement initiatives and due to the large number of attendees we have outgrown the current space. This would include architect, engineering, design and building permit costs with the intention of having additional renovation funding in year two.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced

My3Tech, Inc	Alaska Healthy Communities Population Based Digital Care and Rural Health Insights Program	SD	Rural Alaska has a significant opportunity to improve health outcomes by strengthening chronic disease management, care coordination, and community-based support for residents who face barriers to consistent care. Many rural and frontier communities experience fragmented care, provider shortages, limited visibility into patient needs between visits, and limited tools to support chronic disease self-management. These challenges can lead to delayed interventions, worsening outcomes, avoidable hospitalizations, and additional strain on limited rural healthcare capacity. This project addresses that opportunity by deploying a Healthy Communities digital care model that combines mobile patient engagement tools, care and case management workflows, and interoperable data and analytics. The solution will help rural providers, care teams, and community partners identify high-risk individuals, monitor health status, coordinate services, and support self-management. The opportunity is to create a scalable, technology-enabled approach that helps rural communities move from reactive, episodic care to more proactive, coordinated, and community-centered health management. By combining patient-facing tools with provider workflows and analytics, the project will improve continuity of care, strengthen coordination, and support healthier rural communities over time.	Our proposed approach is to implement a Healthy Communities population-based digital care model that combines mobile patient engagement, structured care and case management workflows, and interoperable data and analytics to improve chronic disease management, care coordination, and community-based support in rural and frontier Alaska. The project is designed to help providers, care teams, and community partners move from fragmented, reactive care to a more proactive, data-informed model. In the first phase, we will work with rural providers, Tribal organizations, and community partners to identify pilot communities, priority populations, and care coordination needs. The solution will be configured to support patient engagement, care planning, outreach, follow-up, and reporting workflows while establishing the core data and operational requirements needed for implementation and future scale. In the second phase, providers and care teams will use mobile and patient-facing tools to support individuals between visits. Patients will access education, track symptoms, receive reminders, and communicate with care teams. Providers and care coordinators will use dashboards, alerts, and structured workflows to identify high-risk individuals, monitor follow-up needs, and intervene earlier. The project will also establish an interoperable analytics layer to support rural health insights, population health monitoring, and reporting, with pilot deployments validating the model for broader expansion.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

My3Tech, Inc	Rural Care Access and Mobile Health Enablement Program for Members, Providers, and Families	SD	Alaska’s rural and frontier communities face ongoing barriers to timely, coordinated healthcare due to geographic isolation, transportation limitations, provider shortages, and limited local healthcare infrastructure. Many residents must travel long distances for routine care, specialty services, and chronic disease management, often resulting in delayed treatment and increased health risks. These challenges are especially severe for older adults, individuals with chronic conditions, and those who need continuous monitoring and care coordination. This project will address those gaps by deploying mobile-enabled digital health tools, telehealth services, and coordinated care management tailored for rural settings. Through mobile applications, remote patient monitoring, and secure virtual care connections, providers can extend services beyond traditional clinical sites and reach patients in remote communities more effectively. The initiative will allow care teams to conduct virtual visits, monitor patient health remotely, coordinate services across providers, and respond earlier when risks are identified. These capabilities will reduce delays in care, improve chronic disease management, and strengthen continuity of care. The overall goal is to create a scalable, technology-enabled care access model that expands healthcare availability, supports rural providers, and delivers more proactive, connected care across Alaska’s rural and frontier communities.	The proposed approach is to implement a mobile-first, technology-enabled care access model that expands healthcare delivery to rural and frontier communities through telehealth services, remote patient monitoring, and coordinated care management tools. The initiative will leverage secure cloud-based digital health platforms designed to connect patients, providers, and care teams across Alaska’s geographically dispersed communities. In the first phase, the project will establish partnerships with participating rural healthcare providers, tribal health organizations, and community partners to identify pilot communities and priority populations. During this phase, the technology platform will be configured to support mobile patient engagement, telehealth consultations, and remote monitoring workflows aligned with existing provider and care coordination processes. The second phase will focus on deploying mobile health applications and telehealth capabilities that allow patients to access virtual visits, communicate with care teams, receive health education, and monitor chronic conditions from their homes or community locations. Remote patient monitoring devices and connected health tools will enable healthcare providers to track key health indicators and intervene earlier when health risks are identified. Care teams will use integrated care coordination dashboards and workflow tools to manage patient outreach, follow-up care, and coordination between providers. These tools will support proactive management of chronic conditions, care transitions, and ongoing monitoring of high-risk individuals. Pilot deployments will initially focus on selected rural communities to validate operational workflows, technology integration, and patient engagement approaches. Based on pilot outcomes, the program can expand to additional regions through a hub-and-spoke model that connects rural providers, community organizations, and care teams through shared digital infrastructure. This phased approach ensures rapid implementation, measurable outcomes during the first year, and a scalable model that can support long-term improvements in healthcare access for rural Alaskan populations.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

My3Tech, Inc	Spark Digital Health Innovation and Remote Monitoring Program	SD	Rural and frontier communities across Alaska can improve health care delivery through digital health tools, remote patient monitoring, and interoperable clinical data exchange. Geographic isolation, transportation barriers, provider shortages, and limited specialty access often make timely follow-up, ongoing monitoring, and consistent communication difficult, especially for people with chronic conditions or complex care needs. This project will deploy a Spark Technology & Innovation model that combines mobile health apps, patient-facing tools, remote monitoring workflows, and integration with HIE and other clinical systems. These capabilities will help rural residents track symptoms, stay connected with care teams, receive timely support, and remain engaged in care between visits. Providers will gain better visibility into patient risk, status, and follow-up needs, enabling earlier intervention and better care coordination. Interoperability is central to the project’s value. By connecting EHR, claims, pharmacy, HIE, and related systems, the solution will reduce data silos, support more complete longitudinal patient records, and enable faster, better-informed decisions across care settings. The result is a scalable, sustainable model that improves access, strengthens continuity of care, and supports technology-enabled health care delivery across Alaska’s remote and frontier communities.	Our approach is to implement a Spark Technology & Innovation model that combines consumer-facing digital health tools, remote patient monitoring, patient communication capabilities, and interoperable clinical and Population Health data exchange to improve healthcare delivery in rural and frontier Alaska. The project will follow a phased, pilot-first approach so participating providers and communities can validate workflows, demonstrate early outcomes, and scale successful practices over time. This aligns with My3Tech’s eHealth, care management, and integration capabilities, supporting mobile engagement, CCM, RPM, TCM, and real-time connectivity across clinical and administrative systems. In the first phase, we will work with participating rural providers, Tribal organizations, community providers, and partners to identify pilot communities, priority populations, and the most suitable digital health use cases. We will configure the solution to support mobile patient engagement, symptom tracking, alerts, communication with care teams, and remote monitoring workflows, while defining the technical and operational requirements for integration with existing systems such as EHRs, HIE connections, and other relevant clinical or program data sources. In the second phase, participating organizations will launch pilot deployments of mobile apps, patient-facing tools, and remote monitoring-enabled workflows that help patients stay connected with care teams between visits and enable more timely intervention when risks emerge. Providers and care coordinators will use dashboards, alerts, and integrated workflows to monitor patient status, respond to changes, and improve continuity of care. This model is designed to reduce delays in follow-up, improve engagement, and strengthen care quality for people in remote communities. The project will also establish an interoperable innovation layer connecting digital tools with HIE and other clinical data systems to support real-time monitoring, provider and patient alerts, and more coordinated care delivery. Initial pilots in selected rural communities will validate workflow effectiveness, patient adoption, and reporting approaches. Based on pilot results, the project can expand through a scalable hub-and-spoke model to additional communities and provider partners across Alaska. This phased approach supports Alaska’s RHTP priorities around technology innovation, rural impact, measurable outcomes, and sustainable transformation.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Nakaani Technologies, LLC	Digital Health Innovation to Strengthen Rural Access, Workforce, and Care Coordination	AK	Rural and frontier communities in rural Alaska face significant barriers to timely, coordinated health care. Geographic isolation across dispersed island communities often requires costly, weather-dependent travel for specialty care, diagnostics, and follow-up. Limited workforce capacity, high provider turnover, and reliance on Community Health Aides/Practitioners can contribute to care delays, fragmented referrals, and challenges managing chronic conditions, behavioral health needs, and prevention. Health systems serving the region, although robust, are often complex or built as a "one-size-fits-all" model, which often overlooks the need to meet growing administrative and reporting demands while operating with constrained infrastructure, uneven broadband reliability in some locations, and aging health IT systems that may not fully support coordinated, team-based care. These factors can contribute to avoidable medevac use, gaps in continuity when patients travel outside their home community, and difficulty tracking outcomes across providers. This project addresses the opportunity to deploy culturally aligned, entry-level, tribal-ready digital health tools to strengthen care coordination, improve referral visibility, support workforce efficiency, and enable proactive population health management—helping improve access, quality, and long-term sustainability of rural health delivery across rural Alaska.	Nakaani would like to pilot ALEX across one or more independent or tribal health organizations. ALEX is a healthtech platform designed to support all areas of operation of healthcare provider type, with networked care as a native principle of the platform. Currently covered healthcare providers include hospitals, clinics, pharmacies, labs, and imaging centers. For healthcare providers, the platform covers clinical care including telemedicine, billing, accounting, inventory management, procurement, lab order tracking, imaging order tracking, pharmacy management, queue management, patient relationship management connected to clinical care operations, and enterprise configuration/data governance. For patients, the platform’s free patient app provides access to patient health data, appointment booking, and telemedicine with providers using ALEX. Additionally, ALEX is a continuously improving platform that is designed to be flexible enough to keep up with modern technology. Soon, ALEX will add a fully comprehensive HR module to support workforce payroll, staff learning and compliance, attendance, and benefits management. ALEX also plans to add a claims management module that reduces claims error and improves claims adjudication to shorten revenue cycle. Today, these functionalities are spread across multiple legacy systems, which limits the contextual data analysis that organizations can use to generate insights that improve care operations. ALEX is also significantly cheaper than legacy systems since it is priced on a pay per use model, which is more aligned with the principles of value based care. ALEX does not charge for maintenance or any upgrades that would benefit all healthcare providers on its platform. This prevents vendor lock-in and ensures the team behind ALEX is bought in to continuously support healthcare. Altogether, ALEX would save healthcare organizations 30-40% in TCO of health IT systems over 5 years, which is capital that can be used to reinvest into delivering better care. ALEX is currently in use by a psychiatric hospital in India and over a dozen aesthetic clinics in Thailand. However, since ALEX is new technology to US healthcare, it is difficult to immediately onboard all clinics in a tribal health organization’s network. Currently, ALEX has planned to add claims processing electronically to IHS/CMS for Q4/Q1 2026/27. Furthermore, prior to a wider rollout, ALEX must validate its workflows to ensure buy in from all stakeholders.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Aleutians East Borough; Aleutians West Census Area; Northwest Arctic Borough; Yakutat (City and Borough)	Deferred or Not Advanced

NAMI Alaska Incorporated	Hands Across Alaska - Rural Alaska Mental Health Outreach and Wellness Initiative	AK	Alaska faces persistent behavioral health disparities driven by geography, workforce shortages, transportation barriers, and limited service availability in rural and remote communities. Many Alaskans—particularly those living in small, isolated communities and Alaska Native communities—lack access to timely mental health education, early intervention supports, and peer-driven resources. Financial barriers and limited local services often leave individuals and families with few options until challenges escalate. As a result, many Alaskans encounter the behavioral health system only during periods of crisis, placing increased strain on emergency services, clinical providers, and public safety systems. Expanding access to community-based mental health education and peer support provides an important prevention-focused opportunity to address these challenges. Evidence-based education and peer-led support programs equip individuals and families with knowledge, coping skills, and supportive networks that help people recognize mental health concerns earlier, support loved ones, and navigate available resources. Providing accessible mental health wellness resources and peer-led support groups offers an upstream lifeline for Alaskans across the state—particularly in rural and underserved communities—helping individuals and families manage challenges before they escalate and strengthening Alaska’s community-based behavioral health continuum.	This project will strengthen statewide coordination and outreach to expand access to preventive, community-based mental health supports, with particular focus on rural and Alaska Native communities. By enhancing education, peer support, and connection, the initiative seeks to reduce reliance on crisis-driven services and advance recovery-oriented systems of care. Through partnerships with communities, behavioral health organizations, providers, and tribal governments, the project will ensure that more Alaskans—regardless of geography or circumstance—receive timely resources, guidance, and support. This approach not only strengthens the state’s behavioral health continuum but also empowers individuals, families, and communities to take an active role in promoting mental well-being and resilience. This also includes promotion of evidence-based mental health education, including family engagement practices, in rural school settings and/or youth-based organizations utilizing our NAMI educational programs addressing youth mental health.	\$250K-\$1M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

