# PREFACE

## PURPOSE OF THIS REPORT

The Alaska Bureau of Vital Statistics 2003 Annual Report was written by the Research Unit staff of the Alaska Bureau of Vital Statistics. This report contains data on births, fetal and infant deaths, adoptions, marriages and divorces, and deaths. The purpose of this report is to provide reference material and indicators for health and vital events in Alaska. Other data sources for analyzing public health trends are also available from the Alaska Department of Health and Social Services.

## HOW THIS REPORT IS ORGANIZED

### Table of Contents

The table of contents contains chapter headings and major sections, and lists of tables, charts, and maps.

### Preface

This section describes the organization of this report.

### Executive Summary

The executive summary includes population estimates and numbers and rates of vital events (births, deaths, marriages, divorces, and adoptions) in Alaska for the 2003 calendar year.

### Introduction

The introduction provides an overview of Alaska, information on population and demographics, and an explanation of how vital statistics are collected and recorded.

### Births

The birth section includes tables showing numbers of births by census area (borough) and Native Regional Corporation, birth characteristics of babies, and demographic and behavioral information on parents.

### Fetal and Infant Deaths

This chapter includes tables showing fetal deaths by census area (borough) and Native Regional Corporation, and deaths and mortality rates for infants up to one year of age by census areas, Native Regional Corporations, and causes of death.

### Child and Adolescent Deaths

This chapter provides specific information on deaths to children from birth through 19 years of age.

### Deaths

This section includes information on all deaths by census area (borough) and Native Regional Corporation; death rates; causes of death; and age, gender, and race of decedents.

### Adoptions

The adoption chapter provides information on census areas (borough) and Native Regional Corporation boundaries where adoption decrees were granted; adoptions by age, race, and type of adoption.

### Marriages and Divorces

This chapter provides information on the number and rates of marriages and divorces by residence and census area (borough) of occurrence.

### Appendices

The appendices include definitions of terms, technical notes, classification of causes of death, prenatal care index, Year 2010 Health Objectives, geographic overview, sample certificates, and population statistics.

## **HOW TO OBTAIN A COPY**

The 2003 Annual Report of the Bureau of Vital Statistics is available at many local libraries throughout the state and on the Internet at:

[www.hss.state.ak.us/dph/bvs/data/default.htm](http://www.hss.state.ak.us/dph/bvs/data/default.htm)

We welcome any comments, questions, or concerns you may have about this report. You may contact us at:

Alaska Department of Health and Social Services  
Division of Public Health  
Bureau of Vital Statistics  
5441 Commercial Blvd.  
PO Box 110675  
Juneau, Alaska 99811-0675

Phone: (907) 465-8602

Fax: (907) 465-4689

Email: [BVSResearch@health.state.ak.us](mailto:BVSResearch@health.state.ak.us)

The staff of the Bureau of Vital Statistics extends our gratitude to each person who participated in our data gathering effort. Accurate data are essential to the Bureau's effort to report reliable vital event information. We appreciate the assistance of others in maintaining the integrity of our data.

## **ADDITIONAL INFORMATION**

Additional information, including how to obtain copies of vital event certificates, is available on the Internet at:

[www.vitalrecords.alaska.gov](http://www.vitalrecords.alaska.gov)

The Research Unit is also available for special information requests on vital statistics data. For non-governmental organizations the fee for research is \$70/hour. For further assistance, please contact the Research Unit at:

Phone: (907) 465-8602

Fax: (907) 465-4689

Email: [BVSResearch@health.state.ak.us](mailto:BVSResearch@health.state.ak.us)

## **ACKNOWLEDGMENTS**

Most of the data and health indicators presented in this report are based upon information supplied by many people throughout the state. Birth mothers, doctors, midwives, other birth attendants, medical facilities, medical examiners, magistrates, funeral directors, and a host of other individuals complete information on vital records.

# EXECUTIVE SUMMARY

## Alaska's Population

Total Population.....	648,280 <sup>1</sup>
White.....	462,006 <sup>1</sup>
Native.....	102,542 <sup>1</sup>
African American.....	23,094 <sup>1</sup>
Asian/Pacific Islander.....	30,067 <sup>1</sup>
Male.....	333,686 <sup>1</sup>
Female.....	314,594 <sup>1</sup>
Natural Increase.....	6,904 <sup>2</sup>
Natural Increase Rate.....	10.6 <sup>3</sup>

## Deaths

Total Resident Deaths.....	3,181
Crude Death Rate.....	490.7 <sup>4</sup>
Age-Adjusted Death Rate.....	832.7 <sup>5</sup>
Male Age-Adjusted Death Rate.....	958.5
Female Age-Adjusted Death Rate.....	713.8
Age-Adjusted Cancer Death Rate.....	187.7
Age-Adjusted Heart Disease Death Rate.....	194.4
Age-Adjusted Accidental Death Rate.....	55.1
Age-Adjusted Suicide Death Rate.....	20.6
Infant Mortality Rate.....	6.9 <sup>6</sup>
White Infant Mortality Rate.....	5.8
Native Infant Mortality Rate.....	9.4

## Births

Total Births.....	10,085
Crude Birth Rate.....	15.6 <sup>3</sup>
White Crude Birth Rate.....	13.9
Native Crude Birth Rate.....	21.6
African American Crude Birth Rate.....	11.7
Asian/Pacific Islander Crude Birth Rate.....	16.6
Teen Birth Rate.....	40.7 <sup>7</sup>
Fertility Rate.....	72.1 <sup>8</sup>
White Fertility Rate.....	65.3
Native Fertility Rate.....	98.0
African American Fertility Rate.....	61.3
Asian/Pacific Islander Fertility Rate.....	65.3
Low Birth Weight Percentage.....	5.9 <sup>9</sup>
White Low Birth Weight Percentage.....	5.6
Native Low Birth Weight Percentage.....	6.1
African Amer. Low Birth Weight Percentage.....	9.4
Asian/PI Low Birth Weight Percentage.....	5.6

## Other Vital Statistics

Fetal Deaths.....	59
Fetal Death Rate.....	5.0 <sup>6</sup>
Adoptions.....	749
Crude Adoption Rate.....	1.2 <sup>3</sup>
Marriages.....	5,246
Crude Marriage Rate.....	8.1 <sup>3</sup>
Divorces.....	2,867
Crude Divorce Rate.....	4.4 <sup>3</sup>

<sup>1</sup>Population estimates are from the Alaska Department of Labor, Research and Analysis Section, Demographics Unit.

<sup>2</sup>Natural Increase is the difference between live births and deaths. Natural Increase does not include migration.

<sup>3</sup>Natural Increase, Birth, Marriage, Divorce, and Adoption Rates are events per 1,000 population.

<sup>4</sup>Crude Death Rates are deaths per 100,000 population.

<sup>5</sup>Age-Adjusted Death Rates are adjusted to the U.S. 2000 standard population. (See Appendix B)

<sup>6</sup>Infant Mortality and Fetal Death Rates are 3-year averages (2001–2003) of infant deaths (death cohort) and fetal deaths per 1,000 live births.

<sup>7</sup>Teen Birth Rate is the number of births to teens per 1,000 females 15–19 years of age.

<sup>8</sup>Fertility Rates are births per 1,000 females 15–44 years of age.

<sup>9</sup>Low Birth Weight Percentages are infants born weighing less than 2,500 grams per 100 live births.

# INTRODUCTION

## ABOUT ALASKA

Alaska is the largest of the 50 states and contains approximately 16 percent of the country's landmass. Because of its size, Alaska has widely diverse geographic, climatic, and demographic characteristics, all of which affect public health.

Alaska contains roughly 586,412 square miles of land. Alaska's population in 2003 was 648,280, or slightly more than one person per square mile. Alaska also claims the most northern, western and eastern points of land in the United States, more miles of coastline than all of the contiguous 48 states combined (6,640 miles not including islands), over 5,000 glaciers, over 3 million fresh water lakes (one of which, Iliamna, is the second largest lake entirely within the U.S.), and 3,000 rivers, of which the Yukon is the third longest river in the United States. Much of the coastline and fresh water areas are used as transportation corridors, as well as fishing grounds. Remote lands are used for hunting and recreational activities.

Unique climatic conditions affect Alaska's people. Temperatures can range from as high as 100°F to lows that approach -80°F. Alaska experiences extremes in precipitation as well. Some areas of the state may receive up to 200 inches of precipitation annually, while other areas receive as little as 12 inches.

With diverse cultures, sparse population, severe temperatures, vast coastline, and outdoor lifestyles, the state experiences many unique health care challenges. One such challenge is assisting residents who live in remote areas of the state. The Native Health Corporations, the Alaska Compact between the Indian Health Service and individual tribes, the State of Alaska, and private entities provide health care in these areas through funding for public health nurses and other health care workers.

The Bureau of Vital Statistics 2003 Annual Report focuses on health status indicators in Alaska. Some comparisons between Alaska health status indicators and national indicators are made. Although some similarities exist between Alaska and the rest of the United States, there is

much dissimilarity. By reporting these indicators, our hope is to assist other professionals to evaluate the status of health in Alaska. The events and vital statistics discussed throughout this report can be useful tools for health care planners, providers, and professionals, but do not provide answers in themselves.

## HOW VITAL STATISTICS ARE COLLECTED

Section 18.50.010 of the Alaska Statutes establishes the Bureau of Vital Statistics to install, maintain, and operate a system of vital records. These records contain birth, death, fetal death, divorce, marriage, and adoption information.

When a birth occurs in Alaska, there is a legal process for recording that birth (AS 18.50.160). Generally, a physician, midwife, and/or hospital medical records staff person prepares a birth certificate from information provided by the birth parent(s) and the delivery attendant. Death certificates are usually completed by a funeral home staff member or a local magistrate, and then certified by the attending physician or medical examiner.

Death certificates should be filed with the local recording district office within three days of the date of death (AS 18.50.230). After the certificate has been recorded at the local district office, it is then forwarded to the Bureau of Vital Statistics in Juneau for registration.

When a birth or death occurs in Alaska to a resident of another state, the Bureau sends the respective state's registrar a copy of the certificate. Similarly, when a birth or death occurs to an Alaskan resident in another state, that state's registrar, by formal agreement, sends a copy of the certificate to the Alaska Bureau of Vital Statistics. This cooperative arrangement allows us to include all births and deaths involving Alaskan residents wherever they occur within the country.

In the past, the Alaska Court System issued a license and filed a certificate for each marriage performed in the state. The certificate was filed with the local recording office of the Court System within seven days of the marriage (AS18.50.270). The local recording office then forwarded the certificate to the Bureau for registration and permanent retention. In 1997 the Bureau of Vital Statistics began

issuing marriage licenses in Juneau, Anchorage, and Fairbanks, as well as registering and providing permanent retention of documents. Marriage licenses in other parts of the state continue to be issued by the Court System under the Bureau's oversight.

Divorce, dissolution, and annulment certificates are prepared by a clerk of the court from information provided by the petitioner, plaintiff, and (possibly) court documents. The completed certificate is then forwarded to the Bureau for final registration (AS 18.50.280).

For each adoption granted by the court, a report of adoption is prepared and registered with the Bureau (AS 18.50.210). In the event that a child was born in Alaska and adopted in another state, the Bureau receives and acts on that state's report of adoption.

## **POPULATION ESTIMATES**

Population estimates used in this report were obtained from the State of Alaska, Department of Labor (DOL), Research and Analysis Section (R&A), Demographics Unit. Totals are made by race, age, and geographic area. The 2003 Alaskan census population was 648,280 persons, with 333,686 males and 314,594 females. During 2003 there were 106.1 males for every 100 females in Alaska.

The Alaska Department of Labor updates its population estimates annually. The estimate of total population is revised each year to correspond to the U.S. Census Bureau state total. Using the decennial census as a base, birth, death, IRS, Alaska Permanent Fund and education statistics are used to produce annual population estimates for geographic areas.

Residents of the Anchorage census area comprised 41.9 percent of the state's population during 2003. About 80.0 percent of Alaska's population was concentrated in six census areas: Anchorage, Fairbanks, Juneau, Kenai, Ketchikan, and Matanuska-Susitna.

The age of a population is important when interpreting vital statistics, because behaviors and health risks of younger populations differ from those exhibited by older populations. Age, race, and sex distributions within a population are also important. The median age for Alaskan males during 2003 was 33.0 years; for females it was 33.1 years; and for all Alaskans it was 33.1 years. The median

age for males in the United States was 34.8 years and for females it was 37.2 years<sup>1</sup>. For an example of the disparity of the age distribution of Alaska versus that of the United States, please refer to Figure H.1 in Appendix H. For further information about interpretation of vital statistics, refer to "How to Use Vital Statistics" in Appendix B.

## **HOW CERTIFICATES ARE PROCESSED**

In 1994, the Bureau instituted an Electronic Birth Certificate (EBC) system. This system enables hospital and clinic staff to record all birth certificate information by computer. As information is entered for each individual certificate, the computer checks for invalid or improbable data. When the certificate has been entered on the EBC system, the data is certified, recorded, and filed by the Bureau. Each certificate is then examined electronically for missing or out-of-range information and returned to the facility or birth attendant for verification and/or correction. During 2003, almost 97 percent of all births occurring in Alaska were recorded using the EBC.

Other vital records received by the Bureau go through a different verification process. First, a trained documents processor reviews the certificate for completeness. If the certificate is incomplete it is returned to the appropriate office for completion. Once a document has been received and accepted, two different employees enter information into the database. This double-entry verification process reduces data entry errors.

A physician or medical examiner determines causes of death and narrative descriptions are entered on the death certificate. The narrative causes of death are typed into a computer file by Bureau staff. SuperMICAR, a program produced, maintained, and provided by the National Center for Health Statistics (NCHS), codes 85–90 percent of causes of death according to ICD-10 standards. (See Appendix C for groupings of ICD-10 causes of death). The Bureau transmits the computer file by diskette or e-mail to NCHS. NCHS completes coding for the remainder of the records. This coding is then returned to the Bureau and uploaded into its database.

## **HOW THIS REPORT WAS PREPARED**

After documents have been entered into the Bureau's database, research staff performs computer checks to test for missing, out-of-range, and duplicate data. Because

<sup>1</sup> Census 2003, US Census Bureau, Washington DC

this report is based not only on events that occur in Alaska, but also events that occur in other states to Alaska residents, there may be a significant lag time before data is received.

Waiting for all data to arrive and eliminating duplicate entries are both important steps for ensuring the most accurate report possible. Once we believe the data is both accurate and complete, data programs can be run to generate information from which the tables, charts, and narrative analyses can be written for this report.

There are a number of ways to report vital events including numbers of events, rates based on total populations, or rates based on specific populations. For a discussion of the use of vital statistics and a comparison of different populations, see Appendix B.

## **DETERMINATION OF RACE**

The National Center for Health Statistics (NCHS) issues guidelines for determining the race of a child at birth. With few exceptions, the child's race on the birth certificate is the same as the mother's stated race. These guidelines became effective in 1989.

Sometimes race will be recorded differently on death certificates. This can distort death rates, particularly in the case of infant mortality, where a child's race may be reported as white on the birth certificate because the mother is white, and Native on the death certificate because the father is Native. To ensure consistent reporting and calculation of rates, all death certificates for decedents who were born in Alaska in 1989 or later are matched with the birth certificate and the child's race at birth is used for calculating deaths and death rates by race.

# BIRTHS

*"The Embrace"*  
Copyright Rie Munoz, Ltd.

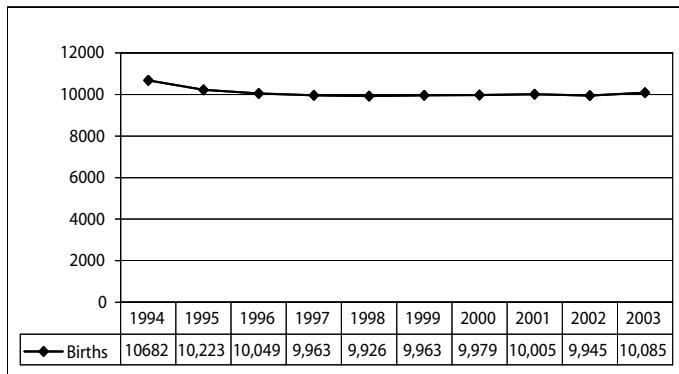

## INTRODUCTION

The Alaska birth certificate provides information about each baby born in Alaska, regardless of the mother's residence state. Through a vital statistics cooperative agreement, birth information is also collected for Alaska mothers who have a baby in another state. Thus, the Bureau of Vital Statistics Information System contains records on all births occurring in the state and all births to residents of Alaska.

The birth certificate contains information about the mother, the father, the pregnancy, and the child. Birth information is collected in hospitals and birth centers

from worksheets completed by parents or medical staff, from medical charts, or by a combination of these sources. Midwives and family members who deliver a baby collect the birth information from their records or from a parent and complete the birth certificate.

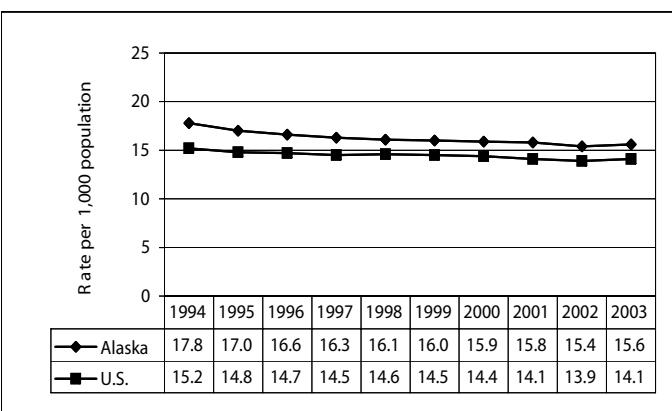

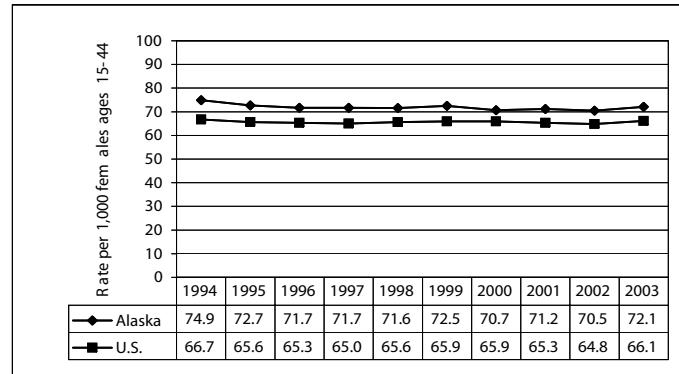

This chapter reports information from the birth certificate such as pregnancy history, parents' education, prenatal care, mother's health risk behaviors, and birth weight, which can be used to monitor and help improve the health of mothers and children.

**FIGURE 1****ALASKA RESIDENT BIRTHS, 1994–2003**

There were 10,085 live births to Alaska residents in 2003 (Figure 1). This is an increase of 1.4 percent from the 9,945 births recorded in 2002. Of these births, 5,195 were boys and 4,890 were girls. Of the 10,085 births in 2003, there were 141 sets of twins and five sets of triplets.

The natural increase in Alaska's population (the increase of births over deaths) was 6,904 persons, representing a natural increase rate of 10.6 persons per 1,000 population. This is a similar rate to the natural increase rate of 10.7 recorded in 2002.

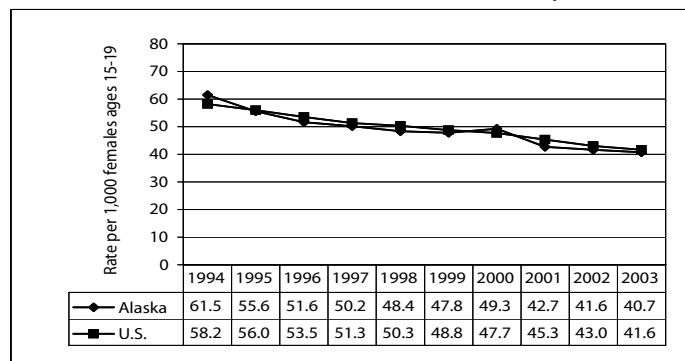

The 2003 crude birth rate of 15.6 per 1,000 population represents a 1.3 percent increase from the 2002 crude birth rate of 15.4, and a 12.4 percent decrease from the crude birth rate of 17.8 per 1,000 population recorded in 1994. The 2003 crude birth rate for the United States was 14.1 live births per 1,000 population<sup>1</sup>, which is a decline of 7.2 percent from the rate of 15.2 in 1994.

**FIGURE 2 CRUDE BIRTH RATES: U.S. AND ALASKA, 1994–2003****FIGURE 3****FERTILITY RATES: U.S. AND ALASKA, 1994–2003**

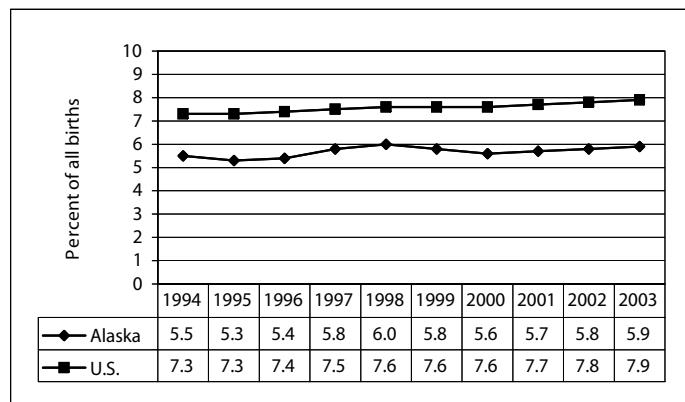

In order to calculate crude birth rates (Figure 2), fertility rates, or any of the other rates used in this report, population estimates must be used. Population estimates are provided by the Department of Labor, Research and Analysis Section, Demographics Unit. Due to the way race information was collected beginning with the 2000 census, previous population estimates are not comparable to current estimates. The Department of Labor has developed smoothed bridge estimates so that population estimates by race made after 2000 are comparable to previous estimates. When reporting rates by race, this report uses smoothed bridge estimates. Please refer to Appendix H for the population estimates used in this report. Furthermore, in order to make a seamless transition from 1990s population estimates to the 2000 Census, the Department of Labor has revised population estimates produced during the 1990s.

The fertility rate (Figure 3) is a more meaningful measure of behavioral patterns than the crude birth rate since it is a measure of the number of births compared to the number of women of usual child-bearing age (15–44 years). The 2003 fertility rate for Alaska was 72.1 births per 1,000 women, representing a 2.3 percent increase from the 2002 fertility rate of 70.5. Alaska's fertility rate was 9.1 percent higher than the U.S. fertility rate of 66.1 in 2003.

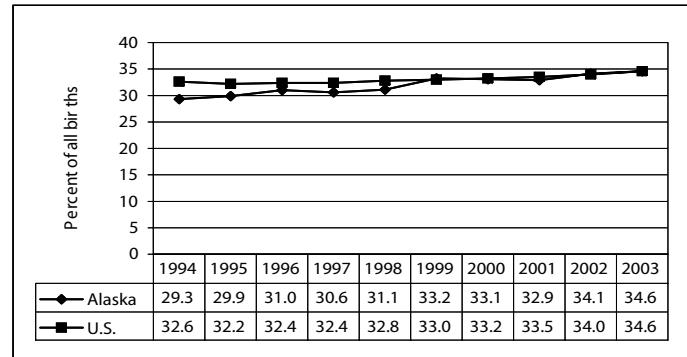

<sup>1</sup>National Center for Health Statistics, U.S. Department of Health and Human Services, "Births: Final Data for 2003," National Vital Statistics Report, Vol. 54, No. 3, September 8, 2005.

**FIGURE 4 TEEN BIRTH RATES: U.S. AND ALASKA, 1994–2003**

The 2003 teen (ages 15–19) birth rate for Alaska was 40.7, which is 2.2 percent below the 2003 U.S. teen birth rate of 41.6 (Figure 4). Alaska's 2003 teen birth rate reflects a decrease of 2.2 percent from the 2002 rate of 41.6. Since 1994, the teen birth rate in Alaska has declined by one-third (33.8 percent).

**FIGURE 5 PERCENTAGE OF LOW BIRTH WEIGHT INFANTS: U.S. AND ALASKA, 1994–2003****FIGURE 7 MOST POPULAR BOYS' AND GIRLS' NAMES: ALASKA, 1993, 1998, AND 2003**

**FIGURE 6 PERCENTAGE OF UNWED MOTHERS: U.S. AND ALASKA, 1994–2003**

Low birth weight [live births that weigh less than 2,500 grams (5 pounds, 8 ounces)] is an important predictor of infant death. Infants born with low birth weight also are more likely to need extensive medical treatment. The incidence of low birth weight (Figure 5) babies born in Alaska during 2003 was 5.9 percent of total live births, an increase of 1.7 percent from the 2002 Alaska percentage of 5.8 percent. Although the incidence of low birth weight births has been increasing for both Alaska and the U.S. over the last decade, the Alaska low birth weight percentage is 25.3 percent lower than the U.S. percentage.

Of the total births to Alaska residents during 2003, 34.6 percent were to unmarried women (Figure 6). This is an increase of 1.5 percent over the 34.1 percentage reported for Alaska in 2002.

The most popular boy's name in 2003 was Joseph and the most popular girl's name was Hannah. Figure 7 below shows the ten most popular boys' and girls' names for the years 1993, 1998, and 2003.

## **BIRTHS BY RESIDENCE AND RACE**

The following tables of this chapter show annual occurrences of live births to Alaska residents during 2003 and for the three-year period 2001 through 2003.

Annual rates and three-year rates for the state as a whole, its 27 census areas, and 12 Native Regional Corporations are shown by race and residence of the mother. Natality statistics on the mother's age, marital status, education, birth facility, prenatal care, cesarean delivery, pre-term births, and low birth weight are presented.

The table for the statewide totals (Table 1) provides birth statistics for the white, black, Native, and Asian/Pacific Islander races. However, due to the low number of reportable events for some census areas or boroughs, birth outcomes by census area (borough) and Native Regional Corporation are only shown for the two predominant races in Alaska: Native and white.

Also, unknown values are not reported in these tables. Thus, the percentages for certain categories such as mother's age group may not add up to the total number of births.

Since female population estimates for the age groups of 15–17 and 18–19 are not available for individual census areas, fertility rates and teen birth rates cannot be calculated for these tables (Table 2 and Table 3). Furthermore, due to the way race information was collected in the Federal 2000 Census, population estimates by race beginning in 2000 are not comparable to previous population estimates. The Alaska Department of Labor has developed bridge estimates so that the federal population estimates by race in 2000 and later years will be comparable to previous years. Bridge estimates by census area by race prior to 2003 are not available. When complete bridge estimates by census area by race are published, the online Annual Report will be updated. The following Web address is for the online Annual Report:

[www.hss.state.ak.us/dph/bvs/data/default.htm](http://www.hss.state.ak.us/dph/bvs/data/default.htm).

Note: Unknown responses are excluded from the denominator when calculating percentages.

(1) Birth rate per 1,000 population. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

(2) Population estimates by census area for 15–17 and 18–19 are not available for 2003. Therefore, rates for these age groups are unavailable.

(3) Fertility rate per 1,000 female population ages 15–44. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

\* Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

\*\* Data suppressed for confidentiality concerns if total births to residents, by race, is less than five observations.

Note: Unknown responses are excluded from the denominator when calculating percentages.

(1) Birth rate per 1,000 population. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

(2) Population estimates by census area for 15–17 and 18–19 are not available for 2003. Therefore, rates for these age groups are unavailable.

(3) Fertility rate per 1,000 female population ages 15–44. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

\* Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

\*\* Data suppressed for confidentiality concerns if total births to residents, by race, is less than five observations.

Note: Unknown responses are excluded from the denominator when calculating percentages.

(1) Birth rate per 1,000 population. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

(2) Population estimates by census area for 15–17 and 18–19 are not available for 2003. Therefore, rates for these age groups are unavailable.

(3) Fertility rate per 1,000 female population ages 15–44. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

\* Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

\*\* Data suppressed for confidentiality concerns if total births to residents, by race, is less than five observations.

Note: Unknown responses are excluded from the denominator when calculating percentages.

(1) Birth rate per 1,000 population. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

(2) Population estimates by census area for 15–17 and 18–19 are not available for 2003. Therefore, rates for these age groups are unavailable.

(3) Fertility rate per 1,000 female population ages 15–44. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

\* Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

\*\* Data suppressed for confidentiality concerns if total births to residents, by race, is less than five observations.

Note: Unknown responses are excluded from the denominator when calculating percentages.

(1) Birth rate per 1,000 population. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

(2) Population estimates by census area for 15–17 and 18–19 are not available for 2003. Therefore, rates for these age groups are unavailable.

(3) Fertility rate per 1,000 female population ages 15–44. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

\* Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

\*\* Data suppressed for confidentiality concerns if total births to residents, by race, is less than five observations.

Note: Unknown responses are excluded from the denominator when calculating percentages.

(1) Birth rate per 1,000 population. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

(2) Population estimates by census area for 15–17 and 18–19 are not available for 2003. Therefore, rates for these age groups are unavailable.

(3) Fertility rate per 1,000 female population ages 15–44. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

\* Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

\*\* Data suppressed for confidentiality concerns if total births to residents, by race, is less than five observations.

Note: Unknown responses are excluded from the denominator when calculating percentages.

(1) Birth rate per 1,000 population. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

(2) Population estimates by census area for 15–17 and 18–19 are not available for 2003. Therefore, rates for these age groups are unavailable.

(3) Fertility rate per 1,000 female population ages 15–44. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

\* Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

\*\* Data suppressed for confidentiality concerns if total births to residents, by race, is less than five observations.

Note: Unknown responses are excluded from the denominator when calculating percentages.

(1) Birth rate per 1,000 population. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

(2) Population estimates by census area for 15–17 and 18–19 are not available for 2003. Therefore, rates for these age groups are unavailable.

(3) Fertility rate per 1,000 female population ages 15–44. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

\* Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

\*\* Data suppressed for confidentiality concerns if total births to residents, by race, is less than five observations.

Note: Unknown responses are excluded from the denominator when calculating percentages.

(1) Birth rate per 1,000 population. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

(2) Population estimates by census area for 15–17 and 18–19 are not available for 2003. Therefore, rates for these age groups are unavailable.

(3) Fertility rate per 1,000 female population ages 15–44. Population estimates by race by census area are only available for 2003. Therefore, three year rates are unavailable.

\* Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

\*\* Data suppressed for confidentiality concerns if total births to residents, by race, is less than five observations.