NAMI Fairbanks	Strengthening Community with Mental Health Advocacy	AK	As a local behavioral health and social service nonprofit deeply rooted in Interior Alaska, we are committed to advancing Alaska led strategies that build in state capacity, expand access to community-based behavioral health services, and ensure that infrastructure and value remain in Alaska. Our work naturally aligns with the State’s priorities for strengthening rural health systems, and the proposed initiatives of this grant directly support our mission.	Our peer support groups, crisis navigation services, and community trainings are already among the few behavioral health support options easily accessible to rural Interior residents. NAMI Fairbanks’ public education, stigma reduction initiatives, and early-intervention programs strengthen community resilience and reduce the likelihood of behavioral health crises. By expanding preventative mental health programming in schools, Tribal communities, and rural hubs, we will help build a proactive culture of well being across the region.	\$50,000-\$250,000	Single Community	Fairbanks North Star Borough	Deferred or Not Advanced
NAMI Juneau	Juneau place-based crisis stabilization feasibility study	AK	The State of Alaska, communities and providers statewide have invested many resources to learn from, adapt and implement the Crisis Now framework into local settings. The Juneau Crisis Now Workgroup eagerly anticipated local implementation of all three essential Crisis Now elements into their community. Juneau residents in a behavioral health crisis can access two out of three essential components: ‘Someone to Contact’ and ‘Someone to Respond’. The Juneau community sees a remaining need for access to place-based behavioral health crisis care (‘A Safe Place for Help’) outside of the hospital setting. The Juneau Crisis Now Workgroup believe the community has the necessary resources to implement a place-based crisis stabilization program for adults, and possibly youth. The primary barrier to developing place-based crisis stabilization has been the lack of an operator to access and maximize readily available community resources to develop a program. The Juneau Crisis Now Workgroup, with lead applicant support from NAMI Juneau, desire to conduct a feasibility study to explore potential place-based stabilization programs in Juneau. The study would provide updated and realistic information on the needs, opportunities and fiscal impacts of program operations so the community understands what is feasible and realistic for Juneau. The feasibility study can then be used by the Workgroup and other community partners to have more informed, focused conversations with potential operators.	NAMI Juneau will serve as fiscal agent on behalf of the Juneau Crisis Now Workgroup for any fund awards and plans to contract with Agnew::Beck Consulting for their experience with place-based crisis stabilization program feasibility studies and the Juneau community. Phase 1-Market Research: The market research will include 1)Up to 20 interviews with community partners, including: Tribal and non-Tribal behavioral health, housing and homelessness service providers, Bartlett Regional Hospital ED and MHU staff, peer support and behavioral health advocates, first responders and City and Borough of Juneau staff. 2)Data collection and analysis, including but not limited to: First responder data, Bartlett Regional Hospital ED and MHU data, community behavioral health provider utilization data, Alaska’s Hospital Discharge Database and healthcare workforce reports. Findings will be summarized in a written memo and PowerPoint presentation for review with the Juneau Crisis Now Workgroup. Findings will be mapped to SAMHSA’s continuum of place-based crisis care models to identify areas of alignment between community gaps and possible care models. Juneau Crisis Now Workgroup will guide selection of up to three place-based crisis stabilization concepts for further analysis. Phase 2-Financial, Technical and Operational Feasibility: Conceptual staffing plans and billable revenue streams will be developed for each selected concept. The financial feasibility study will develop a three-year operating pro forma to identify the most likely financially viable model. Technical feasibility will examine whether the model is defined in licensing or regulation and with existing or potential Medicaid-billable services. Operational feasibility will review conceptual staffing models and proposed operating hours to examine alignment with workforce capacity and community need. The Juneau Crisis Now Workgroup and other key partners will provide feedback on assumptions included in the study throughout the process. Phase 1 & 2 will findings be summarized in a publicly available written report. Phase 3-Concept Selection and Next Steps: Within one year from project start the Juneau Crisis Now Workgroup will review feasibility study findings and select the most impactful, sustainable concept for the community. This phase may include creation and presentation of materials to different audiences and identify next steps for project implementation, including proposal development for future funds.	\$50,000-\$250,000	Single Community	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

NAMI Juneau	OPEN: Outpatient Planning and Exploration at NAMI Juneau	AK	Patients seeking mental health treatment in Alaska face significant barriers to receiving outpatient treatment, including long waitlists and lack of Medicaid-accepting private practice therapists. Alaska's 2023 Scorecard from the Department of Health acknowledges that barriers to accessing mental health and substance use treatment include a lack of available treatment options, lack of insurance or funds to pay for services, and long waitlists. The 2024 Milliman report commissioned by Alaska's Division of Behavioral Health notes that Alaska faces increased service demand, workforce shortages, and care delivery barriers. These challenges are particularly complicated by the state's size, geography, and diverse demographics. NAMI Juneau's Juneau Mental Health directory lists private practice mental health providers in Juneau and shows that none accept Medicaid. Insurance options include Aetna, Premera/BCBS, Cigna, Optum, Tricare, EBMS, ComPsych, and self-pay, but not Medicaid. Juneau's community mental health organizations that do accept Medicaid are the primary access points for Medicaid recipients, creating concentrated demand on a small number of providers and contributing to the waitlist problem. NAMI Juneau proposes conducting a study that would assess the feasibility of including outpatient treatment as a NAMI Juneau offering, reducing wait times and increasing access to quality care.	NAMI Juneau proposes to address the shortage of Medicaid-accepting outpatient mental health providers in Juneau by conducting a feasibility study to assess the viability of adding outpatient therapy services as a core NAMI Juneau program offering. This planning phase would be led by a contracted consultant with expertise in behavioral health program development and nonprofit service delivery. The timing of this study is particularly opportune: Alaska Medicaid State Plan Amendment 25-0005, effective July 1, 2025, removes prior authorization requirements for rehabilitative behavioral health services, reducing a significant administrative barrier to outpatient mental health service delivery. The consultant would produce a comprehensive report examining three primary areas of inquiry. First, the study would assess workforce and employment models, exploring how NAMI Juneau could structure the employment or contracting of licensed therapists, including considerations around compensation, supervision requirements, licensure, and retention in a high cost-of-living community. This would include a review of comparable models that have successfully integrated outpatient services, and recommendations for NAMI Juneau structures. Second, the study would examine billing and sustainability, analyzing the financial infrastructure needed to bill Medicaid and other insurance providers, including credentialing requirements, billing systems, reimbursement rates, intake and assessment, and the administrative capacity required to manage a clinical billing operation. This analysis would identify what startup investment would be needed and what an ongoing sustainable revenue model could look like. Third, the study would evaluate mission alignment, assessing how an outpatient therapy program would complement NAMI Juneau's existing education, advocacy, and peer support work. This would potentially include community input and stakeholder engagement to ensure that any new services reflect the values and priorities of those NAMI Juneau serves. The completed feasibility report would give NAMI Juneau's leadership and board the information needed to make an informed decision about whether and how to move forward with implementation, and would serve as the foundation for future funding requests for that next phase of work.	\$50,000-\$250,000	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

NAMI Juneau	Together We Are Strong(er)	AK	NAMI Juneau has developed four behavioral health training programs tailored specifically to Alaska communities, addressing gaps that national programs fail to fill: Suicide Safety Planning, Social Emotional Health Education (SEHE),Peer Support Associate, and Together We Are Strong. At the top of this list is Together We Are Strong, a two-day suicide prevention training with integrated indigenous values specific to local cultures developed in partnership with the Central Council of Tlingit and Haida, in which participants practice direct conversations with someone who is suicidal. In rural Alaska, where crisis response often means involuntary hospitalization hours away, community members trained to support someone through a suicidal crisis can be lifesaving. Because these programs are relatively new, they lack the formal evaluation needed to assess effectiveness, capture participant feedback, and identify areas for improvement. Without evaluation, these programs cannot pursue evidence-based designation, a credential that determines whether funders, employers, and partner organizations will invest in or require a training. This project would develop a rigorous evaluation framework for NAMI Juneau's locally developed programs, measuring participant outcomes, satisfaction, and skill retention to produce the data needed to pursue formal evidence-based status and expand access to these critical trainings across Alaska.	Evaluation is the foundation of effective, credible programming. For training programs to be trusted by participants, partners, and funders, they must be grounded in data that demonstrates what is working and what needs improvement. Formal evaluation also opens the door to evidence-based designation, which signals to schools, employers, and health organizations that a program meets a recognized standard of quality. For NAMI Juneau's locally developed programs, evaluation is the critical next step toward becoming a more official, widely respected, and broadly adopted resource for Alaska communities. With NAMI Juneau will contract with an external evaluator to design and implement a formal evaluation process for its locally developed behavioral health training programs. This approach will strengthen program quality, build credibility with funders and partner organizations, and ultimately position NAMI Juneau's trainings for recognition on the Suicide Prevention Resource Center (SPRC) Best Practices Registry, a nationally recognized standard for suicide prevention programming. In Year 1, the evaluator will develop a participant survey tool to measure outcomes, skill retention, and satisfaction among training attendees. Data collection will begin as trainings are delivered, establishing a baseline for program performance. In Year 2, data collected from participants will be reviewed and used to refine program content and delivery as needed. Data collection will continue, building a stronger evidence base. In Year 3, findings will be compiled and submitted to the SPRC Best Practices Registry for formal recognition. Alongside the evaluation of participant outcomes, the evaluator will also assess training methods and delivery procedures. As part of this work, NAMI Juneau will hire someone to develop detailed program manuals covering both the evaluation process and a train-the-trainer model. Currently, only the staff who developed these trainings can deliver them, which limits how often they can be offered each year. Without a documented manual, training new facilitators means simply telling them to repeat the content word for word, which is an inadequate foundation for a train-the-trainer program. Thorough documentation of training methods is a natural outcome of evaluating how programs are taught, and will make NAMI Juneau's programs more transferable, scalable, and sustainable over time.	\$50,000-\$250,000	Multi-Community or Participating in Regional Hub-and-Spoke	Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Ketchikan Gateway Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Wrangell (City and Borough); Yakutat (City and Borough)	Deferred or Not Advanced

NAMI Juneau	Transformation of Juneaumentalhealth.org	AK	Navigating behavioral health services in Juneau is a well-documented challenge for residents and providers alike. NAMI Juneau's Juneau Mental Health directory (juneaumentalhealth.org) opens with the acknowledgment that "mental health resources can be difficult to navigate," and offers direct navigation assistance by phone and email. Research shows that for every one day of wait time, one percent of patients give up seeking care altogether. Community-based coordination and referral is an evidence-supported strategy for reducing long periods of untreated mental illness and preventing negative outcomes. Over 13 years ago, NAMI Juneau created juneaumentalhealth.org as a centralized directory of behavioral health providers, used by primary care providers, social service agencies, and community members alike. The site already draws significant traffic: over 2,000 unique visitors and 4,000 sessions in the past year, with users spending an average of five minutes searching the provider directory, which is accessed over 2,700 times annually. Despite this demand, the site's technology has not kept pace: only one of its tabs is searchable, and staff cannot embed hyperlinks in provider matrices. No mobile app currently exists, further limiting accessibility. NAMI Juneau proposes to upgrade the Juneau Mental Health website and develop a companion mobile app, making behavioral health resources more easily navigable for both the general public and the providers who serve them.	NAMI Juneau proposes to address the challenge of navigating behavioral health services in Juneau through two related technology upgrades: a significant rebuild of the existing Juneau Mental Health website (juneaumentalhealth.org) and the development of a companion mobile app. NAMI Juneau has already identified developers for both the website and the app, positioning this project for timely execution. The upgraded website will serve as the backbone of the project, providing a more robust, user-friendly platform for both community members seeking services and providers making referrals. The rebuild will make all tabs and directories fully searchable and allow hyperlinks to be embedded directly in provider matrices while preserving print functionality. A modern, well-structured website also creates the foundation upon which additional features can be more easily integrated over time, such as multilingual access or other evidence-supported strategies for reducing barriers to care for our Juneau community members. Unlike national directories such as Psychology Today, juneaumentalhealth.org is specifically designed for Juneau's behavioral health landscape. Without duplicating existing resources, the site fills gaps that national platforms do not: it lists community mental health organizations by the specific services they provide, includes free support groups, and maintains an active therapist listserv used regularly by local providers to coordinate referrals and share continuing education opportunities. The directory is also actively maintained through annual outreach and ongoing updates, ensuring accuracy in a way that self-reported national directories cannot replicate. The companion mobile app will extend the reach of the directory to users who rely on mobile technology to find and access services. The app would provide a variety of behavioral health tools including a searchable provider directory with filters for insurance type, specialty, and availability, prominent crisis resources and hotlines, and referral support functionality for primary care and social service providers. Research shows that up to 40 percent of behavioral health referrals fail due to missed appointments or lack of follow-up; a well-designed navigation tool directly addresses this gap. Together, the upgraded website and app will make Juneau's behavioral health resources more accessible, more current, and easier to use for the individuals who need them most.	Under \$50,000	Single Community	Juneau (City and Borough)	Deferred or Not Advanced

Nancy Morgan Wound Care LLC	HealthForce One: Rural Healthcare Workforce and Clinical Support for Alaska	NV	Rural Alaska faces significant barriers to specialty healthcare access due to geographic isolation, workforce shortages, and limited access to advanced clinical training. Many patients must travel long distances to receive specialized care, creating delays in treatment and increasing healthcare costs. At the same time, many local healthcare providers are capable of managing more complex conditions if they have access to specialized training, clinical decision support, and remote consultation with experienced specialists. This project addresses the opportunity to strengthen Alaska’s healthcare system by expanding the capabilities of the existing workforce. By providing targeted education, workforce coordination, and remote specialist support, HealthForce One enables local clinicians to manage more advanced care within their own communities.	HealthForce One proposes a workforce-centered model designed to strengthen rural healthcare capacity through training, clinical support, and workforce coordination. The project will provide specialized education programs designed for clinicians practicing in rural and remote settings. These programs focus on practical clinical skills, decision support tools, and protocols that enable providers to manage complex cases safely within their scope of practice. In addition to training, the project establishes a remote specialist support network composed of U.S.-based physicians and advanced clinicians who can provide consultation, case review, and clinical guidance when local providers encounter complex situations. The project operates through a hub-and-spoke model that connects regional health systems with rural clinics and community providers. This structure ensures that care remains locally delivered while clinicians have access to the expertise and support needed to manage challenging cases. By strengthening local workforce capacity and providing access to remote specialist support, the model expands access to care, reduces unnecessary patient travel, and improves clinical confidence among rural healthcare providers.	\$1M-\$5M	Specialist	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Kenai Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; Northwest Arctic Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Napakiak Rural Health Solutions, LLC	Project NORTHSTAR: ARPA-H PARADIGM Innovation Delivering Hospital Care to Rural Alaska	AK	Alaska’s rural health system operates under conditions unlike any other state. Advanced care, diagnostics, specialty consultation, and obstetrics, often require air, river, or seasonal travel. These realities limit local diagnostic capacity, strain workforce availability, and force reliance on transporting patients rather than delivering appropriate care closer to home. The human cost is significant. Rural Alaskans experience high rates of chronic disease, poor maternal and infant outcomes, behavioral health crises, and substance misuse. Many communities lack reliable access to emergency departments, intensive care, dental services, or behavioral health. Community Health Aides/Practitioners (CHA/Ps) and EMS providers shoulder extraordinary responsibility, yet 64% of rural hospital staff report difficulty securing timely specialty referrals. The result is delayed care, preventable escalations, and families separated during critical moments. Project NORTHSTAR addresses this diagnostic and access gap by deploying the GOHOSPITAL Care Delivery Platform (CDP), integrated with Tribal and regional health partners to bring hospital-level diagnostics, maternal monitoring, chronic disease management, and tele-specialty support directly into villages. This disciplined, regionally governed model strengthens local workforce capacity, reduces avoidable transport, and builds a more sustainable rural health architecture that keeps care closer to home.	Our proposed approach is Project NORTHSTAR: a disciplined, regionally governed mobile care model that deploys the GOHOSPITAL mobile CDP as a seamless extension of Alaska’s existing THOs and regional hospital hubs. GOHOSPITAL, developed under the ARPA-H Platform Accelerating Rural Access to Distributed and Integrated Medical Care (PARADIGM) program, is a rugged, modular, Arctic-hardened mobile unit equipped with point-of-care laboratory, diagnostic imaging, telehealth connectivity, and restorative dental capability. It delivers hospital-level services directly to rural Alaskans while operating as a true extension of existing hubs. Rather than building parallel systems, we strengthen the hub-and-spoke architecture already serving rural Alaska. In Year 1, NRHS will partner with the ANTHC, FHP, and FMH to activate the Interior hub serving the Fairbanks to Delta Junction region. If success is clear, expansion into the Anchorage area may be considered. GOHOSPITAL units operate on data-driven rotational routes integrated with hospital EHRs and informed by regional disease prevalence, Medicaid transport patterns, and referral gaps. Services focus on high-impact areas: maternal monitoring, chronic disease management, behavioral health continuity, point-of-care diagnostics, preventive dental services (Year 3), and real-time tele-specialty consultation. All deployment, clinical scope, and data governance protocols operate under the authority of participating Tribal Health Organizations. Leveraging Homeward Health’s AI-native rural platform, Homeward supports patient engagement, route optimization, care navigation, and clinical workflows that enhance local health workers through tele-supervision. Combined with AI-powered Revenue Cycle Management (RCM) and alternative payment models such as maternal bundles, these tools ensure long-term viability without new subsidies. The approach aligns with Alaska’s six RHTP initiatives: Healthy Beginnings, Health Care Access, Healthy Communities, Strengthen Workforce, Spark Technology & Innovation, and Pay for Value. Year 1 is focused on the Interior hub to ensure operational stability and compliance with federal timelines. Future expansion occurs after documented performance in reducing avoidable travel, increasing in early detection of diseases, and strengthening reimbursement integrity. Project NORTHSTAR is designed to endure beyond the grant period through sustainable reimbursement and strengthened local capacity.	Over \$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Fairbanks North Star Borough; Juneau (City and Borough)	Deferred or Not Advanced

National Alliance for Drug Endangered Children	Mat-Su Valley Drug Endangered Children Help Rural Heath Transformation Program	CO	Rural communities within the Mat-Su Borough face increasing healthcare access challenges due to population growth, workforce shortages, and limited healthcare infrastructure. Many residents must travel to Anchorage or other urban centers to receive behavioral health, specialty, and preventive services. These barriers disproportionately impact children, families, individuals experiencing substance use disorders, and residents with complex health needs. At the same time, Mat-Su communities have strong local networks of healthcare providers, community organizations, and public safety partners who are working independently to address these challenges. However, coordination between systems remains limited, and many residents struggle to navigate available services. This project represents an opportunity to transform how rural health services are delivered in the Mat-Su region by strengthening coordination among healthcare providers and expanding innovative service delivery models. By building a collaborative regional approach that integrates primary care, behavioral health, and community-based services, the project will improve access to care and better support the health and wellbeing of rural residents.	The proposed initiative will create a coordinated rural health network for the Mat-Su region that improves access to care through collaboration, innovative service delivery models, and expanded use of technology. Key strategies will include strengthening partnerships between healthcare providers, behavioral health services, community organizations, and public safety partners to improve coordination of care and referrals. By utilizing the information and data that has been gathered over the last several years, we can improve system gaps and services. A central component of the project will be improving access to behavioral health and substance use disorder services, which remain significant needs across the region. Through coordinated screening, referral pathways, and integrated care models, residents will be better connected to the services they need. The initiative will also focus on supporting children, youth, and families who are impacted by substance misuse and related health challenges. By identifying individuals earlier and connecting them to community-based services, the project will help prevent long-term health consequences and strengthen overall community wellbeing. Through a regional hub-and-spoke model, healthcare providers and community organizations will work collaboratively to deliver services closer to home while improving care coordination across the Mat-Su region.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Matanuska-Susitna Borough	Deferred or Not Advanced
Native Village of Chenega	Clinic planning and design for future health care in Chenega	AK	Since the Chenega Clinic was built in 2006, there have been changes in both the community demographics and how health care can be delivered to rural areas. As residents and health care providers consider the future of care delivery in Chenega, we want to ensure that any future remodel or construction aligns with community needs, best practices, and offers flexibility as both evolve over time. This project will proactively capture community planning for future design of the health clinic in Chenega. Through community surveys and other outreach activities, this project will also kickstart dialogue with health care organizations about future workforce needs, technology upgrades and community-informed priorities in addition to a concept design of the physical clinic building.	The Native Village of Chenega will work with community planning and design professionals to collect information on health care needs of residents and synthesize the information into a report that can be used to create architectural drawings of a new health clinic. Our hope is that each step of the process will be a collaboration between Chenega residents, health care providers and space planning experts to create a final design that anticipates the health goals and objectives important to the Chenega community.	\$50,000-\$250,000	Single Community	Chugach Census Area	Advance to Planning

Native Village of Chenega	Emergency services ambulance for Chenega	AK	In Chenega, a small island village in Prince William Sound without a full-service hospital, emergency medical service is a critical part of health care that requires access to specialized equipment for adequate pre-hospital assessment, care and stabilization before air transport to the nearest hospital. An upgraded ambulance with emergency supplies and wireless or cellular equipped connectivity will allow local community health aides and trained volunteers to provide continuous care and connection to remote specialists in a medical emergency, even while waiting for an air carrier at the airport, which is more than a mile from the Chenega health clinic on gravel roads. With an upgraded ambulance, all Chenega residents from youth to Elder will have expanded access to a higher level of local first-response care that can improve their health outcomes and potentially decrease costly hospital stay lengths due to adequate care and guidance from the start of medical response. The current community ambulance is outdated, unreliable and insufficient for use in rural Alaska. A new ambulance will ensure that local health aides and trained volunteers can safely provide care and be connected to remote specialists that are familiar with the emergency equipment onboard. Being able to provide top-notch care is a key part of a healthcare provider's job satisfaction and may inspire volunteers to continue training with potential for advancement.	The Native Village of Chenega is the local government and community service provider. Through a partnership with Chugachmiut, our region's Tribal health organization, and their EMS specialist staff, we will identify an appropriate ambulance replacement for use in Chenega. The ambulance will also be equipped with wireless or cellular communications devices that will allow local first responders to connect with remote specialists that can guide them through appropriate medical care and stay connected to air carriers enroute to Chenega for transport to the nearest hospital. Chenega is less than an hour by air to Anchorage where Alaska's highest rated trauma hospitals are located. Chugachmiut currently hires and trains a community health aide practitioner who works at the local clinic and will be able to identify further training for the new ambulance equipment. Chenega also works with Chugachmiut to provide training for local EMS volunteers on a regular basis. Once a new ambulance is procured and delivered, we will work with our partners in the Tribal health system to ensure ongoing maintenance and equipment training standards are established. This will allow long-term use of the equipment as well as creating a pipeline of backup and future care providers. The Native Village of Chenega is prepared to support ongoing maintenance of the ambulance and any administrative functions necessary to ensure safe and continued use.	\$250K-\$1M	Single Community	Chugach Census Area	Deferred or Not Advanced

Native Village of Chitina	Native Village of Chitina CHAP Training and Support	AK	The NVC’s proposal addresses several critical challenges affecting access to consistent, high-quality healthcare in its rural community. Chitina is geographically isolated, with limited on-site medical services and significant barriers to timely care, including long travel distances to regional health facilities, harsh weather conditions, and transportation costs. These barriers often delay diagnosis and treatment, contributing to poorer health outcomes and increasing reliance on emergency services. One key problem is the shortage of trained healthcare providers available within the community. The current Community Health Aide/Practitioner (CHAP) cannot meet local needs, particularly when providers are not trained to higher CHAP certification levels that allow them to deliver a broader scope of care. Without advanced CHAP-level training, NVC must rely heavily on distant clinics or hospitals. The proposal also addresses workforce sustainability. By training an existing CHAP provider to reach CHAP 4 level—the highest certification in the CHAP program—the community would gain a more experienced practitioner capable of handling complex cases, mentoring other aides, and providing expanded clinical services. Additionally, training a local resident to become a CHAP strengthens culturally responsive care, since local providers are more likely to remain in the community. This proposal also addresses the need to provide a CHAP locum when the CHAP 3 attends training.	The Native Village of Chitina (NVC) proposes strengthening its Community Health Aide Program (CHAP) to improve healthcare access, quality, and sustainability for residents of rural Chitina. The project focuses on expanding local clinical capacity and strengthening the healthcare workforce. First, NVC will support advancing an existing provider from CHAP Level 3 to Level 4. This upgrade will enable the clinic to diagnose and manage more complex conditions locally, reducing the need for patients to travel long distances for care. Second, the project will train a local resident to become a new Community Health Aide, increasing staffing capacity while fostering a workforce rooted in the community. Training a local provider promotes cultural familiarity, continuity of care, and long-term retention in the clinic. Together, these efforts will enhance service delivery, strengthen the rural healthcare workforce, and ensure that residents of Chitina have more reliable access to timely, high-quality healthcare close to home.	\$250K-\$1M	Clinic	Single Community	Copper River Census Area	Advance to Implementation Application

Native Village of Chitina	Native Village of Chitina Elder Care Services Project	AK	The Native Village of Chitina faces a growing challenge: ensuring that local Elders can age safely in their homes while receiving consistent, culturally responsive care. Currently, the elder services NVC provides are not billable, are paid for from the NVC's general fund, and are not sustainable. In a remote community like Chitina, access to health services is limited by distance, weather, transportation barriers, and workforce shortages. Training eight Elder Service Care Providers to become Certified Personal Care Assistants (PCAs) directly addresses these barriers by building local capacity and strengthening continuity of care. By earning PCA certification, these caregivers would be qualified to provide essential daily living supports such as personal hygiene assistance, medication reminders, mobility support, meal preparation, and basic health monitoring. Because they are members of the community, they offer culturally grounded care, speak the local language, and understand traditional values—factors that increase trust, compliance, and overall well-being among Elders.	This project strengthens healthcare access in the remote Alaska Native community of Chitina by training eight Elder Service Care Providers to become Certified Personal Care Assistants (PCAs). Due to geographic isolation, limited local providers, transportation barriers, and the high cost of traveling to regional healthcare hubs, residents—especially Elders—often struggle to obtain consistent care. The Native Village of Chitina (NVC) will address these challenges by building a locally trained workforce capable of delivering in-home and community-based services. By certifying existing caregivers as PCAs, the project expands the community’s ability to provide routine health support, assistance with daily living activities, and monitoring for vulnerable residents. This approach ensures that care is delivered by trusted community members who understand local culture, language, and traditions, improving both comfort and quality of care. Developing local capacity also reduces reliance on distant providers, strengthens long-term healthcare sustainability, and supports healthier aging in place for Chitina’s Elders.	\$50,000-\$250,000	Clinic	Single Community	Copper River Census Area	Advance to Implementation Application

Native Village of Chitina	Native Village of Chitina Telehealth Capability Improvement Project	AK	The NVC proposes expanding telehealth capabilities in the community by upgrading broadband connectivity, installing a Starlink satellite system, and purchasing modern telehealth equipment including monitoring digital stethoscopes, and kits for patients, such as blood pressure monitors, glucose meters, and pulse oximeters. These improvements will strengthen access to healthcare in this remote Alaska community where travel to regional hospitals can be difficult, expensive, and weather-dependent. Upgrading broadband infrastructure will provide the reliable internet speeds required for secure video consultations, electronic health records, and data transmission between the Chitina Tribal Clinic and regional healthcare providers. Installing a Starlink satellite system will ensure redundant, high-speed connectivity even when traditional internet service is disrupted, allowing telehealth services to continue during emergencies or severe weather. The project also includes purchasing telehealth devices for the clinic and portable remote monitoring kits. These tools may include digital stethoscopes, blood pressure monitors, pulse oximeters, and other diagnostic equipment that allow healthcare professionals to assess patients remotely with greater accuracy. Remote monitoring kits will enable patients with chronic conditions to track vital signs from home and transmit data directly to providers.	The Native Village of Chitina (NVC) proposes expanding telehealth capabilities at the Chitina Tribal Clinic to address longstanding barriers to healthcare access caused by geographic isolation and limited transportation infrastructure. Residents of Chitina often face lengthy and costly travel to reach regional medical centers, which can delay care and discourage routine visits. Strengthening telehealth systems offers a practical and sustainable solution by enabling patients to connect remotely with physicians, specialists, and behavioral health providers. The proposed approach focuses on improving the clinic’s telehealth infrastructure, including reliable broadband connectivity, modern telemedicine equipment, and secure digital platforms that support virtual consultations. By integrating these tools into routine clinic operations, healthcare providers can deliver timely diagnoses, treatment recommendations, and follow-up care without requiring patients to travel long distances. Telehealth will also support behavioral health services, which are particularly important in rural communities where access to specialists is limited.	\$250K-\$1M	Clinic	Single Community	Copper River Census Area	Advance to Implementation Application