## INTRODUCTION

### FETAL DEATHS

A fetal death is defined as death before the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation, the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

Alaska Statute 18.50.240 requires the filing of a fetal death certificate for each fetal death that occurs in the state

when the pregnancy has lasted at least twenty weeks. The filing of certificates for fetal deaths which occur prior to the twentieth week of pregnancy is optional. This chapter includes information only for fetal deaths in which either the estimated gestation or the calculated gestation (last menstrual date subtracted from the date of delivery) is at least twenty weeks.

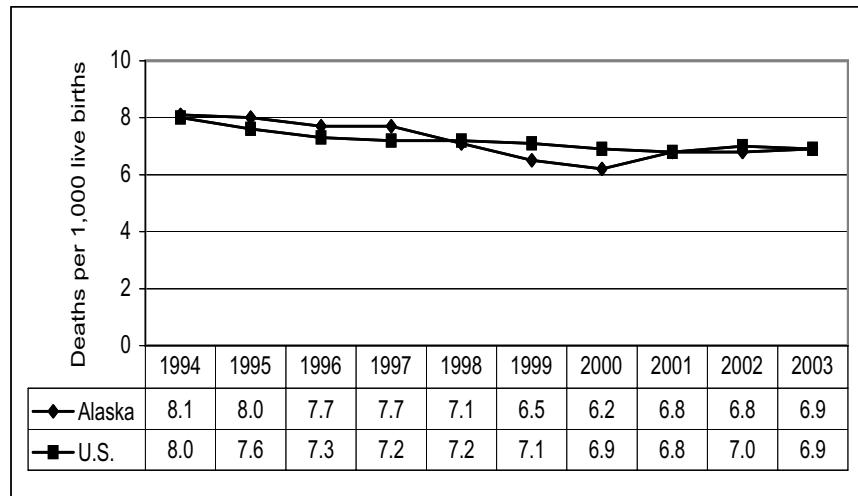

## INFANT DEATHS AND MORTALITY RATES

Infant deaths are defined as deaths that occur after a live birth and before an infant's first birthday. Infant mortality may be calculated by either of two methods: a birth cohort or a death cohort. A birth cohort includes all infants born in the same calendar year who die within one year of their birth. A death cohort includes all infant deaths that occur in a given calendar year, regardless of the birth year.

The birth cohort method is more relevant for calculating infant mortality rates because it calculates a rate for a specific group of infants, whereas the death cohort method calculates a rate based on comparing deaths in one year against births in the same year. The death cohort calculation includes infants who died in the report year (2003) but may have been born in the previous year (2002), and excludes infants who were born in the report year but die in the following year.

The total number of infant deaths (death cohort) to resident mothers in 2003 was 70. This is a 27.3 percent increase from the 55 infant deaths in 2002 and a 14.6 percent decrease from the 82 infant deaths in 1994. The total number of infant deaths (birth cohort) to resident mothers in 2003 was 63, a 6.8 percent increase from the 59 infant deaths in 2002 and a 13.7 percent decrease from the 73 infant deaths in 1994.

A few additional (or less) infant deaths can cause large fluctuations in the infant mortality rate (IMR) from one year to the next. Therefore, Alaska's annual IMR is calculated on a three-year moving average in order to provide a more reliable basis for comparison. The 2001 to 2003 three-year average IMR (death cohort) was 6.9 deaths per 1,000 live births, a 1.5 percent increase from the rate of 6.8 for 2000 to 2002. The U.S. infant mortality rate in 2003 was 6.9 deaths per 1,000 live births, which is slightly lower than the rate of 7.0 in 2002.

**FIGURE 8****INFANT MORTALITY RATES: U.S.\* AND ALASKA, 1994–2003**

Note: Alaska rates are three-year moving averages. U.S. rates are single year rates.

When discussing infant mortality, a distinction is made between neonatal mortality (deaths prior to the 28th day of life) and postneonatal mortality (deaths from the 28th day up to one year). Neonatal deaths are frequently associated with circumstances related to pregnancy and delivery while postneonatal deaths are often associated with living conditions. Alaska's three-year neonatal mortality rate has generally been lower than the neonatal mortality rate for the United States (Figure 9), while its three-year postneonatal mortality rate has been higher (Figure 10). The 2001 to 2003 three-year average neonatal mortality rate was 3.0 deaths per 1,000 live births, which is 3.2 percent lower than the previous three-year period. The U.S. neonatal mortality rate was 4.6 deaths per 1,000 live births, down slightly from the rate of 4.7 in 2002.

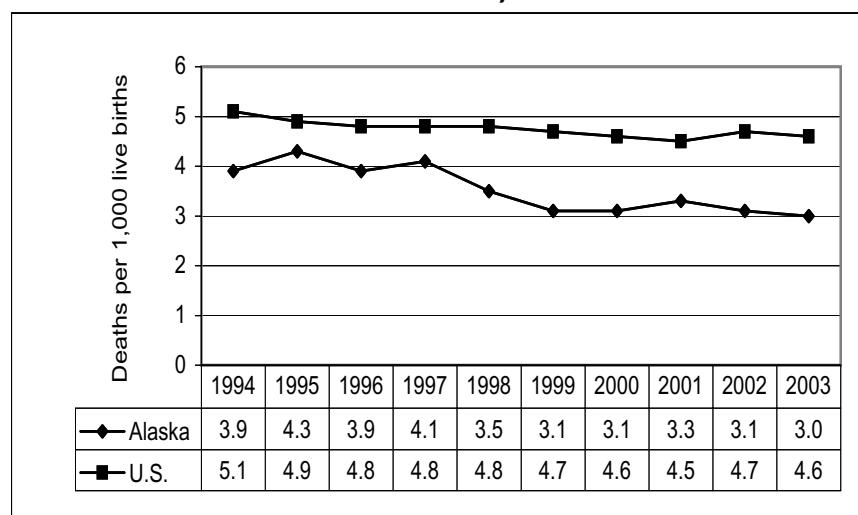

The 2001 to 2003 three-year average postneonatal mortality rate was 4.0 deaths per 1,000 live births, up 5.3 percent from 3.8 deaths per 1,000 live births for 2000 to 2002. The U.S. postneonatal mortality rate was 2.2 deaths per 1,000 live births, a slight decrease from the rate of 2.3 in 2002. Since 1994, both the Alaska three-year neonatal and postneonatal mortality rates have declined 23.1 and 4.8 percent, respectively.

\*U.S. rates provided by the United States Department of Health and Human Services (US DHHS), Centers for Disease Control and Prevention (CDC), National Center for Health Statistics (NCHS), Office of Analysis, Epidemiology, (OAE): Compressed Mortality File (CMF) compiled from CMF 1968–1988, Series 20, No. 2A 2000, CMF 1989–1998, Series 20, No. 2E 2003 and CMF 1999–2002, Series 20, No. 2H 2004 on CDC WONDER On-line Database; "Deaths: Final Data for 2003," National Vital Statistics Report, Vol. 54, No. 13, April 19, 2006, p. 11.

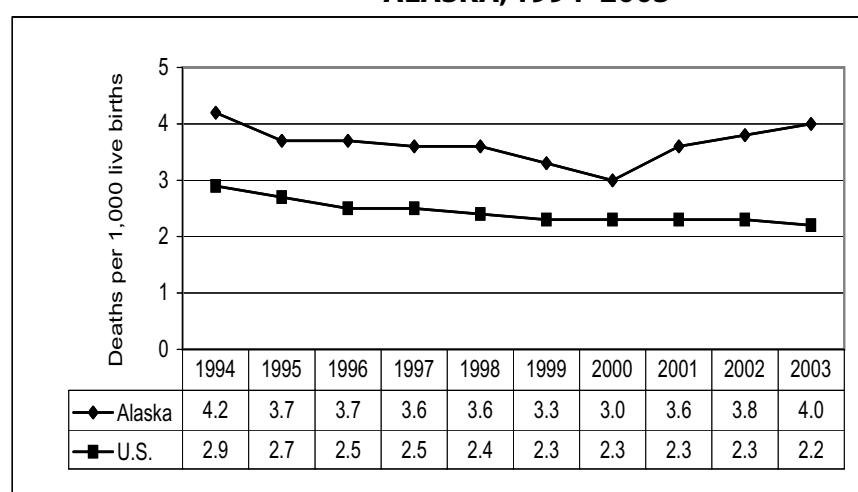

Tables 8 and 9 (pages 65 and 66) show the number of infant deaths by cause of death. The causes of death are based on the 130 selected causes of infant death tabulation list in ICD-10. From 1979 to 1998, causes of death were classified using ICD-9. Publications or tables showing mortality data under ICD-10 may differ substantially from those under ICD-9. Cause-of-death data across ICD revisions are not directly comparable, unless adjustments are made for the coding and classification changes. For further discussion on the implications of changing ICD revisions, please refer to Appendix C.

The remaining tables of this chapter show the annual occurrences of fetal and infant deaths to Alaska residents during 2002 and for the three-year period, 2000 through 2002.

Annual rates and three-year rates for the state as a whole, its 27 census areas or boroughs, and 12 Native Regional Corporations are shown by the race and residence of the infant. Note that the infant's race is the same as the mother's race. The table of state totals provides birth information for the white, black, Native, and Asian/Pacific Islander races. However, due to the low number of reportable events for some census areas, Native Regional Corporations, or boroughs, fetal and infant deaths by these areas are only shown for the two predominant races in Alaska: Native and white.

**FIGURE 9****NEONATAL MORTALITY RATES: U.S.\* AND ALASKA, 1994–2003**

Note: Alaska rates are three-year moving averages. U.S. rates are single year rates.

**FIGURE 10 POSTNEONATAL MORTALITY RATES: U.S.\* AND ALASKA, 1994–2003**

Note: Alaska rates are three-year moving averages. U.S. rates are single year rates.

# CHILD AND ADOLESCENT DEATHS

"Kittiwakes, St. George"  
Copyright Rie Munoz, Ltd.

## INTRODUCTION

This chapter provides information on deaths to children and adolescents from 0 to 19 years of age. Deaths and death rates are reported by the following age groups: less than 1 year, 1 to 4 years, 5 to 9 years, 10 to 14 years, 15 to 19 years, and the total number of child and adolescent deaths. Note that for infants less than 1 year of age, infant

death rates are reported only at the statewide level. The infant death rates reported in this chapter are different than the infant mortality rates reported in Chapter 2. Infant mortality rates are based on the number of live births, while infant death rates are based on the estimated population under 1 year of age.

Statewide child and adolescent deaths and death rates are reported by age group and the sex and race of the child or adolescent. However, due to the low number of reportable events for most areas, child and adolescent deaths by census area, borough, and Native Regional Corporation are only reported by age group. Also, since population estimates for infants less than one year of age are only available at the statewide level, the death rates for this age group are not reported by census area (borough). Infant mortality rates by census area (borough) are available in Chapter 2. Since population estimates are not available by Native Regional Corporation and age group, rates are not reported in Table 13.

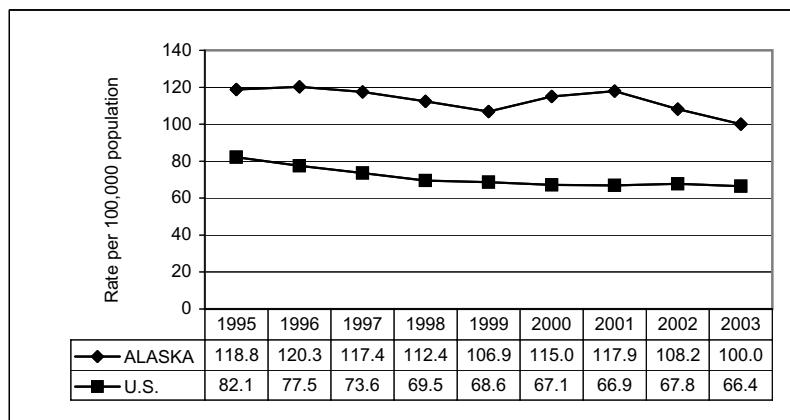

Death rates for Alaskan adolescents are higher than the corresponding U.S. rates in all age groups (Table 10). Both the Alaska and the U.S. death rates for adolescents age 15 to 19 (Figure 11) are lower than in 1995 (15.8 percent and 19.1 percent, respectively), although the Alaska rate is still 50.6 percent higher than the U.S. rate for this age group. Unfortunately, national death rates by cause were not available for the 15 to 19 age group at the time of printing. Typically, Alaskan teens in this age group are more likely to die from suicide compared with U.S. teens. In 2003, the suicide rate for this age group in Alaska was over three times the 2002 national rate (24.5 per 100,000 vs. 7.4). Typically, Alaska has a higher rate of unintentional injuries than the U.S. rate. In 2003, though, the unintentional injury rate for Alaska was lower than the 2002 U.S. rate (25.4 per 100,000 vs. 35.0).

**TABLE 10** AGE-SPECIFIC ADOLESCENT DEATH RATES:  
ALASKA AND THE U.S.\*<sup>1</sup>, 1995–2003

Note: Statewide totals include deaths where the census area or borough of residence is unknown.

\*Rates based on fewer than 10 occurrences are statistically unreliable and should be used with caution.

Population estimates are not available for infants less than one year of age by census area, so deaths and death rates for this age group are not reported separately.  
Rates are per 100,000 population.

## INTRODUCTION

The death certificate contains information about each death that occurs in Alaska, regardless of the decedent's residence state. Through a vital statistics cooperative agreement, death information is also gathered for Alaska residents who die in another state. Thus, the Bureau of Vital Statistics Information System contains records on all deaths occurring in Alaska and all deaths to Alaska residents.

The information on the death certificate comes primarily from two sources. Funeral directors gather the

demographic information about the decedent, which is typically supplied by a family member or a close friend of the decedent. The cause of death information is usually provided by a certifying physician or a medical examiner.

This chapter reports cause of death information from the death certificate by various demographic characteristics, such as residence, race, sex, and age.

There were 3,181 deaths to Alaska residents in 2003. Of this number, 183 (5.8 percent) died out of state. A total

of 3,115 deaths occurred in Alaska: 2,998 were Alaska residents and 117 were out of state residents. The 3,181 resident deaths was a 4.9 percent increase from the 3,033 resident deaths in 2002. Since 1994, the number of deaths to Alaska residents (Figure 12) has increased by 29.0 percent.

In 2003, the crude death rate in Alaska (Figure 13) was 490.7 deaths per 100,000 residents. This rate is 4.2 percent higher than that of 2002 and is a 19.6 percent increase from the crude death rate of 410.4 in 1994. This increase is partially due to the fact that the median age in Alaska has been increasing and older persons are more likely to die than younger persons. In 1994, the median age of all Alaskans was 31.0 years, compared with a median age of 33.1 years in 2003. Although the crude death rate in Alaska has increased while the U.S. rate decreased, the Alaska crude death rate is still 41.7 percent lower than the U.S. rate.

When comparing death rates between different populations, age-adjusted death rates should be used. This is because populations with a higher proportion of elderly people will tend to have higher crude death rates. For example, the U.S. has a higher crude death rate than Alaska, in part because the median age in the U.S. (36.0 years) is higher than the median age in Alaska. When comparing age-adjusted death rates, the Alaska rate is identical to the U.S. rate (Figure 14). The age-adjusted death rate in Alaska increased 4.0 percent from the rate of 800.7 in 2002, but has overall decreased 10.9 percent since 1994.