Native Village of Chitina	Native Village of Chitina Healthy Nutrition Project	AK	The NVC’s plan to complete its community kitchen with commercial-grade equipment addresses a critical challenge in providing safe, nutritious, and culturally relevant meals for residents. Currently, the tribal office’s kitchen's outdated and limited appliances constrain the village's ability to efficiently prepare large quantities of food, making it difficult to support community events, elder programs, and youth initiatives. By installing commercial-grade ovens, stoves, refrigerators, and prep stations, the Multi-Purpose Building kitchen will be able to handle larger meal volumes safely and more efficiently, ensuring food is prepared in accordance with health standards. This upgrade also supports community health by enabling the preparation of traditional foods in ways that preserve nutrition and cultural practices. Improved equipment reduces food spoilage, lowers the risk of contamination, and allows for consistent meal service during emergencies or public gatherings. Additionally, a modern kitchen enhances the village's ability to offer food-based programs that teach cooking skills, nutrition, and cultural traditions to younger generations. Overall, completing the kitchen strengthens food security, promotes health, and supports cultural continuity. It transforms the kitchen into a reliable hub for community gatherings, education, and wellness, addressing both practical and social needs while empowering the NVC to serve its residents better.	The Native Village of Chitina will complete and equip its 622-square-foot community kitchen with commercial-grade appliances to expand reliable, culturally appropriate food preparation for the community. The approach focuses on installing safe, modern equipment, training local staff and volunteers, and establishing regular meal programs that prioritize nutritious, locally sourced foods when possible. The kitchen will support elders, children, and residents recovering from illness while strengthening food safety and preparation capacity. By improving access to healthy meals and nutrition education, the project addresses diet-related chronic diseases common in rural Alaska. The completed kitchen will serve as a sustainable hub for community health and community.	\$50,000-\$250,000	Clinic	Single Community	Copper River Census Area	Deferred or Not Advanced

Native Village of Chitina	Native Village of Chitina Medevac Access & Safety	AK	The Native Village of Chitina’s (NVC) goal is to improve medevac by adding runway lighting and a 5000-gallon fuel tank at the 2,850 ft x 75 ft Chitina Airport. The lack of aviation fuel and runway lighting at the Chitina Airport significantly affects access to health care for residents of the small rural community. Because Chitina has no hospital and only limited primary medical services available at its local clinic, residents often rely on air transportation to reach larger health care facilities in Anchorage during emergencies. Because the airport lacks reliable fuel supplies, aircraft transporting patients, medical personnel, or supplies must carefully plan routes or avoid landing in Chitina altogether, creating delays and reducing flight availability. The absence of runway lighting further compounds the problem by restricting aircraft operations to daylight hours. This limitation can force patients to wait until morning for transport, potentially worsening medical outcomes in situations such as trauma, cardiac events, or severe illness. For Chitina, where aviation is the primary link to advanced medical services, basic airport infrastructure is closely tied to public health. The improvements described above will strengthen the overall health care safety net for Chitina residents, and for the 7,000 to 10,000 fishermen drawn to the Chitina dipnet fishery each summer, and the 20,000 to 80,000 tourists drawn to Wrangell-St. Elias National Park.	Phase I: Design, Permissions, and Approvals: Develop a design for the 5000-gallon tank through a qualified engineer. Enter into a lease with the landowner, Ultima Thule Lodge, for the site of a 5000-gallon fuel tank. Obtain approval for the plan from the state fire marshal. Phase II: Regulatory Compliance. Develop a Spill Prevention, Control, and Countermeasure Plan developed by a registered professional engineer. Develop a secondary containment system using a double-walled design. Ensure adherence to Alaska Department of Environmental standards for leak detection and spill prevention. Phase III: Site Preparation and Installation. Have a qualified engineer build a monolithic concrete support pad that is at least 1 foot beyond the tank's exterior on all sides. Level the tank, installing atmospheric venting with a weatherization cap, complete fencing, and security measures. Phase IV: Train operators in spill prevention, containment, and emergency response. Complete inspections and release detection testing as required by EPA and state regulators.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Copper River Census Area	Deferred or Not Advanced

Native Village of Chitina	Native Village of Chitina Patient Transport Project	AK	The NVC's proposal would replace its three aging patient transport vehicles with a new Chrysler Pacifica, a Ford Transit Van, and a 4WD or AWD Ford Explorer. These vehicles would significantly improve patient transportation in Chitina by providing safer, more reliable travel between the community and the regional medical hub in Anchorage. Chitina residents must often travel long distances for specialty care, diagnostic testing, and follow-up appointments that are not available locally. Reliable ground transportation is, therefore, critical to maintaining consistent access to healthcare. An AWD or 4WD Ford Explorer would provide a dependable option for transporting individual patients or small groups, particularly elders or patients with mobility limitations. Its four-wheel-drive or all-wheel-drive capability and durability make it well-suited for Alaska's challenging road conditions, including winter snow, ice, and rough rural highways. The 33-mile Edgerton Highway from Chitina to the Richardson Highway, and the 180-mile Glenn Highway to Anchorage, particularly the Long Lake section, are among the most dangerous winter roads in Alaska – and the country. It is not unusual for 20 accidents to occur in a day along the Glenn Highway, according to ADOT and Anchorage Police Department statistics. The vehicle would allow health staff or community representatives to safely escort patients on long trips while ensuring comfort during extended travel.	The Native Village of Chitina (NVC) will improve access to healthcare by replacing three aging patient transport vehicles with a Chrysler Pacifica, a Ford Transit Van, and a 4WD or AWD Ford Explorer. These vehicles will support safe, reliable transportation for residents traveling from Chitina to Anchorage for medical services that are not available locally. Because community members must travel long distances for specialty care, diagnostic testing, and follow-up appointments, dependable transportation is essential for maintaining consistent healthcare access. The AWD or 4WD Ford Explorer will be used for individual patients or small groups, especially elders and individuals with mobility limitations. Its durability and enhanced traction will allow drivers to navigate Alaska’s hazardous winter road conditions more safely, including snow, ice, and rough rural highways. Health staff or trained community representatives will use the vehicle to escort patients on long-distance trips, ensuring both safety and comfort during travel.	\$250K-\$1M	Clinic	Single Community	Copper River Census Area	Deferred or Not Advanced

Native Village of Chitina	Native Village of Chitina Recovery and Healing Camp Feasibility Project	AK	The NVC faces significant challenges related to alcohol and substance abuse, which have profound impacts on the health, safety, and cultural continuity of its community members. Rates of substance misuse in rural Alaska often exceed statewide averages, and limited access to healthcare and treatment services exacerbates the problem. Establishing a seasonal cultural recovery camp could directly address these challenges by providing a holistic, culturally grounded approach to healing. Such a camp would integrate traditional practices, language, and subsistence activities—such as fishing, hunting, and crafts—into recovery programs. Engaging participants in culturally meaningful activities strengthens identity, fosters resilience, and builds community support, which are critical protective factors against relapse. By combining cultural engagement with evidence-based treatment strategies, the camp would fill a gap left by standard treatment facilities that may be geographically distant or culturally disconnected.	This project will conduct a feasibility study for a seasonal Cultural Recovery Camp led by the Native Village of Chitina (NVC) to support individuals experiencing alcohol and substance use challenges. The approach centers on integrating culturally grounded healing practices with practical planning and community engagement. Project activities will include consultations with tribal leadership, Elders, and community members to identify culturally appropriate program elements such as land-based activities, traditional knowledge sharing, and mentorship. The study will assess potential camp locations, evaluate infrastructure and transportation needs, and examine staffing models that incorporate both clinical and cultural support roles. Researchers will also review successful Indigenous recovery models and regional service gaps to inform program design. Findings will guide the development of an operational framework outlining seasonal programming, safety protocols, partnerships, and estimated costs. The feasibility assessment will determine whether a seasonal camp can effectively support recovery outcomes and whether the model could expand into a year-round cultural wellness and recovery center.	\$50,000-\$250,000	Clinic	Single Community	Copper River Census Area	Deferred or Not Advanced
Native Village of Eklutna	Expansion of the Eklutna Health Clinic	AK	The Eklutna Community Clinic has consistently seen increasing numbers of patients and appointments since opening in 2019, and is now well-positioned to plan an expansion to accommodate the needs of our community and increase the options and opportunity of services.	The proposed plan is to acquire funds to support planning a strategic expansion of the Eklutna Community Clinic so that the facility can continue to operate at full capacity and meet community needs. This would include the increase in medical treatment rooms, spaces designed for behavioral health appointments, wellness and physical therapy space, traditional healing, and office/administrative spaces. Strategically planning for expansion would ensure that the Native Village of Eklutna’s clinic will be ready to provide access to essential and meaningful services to the public in a thoughtful and fiscally responsible manner.	\$50,000-\$250,000		Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Advance to Planning

Native Village of Eklutna	Emergency Generator Backup	AK	Currently, if the power goes out the Clinic would have to close and would not be able to continue to provide health care. Also, there would be a risk of losing valuable medication, vaccines, and potential patient supplied samples/specimens. This would be a cost saving initiative as it will help prevent the damage of consumable medical inventory that are on hand during a power outage.	Our proposed approach would be to purchase and install an appropriately sized backup generation system to ensure that if there was a power outage the system would automatically kick on and provide the necessary power to keep our clinic doors open, health care provided, and refrigeration units up and running, so nothing would be lost or wasted.	\$50,000-\$250,000		Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Matanuska-Susitna Borough	Deferred or Not Advanced
Native Village of Eyak- Ilanka Community Health Center	ICHC and CCMC Exploratory/Planning Phases for One Healthcare System in Cordova	AK	The Native Village of Eyak (NVE) and the City of Cordova have begun open discussions to identify best practices and determine the next steps needed to preserve and expand essential medical services including maintaining access to a critical access hospital, which include exploring a potential merger between ICHC and CCMC. As noted earlier, rural communities face a wide range of ongoing and emerging challenges that make it difficult for smaller healthcare organizations to enhance and expand local medical services. ICHC and CCMC are seeking the resources and support needed to begin the initial exploratory steps of a potential merger, including evaluating how combining services could strengthen financial stability, improve operational efficiency, and ultimately enhance care for the Cordova community. In addition, ICHC and CCMC both meet challenges when it comes to aging healthcare facilities and ensuring compliance with current medical standards. Due to no other alternatives for continuing services, NVE purchased the current ICHC building in 2023, despite its dilapidated condition. As the Cordova community considers the possibility of transitioning to a single healthcare entity, it is important to explore what additional opportunities and needs exist for co locating services and improving infrastructure to ensure adequate, modern, and efficient medical space for both patients and staff.	While local City and Tribal governments have come together to review the next steps and continued medical needs for the community, additional information, resources, and experts are needed to ensure an accurate and informed discussion can be made on the possibility of one healthcare entity for the community. This includes the hiring of a project manager, completing financial and operational assessments, fair market appraisals, legal support, and structural/engineering assessments. This process would allow all parties to assess the needs and strengths each healthcare facility brings to a potential merger and determine the most effective path toward financial and operational sustainability, ensuring the long term delivery of healthcare services to the community under a unified provider. In addition, if a merger was feasible, it would help facilitate the needs and opportunities for expanded services such as specialty clinics, expanding outpatient services such as pharmacy etc. It will also help identify opportunities for advancement in services such as the need for new medical equipment and the use of AI and new technology in current and future services.	\$1M-\$5M	Clinic	Single Community	Chugach Census Area	Advance to Implementation Application

Native Village of Kotzebue	Kotzebue Tribal Family Wellness and Behavioral Health Prevention Initiative	AK	Rural Alaska communities continue to experience significant health disparities related to behavioral health challenges, substance misuse, suicide risk, and family stress. In communities such as Kotzebue, limited access to preventative services means that many families only receive support once issues have escalated into crisis. While regional health providers deliver essential clinical services, there is a gap in community-based prevention, early intervention, and culturally grounded wellness programs that help families build resilience before serious health challenges develop. The Native Village of Kotzebue seeks to expand its Healthy Families and Community Wellness Program to address this gap by strengthening preventative services that support youth, parents, and families. Evidence across Alaska Native communities shows that strong cultural identity, connection to Elders, language, and community engagement serve as powerful protective factors for mental health and overall wellness. Expanding culturally grounded wellness programming can play a critical role in preventing behavioral health crises, reducing suicide risk among youth, and improving long-term health outcomes in rural communities.	The Native Village of Kotzebue proposes to expand its Healthy Families and Community Wellness Initiative to strengthen community-based prevention and early support for families and youth. The initiative will focus on several core strategies: Family Wellness and Parenting Support Expanding family support programming that provides parenting education, family engagement activities, and early assistance for households experiencing stress or instability. These activities help address Adverse Childhood Experiences (ACEs) by strengthening family stability, reducing trauma exposure, and supporting healthy childhood development. Youth Engagement and Mentorship Developing youth-centered wellness activities that connect young people with positive mentors, cultural teachings, and safe spaces for healthy development. Cultural Identity as a Health Protective Factor Integrating Iñupiaq cultural knowledge, language exposure, and intergenerational learning opportunities into wellness programming. Cultural identity and connection to Elders are recognized protective factors that strengthen resilience and support long-term mental health. Community-Based Behavioral Health Prevention Creating opportunities for early engagement that address risk factors related to substance misuse, suicide risk, and mental health challenges before they require clinical or emergency intervention. Coordination with Regional Health Providers Strengthening coordination between community wellness programs and regional health providers so families can be connected to appropriate services when needed.	\$50,000-\$250,000	Single Community	Northwest Arctic Borough	Advance to Implementation Application

Native Village of Kotzebue	Iglut Senior Apartments Healthy Aging Renovation Project	AK	The Native Village of Kotzebue seeks to renovate the Iglut Senior Apartments, an Elder housing facility built in the early 2000s that has not received significant upgrades since construction. As the building ages, infrastructure systems such as heating, ventilation, plumbing, and interior fixtures require modernization to maintain safe and healthy living conditions for residents. In rural Alaska communities like Kotzebue, limited housing options for Elders can create health and social challenges. Safe and accessible housing plays a critical role in supporting independence, reducing injury risk, and maintaining connections to family and community support networks. Renovating the Iglut Senior Apartments presents an opportunity to strengthen community health by improving the living environment for senior residents. The project will address aging infrastructure, improve accessibility for residents with mobility limitations, and enhance the overall safety and comfort of the building. Investing in these improvements supports long-term community health by allowing Elders to remain in stable housing in their home community rather than relocating to distant care facilities or regional hubs.	The Native Village of Kotzebue proposes to conduct a comprehensive assessment and phased renovation of the Iglut Senior Apartments to improve building infrastructure, accessibility, and overall living conditions for Elder residents. The project will focus on building upgrades that directly support healthy aging, including improvements to heating and ventilation systems, plumbing infrastructure, accessibility modifications, and modernization of interior spaces such as kitchens, bathrooms, flooring, and lighting. These upgrades will improve safety and reduce environmental risks for residents with mobility limitations or chronic health conditions. Energy efficiency improvements will also be evaluated to improve indoor environmental conditions while reducing long-term operating costs. Renovations will be planned carefully to minimize disruption to residents while ensuring the facility remains a safe and comfortable place to live during the improvement process. The Native Village of Kotzebue has experience managing housing programs and coordinating infrastructure projects and will work with regional partners, contractors, and housing professionals to implement the renovations.	\$250K-\$1M	Single Community	Northwest Arctic Borough	Deferred or Not Advanced

Native Village of Kotzebue	KOTZ Radio Rural Health and Emergency Communication Infrastructure Initiative	AK	Rural communities in Northwest Alaska face significant barriers to accessing timely health information and emergency communications due to geographic isolation, limited transportation infrastructure, and inconsistent internet connectivity. For decades, KOTZ Radio has served as a trusted regional communication platform providing emergency alerts, community announcements, and health information to residents across the Northwest Arctic region. Recent changes to national public broadcasting funding and increasing operational costs threaten the sustainability of rural radio stations that provide these essential services. Without reliable local broadcasting capacity, rural communities risk losing a critical communication system that supports emergency response, health awareness, and public safety. This project seeks to strengthen the operational stability of KOTZ Radio so it can continue serving as a vital communication infrastructure for rural communities	The Native Village of Kotzebue will support the continued operation of KOTZ Radio to ensure the station remains a reliable communication platform for emergency alerts and public health messaging across the Northwest Arctic region. Funding will support core operational capacity including broadcast infrastructure, technical equipment, staffing, and programming that delivers critical health information and emergency communications to rural communities. KOTZ Radio will continue broadcasting public health messaging, behavioral health awareness information, emergency alerts, and community wellness programming that reaches residents across the region. The station will also strengthen coordination with Tribal programs, regional health providers, emergency responders, and community organizations to ensure timely dissemination of health and safety information during emergencies and public health events. By strengthening rural communication infrastructure that supports health awareness, emergency preparedness, and behavioral health outreach, this project contributes to Alaska’s broader efforts to improve health outcomes, reduce health disparities, and strengthen community resilience in rural and Alaska Native communities.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Northwest Arctic Borough	Deferred or Not Advanced

Native Village of Kotzebue	Kotzebue Rural Environmental Health & Community Cleanup Initiative	AK	The community of Kotzebue faces ongoing environmental challenges related to accumulated debris, abandoned materials, and environmental hazards within residential areas, public spaces, and surrounding subsistence-use areas. Limited infrastructure for waste management and the high cost of cleanup in remote communities contribute to these conditions. Environmental hazards can impact public safety, environmental quality, and community wellbeing. Addressing these issues through coordinated cleanup efforts provides an opportunity to improve environmental health while strengthening community engagement. This project seeks to organize a community-driven environmental cleanup initiative that improves the overall health and safety of Kotzebue while promoting environmental stewardship consistent with Iñupiaq values.	The Native Village of Kotzebue proposes to coordinate a community-wide environmental cleanup and restoration initiative that focuses on reducing environmental hazards and improving community health. Key activities may include: • Organizing community cleanup events and debris removal efforts • Identifying environmental hazards in residential areas and public spaces • Supporting proper disposal of waste and hazardous materials • Engaging youth and community volunteers in environmental stewardship activities • Coordinating with local partners to improve long-term environmental management The project will be led by the Tribe and implemented through collaboration with local organizations and community volunteers. Outreach and education will also be included to strengthen community awareness of environmental health and stewardship.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Northwest Arctic Borough	Deferred or Not Advanced

Native Village of Tanana	Tanana Step-Down Substance Use Treatment Program	AK	Alaska lacks adequate step-down care options for adults leaving intensive residential substance use treatment programs. While high-intensity programs provide essential initial care, there is a critical gap in transitional support for those who need to step down into lower-intensity care while continuing to receive structured support in a real community setting. Existing recovery residences and sober living homes are concentrated in road-accessible hubs such as Fairbanks, Anchorage, Wasilla, and Kenai, leaving rural and off-road regions without culturally grounded step-down programs. This gap most affects Alaska Native individuals from rural and remote communities who, after residential treatment, often return home without the ongoing supports needed to sustain recover. For individuals with chronic or long-term addictions, the lack of supportive transitional care dramatically increases the risk of relapse and prevents successful reintegration into family and community life. To address this gap, we will establish a step-down residential program in Tanana that provides continued recovery support, life skills development, and community-based living in a culturally grounded environment. Supported by Tanana’s new health clinic, the program will expand access to care and advance RHTP goals by adding a new level of rural, tribally led step-down care that reduces avoidable relapse and repeat treatment episodes.	We will establish the Tanana Step-Down Substance Use Treatment Program through three overlapping phases: facility renovation, program development, and staged implementation. Phase 1 (Years 1–2): Facility Renovation The project will renovate the east wing of Tanana’s Elders building to create a six-bed residential space for step-down treatment. Renovations will include resident rooms, office space, and shared program areas, with kitchen facilities jointly used by the Elders program to support operational efficiencies. Design planning will balance integration and separation between Elder and recovery services while ensuring safety, privacy, accessibility, and cultural appropriateness. Phase 2 (Year 2): Program Planning and Development In partnership with Tanana Chiefs Conference (TCC), this phase will establish the clinical, cultural, and operational foundations of the program. Key activities include defining eligibility, developing individualized treatment planning, staffing and referral pathways, and structuring Medicaid and tribal billing processes. The program will integrate Alaska Native cultural practices, Elder mentorship, family engagement, life skills, and employment readiness supports. Partnership agreements, data systems, evaluation tools, and staff training will be completed. The program design will align closely with services provided through the new Tanana clinic, ensuring access to telebehavioral health, on-site counseling, and group services. Phase 3 (Years 3–4): Staged Implementation Beginning in Year 3, the program will open at reduced capacity and scale up to full operation. It will serve individuals completing intensive residential treatment—including those from court-involved programs—who require structured, community-based recovery support. Residents will engage in life skills practice, cultural activities, and employment opportunities consistent with individualized treatment plans and recovery goals. Lengths of stay will range from one month to one year. Continuous quality improvement, evaluation, and participant feedback will guide program refinement. The program’s long-term sustainability will be supported by Tanana Tribal Council health funds, Medicaid billing coordinated through TCC, and other braided revenue sources, ensuring continued operation beyond the initial project period.	\$1M-\$5M	Multi-Community or Participating in Regional Hub-and-Spoke	Yukon-Koyukuk Census Area	Advance to Implementation Application

Native Village of Tanana	Tanana Dental Health Aide Therapist (DHAT) and Provider Housing Renovation Project	AK	Rural Interior Alaska communities face persistent gaps in access to basic dental and primary care due to provider shortages, distance, and harsh travel conditions. The Native Village of Tanana (NVT) is completing a new 6,575-square-foot health clinic in June 2026 with a full dental suite and multipurpose exam room for dental, optical, and consultation services, creating a hub for improved oral health and primary care in Tanana and nearby villages. During clinic planning, NVT and Tanana Chiefs Conference identified placement of a Dental Health Aide Therapist (DHAT) in Tanana as an opportunity to expand access to continuous, community-based dental care. DHATs are trained to live and work in rural communities, providing preventive and restorative services that reduce reliance on infrequent itinerant dentist visits. However, recruitment and retention of DHATs and other clinical staff are constrained by the lack of safe, affordable housing. The limited local rental market consists mainly of older, inefficient units with high costs, and few suitable options exist for permanent or itinerant professionals. To address this barrier, NVT will renovate a former Indian Health Service duplex, now used as office space, back to its original purpose as dedicated provider housing.	Over a two-year period, NVT will renovate a office space to provide dedicated provider housing. Phase 1: Design and Pre-Construction (Months 1–6) During the initial phase, NVT will issue a design-build Request for Proposals (RFP), select a qualified contractor and design firm, and finalize designs and renovations plans. Working with the designer and contractor, NVT will develop detailed plans to convert the building into safe, code-compliant housing suited to clinical providers. Design work will prioritize privacy, soundproofing, accessibility, and energy efficiency, while identifying needed structural repairs such as roof and exterior improvements, electrical and plumbing upgrades, ventilation and indoor air quality enhancements, and insulation and heating system improvements to reduce operating costs. Permitting and pre-construction logistics will be completed so that construction can commence at the start of Phase 2. Phase 2: Renovation Work (Months 7–20) Renovation will transform the former facility into two durable housing units for the Dental Health Aide Therapist (DHAT) and other clinical staff, including itinerant providers. Work will include roof and siding replacement, new windows, updated electrical and plumbing systems, installation of high-efficiency heating and ventilation, and reconfiguration of interior layouts to create comfortable, functional living spaces. Finishes and furnishings will meet long-term professional housing standards and include reliable internet and workspace. NVT will prioritize local workforce participation where feasible and ensure quality through use of licensed contractors experienced in remote Alaska construction. As renovation milestones are completed, inspections will be conducted, with final inspection and certification for occupancy near the end of this phase. Phase 3: Occupancy and Integration (Months 21–24) The renovated units will then serve as dedicated quarters for the DHAT stationed in Tanana and other rotating providers supporting the new clinic and nearby communities. NVT will establish policies governing use of the units and coordinate with Tanana Chiefs Conference to house supervising dentists, primary care clinicians, and visiting specialists. By providing stable, proximate housing, the project will make it feasible for a DHAT to live and work in Tanana, strengthen provider recruitment and retention, and improve the continuity and reliability of care across the region.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Yukon-Koyukuk Census Area	Deferred or Not Advanced

Native Village of Tyonek	Native Village of Tyonek-Indian Creek Health Clinic Renovation	AK	The Native Village of Tyonek seeks to renovate the Tyonek Indian Creek Health Clinic to address aging infrastructure that affects the delivery of healthcare services in a remote rural community. The clinic building is approximately 2,500 square feet and houses Community Health Aide services, exam rooms, behavioral health space, dental space for visiting providers, laboratory services, and staff offices. The lower level of the building houses the Indian Creek Health Department, which provides public health and community wellness programs. Due to the age of the building, several structural and mechanical systems require repair and modernization, including exterior siding, sidewalks, interior ceiling and sheet rock repairs from water damage, lighting systems, doors, plumbing fixtures, and installation of a reliable furnace system. Renovating the clinic will improve safety, protect medical equipment and vaccine storage, and ensure the facility remains capable of supporting healthcare services for the Tyonek community	The Native Village of Tyonek will address aging infrastructure at the Tyonek Indian Creek Health Clinic through targeted facility renovations that improve safety, functionality, and sustainability of the building. The project will focus on repairing exterior siding and sidewalks, replacing damaged ceiling tiles and sheetrock from water damage, upgrading lighting systems, doors, and plumbing fixtures, and installing a reliable furnace to ensure consistent heating during winter months. Improvements will also address building safety systems and interior workspaces to support healthcare staff and patient services. Renovations will be coordinated to minimize disruption to clinic operations and maintain access to care for residents. These improvements will help ensure the clinic remains a safe and reliable facility capable of supporting primary care and public health services for the Tyonek community.	\$250K-\$1M	Clinic	Single Community	Kenai Peninsula Borough	Advance to Implementation Application