It is important to note that beginning with 1999 mortality statistics, the U.S. year 2000 standard population is used for age adjusting. Prior to 1999, annual reports used the 1940 standard population. The year 2000 standard population gives more weight (or emphasis) to older age groups. Generally, most age-adjusted death rates will be higher using the year 2000 standard population than rates using the 1940 standard population. When comparing age-adjusted death rates, it is imperative to make sure the same standard population is being used. Alaska Vital Statistics Annual Reports published before 1999 used the 1940 standard population for age adjusting, so age-adjusted rates from these reports cannot be compared to the age-adjusted rates in this report.

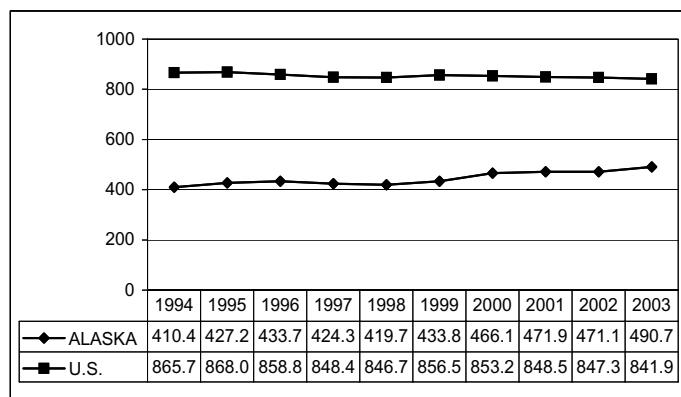

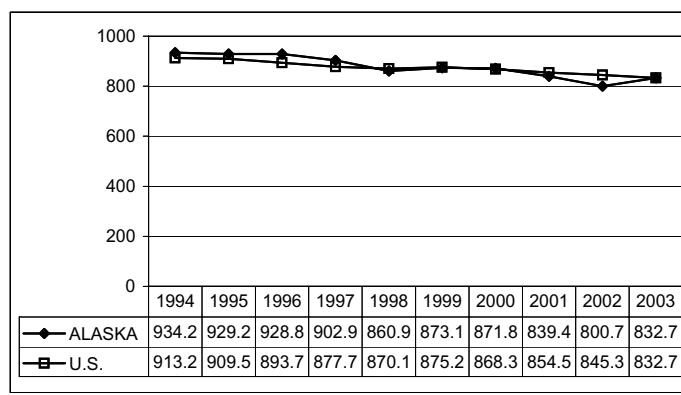

FIGURE 14

AGE-ADJUSTED DEATH RATES: ALASKA AND THE U.S.\* , 1994–2003

\*U.S. death rates shown in this report for 1994–2003 have been recomputed based on revised populations that are consistent with the 2000 census levels. These estimates were produced under a collaborative arrangement between the National Center for Health Statistics and the U.S. Census Bureau. The rates are based on the 2000 census counts by age, race, and sex, modified to be consistent with U.S. Office of Management and Budget racial categories as of 1977 and historical categories for death data. Death rates previously published in annual reports from 1991 to 1999 were based on postcensal population estimates derived from the 1990 census.

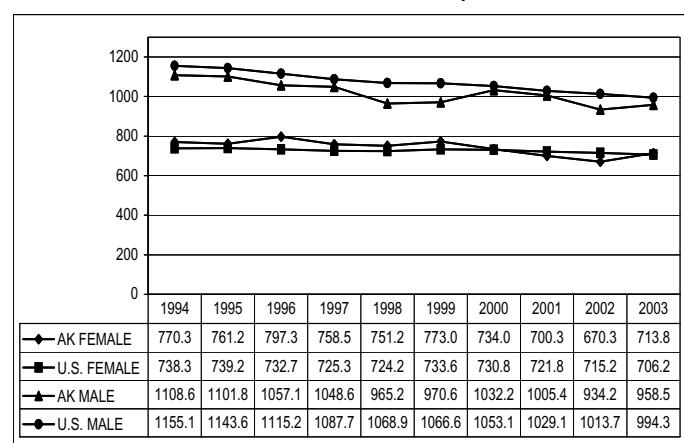

Males in Alaska and the U.S. have higher age-adjusted death rates than females (Figure 15). From 2002 to 2003, the age-adjusted death rate for males in Alaska increased 2.6 percent while the age-adjusted death rate increased 6.5 percent for females. Since 1994, the age-adjusted death rate for males has decreased 13.5 percent while the age-adjusted death rate for females in Alaska has decreased 7.3 percent.

Compared with females, males have the greatest risk of death in age groups 15–24 and 25–34, as they are 1.9 and 2.4 times, respectively, more likely as to die as females. (Table 16A).

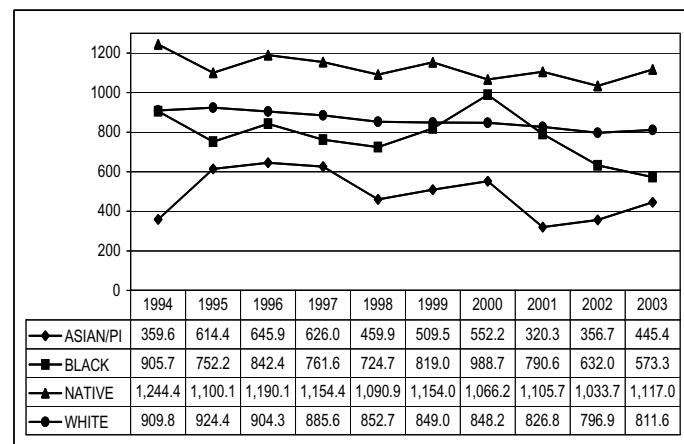

The risk of death also differs by race in Alaska (Figure 16). Alaska Natives consistently have the highest age-adjusted death rates of any racial group in Alaska, while Asian/Pacific Islanders consistently have the lowest. Furthermore, the age-adjusted death rate for Natives has decreased only 10.2 percent since 1994, while the age-adjusted rate for whites has decreased 10.8 percent. Native age-specific death rates are at least twice that of whites for age groups 00–04, 15–24 and 35–44 years of age (Table 16B). In particular, Natives in the 15–24 and 25–34 age groups have at least three times the risk (3.0 and 4.1, respectively) of dying compared with whites of the same age group.

Tables 15–16B on the following page list the total number of deaths and death rates, and the number of deaths by age group and age-specific rates by sex and race for Alaska in 2003.

**FIGURE 15 AGE-ADJUSTED DEATH RATES BY SEX:  
ALASKA AND THE U.S. \*, 1994–2003**

**FIGURE 16 AGE-ADJUSTED DEATH RATES BY RACE:  
ALASKA, 1994–2003**

\*U.S. death rates shown in this report for 1994–2003 have been recomputed based on revised populations that are consistent with the 2000 census levels. These estimates were produced under a collaborative arrangement between the National Center for Health Statistics and the U.S. Census Bureau. The rates are based on the 2000 census counts by age, race, and sex, modified to be consistent with U.S. Office of Management and Budget racial categories as of 1977 and historical categories for death data. Death rates previously published in annual reports from 1991 to 1999 were based on postcensal population estimates derived from the 1990 census.

<sup>1</sup>Rate per 100,000 population

## LEADING CAUSES OF DEATH IN ALASKA

This section details the top ten leading causes of death in Alaska during 2003. Leading causes of death are ranked according to the number of deaths. The top ten causes of death in Alaska accounted for almost eight of every ten deaths (77.2 percent) during 2003. All rates in this report have been age-adjusted to the U.S. year 2000 standard population. Beginning with 1999 mortality data, the tenth revision of the International Classification of Diseases (ICD-10) was used to assign the underlying cause of death.

Some differences between ICD-9 and ICD-10 include the following: ICD-10 has about twice the detail of ICD-9; some causes-of-death titles have changed; some chapters have been expanded, added or rearranged; and cause of death coding rules have changed. Of these changes, the one with the most impact will be the change in cause of death coding rules.

Coding rules determine how the underlying cause of death is assigned. Changes in coding rules can greatly impact the assignment of deaths to a particular cause. For this reason, the number of deaths and death rates (by cause of death) are not directly comparable to previously published data. Adjustments can be made so that 1999 (and later) cause of death data can be compared to deaths classified using ICD-9 coding rules. A comparability ratio is used to make this adjustment. The death rates for the years 1994 to 1998 in the leading causes of death section have been comparability modified. For more information on the impact of changing ICD revisions, refer to Appendix C.

The leading causes of death in this chapter are based on the 113 selected causes-of-death list developed by the National Center for Health Statistics (NCHS). This list replaces the 72 selected causes-of-death list used in ICD-9.

## MALIGNANT NEOPLASMS (CANCER)

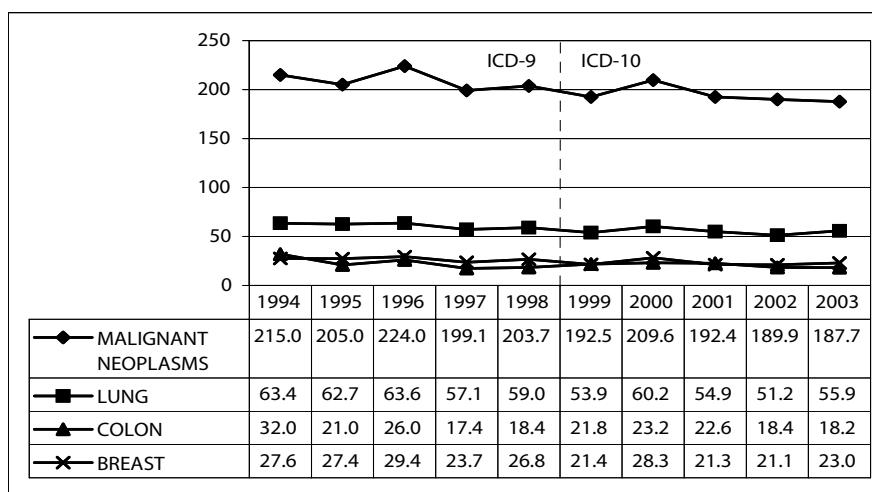

**ICD-9: 140–208; ICD-10: C00–C97**

Malignant neoplasms continued to be the leading cause of death in Alaska. In 2003, almost one-fourth (23.0 percent) of all deaths were due to cancer. Although cancer was the leading cause of death, it ranked second in terms of years of potential life lost (YPLL) (3,656 years). Nationally, cancer was the second leading cause of death, with a rate (190.1 per 100,000) 1.3 percent higher than the Alaska rate (187.7 per 100,000).

Proportionally, more females than males in Alaska died from cancer (23.4 percent and 22.8 percent, respectively). Yet males have a higher age-adjusted death rate than females (227.0 per 100,000 vs. 157.7) that is mainly due to the significantly higher death rates for males in the 65 and older age groups.

Since 1994, the age-adjusted death rate for cancer deaths has decreased 12.7 percent. Lung cancer (ICD-9: 162; ICD-10: C33–C34) has decreased 11.8 percent, breast cancer (ICD-9: 174–175; ICD-10: C50) has decreased 16.7 percent and colon cancer (ICD-9: 153–154; ICD-10: C18–C21) has decreased 43.1 percent during this period.

**FIGURE 17 MALIGNANT NEOPLASMS AGE-ADJUSTED DEATH RATES: ALASKA, 1994–2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

Breast cancer age-adjusted death rates are for females only.

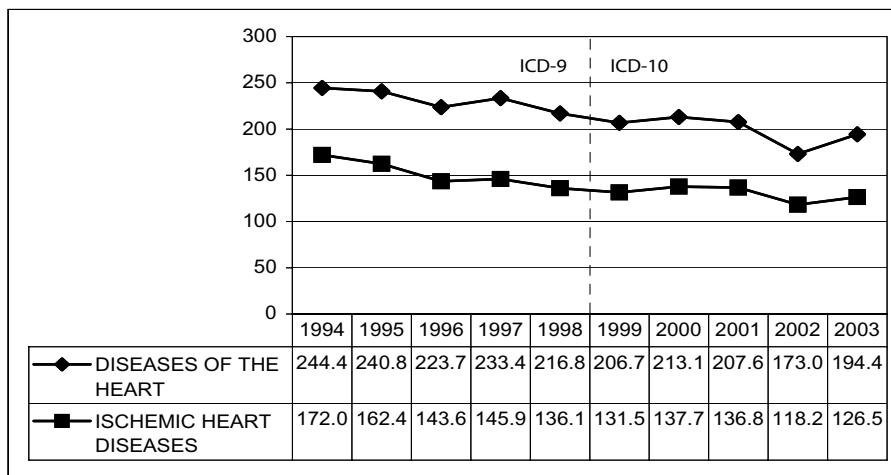

**HEART DISEASE****ICD-9: 390–398, 402, 404, 410–429****ICD-10: I00–I09, I11, I13, I20–I51**

Alaska's second leading cause of death in 2003 was heart disease, accounting for more than one-fifth (21.2 percent) of all deaths. In terms of YPLL, heart disease ranked fourth (3,014 years) among the leading causes of death. Heart disease was the leading cause of death nationally, with a rate (232.3 per 100,000) 19.5 percent higher than the Alaska rate (194.4 per 100,000). The heart disease age-adjusted death rate in Alaska increased 12.4 percent from the rate of 173.0 in 2002.

In Alaska, the percentage of deaths due to heart disease was higher for males than females (22.6 percent and 19.4 percent, respectively), and as with cancer mortality, males had higher age-adjusted death rates (Table 17). Heart disease was the second leading cause of death for whites and Natives.

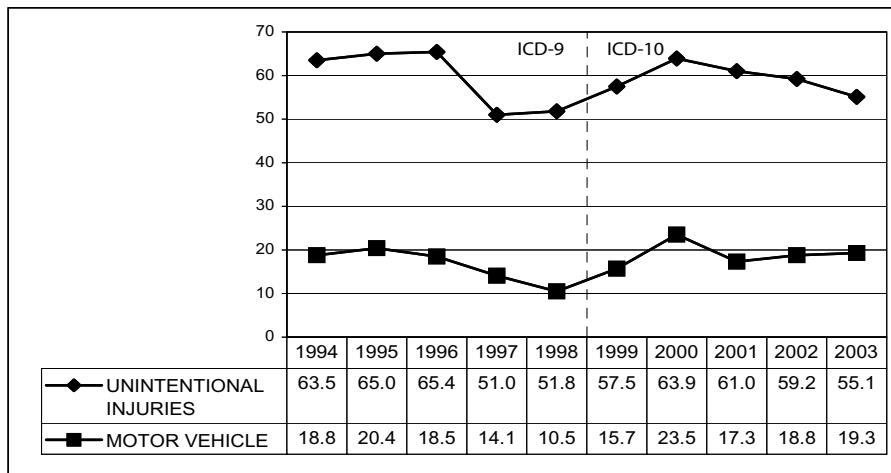

**UNINTENTIONAL INJURIES  
(ACCIDENTS)****ICD-9: E800–E869, E880–E929****ICD-10: V01–X59, Y85–Y86**

One of every ten deaths (10.0 percent) in Alaska during 2003 was due to an unintentional injury, making it the third leading cause of death. Unintentional injury was the leading cause of death in Alaska for all age groups from 5–14 to 35–44 in 2003. Among leading causes of death, unintentional injury ranked first in YPLL (8,287 years), more than double that of any other leading cause of death. Unintentional injury deaths accounted for 10.0 percent of all deaths, but accounted for 26.6 percent of total YPLL. On average, 26.0 years of life were lost prematurely for every unintentional injury death. Unintentional injury was the fifth leading cause of death in the U.S. in 2003, with an age-adjusted death rate (37.3 per 100,000) nearly one-third lower (32.3 percent) than the Alaska rate (55.1 per 100,000).