Native Village of Tyonek	Tyonek EMS Program Strengthening	AK	The Native Village of Tyonek seeks to strengthen its local emergency medical response system to ensure residents have reliable emergency care in this remote rural community. Tyonek is accessible primarily by small aircraft and seasonal boat travel, and residents requiring advanced medical care must be transported to regional hospitals in Anchorage or Kenai. During medical emergencies, local responders play a critical role in stabilizing patients until medevac transport is available. The Tyonek community currently faces challenges maintaining a stable EMS workforce due to a small population, limited volunteer availability, and the absence of a dedicated EMS program coordinator. Without trained responders available, delays in emergency response can place residents at increased risk during medical events such as trauma, cardiac emergencies, or respiratory distress. This project will establish a sustainable rural EMS response model that supports recruitment and retention of up to six community EMS volunteers, development of an EMS coordinator role, and ongoing training opportunities for responders. By strengthening the local EMS workforce and ensuring responders are properly equipped and trained, the project will improve emergency response readiness and protect the health and safety of Tyonek residents.	The Native Village of Tyonek will implement a rural EMS response program designed to meet the needs of small and remote Alaska communities. The program will recruit and support a team of up to six community EMS volunteers who will participate in a responder rotation to ensure emergency coverage within the community. To support participation and retention, EMS volunteers will receive stipends that recognize their commitment to emergency readiness, training, and response activities. Example stipend structure may include a monthly participation stipend of approximately \$300–\$400 for active responders, an on-call stipend of approximately \$150–\$200 per scheduled response week, and a per-call response stipend of approximately \$75–\$100 when responders participate in emergency calls. The project will also establish an EMS Coordinator role responsible for program oversight, responder scheduling, training coordination, equipment maintenance, and coordination with regional healthcare providers and medevac services. Training and professional development will be a key component of the program. EMS volunteers will participate in certification courses, continuing education programs, and regional training opportunities necessary to maintain EMS credentials. This may include participation in events such as the Alaska EMS Symposium to obtain continuing education hours required for certification. Because Tyonek is a remote community, the project may support travel, lodging, and registration costs when responders must travel to attend these educational events.	\$50,000-\$250,000	Clinic	Single Community	Kenai Peninsula Borough	Advance to Implementation Application

Native Village of Tyonek	Tyonek Community Wellness and recreation Center Assessment and Renovation	AK	Tyonek is a remote Alaska community located on the west side of Cook Inlet in the Kenai Peninsula Borough. Residents face barriers to health and wellness services due to geographic isolation and limited access to community gathering and recreation facilities. Travel to larger service centers such as Anchorage is often required for many services and activities that support healthy living. The proposed project will assess an existing building that would be renovated and transformed into Tyonek's Community Wellness and Recreation Center. While the facility will provide a strong focus on supporting elders and elder meal programs, the recreation and wellness spaces will be open and accessible to the entire community, creating a shared location where youth, adults, and elders can gather, participate in activities, and strengthen community relationships. The center will serve multiple purposes including: • A daily gathering place for Elder Lunch Programs and elder wellness activities • A community recreation space open to all residents • A venue for cultural programs and traditional knowledge sharing • A location for community health education and prevention programs • A central gathering space that encourages positive social interaction and healthy activities The design of the building will support flexible use of space so that elders, youth, families, and community organizations can all utilize the facility.	The approach to developing a Community Wellness and Recreation Center in the Native Village of Tyonek will begin with a comprehensive assessment of an existing building to determine the improvements necessary to safely renovate and bring the structure up to current building and safety codes. This initial phase will include a professional building condition assessment conducted by qualified engineers or architects. The assessment will evaluate structural integrity, electrical and mechanical systems, plumbing, accessibility, fire safety, and general life-safety requirements. The goal of this evaluation is to identify deficiencies, determine the scope of necessary upgrades, and develop a clear renovation plan that ensures the building is safe, compliant, and suitable for community use. Following the assessment, project partners will develop renovation designs and cost estimates based on the findings. This phase will include planning upgrades to meet applicable building codes and accessibility standards, as well as improvements needed to support the building's intended uses as a wellness and recreation center. Potential improvements may include electrical and lighting upgrades, heating and ventilation improvements, accessibility upgrades such as ADA-compliant entrances and restrooms, safety improvements, and interior modifications to create functional spaces for recreation and community gatherings. The renovated facility will be designed to include a flexible recreational space where youth, adults, and elders can gather for activities and exercise. Planned amenities may include workout equipment, table tennis, pool tables, foosball, and other recreational activities that encourage participation and social engagement. The facility will be designed to serve elementary-aged children through adults, creating an inclusive space that supports healthy lifestyles and positive youth engagement. Community input will play an important role throughout the planning and implementation process to ensure the facility meets local needs and reflects community priorities. By starting with a thorough building assessment and following a phased renovation approach, the project will transform an existing structure into a safe, functional, and welcoming Community Wellness and Recreation Center that promotes physical activity, social connection, and improved well-being for residents of Tyonek.	\$250K-\$1M	Clinic	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Native Village of Tyonek	Tyonek MedEvac Helipad	AK	The Native Village of Tyonek is a remote Alaska Native community that is not connected to the road system. Access to advanced medical care often requires emergency medical evacuation (MEDEVAC) by helicopter to hospitals in the Anchorage region. Currently, Tyonek relies on a gravel airstrip with operational limitations and no dedicated helicopter landing infrastructure, which can create safety concerns and delays during emergencies, particularly in poor weather or during nighttime operations. These limitations can affect response times for medical evacuations, trauma care, and other urgent health situations where rapid transport is critical. In rural and frontier communities such as Tyonek, timely access to higher levels of care is an essential component of the healthcare system. Establishing a dedicated helipad will improve the reliability, safety, and efficiency of medical evacuation services. The helipad will provide a designated landing location designed for helicopter operations, reducing delays and improving response times for emergency medical transport. This project presents an opportunity to strengthen emergency medical access for Tyonek residents while improving overall safety and logistical support for healthcare delivery in the community.	The Native Village of Tyonek proposes to develop a dedicated helicopter landing facility to support emergency medical evacuation, healthcare access, and essential logistics for this remote community. The project will begin with evaluation and confirmation of a suitable site within or near the village that provides safe helicopter access, minimal environmental impact, and proximity to village infrastructure and emergency response services. The selected location will consider terrain, prevailing winds, and potential obstacles such as trees, powerlines, and coastal bluffs. The helipad will be designed in accordance with Federal Aviation Administration (FAA) heliport guidance, including appropriate dimensions for touchdown and liftoff areas, safety zones, and clear approach paths. The project will include site preparation, surface construction, markings, and safety features such as a clearly marked landing surface and wind cone. Lighting and other safety enhancements may be incorporated where feasible to support operations during low-light conditions. Coordination with the FAA and other regulatory agencies will occur as needed to ensure compliance with aviation safety requirements, including notification of landing area development and evaluation of potential airspace impacts. The completed helipad will provide a reliable location for medical evacuation helicopters to safely land near the village. This will improve emergency response capability and strengthen the community’s healthcare access infrastructure. The project supports the RHTP goal of sustainable access to healthcare by improving emergency transport infrastructure that connects rural residents to higher levels of care when needed. It also supports innovative care delivery by strengthening the emergency medical response network that rural communities depend on to access specialized healthcare services.	\$250K-\$1M	Clinic	Single Community	Kenai Peninsula Borough	Deferred or Not Advanced

Nenana City School District	Nenana Trauma-Engaged Workforce and Student Support (TEWSS) Project	AK	NCS is located in Nenana, Alaska, and serves preschool through 12th grade students at NCS as well as high school students residing at the NSLC. The proposed initiative focuses on the 215 students attending Nenana City School, including students boarding from across the State. Students at NCS experience disproportionately high rates of poverty and adverse childhood experiences (ACEs). Nenana’s poverty rate is 27.6%, more than double the state average, with a child poverty rate of 39%. Boarding students also come from villages with high poverty rates. Between 2021 and 2023, NCS and the LC experienced four student suicide attempts. 12 students required safety plans during the 24–25 school year. Youth Risk Behavior Survey data show that 63% of students reported feelings of hopelessness in the past year, and 33% seriously considered suicide, well above state averages. 47% of students report they do not feel they belong at school, 19% cannot name a single trusted adult in the school, and only 20% report being able to regulate their emotions. In 24–25, NCS recorded 246 disciplinary referrals, including 38 suspensions or expulsions due to violence and 11 related to substance use. Bullying, harassment, and substance misuse remain persistent concerns, particularly among boarding students navigating separation from family and community supports.	During the summer implementation period, two Trauma-Informed Paraprofessionals (TIPs) will be hired and begin structured training in trauma-engaged practices. This training period will focus on building foundational skills and ensuring a supported transition into school-based roles. Once the academic year begins, TIPs will staff the school Wellness Room; support emotional regulation and de-escalation; assist students experiencing distress; and coordinate supports among the school and community partners. Paraprofessionals will operate as part of a multidisciplinary support system aligned with the District’s existing tiered behavioral health framework. These entry-level positions are intentionally designed to support a “grow-our-own” workforce strategy, enabling staff to build skills, complete training and certification pathways, and advance into higher-level human services roles over time. To support implementation and workforce stabilization, a school-based social worker will provide implementation support and mentorship. This role will model and teach trauma-responsive strategies, support the integration of social-emotional learning (SEL) within classrooms, and assist with coordination of school-based supports. The social worker will build internal capacity by coaching educators to confidently embed social-emotional learning (SEL) and trauma-engaged practices into daily instruction and school operations, while mentoring peers to gradually apply these approaches independently over time. This creates a sustainable train-the-trainer model within NCS that strengthens long-term workforce capacity. This position functions as a bridge to reinforce internal systems and does not replace clinical counseling services. Implementation also includes trauma-engaged staff training, including crisis response and de-escalation, cultural humility, SEL integration, and peer support principles where applicable. Staff training stipends and paid education pathways for the TIP’s will support workforce retention and advancement. To support early intervention and reduce disruption to learning, onsite contracted counseling services will be available to students as needed. These services will be coordinated with existing community providers and will not duplicate Medicaid-reimbursable services. This approach aligns with best practices for a multi-tiered system of supports (MTSS) by providing timely, targeted intervention while preserving continuity of care.	\$50,000-\$250,000	Statewide	Yukon-Koyukuk Census Area	Deferred or Not Advanced

Nenana Volunteer Fire/EMS Department	Nenana Mobile Crisis Team	AK	Nenana is a rural Interior Alaska community with approximately 350 year-round residents and about 100 students who reside at the Nenana Student Living Center during the academic year, serving youth from across Alaska. The community also supports surrounding Denali Borough areas by providing emergency medical transport and response services. Nenana is experiencing a growing need for coordinated responses to behavioral health crises, yet emergency systems are often required. Behavioral health crises account for approximately 33% of all emergency calls responded to by the Nenana Volunteer Fire Department (NVFD), many involving youth. NVFD currently responds to these calls as part of its emergency role but does so without a mobile crisis structure, standardized protocols, or specialized behavioral health crisis training. As a result, emergency medical services, fire personnel, and law enforcement often serve as the first point of contact for crises that are not medical in nature. Nenana has completed preliminary readiness work and demonstrated strong commitment to developing a Mobile Crisis Team (MCT). This project focuses on intentionally planning the design and operational structure of an MCT within NVFD prior to implementation. The planning phase will develop operational plans, policies and procedures, workforce and training strategies, funding pathways, and phased implementation timelines to ensure the model is coordinated, sustainable, and responsive to community needs.	The proposed approach focuses on a structured planning phase to design and operationalize a Mobile Crisis Team (MCT) that will be housed within the Nenana Volunteer Fire Department (NVFD), ensuring the model is ready for safe, coordinated, and sustainable implementation. Planning activities will begin with confirming the scope and design of the MCT, including response criteria, hours of coverage, and coordination with existing emergency response operations. The planning process will align the MCT with NVFD’s structure while clearly defining how crisis response integrates with behavioral health partners, emergency medical services, and other community resources. The approach emphasizes cross-agency coordination and role clarity. Key partners, including behavioral health providers, schools, healthcare, and regional response partners, will be engaged to formalize referral pathways, communication protocols, and aftercare coordination. This ensures the MCT complements existing services and avoids duplication or system strain. A central component of the planning phase will be the development of policies, procedures, and safety protocols specific to mobile crisis response within NVFD. This includes response criteria, escalation guidelines, supervision structures, and alignment with state guidance and best practices. Workforce and training planning will identify appropriate staffing and volunteer models, training and certification requirements, supervision and clinical oversight needs, and a phased training plan tied to implementation milestones. The planning phase will also address funding and sustainability, including identification of potential Medicaid billing pathways, grant opportunities, and braided funding strategies to support long-term operations. Legal, risk, and compliance considerations will be reviewed to ensure the model is viable prior to launch. The planning process will conclude with a phased implementation roadmap that outlines next steps, timelines, and decision points for NVFD leadership and board approval. This approach ensures that any transition to full implementation is intentional, coordinated, and aligned with NVFD’s capacity and mission.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Yukon-Koyukuk Census Area	Advance to Planning

Nenana Volunteer Fire/EMS Department	Nenana EMS Planning Project	AK	Nenana is a rural Interior Alaska community of approximately 350 year-round residents located along the Parks Highway corridor between Fairbanks and Anchorage. Because this highway is the primary route connecting major Interior communities, Nenana experiences seasonal fluctuations in travel, tourism, and recreation that increase demand for emergency response. The Nenana Volunteer Fire Department (NVFD) provides the community’s primary emergency medical response across approximately 37 miles of roadway and surrounding remote areas. The community is situated between the Nenana and Tanana Rivers and serves as a hub for hunting, boating, and outdoor recreation, often requiring responders to operate in remote environments with extended response times. Like many rural EMS agencies, NVFD faces increasing call complexity, limited workforce capacity, volunteer fatigue, and constrained funding and billing infrastructure. The nearest emergency department is approximately 55 miles away, making many transports lengthy and resource intensive. Many 911 calls could be safely addressed through on-scene assessment, treat-in-place care, telehealth consultation, or referral to community-based services. A structured planning process will allow NVFD to assess readiness for community paramedicine, mobile integrated health, advanced certifications, and alternate care models that improve patient outcomes while strengthening workforce sustainability and rural EMS capacity.	The proposed project will support the Nenana Volunteer Fire Department in conducting a structured planning and readiness phase to guide the thoughtful expansion and modernization of emergency medical response services. This approach prioritizes feasibility, workforce sustainability, and alignment with statewide EMS best practices before implementation. The planning phase will begin with a comprehensive program readiness and feasibility assessment to evaluate NVFD’s current operational capacity, staffing levels, volunteer availability, and burnout risk. This assessment will clarify which emergency medical service models, such as treat-in-place, community paramedicine, mobile integrated health (MIH), telehealth consultations, and alternate destination transport, are realistic and appropriate for Nenana’s geography, call volume, and workforce structure. Workforce development planning will focus on mapping EMS career pathways from EMT-Basic through A-EMT and Paramedic, including assessing readiness to standardize certifications and phase out legacy EMT levels. The project will identify training timelines, certification requirements, local instructional capacity, and Train-the-Trainer opportunities, while planning tuition and support pathways for students entering a Paramedicine A.A.S. program. Recruitment and retention strategies will be developed to strengthen volunteer and paid responder pipelines, reduce burnout, and improve coverage depth. The approach will also include assessments of training and instructional capacity, technology and data infrastructure, and equipment and facility needs. This includes evaluating readiness for Patient Care Reporting (PCR), NERIS/ImageTrend reporting, billing documentation, and secure storage for medications and equipment. EMS billing practices, Medicaid and IHS reimbursement structures, and alternative payment models will be reviewed to support long-term financial sustainability. Throughout the planning phase, clear governance, coordination, and evaluation structures will be established. A phased implementation roadmap, performance metrics, and sustainability strategies will be developed to ensure alignment across workforce, technology, and billing systems. This approach positions NVFD to responsibly advance toward a modern, community-centered rural EMS system that improves patient outcomes while reinforcing operational and workforce stability.	Under \$50,000	Multi-Community or Participating in Regional Hub-and-Spoke	Denali Borough; Yukon-Koyukuk Census Area	Deferred or Not Advanced

New Hope Counseling Center	Counseling Services for Uninsured	AK	Mental health challenges have been a long term concern in AK as many struggle with substance abuse, depression, anxiety disorders and suffer from traumatic experiences. Unfortunately sexual abuse is rampant in our state which can cause multi-faceted devastation for generations to come, not only personally, but on families and communities as well. At New Hope Counseling Center, we want to be resources of hope, change and restoration for people who struggle with substance abuse and mental health challenges and have suffered from traumatic experiences. Through our time as a counseling center, however, we have found that access to treatment can be hindered by financial constraints. While we bill most insurances and offer a 25% administrative discount for those who are uninsured, many who are uninsured are still not able to seek services due to cost. We are hoping that this grant can help subsidize services for those who are uninsured so that some of the most vulnerable populations will be able to seek services to assist them toward a pathway of recovery and restoration and flourishing.	Through this grant, we hope to be able to increase access to our services both locally and state wide. For those who are uninsured, they will be able to acquire services at a significantly discounted rate as the grant subsidizes their fee, making services accessible and cost effective for the client as well as New Hope Counseling Center. We will be able to market our services in rural communities in Western AK and Southeast AK thru tele-behavioral health where access to services is often very limited. We will also be able to market our services locally, communicating subsidized rates for those without insurance. Making services more affordable to clients without insurance will offer the hope and resources needed to address the challenges that hinder individuals from progressing in life.	\$50,000-\$250,000	Behavioral health/substance use disorder treatment	Statewide	Anchorage (Municipality); Bethel Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Nome Census Area; Sitka (City and Borough)	Deferred or Not Advanced

New Life Perinatal Support Services	Implementing Integrated Home-Based Perinatal Support to Improve Maternal and Neonatal Outcomes	AK	Alaska’s rural and frontier communities experience persistent disparities in maternal and neonatal outcomes and preventable morbidity. These disparities are driven by geographic isolation, limited access to postpartum follow-up care, gaps in perinatal health education, cultural barriers, limited provider time for patient education, fragmented care coordination and the absence of a trained perinatal support workforce. In Northern and Southwestern Alaska, one-third of postpartum women report not receiving a postpartum checkup (Alaska PRAMS), increasing the risk of delayed identification of maternal and neonatal warning signs, preventable complications, and avoidable emergency department use. In remote communities, delayed care may result in costly aeromedical transport exceeding \$30,000 per flight, illustrating the high cost of delayed identification of complications. These challenges are not limited to specific regions but reflect systemic barriers to perinatal care access across Alaska’s rural and frontier communities. There is a significant opportunity to improve maternal and neonatal outcomes and strengthen continuity between clinical care and home recovery by expanding community-based perinatal workforce capacity, improving early risk identification in the home setting, and enhancing coordination between families and providers across the peripartum period.	This project establishes a scalable, community-based workforce that delivers structured, individualized, home based, health education and support to peripartum families. Designed for rural and frontier communities with limited maternal and neonatal infrastructure, the model embeds locally recruited Perinatal Support Professionals (PSPs) within each community to function as a bridge between families and the formal healthcare system. This non-clinical role operates within a defined scope of practice, focused on patient education, preventive care, early intervention, screening, care coordination and maternal recovery support. PSPs will complete an evidence based, standardized training and credentialing program, with cyclical competency requirements and ongoing supervision. This will establish a scalable, competent, localized workforce model capable of serving rural and remote communities. An initial regional capacity and needs assessment will identify existing infrastructure, key referral and escalation partnerships, baseline data (including emergency transfers, readmissions, priority outcome disparities and workforce capacity) and priority regions for implementation. Each enrolled family will receive a structured package of approximately 20–40 hours of support during the peripartum period, with duration adjusted based on risk stratification and family need. This duration reflects the clinical reality that the highest-risk window for maternal and neonatal complications occurs in the weeks following hospital discharge, when feeding patterns, weight trends, jaundice progression, maternal blood pressure changes, mood instability, infection, wound recovery and family adaptation to newborn care, evolve over days—not minutes. Extended shifts allow opportunity for longitudinal observation and support, enabling real-time lactation and newborn care coaching; offering practical support that stabilizes the families transition, fostering maternal-newborn bonding and reducing maternal strain during recovery, reinforcing peripartum education and enabling early identification of subtle warning signs that brief visits may miss. A secure, HIPAA-compliant, app-based EMR will standardize documentation, trigger escalation alerts, facilitate provider communication, and enable continuous data collection to evaluate outcomes and workforce utilization.	\$250K-\$1M	Maternal health	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

NextGen Dx, Inc	AI technology-enabled maternal-fetal care for healthy beginnings across Alaska	CA	Congenital heart disease (CHD)—the most common, serious, and costly birth defect—is missed by screening ultrasound more than half the time. Despite universal recommendation for prenatal ultrasound screening (the standard second-trimester ultrasound), a third of the world lacks ultrasound, including in Alaska where half of the counties are maternity care deserts. Scalable, accurate fetal screening—both hardware and software—is urgently needed for fetal heart and every problem and organ system that is evaluating using fetal ultrasound.	NextGen Dx delivers affordable, AI-enabled, full-stack fetal screening and monitoring. NextGen Dx addresses all causes for poor fetal ultrasound: Lack of ultrasound machines >> We provide an affordable, portable, easy-to-use ultrasound system. Required anatomic views are missed or are poor-quality unsuitable for diagnosis >> NextGen's on-board AI identifies and optimizes images in real time. Fetal biometric measurements are laborious and error-prone >> AI automates accurate biometric measurements. Inexperienced image interpretation >> AI provides screening diagnosis at the point of care. Lack of access to image storage/PACS >> System sends imaging securely to cloud PACS for review, sharing, telemedicine and quality improvement (supporting healthcare IT infrastructure).	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Nightingale College	Rural Nursing Education in AK	UT	Rural, remote, and frontier Alaska communities face a compounding crisis: severe nursing shortages, insufficient access to nursing education, and a revolving door of imported providers who lack the cultural understanding and trust essential to effective care. Traditional nursing education requires relocation to urban centers—a barrier that disproportionately excludes Alaska Native, rural, and underserved community members who are often the most motivated to serve. The result is a workforce that doesn't reflect the people it treats, and communities that remain underserved generation after generation. Nightingale College has partnered in Alaska for over five years because we believe geography should never determine who becomes a nurse—or who gets quality care. Our blended distance-learning model serves both the optimal student and those from underserved communities needing flexible, accessible pathways. Students complete accredited programs (LPN through MSN) without leaving home, training in facilities where they'll practice alongside people they already know. This is workforce architecture rooted in a simple truth: like people caring for like people produces better outcomes. RHTP investment will expand proven Alaska enrollment from 121 to 300 students by September 2026, building a sustainable pipeline that reflects our shared mission: better humanity through healthcare access for every Alaskan, in every region.	This concept scales enrollment from 121 to approximately 300 students within the first program year using Nightingale's existing curriculum, faculty recruitment capacity, technology platform, and clinical agreements—minimizing startup risk while maximizing speed to impact. Nightingale College leverages a proven blended distance-learning model that has operated successfully in Alaska for five years, combining three core elements: accessible online education, embedded local clinical training, and comprehensive learner support designed for students from underserved and rural communities. Phase 1 — Partnership Expansion & Student Recruitment (Months 1–6): Working with existing Alaska partners to identify prospective nursing students already employed or residing in rural communities. Recruitment will prioritize Alaska Native, rural, and frontier community members through partnerships with AHHA, the Alaska Health Workforce Coalition, AK DOL, and the Alaska Federation of Natives. Phase 2 — Blended Education Delivery (Ongoing): Students complete didactic coursework online from their home communities, supported by Nightingale's dedicated Learner Support Services team providing academic coaching, tutoring, and wrap-around services recognized with a Beacon Award from NWCCU for our 73% diverse student population. Learning follows a three-step model: individual study with learner support, faculty-led online verification of knowledge, and in-person clinical validation of skills at local healthcare facilities. Internet access through community centers in rural areas eliminates connectivity barriers. Phase 3 — Clinical Integration & Workforce Placement (Ongoing): Clinical education is embedded within partnering hospitals, Tribal health organizations, community clinics, and Critical Access Hospitals. Students train where they will practice, building relationships and institutional knowledge that accelerate readiness and retention. Clinical partnerships are already established across multiple Alaska regions with capacity to expand. Phase 4 — Service Commitment & Retention (Post-Graduation): All RHTP scholarship recipients enter five-year formal service agreements with participating healthcare employers, ensuring graduates remain in rural Alaska communities. Because students never left their communities to train, retention is organic rather than incentivized—they're already home.	\$1M-\$5M	Statewide	Aleutians East Borough; Aleutians West Census Area; Anchorage (Municipality); Bethel Census Area; Bristol Bay Borough; Chugach Census Area; Copper River Census Area; Denali Borough; Dillingham Census Area; Fairbanks North Star Borough; Haines Borough; Hoonah-Angoon Census Area; Juneau (City and Borough); Kenai Peninsula Borough; Ketchikan Gateway Borough; Kodiak Island Borough; Kusilvak Census Area; Lake and Peninsula Borough; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Northwest Arctic Borough; Petersburg Borough; Prince of Wales-Hyder Census Area; Sitka (City and Borough); Skagway (Municipality); Southeast Fairbanks Census Area; Wrangell (City and Borough); Yakutat (City and Borough); Yukon-Koyukuk Census Area	Deferred or Not Advanced

Nine Star Education and Employment Services	Development of Healthcare Workforce Development Pipeline to Improve Outcomes for Community Partners	AK	Nine Star requests a grant to provide RHTP Employment Readiness Services to provide coordinated workforce development support for regional nonprofit tribal consortiums, community based workforce development programs and rural health agencies, with the goal of recruiting, advancing and retaining employees, as well as providing access and placement in remote and on-site jobs. Nine Star has a successful track record of providing strong workforce development services for the last 50 years, including our academic skills training, WorkKeys training and assessments, digital literacy training and certifications, financial literacy training, soft skills training, and job placement services. Nine Star is actively developing partnerships in Nome, Kotzebue, and Nuiqsut, and is exploring the needs in Bethel, Yakutat and Talkeetna to upskill, train and place rural residents in healthcare-related roles, such as Community Health Aides, Community Behavioral Health Aides, and Dental Health Aides. The culturally-sensitive services Nine Star provides would be customized to meet the specific needs of the communities inviting us in, and would help to create ready employees.	Our approach focuses on 4 rural Alaskan communities with an acute need for well-trained and prepared health care workers. Nine Star’s goal is to establish strong partnerships with local regional nonprofit tribal entities, existing community workforce development programs and healthcare organizations to provide workforce development training and education services that expand Nine Star’s successful job training curriculum, emphasize the unique cultural identities of the region, provide new job opportunities within the region and avoid outmigration. Through our partnerships with community leaders we hope to ensure that every person is well prepared for healthcare jobs in Alaska and we have established a local employment services model benefiting aspiring job seekers, the community and employment partners. Nine Star would serve as the training agency to ‘fill in the gaps’ assessed by our partners to help upskill existing employees, prepare jobseekers for long-term success, and to utilize our extensive course offerings and services to customize our approach to ensure employers have a strong roster of job candidates, and that local job seekers have access to remote jobs. Robust partnerships require a local presence to facilitate recruitment, training, and job placement. In 2025, Nine Star obtained limited grant funding to plan for development of distance-delivery training hubs to create a workforce pipeline for Bethel, Nome, Kotzebue, and Yakutat. Courses available from Nine Star would include GED preparation, financial literacy, resilience development, digital literacy, soft skills, and some hard skills focused on health care. In future project years, additional rural communities would be added to fully address employment needs and serve Network members. As part of the partnership with each community, we would collectively hire an Outreach Coordinator to help create strong relationship with our healthcare employment partners to map out employment needs and skills and provide a steady pipeline of prepared and aspiring candidates. IT upgrades at Nine Star’s main office would facilitate Network projects, including mapping available health care training and wraparound services; defining measurable Network objectives; establishing data sharing to monitor recruitment, outcomes, placement, retention, and certifications; evaluating results; and modifying strategies to meet employers’ needs.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Matanuska-Susitna Borough	Deferred or Not Advanced