**FIGURE 18****HEART DISEASE AGE-ADJUSTED DEATH RATES:  
ALASKA, 1994–2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

**FIGURE 19 UNINTENTIONAL INJURY AGE-ADJUSTED DEATH RATES: ALASKA, 1994–2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

Alaska males were 2.2 times more likely than females to die from an unintentional injury (75.9 per 100,000 vs. 34.6) in 2003. One-ninth of all Native deaths were from unintentional injuries. Unintentional injury was the third leading cause of death for Natives and whites.

In 2003, there were 119 motor vehicle deaths, accounting for 37.3 percent of all unintentional injury deaths. The 2003 motor vehicle age-adjusted death rate (19.3 per 100,000) was 2.7 percent higher than the rate of 18.8 per 100,000 in 2002, but 17.9 percent lower than the 2000 rate (23.5 per 100,000).

**CEREBROVASCULAR DISEASE****ICD-9: 430–434, 436–438; ICD-10: I60–I69**

Cerebrovascular disease was the fourth leading cause of death in 2003. In terms of YPLL, cerebrovascular disease ranked fifth (626 years) among leading causes of death. On average, 3.4 years of life were lost prematurely from cerebrovascular disease, showing that cerebrovascular disease is primarily a disease affecting older persons. Nationally, cerebrovascular disease was the third leading cause of death, but with an age-adjusted death rate (53.5 per 100,000) 10.7 percent lower than the Alaska rate (59.9 per 100,000).

In Alaska, cerebrovascular disease was the third leading cause of death for females, but the sixth leading cause of death for males. The female age-adjusted death rate was also higher than that of males (63.4 per 100,000 vs. 53.0). Cerebrovascular disease was the fourth leading cause of death for Natives and the fifth for whites.

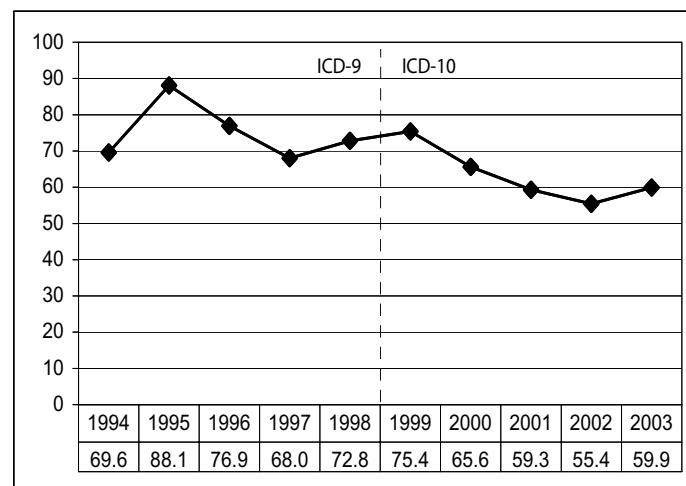

**CHRONIC LOWER RESPIRATORY DISEASE  
(CHRONIC OBSTRUCTIVE PULMONARY DISEASE)****ICD-9: 490–494, 496; ICD-10: J40–J47**

With 148 deaths during 2003, chronic lower respiratory disease (CLRD) was the fifth leading cause of death in Alaska and ranked ninth in terms of YPLL (312 years). On average, 2.1 years of potential life were lost for each CLRD death, which is the second lowest average of all leading causes. In the U.S., CLRD was the fourth leading cause of death in 2003 with an age-adjusted rate of 43.3 deaths per 100,000, which is 6.9 percent lower than the Alaska rate of 46.5.

In Alaska, males had higher age-adjusted death rates than females (56.9 per 100,000 vs. 39.7) in 2003, but proportionally more females than males (5.1 percent compared with 4.3 percent) died from CLRD.

Proportionally, more whites died from CLRD than Natives (5.0 percent compared with 4.0 percent) in 2003.

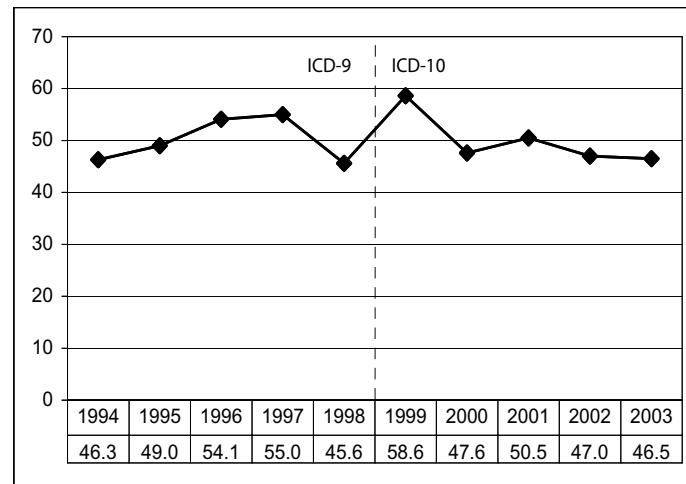

**FIGURE 20 CEREBROVASCULAR DISEASE AGE-ADJUSTED DEATH RATES: ALASKA, 1994–2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

**FIGURE 21 CHRONIC LOWER RESPIRATORY DISEASE AGE-ADJUSTED DEATH RATES: ALASKA, 1994–2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

**INTENTIONAL SELF-HARM (SUICIDE)**  
**ICD-9: 950-959; ICD-10: U03,X60-X84,Y87.0**

Intentional self-harm remained the sixth leading cause of death in 2003. Among leading causes of death, suicide ranked third in YPLL (3,419 years). On average, 27.6 years of potential life were lost for each suicide death, showing suicide's significant impact on the mortality of younger Alaskans. Intentional self-harm was the eleventh leading cause of death in the U.S. during 2003, with an age-adjusted rate (10.8 per 100,000) 47.6 percent lower than the rate in Alaska (20.6 per 100,000).

In Alaska, males were nearly four and a half times more likely than females to die of intentional self-harm (34.1 per 100,000 vs.

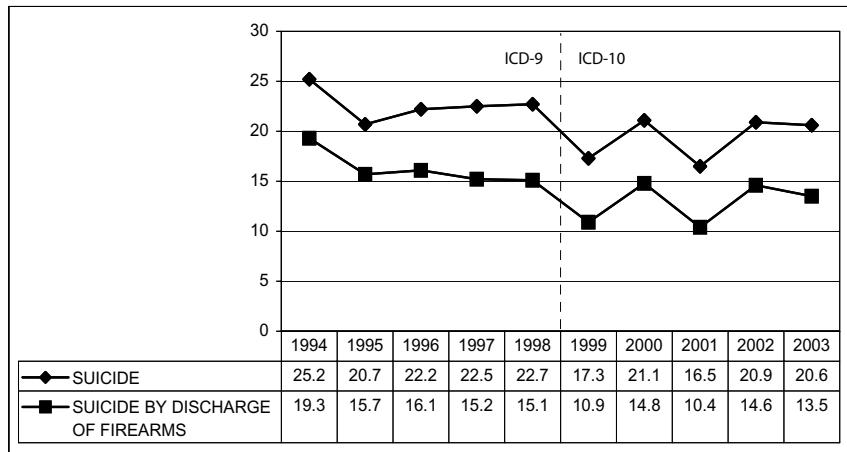

7.6) during 2003. Suicide was the ninth leading cause of death for females and the fourth leading cause for males. Intentional self-harm was the fifth leading cause of death for Natives and the seventh for whites (5.8 percent and 3.3 percent). Firearms were used in 79 of 124 (63.7 percent) suicide deaths in 2003.

**DIABETES MELLITUS**  
**ICD-9: 250; ICD-10: E10-E14**

The seventh leading cause of death in 2003 was diabetes. In the number of years of potential life lost, (526 years) diabetes was seventh. Nationally, diabetes was the sixth leading cause of death, with an age-adjusted rate (25.3 per 100,000) 8.0 percent lower than the Alaska rate of 27.5 per 100,000 standard population.

Diabetes was the seventh leading cause of death in Alaska for females and males, but males had a higher age-adjusted death rate than females (35.0 per 100,000 vs. 20.2). For whites, diabetes was the sixth leading cause of death, while for Natives, diabetes was the tenth leading cause of death.

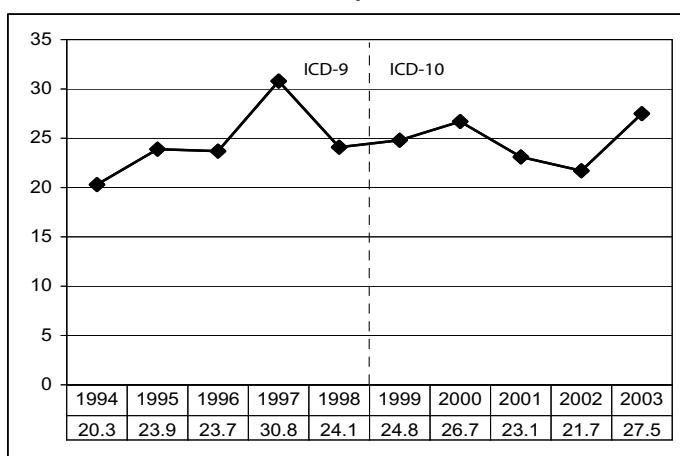

**FIGURE 22 INTENTIONAL SELF-HARM (SUICIDE) AGE-ADJUSTED DEATH RATES: ALASKA, 1994-2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

**FIGURE 23 DIABETES MELLITUS AGE-ADJUSTED DEATH RATES: ALASKA, 1994-2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

**INFLUENZA AND PNEUMONIA****ICD-9: 480–487 ; ICD-10: J10–J18**

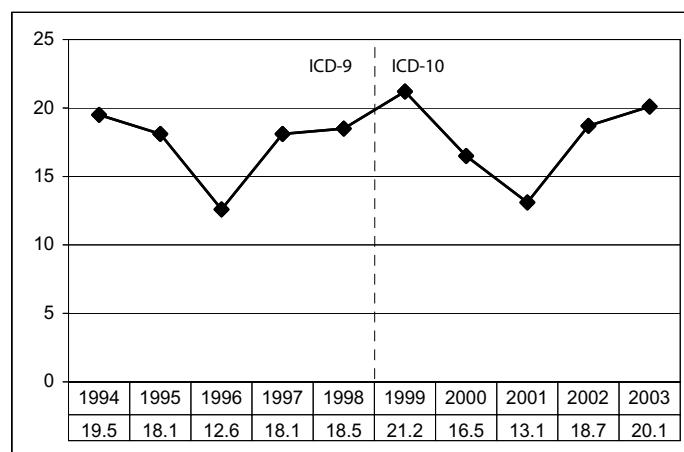

Influenza and pneumonia was the eighth leading cause of death in 2003. In terms of YPLL, influenza and pneumonia ranked eighth (429 years) in 2003. Of the 59 influenza and pneumonia deaths in 2003, all but five were from pneumonia. Influenza and pneumonia was the seventh leading cause of death nationally in 2003, with an age-adjusted rate (22.0 per 100,000) 9.5 percent higher than the Alaska rate (20.1 per 100,000).

For Natives, deaths from influenza and pneumonia accounted for 3.3 percent of deaths and was the seventh leading cause of death. However, for whites, influenza and pneumonia deaths accounted for only 1.5 percent of deaths and was the tenth leading cause of death. Natives have an age-adjusted death rate 2.8 times higher than whites (44.9 per 100,000 vs. 16.2). This is mainly due to the significantly higher death rates for Natives in the 55 and older age groups.

**CHRONIC LIVER DISEASE AND CIRRHOSIS****ICD-9: 571; ICD-10: K70, K73–K74**

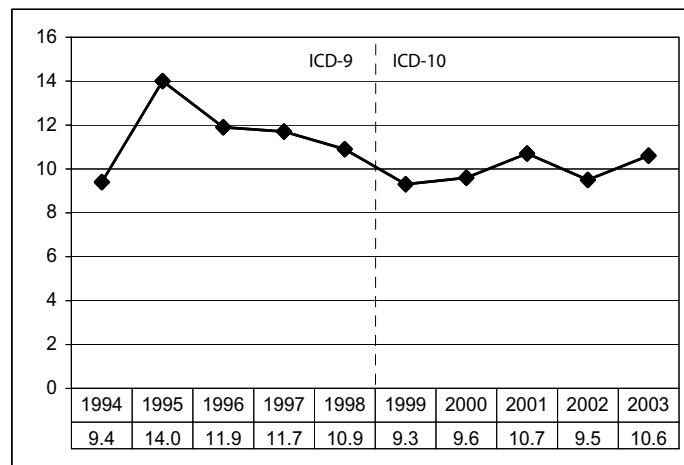

Chronic liver disease and cirrhosis (CLDC) was the ninth leading cause of death in Alaska during 2003, but was the sixth leading cause in total YPLL (607 years). CLDC was only the twelfth leading cause of death in the U.S. in 2003 and had an age-adjusted death rate 12.3 percent lower than the Alaska rate (9.3 per 100,000 vs. 10.6).

CLDC was the eighth leading cause for Natives and the ninth for whites. Proportionally, fewer whites died from CLDC (1.7 percent) compared with Natives (2.6 percent). The male age-adjusted death rate, 14.5 per 100,000, was more than twice as high as the rate for females (6.7 per 100,000).

**FIGURE 24****INFLUENZA AND PNEUMONIA  
AGE-ADJUSTED DEATH RATES:  
ALASKA, 1994–2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

**FIGURE 25****CHRONIC LIVER DISEASE AND  
CIRRHOSIS AGE-ADJUSTED DEATH  
RATES: ALASKA, 1994–2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

**ALZHEIMER'S DISEASE****ICD-9: 331.0; ICD-10: G30**

Alzheimer's disease was the tenth leading cause of death in 2003. The number of Alzheimer's deaths in 2003 (56) was 8.2 percent lower than in 2002 (61). With a total YPLL of only two years, Alzheimer's ranked the lowest of all leading causes of death. Nationally, Alzheimer's was also the eighth leading cause of death, with an age-adjusted rate 3.2 percent lower than the Alaska rate (21.4 and 22.1 per 100,000 respectively).

For females, Alzheimer's was the sixth leading cause of death but was not in the top ten leading causes for males. Nearly eight of every ten (78.6 percent) Alzheimer's deaths were female.

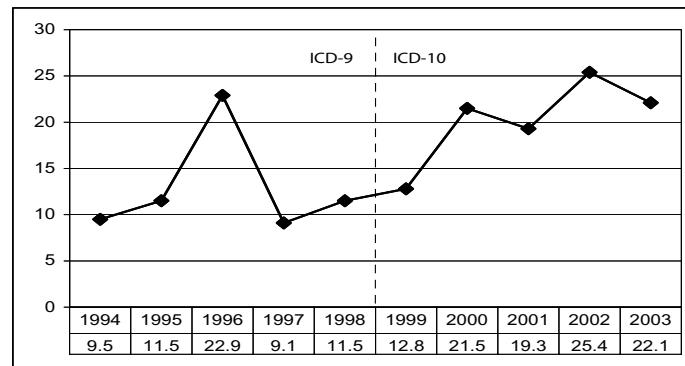

The recent large increase in Alzheimer's deaths is not completely unexpected since the change from ICD-9 cause of death coding rules to ICD-10 coding rules. The comparability ratio for Alzheimer's deaths is 1.55, meaning that for any given year, approximately 55 percent more deaths would be classified as Alzheimer's deaths using ICD-10 cause of death coding rules than if ICD-9 coding rules had been used.

**OTHER CAUSES OF DEATH****ALCOHOL-INDUCED DEATHS****ICD-9: 291, 303, 305.0, 357.5, 425.5, 535.3,****571.0–571.3, 790.3, E860****ICD-10: F10, G31.2, G62.1, I42.6, K29.2, K70, R78.0,****X45, X65, Y15**

Alcohol-induced mortality includes deaths due to alcohol psychoses, alcohol dependence syndrome, non-dependent abuse of alcohol, alcohol-induced chronic liver disease and cirrhosis, and alcohol poisoning. It does not include deaths due to traumatic injury, such as motor vehicle crashes.

With 120 deaths in 2003, alcohol-induced causes would have been the seventh leading cause of death in Alaska if it was in the leading causes of death tabulation list. The total YPLL was 1,652 years, which would have ranked alcohol-induced deaths fifth. On average, 13.8 years of productive life were lost for each alcohol-induced death. The U.S. age-adjusted rate for alcohol-induced causes was 7.0 per 100,000, a rate just one-third the Alaska rate of 21.0 per 100,000.

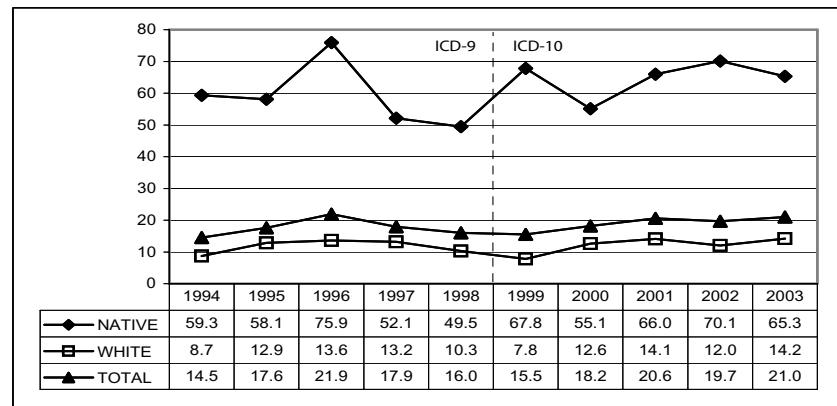

**FIGURE 26 ALZHEIMER'S DISEASE AGE-ADJUSTED DEATH RATES: ALASKA, 1994–2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

**FIGURE 27A ALCOHOL-INDUCED AGE-ADJUSTED DEATH RATES BY RACE: ALASKA, 1994–2003**

Rates are per 100,000 U.S. year 2000 standard population.

Rates previous to 1999 have been comparability modified. Refer to Appendix C for more information on comparability-modified rates.

For Natives, alcohol-induced causes would have been the fourth leading cause of death with 57 deaths. One of every 13 (7.9 percent) Native deaths was an alcohol-induced death. With 61 deaths, alcohol-induced deaths would have been the eighth leading of cause of death for whites.

Males were more than three times as likely than females to die from alcohol-induced causes (Figure 27B), but the disparity in Alaska is less than that of the U.S. Nationally, males were over three times (3.3) more likely to die from alcohol-induced causes compared with females (11.0 per 100,000 compared with 3.3).

#### FIREARM-RELATED DEATHS

**ICD-9: E922, E955.0–E955.4, E965.0–E965.4,**

**E970, E985.0–E985.4**

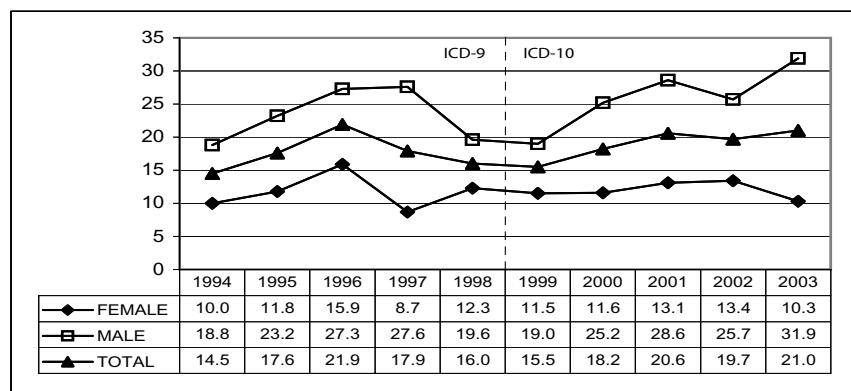

**ICD-10: W32–W34, X72–X74, X93–X95,**

**Y22–Y24, Y35.0**

One hundred twenty-one Alaskans died from firearm injuries in 2003. With a YPLL of 3,550 years, firearm-related mortality would have ranked third on the leading cause list, behind unintentional injuries, (8,287 years) and malignant neoplasms (3,656 years). This is an average YPLL of 29.3 years per death, illustrating the burden of firearm-related mortality among young Alaskans. Nationally, the firearm-related mortality age-adjusted death rate was 10.3 deaths per 100,000, a rate 48.2 percent lower than the Alaska rate of 19.9 deaths per 100,000.

With 37 deaths to Alaska Natives, firearm-related deaths accounted for 5.1 percent (or about one of every 20) of all deaths to Native residents. The 73 firearm-related deaths to whites accounted for only 3.3 percent of all white deaths. The standardized rate for males was more than six times the rate for females, with 34.2 per 100,000 standard population compared to 5.5 (Figure 28B).

**DRUG-INDUCED DEATHS**

**ICD-9:** 292, 304, 305.2-305.9, E850-E858, E950.0-E950.5, E962.0, E980.0-E980.5  
**ICD-10:** F11.0-F11.5, F11.7-F11.9, F12.0-F12.5, F12.7-F12.9, F13.0-F13.5, F13.7-F13.9, F14.0-F14.5, F14.7-F14.9, F15.0-F15.5, F15.7-F15.9, F16.0-F16.5, F16.7-F16.9, F17.0, F17.3-F17.5, F17.7-F17.9, F18.0-F18.5, F18.7-F18.9, F19.0-F19.5, F19.7-F19.9, X40-X44, X60-X64, X85, Y10-Y14

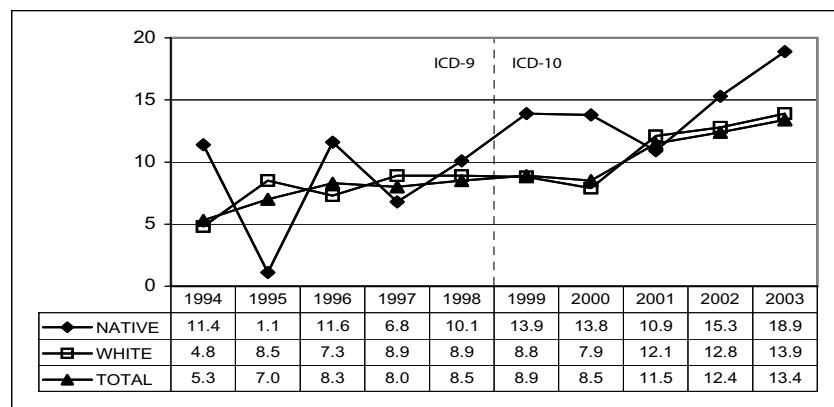

Drug-induced mortality includes deaths from dependent and nondependent use of drugs (legal and illegal use) and poisoning from medically prescribed and other drugs. It excludes accidents, homicides, and other causes indirectly related to drug use. Also excluded are newborn deaths due to the mother's drug use.

There were 86 drug-induced deaths in 2003, which would have been the eighth leading cause of death if it were in the leading causes of death tabulation list. With a YPLL of 2,340 years, drug-induced deaths would have ranked fifth in YPLL. The average YPLL of 27.2 years for drug-induced mortality shows that drug-induced causes are more of a problem with younger Alaskans. The U.S. age-adjusted mortality rate for drug-induced mortality was 9.9 per 100,000, which is 26.1 percent lower than the Alaska rate of 13.4 per 100,000. The U.S. death rate for males was nearly two times that of females (12.8 per 100,000 vs. 7.0) but in Alaska, the rate for females (13.1) was only 8.4 percent lower than the rate for males (14.3).

Table 17 (following page) lists the top ten causes of death by sex and race for Alaska during 2003. Since comparatively few deaths occur to decedents of Black or Asian/PI races, the top ten causes are not listed for these races. Table 18 (pages 89 and 90) lists detailed causes of death for Alaska.

The remaining pages in this chapter list summary death information and detailed causes of death by census area (borough) and Native Regional Corporation. The detailed causes of death for each census area (borough) and Native Regional Corporation are based on the most frequent causes of death for each area. Therefore, the detailed causes of death list will likely be unique for each area.

1. 01-03 AGE-ADJUSTED RATE  
 2. 01-03 AGE-ADJUSTED RATE

\* indicates rate is statistically significant at the .05 level or greater.

\*\* indicates rate is statistically significant at the .01 level or greater.

† indicates rate is statistically significant at the .001 level or greater.

‡ indicates rate is statistically significant at the .0001 level or greater.

# ADOPTIONS

*"Picking Blueberries"*  
Copyright Rie Munoz, Ltd.

## INTRODUCTION

Superior courts in Alaska granted 492 adoptions in 2003. This is a 12.8 percent decrease from the 564 superior court adoptions granted during 2002. In addition, 116 cultural adoptions, 58 tribal adoptions, and 87 out of state adoptions were recorded. Not all adoptions involve children. Of the 753 total adoptions in 2003, 19 involved the adoption of adults 18 years of age and over. The total number of adoptions resulted in an adoption rate of 1.2 per 1,000 population.

In 1990, under the Indian Child Welfare Act 25 USC 1903(4), Alaska began issuing substitute birth certificates for cultural adoptions of Native children. Under the Bureau of Vital Statistics' regulations, a substitute birth certificate

may be issued when a Native child is culturally adopted into a family where at least one of the adoptive parents is Native. The 116 cultural adoptions that occurred in 2003 represented a 7.2 percent decrease from the 125 cultural adoptions in 2002.

In 2003, there were 58 tribal adoptions, up 7.4 percent from the 54 tribal adoptions recorded in 2002. Tribal adoptions are granted by the tribal courts and have the same legal rights and permanence as State of Alaska court granted adoptions.

The remainder of this chapter lists the number of statewide adoptions and the number of adoptions by census area (borough) and Native Regional Corporation.

# MARRIAGES & DIVORCES

*"Tenakee Wedding"*  
Copyright Rie Munoz, Ltd.

## MARRIAGES

There were 5,246 marriages performed in Alaska in 2003, involving 4,505 Alaska resident brides and 4,534 Alaska resident grooms. The number of marriages in 2003 was 1.7 percent lower than the 5,336 marriages that occurred in 2002. The crude marriage rate in 2003 was 8.1 marriages per 1,000 residents, down from 8.3 marriages per 1,000 in 2002.

Crude marriage rates (the number of marriages occurring in a census area or borough per 1,000 residents) vary widely in Alaska. For instance, the lowest rate of 1.5 marriages per 1,000 residents was in the Aleutians East Borough. The highest rate of 18.8 marriages per 1,000

residents was in Denali Borough. Locations that are popular tourist destinations (such as Denali National Park) may have higher marriage rates because non-resident couples travel there to get married.

There were 543 marriages in which neither the bride nor the groom was a resident of Alaska, a 1.9 percent increase from the 533 nonresident marriages in 2002. The Juneau Borough had the largest number of nonresident marriages in 2003 with 181, which accounted for 47.6 percent of all marriages occurring in Juneau. The Municipality of Anchorage had the second greatest number of nonresident marriages with 126.

# DIVORCES

There are three administrative methods for terminating a marriage in Alaska: divorce, dissolution, and annulment.

Divorce is an adversarial process in which the terms of the decree are decided by the courts based upon evidence, testimony, and in accordance with Alaska statutes. These terms include disposition of property, living arrangements, and custody and support for any minor children involved. In 2003, there were 998 divorces granted in Alaska. This represents a 2.9 percent decrease from the 1,028 divorces granted in 2002.

A dissolution of marriage is a cooperative agreement between the husband and wife in which both parties agree to the terms for distribution of property, living arrangements, and support and custody of minor children. The agreement is reviewed by the court, which can amend it if it determines the terms are not equitable.

In 2003, there were 1,828 dissolutions of marriage in Alaska. This is a 3.4 percent decrease from the 1,893 dissolutions reported in 2002.

An annulment is a judicial pronouncement declaring a marriage never existed. In 2003, there were six annulments granted in Alaska, which is four less than reported in 2002.

There were 35 instances in which the type of decree was not specified. When not otherwise stated, the term divorce refers to all methods collectively.

In 2003, the total of 2,867 divorces, dissolutions, and annulments resulted in a crude divorce rate of 4.4 divorces per 1,000 population, compared with 4.6 in 2002.

# APPENDIX A: DEFINITION OF TERMS

**Age-Adjusted Death Rate.** A summary of age-specific death rates standardized to one age distribution (such as the 2000 standard population). This summary allows comparisons to be made between populations with different age distributions. (See Appendix B for specific instructions on calculating age-adjusted rates.)

**Age-Specific Birth Rate.** The number of live births for a specific age group divided by the population for the same specific age group, multiplied by a constant of proportionality (usually 1,000).

**Age-Specific Death Rate.** The number of deaths for a specific age group divided by the population for the same specific age group, multiplied by a constant of proportionality (usually 100,000).

**Birth Cohort Infant Mortality Rate.** The birth cohort method of calculating infant mortality tracks all infants born within a calendar year throughout their first year of life. When calculating the 2003 birth cohort rate, all infants who were born during 2003 and died prior to their first birthday, whether in 2003 or in 2004 are included in the numerator. The denominator includes all live births in 2003.

**Birth Weight.** Weight of the infant when born, usually reported in grams.

**Cause of Death.** The cause of death reported is the underlying cause of death and is based on information contained on the death certificate, defined by the World Health Organization's International Classification of Diseases - Tenth Revision as the disease or injury which initiated the train of morbid events leading directly to death, or the circumstances of the accident or violence which produced the fatal injury. (See Appendix C for specific categories.)

**Cause-Specific Death Rate.** The number of deaths due to a specific cause of death divided by the estimated total population, multiplied by a constant of proportionality (usually 100,000).

**Constant of Proportionality.** A number (often 1,000 or 100,000) which is used for calculating a rate so that comparisons are possible and more understandable. (It is easier to compare 21.7 to 21.3 than it is to compare 0.0217 to 0.0213.)

**Crude Birth Rate.** The number of live births divided by the estimated population, multiplied by a constant of proportionality (usually 1,000).

**Crude Death Rate.** The number of deaths divided by the estimated population, multiplied by a constant of proportionality (usually 100,000).

**Crude Divorce Rate.** The number of divorces of all types (divorces, dissolutions, and annulments) divided by the estimated population, multiplied by a constant of proportionality (usually 1,000).

**Crude Marriage Rate.** The number of marriages divided by the estimated population, multiplied by a constant of proportionality (usually 1,000).