Nine Star Education and Employment Services	Interagency Workforce Development Network	AK	Nine Star requests a grant to create an Interagency Workforce Development Network that convenes workforce training providers, Tribal consortiums, career services agencies, & health care providers with the shared goal of increasing the pool of candidates for rural health careers. The Network would reduce costs by eliminating silos that prevent data sharing, redundancies in recruitment & job placement services. Nine Star envisions a cohesive Network to transform workforce development into a seamless, statewide effort focused on increasing the number of CHA/Ps, BHA/Ps, DHATs, CHWs, RNs, and Peer Support Specialists. With 50 years of experience in Alaska workforce development, Nine Star is well-qualified to guide development of the Network and facilitate streamlining training, pre-employment & placement services to reduce the administrative burden on training providers and employers. Recruiting for health careers requires culturally sensitive relationships with the rural communities to be served. Nine Star is evaluating connectivity for 4 new educational hubs that provide career services and training in soft skills to serve Yakutat’s Community Health Center, Bethel’s YKHC, and Kotzebue’s Maniilaq Medical Center. Enhanced rural broadband connectivity will support distance-delivery education with connectivity to Anchorage. Each rural hub would be staffed by an Outreach Coordinator to maintain an ongoing Network presence and sustain relationships in each community.	The most acute need for health care workers is found in Alaska’s remote communities with their unique cultural identities distinct from multicultural urban communities on road systems. Nine Star believes that successfully increasing the rural workforce for these areas requires a transformational approach to eliminate the system of workforce silos operating in Anchorage, Juneau & Fairbanks. The current system hinders collaboration among training providers, employers, and career services providers. Establishing an Interagency Workforce Development Network comprised of all agencies in workforce development would reduce duplicative efforts, streamline workforce development, and align training with market demand. Nine Star would serve as the Network’s convener to assemble educational institutions, training providers, career services agencies, State of Alaska, Tribal entities, and health care providers. Network members would map current training programs, analyze gaps, define Network goals, and build partnerships that focus on rural employers’ specific needs. Nine Star adds value to the Network by providing training in soft skills that improve retention and career development; maintaining ongoing communication with rural partners; and sharing a digital platform to track progress and evaluate services. In the villages, robust partnerships require a local presence to facilitate recruitment, training, and job placement. In 2025, Nine Star obtained limited grant funding to plan for development of distance-delivery training hubs to develop a workforce pipeline pilot for Bethel, Kotzebue, and Yakutat. Hub equipment, which will be optimized for synchronous instruction and virtual collaboration, has the potential to serve the entire Network. Courses available from Nine Star would include GED preparation and soft skills focused on health care. In future project years, additional rural communities would be added to fully address employment needs and serve Network members. IT upgrades at Nine Star’s Anchorage office would facilitate Network projects, including mapping available health care training and wraparound services; defining measurable Network objectives; establishing data sharing to monitor recruitment, outcomes, placement, retention, and certifications; evaluating results; and modifying strategies to meet employers’ needs. The Rasmuson Foundation recently invited Nine Star to apply for a grant of \$200,000 that would support IT upgrades.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Bethel Census Area; Matanuska-Susitna Borough; Nome Census Area; North Slope Borough; Yakutat (City and Borough)	Deferred or Not Advanced

Ninilchik Traditional Council	ADA-Accessible Mobile Integrated Health Expansion for Frontier Communities	AK	Despite long-standing health services in the region, critical access gaps persist: Kasilof Service Gap: Kasilof lies within NTC tribal boundaries yet lacks any permanent health services. Residents travel significant distances for primary care, behavioral health, and urgent services. Mobile pop-up clinics have demonstrated strong demand for recurring care. Mobile Infrastructure Limitations: NTC’s current mobile unit lacks ADA accessibility and sufficient space, limiting access for elders, individuals with disabilities, and patients with complex needs.	The LOI proposes a system-level rural health transformation that redesigns how care is delivered across the southern Kenai Peninsula by integrating our current mobile care, from substance use treatment to urgent care, and co-located primary and behavioral health services into one coordinated access corridor, rather than expanding isolated services. Core Approach Shift from fragmented, site-based care → to an integrated, hub-and-spoke access model led by the Ninilchik Traditional Council and aligned with the Rural Health Transformation Program. How the Concept Works: Mobile Integrated Health as the Front Door: We are a currently licensed Mobile Integrated Health program (with an additional ADA-accessible unit) brings care directly to unserved and underserved communities (especially Kasilof). Focus on prevention, early intervention, chronic disease management, behavioral health, and MOUD. Reduces travel burden and delays in care. Workforce + Technology Enablement Team-based staffing model (PCP, behavioral health, RN, MIH paramedic, care coordination). Telehealth and data integration connect all components into one system. What Makes This a “Transformation” (Not an Expansion) Uses existing licensure → high readiness, low startup risk Closes a tribal-boundary service gap (Kasilof) Integrates prevention + urgent + chronic care into one model Builds sustainable workforce pathways Reduces downstream costs (ED, medevac, delayed care) Creates a replicable rural model, not a one-off project.	\$250K-\$1M	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementati on Application

Ninilchik Traditional Council	Anchor Point Rural Urgent Care and Integrated Access Stabilization	AK	The LOI proposes a system-level rural health transformation that redesigns how care is delivered across the southern Kenai Peninsula by integrating urgent care, and co-located primary and behavioral health services into one coordinated access corridor, rather than expanding isolated services. This project transforms fragmented rural services into a coordinated, tribally led health access corridor that delivers urgent, and integrated primary and behavioral health care close to home for Alaska Native / American Indian children, adults, and Elders, underserved children and adolescents, including those with limited access to preventive, behavioral, and primary care services, adults at risk for or living with chronic disease, including diabetes, cardiovascular disease, respiratory illness, and related conditions Individuals with behavioral health and substance use disorders, individuals with complex medical, behavioral, and social needs, older adults and individuals with mobility limitations or disabilities. Low-income and geographically isolated rural residents These populations experience disproportionate barriers to timely, coordinated care due to distance, workforce shortages, disability access limitations, and fragmented service delivery. The proposed initiative is designed to reduce these inequities by expanding integrated, culturally responsive, and accessible care close to home.	Shift from fragmented, site-based care → to an integrated, hub-and-spoke access model led by the Ninilchik Traditional Council and aligned with the Rural Health Transformation Program. Anchor Point as the Stabilization Hub: Existing building redesigned as a rural urgent care access point. Handles same-day needs, prevents avoidable ED use, and connects patients back to ongoing care. Integrated Care Center for Continuity Repurposed tribally owned property becomes a seven-day integrated urgent care and 5 day week primary care + behavioral health clinic. Multidisciplinary teams manage high-risk patients, underserved children, and adults at risk for chronic disease. Ensures continuity after urgent visits. Workforce + Technology Enablement Team-based staffing model (PCP, behavioral health, RN, medical assistant, care coordination). Telehealth and data integration connect all components into one system.	\$1M-\$5M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Kenai Peninsula Borough	Advance to Implementation Application

Nisma Therapy Services	Interior Alaska Multidisciplinary Rehabilitation & Telehealth Expansion	AK	Interior Alaska faces a severe shortage of rehabilitation providers, including speech-language pathologists, occupational therapists, and physical therapists. This workforce gap creates major barriers to care, forcing many individuals and families to wait months for services or travel long distances to access therapy. Rural communities are especially affected, where specialized rehabilitation services are limited or unavailable. Our clinic currently maintains a waiting list of approximately one year, demonstrating the significant unmet need for rehabilitation services across the region. Delays in care can negatively impact communication, learning, mobility, independence, and overall quality of life. Rehabilitation services are essential for children with developmental delays and autism, individuals with dyslexia and learning disorders, adults recovering from traumatic brain injury or stroke, and older adults experiencing neurological or mobility challenges. This project will expand access to multidisciplinary rehabilitation services by strengthening workforce capacity, expanding telehealth services statewide, improving clinical infrastructure, and adding physical therapy to our existing speech-language pathology and occupational therapy programs.	This project will expand multidisciplinary rehabilitation services across Alaska through workforce development, facility improvements, telehealth expansion, and rural outreach. Funding will support critical facility upgrades to increase therapy capacity and accessibility, ensuring the clinic can safely serve individuals with disabilities and complex medical needs. Improvements will create safe, functional spaces for children, adults, and older adults requiring specialized care. The project will also fund the purchase of specialized therapy equipment and diagnostic materials for conditions including developmental delays, dyslexia, traumatic brain injury, autism spectrum disorder, and neurological disorders. Funding will support development of Activities of Daily Living (ADL) therapy environments, including adaptive kitchen equipment such as a stove and dishwasher, to help patients practice independent living skills. Expansion of telehealth infrastructure will allow clinicians to serve patients throughout the state, particularly in rural and remote communities with limited access to rehabilitation services. Funding will support recruitment, retention, and training of rehabilitation professionals, including speech-language pathologists, occupational therapists, physical therapists, therapy assistants, and clinical support staff. These efforts will strengthen workforce capacity, reduce wait times, and improve access to timely, high-quality care. Together, these investments will allow the clinic to function as a comprehensive, multidisciplinary rehabilitation center, providing essential services to children, adults, and older adults across Alaska and addressing the critical unmet need for rehabilitation care statewide.	\$250K-\$1M	Clinic	Multi-Community or Participating in Regional Hub-and-Spoke	Anchorage (Municipality); Copper River Census Area; Denali Borough; Fairbanks North Star Borough; Matanuska-Susitna Borough; Southeast Fairbanks Census Area; Yukon-Koyukuk Census Area	Deferred or Not Advanced

Nolan Davis DDS LLC	Frontier Aviation Dental Access & Safety Initiative	AK	The Problem Yakutat faces ongoing oral health disparities due to: • No resident full-time dentist • High untreated decay rates • Expensive and weather-dependent travel • Emergency dental evacuations Currently, Dr. Davis uses an older (1969) VFR aircraft that is not optimally equipped for Southeast Alaska’s challenging weather patterns. If weather does not allow for a VFR landing at the destination airport (Yakutat or Juneau), the plane does not carry enough fuel to return to the airport of origin. The 200 mile flight is usually executed at a very low altitude along the coastline below a low cloud ceiling and often through showers. Limited weather capability results in canceled or delayed clinics. Compounding the problem: • Commercial jet service is infrequent • FAA ground-based equipment outages have disrupted reliability numerous times • Potential reductions in federal airline subsidies threaten further flight reductions • Decreased airline service would significantly reduce healthcare access • The weather between Juneau and Yakutat around Mt Fairweather and Glacier Bay can be deadly Without intervention, Yakutat’s access to dental services may become even more unstable. The Opportunity The opportunity is to stabilize and strengthen an existing, proven care model by investing in a safer, more weather-capable aircraft. This ensures healthcare delivery remains independent of commercial airline vulnerabilities.	Phase 1: Aircraft Acquisition • Purchase a safer, IFR-certified aircraft with deicing or anti-icing equipment that is appropriate for Alaska conditions • Ensure enhanced avionics and terrain/weather safety features • Complete FAA registration and insurance underwriting Phase 2: Service Stabilization • Establish consistent monthly or bi-monthly dental rotations • Coordinate scheduling with Yakutat Community Health Center • Expand school-based preventive programs • Strengthen recall systems for ongoing treatment Clinical Services • Preventive care (cleanings, fluoride, sealants) • Restorative care (fillings, crowns, dentures) • Extractions • Emergency stabilization • Pediatric services • Oral health education Portable equipment will continue to be used within local clinic infrastructure.	\$250K-\$1M	Dental	Single Community	Yakutat (City and Borough)	Deferred or Not Advanced

Nolan Davis DDS LLC	Mobile Marine Dental Clinic for Gustavus, Pelican, Elfin Cove, Tenakee and Baranoff Springs	AK	Residents of Gustavus, Pelican, Elfin Cove, Tenakee and Baranoff Springs face profound barriers to oral health care: • No dental clinic or dental provider in Gustavus, Elfin Cove, Baranoff Springs or Tenakee Springs • No health clinic in Elfin Cove or Baranoff Springs • Limited, intermittent dental availability and limited services in Pelican (by Dr. Davis) • No airport in Pelican, Elfin Cove, Tenakee or Baranoff Springs • Travel to Juneau costs hundreds of dollars per visit in transportation and lodging • Weather conditions frequently delay or cancel travel • High rates of untreated decay and periodontal disease • Increased emergency department use for preventable dental issues These conditions contribute to: • Chronic pain and infection • Missed school and work • Higher long-term healthcare costs • Disproportionate oral health inequities in frontier communities The small population of each community does not warrant full time dental provider presence. Fixed-site clinic structures, if constructed, would sit unused the majority of the time and equipment, supplies and materials would be multiplied and wasted. This project addresses a clear opportunity: using Alaska’s marine transportation reality to create a maritime-based healthcare delivery model tailored to Southeast Alaska’s geography.	Phase 1: Vessel Acquisition and Retrofit • Purchase a seaworthy catamaran (for stability) vessel capable of operating safely in Southeast Alaska waters. • Retrofit the vessel with a fully functional mobile dental clinic including: - o Fully functional dental operatory (or two) - o Digital X-ray - o Modern equipment including CAD/CAM crown mill - o Sterilization area - o Accessible patient entrance - o Secure medical storage Phase 2: Staffing and Scheduling • Recruit a licensed dental hygienist and dental assistant (Excellent Staff has been identified) and a Coast Guard certified Captain (already identified if needed) • The dentist submitting this proposal will be the Staff Dentist • Establish a recurring service schedule • Coordinate with community leadership to ensure appointment access • Coordinate with Harbor Masters and the National Park Service (in process) for dock space Phase 3: Community Integration • Partner with local clinics and health aides • Conduct preventive education sessions • Implement telehealth consultation capabilities for specialty referrals Services Provided • Preventive care (cleanings, fluoride, sealants) • Restorative care (fillings, crowns) • Extractions • Emergency stabilization • Pediatric services This approach ensures both urgent and preventive care are addressed consistently.	\$1M-\$5M	Dental	Multi-Community or Participating in Regional Hub-and-Spoke	Hoonah-Angoon Census Area	Deferred or Not Advanced