**Death Cohort Infant Mortality Rate.** The death cohort method is determined by dividing the number of infant deaths by the number of live births in a calendar year. For example, to calculate the death cohort infant mortality rate for 2003, divide the number of infant deaths that occurred in 2003 by the number of live births that occurred during 2003, and multiply the result by a constant of proportionality (usually 1,000). By using the death cohort infant mortality method, some infant deaths will be counted in 2003 when the infant was actually born in 2002. Other deaths to infants born in 2003 who died before their first birthday in 2004 will not be counted. Since the death cohort method of calculating infant mortality does not reflect the number of infant deaths experienced by infants born in a given year, the birth cohort is the preferred calculation method.

**Expectation of Life.** Expectation of life (life expectancy) is the number of years infants born in a specific year can expect to live if they experience the same age-specific death rate experienced during their birth year. (See Appendix B for an explanation of calculating life expectancy.)

**Fertility Rate.** The total number of live births divided by the number of women in the estimated population between ages 15 and 44, multiplied by a constant of proportionality (usually 1,000).

**Gestation.** The period beginning with the first day of the last normal menstrual period and ending with the day of birth. Births occurring between 37 and 41 weeks gestational age are considered full-term.

**ICD-10.** International Classification of Diseases - Tenth Revision. The official classification system which codifies all diseases and injuries. ICD-10 was first introduced in 1999. All deaths between 1979 and 1998 were coded using ICD-9. Prior to 1979, ICD-8 was used to code all deaths. (Refer to Appendix C.)

**Infant Deaths.** Infants who died before their first birthday.

**Infant Mortality Rate (IMR).** The number of infant deaths divided by the number of live births, multiplied by a constant of proportionality (usually 1,000). The IMR can be calculated using either the birth cohort or the death cohort method. The infant mortality rate is the same as the sum of the neonatal infant mortality rate and the postneonatal infant mortality rate.

**Life Expectancy.** See Expectation of Life.

**Live Birth.** A birth where the baby exhibits signs of life after delivery. These signs include breathing, beating of the heart, pulsation of the umbilical cord and movement of voluntary muscles.

**Location of Occurrence.** The place or location where a vital event occurred.

**Location of Residence.** Most tables report Alaska resident information and are based upon or are categorized by place of residence. The location of actual residence; i.e., census area or Native Regional Corporation, is not necessarily the same as a person's "legal residence". The location of residence during a tour of military duty or while attending college is considered actual residence.

**Low Birth Weight.** An infant born weighing less than 2,500 grams. Also see Very Low Birth Weight.

**Low Birth Weight Percentage.** The number of infants born weighing less than 2,500 grams divided by the number of live births, multiplied by 100.

**Native.** Includes Alaska Natives, Native mixed, Aleuts, Eskimos, Canadian Eskimos and Indians, and American Indians.

**Natural Increase.** Population change that results when the number of births exceed the number of deaths. Natural increase does not include population changes as a result of migration in and out of Alaska.

**Neonatal Infant Mortality Rate.** The number of deaths to infants less than 28 days of age divided by the number of live births, multiplied by a constant of proportionality (usually 1,000). The sum of the neonatal infant mortality rate and the post-neonatal mortality rate is the infant mortality rate.

**Postneonatal Infant Mortality Rate.** The number of deaths to infants from 28 days up to one year old divided by the number of live births, multiplied by a constant of proportionality (usually 1,000). The sum of the neonatal infant mortality rate and the postneonatal mortality rate is the infant mortality rate.

**Race of Child.** The first reported race of the mother is considered the race of the child. Prior to 1989, races of both parents were taken into consideration when determining the race of the child using a look-up table. Beginning in 1989, the National Centers for Health Statistics (NCHS) recommended that all states adopt the same standard for determining the race of the child at birth.

**Race/Sex-Specific Death Rate.** The number of deaths for a specific race and sex group, divided by the population for the same specific race and sex group, multiplied by a constant of proportionality (usually 100,000).

**Race-Specific Death Rate.** The number of deaths for a specific racial group divided by the population for the same specific racial group, multiplied by a constant of proportionality (usually 100,000).

**Ratio.** A ratio is a comparative statistic calculated by dividing the number of events experienced by one group by the number of events experienced by a comparable group, i.e., males to females.

**Residence.** See Location of Residence.

**Sex-Specific Death Rate.** The number of deaths for a specific sex (male or female) divided by the population for the same sex, multiplied by a constant of proportionality (usually 100,000).

**Standard Population.** The 2000 standard population is used in this publication for age-adjusted rates. (See Table A.1 on page 185.)

**Teen Birth Rate.** The number of births to females ages 15–19 divided by the estimated population of females ages 15–19, multiplied by a constant of proportionality (usually 1,000).

**Underlying Cause of Death.** The disease or injury which initiated the sequence of events that led to death.

**Very Low Birth Weight.** Infants born weighing less than 1,500 grams.

**Years of Life Lost.** For all deaths occurring before age 65, the difference between 65 (assumed productive life span) and the age at death; sometimes referred to as “years of productive life lost”. (See Appendix B for calculation of years of life lost.)

**TABLE A.1                   2000 STANDARD POPULATION**

# APPENDIX B: TECHNICAL NOTES

## HOW TO USE VITAL STATISTICS

### VITAL EVENTS

Vital events are registered with the Bureau of Vital Statistics and include live births, fetal deaths (after at least 20 weeks gestation), adoptions, marriages, divorces, and deaths. Information on each of these events is provided on standard forms (see Appendix F).

### RELIABILITY OF THE DATA

The reliability of vital records may vary depending on the data collection method. For instance, some information on birth and death certificates is collected and provided by health facilities or medical professionals (birth weight, complications of labor and delivery, cause of death, etc.), while other information is self-reported or reported by relatives (smoking during pregnancy, marital status of deceased, etc.). The Bureau of Vital Statistics makes every effort to complete, verify, and correct information which is missing, invalid, or inconsistent. Ultimately, the reliability of the data depends on everyone who is involved in data collection, storage and retrieval: Bureau staff, medical professionals, magistrates, funeral directors, marriage commissioners, judges, and each individual involved in, or witness to, a vital event.

### COUNTING NUMBERS OF EVENTS

The most basic data available is the number of events. In any analysis, the most pertinent information must be determined and the limitations of that information must be identified. For instance, if you wanted to predict public school kindergarten enrollment, the most pertinent vital event data would be the number of live births in the period which qualifies children for enrollment. You would want to count only resident births for the geographic area of the appropriate schools. You would also need to consider limitations of this data, such as effects of infant and preschool mortality (this information can be obtained from death data), in-migration and out-migration, and alternatives to public school enrollment.

### COMPARING DIFFERENT POPULATIONS

Comparing the number of events in two separate locations may not be meaningful. We can guess that Anchorage

will have more births than Juneau because Anchorage has a larger population. A more meaningful question is, what is the number of births compared to the size of the population? To make this comparison, we calculate a rate or a ratio by dividing the number of events by the population for which that event could have occurred. For instance, if there were 4,200 births in Anchorage and a population of 280,000 people, then the ratio of births to population would be  $4200/280000$  or 0.015 births for every person living in Anchorage. If there were 500 births in Juneau and a population of 30,000 then the ratio of births to population in Juneau would be  $500/30000$  or 0.016666 births for every person living in Juneau.

Since small decimal numbers are awkward to interpret, we change the ratio to a rate by multiplying it by a constant of proportionality. This constant of proportionality can be any number, as long as the same number is used in calculating every rate. To calculate birth rates, we usually use a constant of proportionality of 1,000. Using this method, the birth rate for Anchorage would be  $0.015*1,000$  or 15.0 births per 1,000 population. The birth rate for Juneau would be  $0.016666*1,000$  or 16.7 births per 1,000 population. This number is usually rounded to the nearest tenth (16.7). We can see that while there are fewer births in Juneau in this example, the rate per 1,000 population is greater.

The birth rates described in the last paragraph are crude birth rates because they compare events to the total population. A more meaningful comparison would use only the female population of childbearing ages (15–44 years of age). Let's assume that the number of women ages 15–44 in Anchorage is 60,000 and in Juneau is 7,300. The Anchorage fertility rate would be  $(4200/60000)*1000$  or 70.0 births for every 1,000 women of childbearing age. The Juneau fertility rate would be  $(500/7300)*1000$  or 68.5 births for every 1,000 women of childbearing age. While Anchorage would have a lower crude birth rate than Juneau in this example, the Anchorage fertility rate would be higher than for Juneau. This is because the ratio of women of childbearing age to the total population in Anchorage ( $60000/280000$  or .2143) is lower than in Juneau ( $7300/30000$  or .2433).

Please note that all of the numbers in the foregoing examples are hypothetical for purposes of illustration.

## CONSTANT OF PROPORTIONALITY

In calculating crude birth rates and fertility rates, we used a constant of proportionality of 1,000. Vital statistics may be reported with different constants of proportionality. Readers should familiarize themselves with how rates are calculated so that validity is maintained when comparing rates. Unless rates are calculated with the same constant of proportionality, comparisons will lead to incorrect conclusions. For instance, in this report we calculate death rates per 100,000 population. If the another publication reported deaths per 1,000 population, you would need to convert the rates in this report (by dividing by 100) or the death rates in the other report (by multiplying by 100) in order to make a valid comparison.

## SMALL POPULATIONS & FEW EVENTS

Data based upon small populations and few events require particular care in data analysis. In Alaska, variability is expected when looking at small groups within the population. Precautions are taken to avoid drawing false conclusions from random or unusual events. Two methods are used in this report to provide greater reliability: moving averages and confidence intervals. (For an explanation of each method, see "Vital Statistics Formulas" below.)

## VITAL STATISTICS FORMULAS

### AGE-ADJUSTED RATES

Age-adjusted rates are calculated so comparisons can be made between populations that have different age distributions. For example, a population with a high proportion of young people, generally will have a lower crude death rate than a population with a high percentage of elderly persons. Age-adjusted rates are more appropriate than crude rates when comparing health indicators for populations that have different age distributions. The age-adjusted rates in this report were calculated using the standard population based on the decennial U.S. Census of 2000. (See the Standard Population in Appendix A)

$$\text{Age-Adjusted Death Rate} = \sum m_a (P_a / p)$$

where:

$\sum$  is sum

$m_a$  is the age-specific death rate

$P_a$  is the standard population for the age group

$p$  is the total standard population

### CONFIDENCE INTERVALS

In this report, confidence intervals are used to provide a range within which the true rate will fall with a probability of 95 percent. The size of the range is determined by the number of occurrences, the base population, and the standard error.

Using teen birth rate by census area as an example:

$$3\text{-year births to teens ages 15–19 in 1995–1997} = 3,326 (b)$$

$$3\text{-year annual female teen population in 1995–1997} = 63,687 (p)$$

$$\text{Annual teen birth rate per 1,000 female teens} = (3,326 / 63,687) * 1,000 = 52.2 (R)$$

$$\text{Standard error} = \frac{R}{\sqrt{b}}$$

$$ci = R \pm 1.96 \left( \frac{R}{\sqrt{b}} \right)$$

$$ci = 52.2 \pm 1.96 \left( \frac{52.2}{\sqrt{3,326}} \right) \text{ or } ci = 50.4-54.0$$

We can say, then, that there is a 95 percent probability that the interval from 50.4 to 54.0 contains the true teen birth rate for the state of Alaska for the period 1995–1997.

## EXPECTATION OF LIFE

Expectation of life is the number of years infants born in a specific year can expect to live if they experience the same age-specific death rates for all persons who died during

their birth year. Table B.1 illustrates the calculation of life expectancy for all Alaskans based on data from the five year period 1999–2003.

**TABLE B.1 EXPECTATION OF LIFE FOR ALL ALASKANS: 1999–2003**

**Column A:** Total deaths during five years

**Column B:** Sum of population for each of the five years

**Column C:** Ratio (A/B)

**Column D:** Proportion dying in the age group

For less than 1 year:  $(2*C)/(2+C)$ ;  
for 1–4 years:  $(2*4*C)/(2+4*(1.25*C))$ ;  
all others  $(2*5*C)/(2+5*C)$

**Column E:** Proportion living in age group (1-D)

**Column F:** Number living at beginning of age

For less than 1 year: 100,000; all others:  
 $E*F$  (both from next younger age group)

**Column G:** Number dying in the age group

F (this age group)-F (next older age group)

**Column H:** Number living in the age group

For less than one year:  $F-(.85*G)$ ; for 1–4 years:  $4*F-(2.5*G)$ ; all others:  $(5*F)-(2.5*G)$

**Column I:**

Cumulative population Sum of H for this and all older age groups

**Column J:** Years left at beginning of age (I/F)

**MOVING AVERAGES**

Calculations of 3-year, 5-year, and 10-year moving averages are performed when single-year rates are not reliable. When calculations are based on small numbers, moving averages can help to smooth out rates which vary widely from one year to another.

In Alaska, single-year infant mortality rates are seldom good indicators for the state of health within populations because rates can fluctuate dramatically from year to year. In Alaska, 132 infants died during 1988 and 108 infants died during 1989. The single-year infant mortality rates during 1988 and 1989 were 11.7 and 9.3, respectively. The 3-year moving average IMR (using 1986, 1987, and 1988 data) was 11.0 and (using 1987, 1988, and 1989) 10.4 infant deaths per 1,000 live births.

**YEARS OF LIFE LOST**

Years of Life Lost (YLL), or Years of Productive Life Lost, is the difference between the standardized age of 65 and the age of a decedent who dies before age 65. For purposes of calculation, deaths are assumed to occur at the midpoint of a five-year age interval; i.e. a 41-year-old decedent is assumed to be 42.5 years or halfway between 40 and 45. A person dying at age 41 would be said to have 22.5 years of life lost (65–42.5). Years of Life Lost emphasizes mortality in younger populations and is used in this report to measure the impact of specific causes of death. For a specific decedent group, Years of Life Lost is calculated as follows:

$$\text{YLL} = \sum 65 - mp$$

Where:

YLL is Years of Life Lost

$\sum$  is sum of all decedents' years of productive life lost

65 represents years of productive life

*mp* is the mid-point of the decedent's 5-year age group

# APPENDIX C: MORTALITY

## COMPARISON BETWEEN ICD-9 AND ICD-10

Mortality statistics are compiled under guidelines of the World Health Organization (WHO). The procedures for coding and classifying mortality statistics are known collectively as the International Classification of Diseases (ICD). The ICD provides guidelines for coding death certificates, gives the disease (injury/poisoning) categories, the procedures for selecting the underlying cause of death, and provides definitions such as ‘live birth’, ‘maternal death’, or ‘underlying cause of death’. The ICD also provides the tabulation lists for classifying mortality and the format of the medical certificate of death. Periodically the ICD is revised to allow for advances in medicine and changes in diagnostic terminology. The last revision was in 1999, when the tenth revision (ICD-10) replaced the ninth revision (ICD-9). Since 1999, causes of death have been classified using the tenth revision of this classification (ICD-10).

The ICD structure comprises cause of death categories that are identified by codes. The ninth revision of the ICD had more than 4000 categories and used all numeric codes (001–999) to identify the categories. ICD-10 has approximately twice the clinical detail of ICD-9, with more than 8000 categories identified by alphanumeric codes (A00–Z99). Both revisions provide for greater detail with a decimal numeric subdivision at the four-character level. Tabulation lists, which provide the cause-of-death groupings to present mortality statistics, have also changed. In ICD-9, 72 selected causes of death were used to rank the leading causes of death. This list has been expanded to 113 causes in ICD-10. Sixty-one selected causes were used to rank infant mortality statistics in ICD-9; this list has been expanded to 130 selected causes in ICD-10.

ICD-10 also has more chapters than ICD-9. Diseases of the nervous system and sense organs was split into three chapters in ICD-10: diseases of the nervous system, diseases of the eye and adnexa, and diseases of the ear and mastoid process. Other chapters have been rearranged; in ICD-10 diseases of the immune system are now included with diseases of the blood and blood-forming organs. They were included in the chapter endocrine, nutritional, and metabolic diseases in ICD-9. External causes of injury and poisoning (E codes) and factors influencing health status and contact with health services (V codes) were supplementary chapters in ICD-9; in ICD-10 they are part

of the core classification. Additionally, some cause-of-death titles have changed (e.g. Suicide, ICD-9; Intentional Self-Harm, ICD-10) and some titles have shifted from one section to another. Arguably the change that will have the biggest impact on mortality statistics is the change in cause-of-death coding rules.

Cause-of-death coding rules determine how the underlying cause of death is assigned from the medical information on the death certificate. Changes in these coding rules can produce serious breaks in cause-of-death trends. For example, in 1979 the eleventh leading cause of death (nephritis, nephritic syndrome, and nephrosis) had a rate that was 70% higher than the rate in 1978. The underlying cause of death in 1978 was assigned using ICD-8 coding rules, while mortality statistics in 1979 were coded using ICD-9 rules. Almost all of this increase was due to changes in the coding rules. In this example, the ICD-9 coding rules had a much greater assignment of deaths to this particular cause. Of course, an increase in assignments to one or more causes of death must come at the expense of assignments of death to other causes.

To help measure the impact of changing cause-of-death coding rules, comparability ratios are used. Comparability ratios are calculated by double coding all deaths in a particular year. That is, each death in a given year is assigned a cause of death using both ICD-9 coding rules and ICD-10 coding rules. The comparability ratio is calculated by counting the number of deaths for a selected cause in the new revision (ICD-10) and dividing by the number of deaths for the selected cause in the old revision (ICD-9). The National Center for Health Statistics (NCHS) used the national 1996 death file to derive the comparability ratios.

A comparability ratio that is equal to 1.0 shows that either revision will produce the same number of deaths. It does not, however, suggest that the cause of death was unaffected by the revision change. It is possible that any changes to the assignment of death could have balanced out, leaving the same number of deaths. For example, an increase in assignment of deaths could be counterbalanced by a narrower cause of death title (i.e. fewer cause of death codes).

A comparability ratio that is greater than 1.0 usually suggests an increase in the assignments of death under ICD-10 or that the cause-of-death title is broader under ICD-10. Conversely, a comparability ratio less than 1.0 usually suggests a decrease in the assignments of death under ICD-10 or the cause of death title is narrower under ICD-10.

Leading causes of death are based on the 113 selected causes-of-death list developed by the National Center for Health Statistics (NCHS). This list replaces the 72 selected causes-of-death list used in ICD-9. Since comparability ratios are used to measure the impact of changing coding rules, it is important to remove the effects of changing tabulation lists. For that reason, the ICD-9 codes used for some causes of death in this report differ from the codes used in the ICD-9 tabulation list. For example, accidents and adverse effects (E800–E949) was a cause-of-death category in the ICD-9 tabulation list. In the ICD-10 tabulation list, however, adverse effects are listed separately from accidents. For that reason, adverse effects (E870–E879, E930–E949) are not included in the ICD-9 codes for unintentional injury (accidents) in this report. For the same reasons, ICD-9 code 435 is not included in the cause-of-death category cerebrovascular diseases.

### **AGE-ADJUSTED RATES**

The crude death rate is commonly used to measure mortality. However, the age composition of the population can greatly influence the crude death rate. For example, since most deaths occur to persons over 70 years of age, a population that is aging will naturally see an increase in the crude death rate. Therefore, using the crude death rate to measure trends can be misleading if the age distribution of the population has changed over time. To help overcome this and other limitations of the crude death rate, age adjustment is used in mortality statistics. Age adjustment needs a standard age distribution, usually called a standard population. In the past, the most frequently used standard in the United States was based on the 1940 U.S. population. Beginning with 1999 mortality statistics, however, the U.S. and the Bureau of Vital Statistics began using the year 2000 standard population for age adjustment. **One impact of changing the standard population is that comparisons with previously published age-adjusted death rates will be meaningless, since age-adjusted death rates using different standard populations are not directly comparable.** Generally, the year 2000 standard will give age-adjusted death rates that are much higher than those based on the 1940 standard.

**TABLE C.1****ICD CAUSE OF DEATH CODES**

CAUSE OF DEATH	ICD-10 CODES	ICD-9 CODES
INFECTIOUS AND PARASITIC DISEASE	A00-B99	001-139
TUBERCULOSIS	A16-A19	101-018
MENINGOCOCCAL INFECTION	A39	036
SEPTICEMIA	A40-A41	038
VIRAL HEPATITIS	B15-B19	070
HUMAN IMMUNODEFICIENCY VIRUS (HIV) DISEASE	B20-B24	042-044
MALIGNANT NEOPLASMS	C00-C97	140-208
ESOPHAGUS	C15	150
STOMACH	C16	151
COLON, RECTUM AND ANUS	C18-C21	153-154
LIVER AND INTRAHEPATIC BILE DUCTS	C22	155
PANCREAS	C25	157

# APPENDIX D: PRENATAL CARE

## KESSNER INDEX

The classification of prenatal care as adequate, intermediate, or inadequate is derived from the Institute of Medicine's Three-Factor Prenatal Care Index.<sup>1</sup> The classes of care are in accordance with recommendations for prenatal care set forth by the American College of Obstetricians and Gynecologists and the World Health Organization. This classification scheme accounts for length of gestation by requiring fewer prenatal visits for pregnancies with short gestation time. Records with missing information (i.e. last normal menstrual period, gestation weeks, number of visits, or month prenatal care began) are assigned to the inadequate prenatal care category.

The gestation weeks are calculated by subtracting the last menstrual date from the child's birth date. If the last menstrual date is missing from the birth record, the doctor's (or other medical professional's) estimate of gestation is used. The accuracy of the level of prenatal care is only as reliable as the information provided by the mother and her care giver.

The table below shows the Institute of Medicine's Three-Factor Prenatal Care Index.

**TABLE D.1**

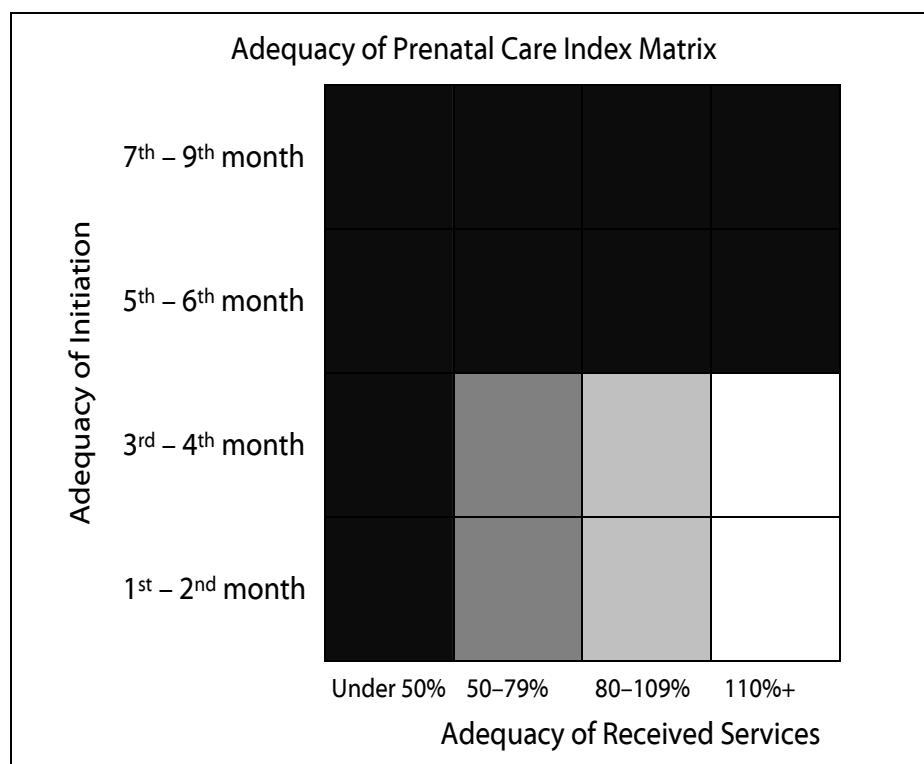

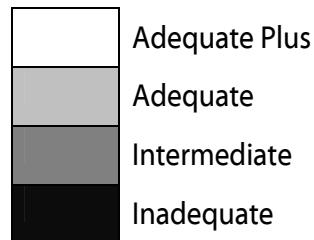

GESTATION	TRIMESTER CARE BEGAN AND/OR NUMBER OF PRENATAL VISITS	LEVEL OF CARE
<= 13 Weeks	At least 1 visit	Adequate
	No prenatal visits	Intermediate
14–17 Weeks	1st trimester and at least 2 visits	Adequate
	1st or 2nd trimester and 1 visit	Intermediate
	No prenatal visits	Inadequate
18–21 Weeks	1st trimester and at least 3 visits	Adequate
	1st or 2nd trimester and 1–2 visits	Intermediate
	No prenatal visits	Inadequate
22–25 Weeks	1st trimester and at least 4 visits	Adequate
	1st or 2nd trimester and 2–3 visits	Intermediate
	3rd trimester or no more than 1 visit	Inadequate
26–29 Weeks	1st trimester and at least 5 visits	Adequate
	1st or 2nd trimester and 2–4 visits	Intermediate
	3rd trimester or no more than 1 visit	Inadequate
30–31 Weeks	1st trimester and at least 6 visits	Adequate
	1st or 2nd trimester and 3–5 visits	Intermediate
	3rd trimester or no more than 2 visits	Inadequate
32–33 Weeks	1st trimester and at least 7 visits	Adequate
	1st or 2nd trimester and 4–6 visits	Intermediate
	3rd trimester or no more than 3 visits	Inadequate
34–35 Weeks	1st trimester and at least 8 visits	Adequate
	1st or 2nd trimester and 5–7 visits	Intermediate
	3rd trimester or no more than 4 visits	Inadequate
=> 36 Weeks	1st trimester and at least 9 visits	Adequate
	1st or 2nd trimester and 5–8 visits	Intermediate
	3rd trimester or no more than 4 visits	Inadequate

**APNCU INDEX**

The APNCU index makes use of two types of prenatal care information obtained from birth certificate data: when prenatal care began (adequacy of initiation) and the number of prenatal visits from when prenatal care began until delivery (adequacy of received services). The APNCU index classifies the adequacy of initiation as follows: pregnancy months 1 and 2, months 3 and 4, months 5 and 6, and months 7 to 9. To classify the adequacy of received services, the number of prenatal visits is compared to the expected number of visits for the period between when care began and the delivery date. The expected number of visits is based on the American

College of Obstetricians and Gynecologists prenatal care standards for uncomplicated pregnancies and is adjusted for the gestational age when care began and for the gestational age at delivery. A ratio of observed to expected visits is calculated and grouped into four categories—Inadequate (received less than 50% of expected visits), Intermediate (50%–79%), Adequate (80%–109%), and Adequate Plus (110%). The final APNCU index measure combines these two dimensions into a single summary score. The chart below summarizes the two dimensions of the APNCU index.

**TABLE D.2****Summary Index**

# APPENDIX E: YEAR 2010 HEALTH OBJECTIVES

The U.S. Department of Health and Human Services published Healthy People 2010: Understanding and Improving Health<sup>1</sup> to comprehensively address health promotion and disease prevention opportunities in order to allow local communities and states to choose from among its recommendations in addressing their own highest priority needs.

The Alaska Department of Health and Social Services,

Division of Public Health has, using the framework of Healthy People 2010, developed targets for improving the health of Alaskans. Healthy Alaskans 2010: Targets and Strategies for Improved Health takes Alaska's unique situation and challenges into account.

The table below provides a brief comparison of some of the national and state objectives compared with Alaska vital statistics from 2001 through 2003.

HEALTH INDICATOR	YEAR 2010 HEALTH OBJECTIVES			Healthy People Objectives	Healthy Alaskans Objectives
	2001	2002	2003		
Malignant Neoplasm (Cancer) Death Rate <sup>2</sup>	192.4	189.9	187.7	159.9	162.0
Accident and Adverse Effects Death Rate <sup>2</sup>	62.3	61.2	56.7	17.5	31.0
Intentional Self-Harm (Suicide) Death Rate <sup>2</sup>	16.5	20.9	20.6	5.0	11.0
Cerebrovascular Disease Death Rate <sup>2</sup>	59.3	55.4	59.9	48.0	60.0
Chronic Obstructive Pulmonary Disease Death Rate <sup>2</sup>	50.5	47.0	46.5	60.0	21.7
Diabetes Mellitus Death Rate <sup>2</sup>	23.1	21.7	27.5	45.0	62.0
Chronic Liver Disease and Cirrhosis Death Rate <sup>2</sup>	10.7	9.5	10.6	3.0	6.0
Infant Mortality Rate <sup>3</sup>	6.8	6.8	6.9	4.5	4.5
Neonatal Infant Mortality Rate <sup>3</sup>	3.3	3.1	3.0	2.9	2.5
Postneonatal Infant Mortality Rate <sup>3</sup>	3.6	3.8	4.0	1.2	2.3
Low Birth Weight (<2500 grams) Percent	5.7%	5.8%	5.9%	5.0%	4.0%
Very Low Birth Weight (<1500) Percent	1.3%	0.9%	0.9%	0.9%	0.8%
Mothers Abstaining from Tobacco Use During Pregnancy	82.6%	82.0%	82.9%	99.0%	85.0%
Alaska Mothers Receiving Prenatal Care During the First Trimester	77.9%	76.9%	76.3%	90.0%	85.0%
White Mothers Receiving Prenatal Care During the First Trimester	82.3%	81.5%	80.8%	90.0%	85.0%
Native Mothers Receiving Prenatal Care During the First Trimester	68.8%	67.5%	68.4%	90.0%	85.0%

<sup>1</sup>U.S. Department of Health and Human Services. *Healthy People 2010: Understanding and Improving Health*. 2nd ed. Washington, DC: U.S. Government Printing Office, November 2000.

<sup>2</sup>Rate per 100,000 U.S. 2000 standard million population.

<sup>3</sup>Infant mortality rates are three-year averages.

# APPENDIX G: GEOGRAPHIC INFORMATION

Some of the information in this report is provided by geographic regions. There are three different ways in which Alaska is divided into regions: 1) by census area;

2) by Native Regional Corporation boundaries; and 3) by judicial districts. The following alphabetic list shows the census area and Native Regional Corporation for each location.

LOCATION	CENSUS AREA	NATIVE REGIONAL CORPORATION
ADAK	ALEUTIANS WEST	ALEUT CORP.
AFOGNACK	KODIAK ISLAND BOROUGH	KONIAG INC.
AKHIOK	KODIAK ISLAND BOROUGH	KONIAG INC.
